graft versus host disease a condition where immunocompetent donor cells recognize and react against the recipient's tissues, because the recipient is immunosuppressed or cannot recognize the different genetic constitution of the donor cells.

Graham, Thomas (1805-69), Scottish chemist, one of the founders of physical chemistry; he conducted research on absorption of gases, osmosis, diffusion, colloids, and dialysis.

Graham's law of diffusion a law stating that at equal temperatures and pressures the rates of diffusion of gases are inversely proportional to the square roots of their densities and hence to the square roots of their relative molecular masses $(M_r s)$. Thus for two gases A and B,

$$J_A/J_B = \overline{v}_A/\overline{v}_B = M_{rB}^{1/2}/M_{rA}^{1/2},$$

where J_A and J_B , $\overline{\nu}_A$ and $\overline{\nu}_B$, and $M_{\tau A}$ and $M_{\tau B}$ are the fluxes, mean velocities, and relative molecular masses of A and B, respectively.

grain 1 any small, hard particle, e.g. a grain of sand. 2 any simple single-seeded indehiscent fruit in which the seed wall fuses with the carpel wall during development. Technically called a caryopsis, it is typical of the cereals and other grasses. 3 (in photography) any of the many particles of silver halide in a photographic emulsion. The resolution possible in the image is inversely proportional to the grain size in the emulsion. 4 any of the dried insect bodies present in dyes such as cochineal.

the kilogram in both the Système International (SI) and the metric system (cgs or mks) of units.

+gram comb. form indicating a drawing, something written or recorded; the record produced by an instrument, e.g. spectrogram; the visible result of a procedure, e.g. autoradiogram, chromatogram.

gram-atom or gram-atomic weight abbr.: g-atom; the atomic weight of an element expressed in grams; it has now been replaced by amount of substance, measured in **moles**.

gram-equivalent or (formerly) gram-equivalent weight abbr.: g-equiv; an equivalent (def. 3) expressed in grams.

gramicidin any of a group of linear polypeptide antibiotics that are active against Gram-positive microorganisms and are isolated from cultures of *Bacillus brevis*. The commercial material is a mixture of gramicidins A, B, C, and D, all of which consist of chains of 15 amino-acid residues in a pattern of alternating D- and L-forms; all have a formyl group at the N terminus and an ethanolamine residue at the C terminus. Gramicidins increase the permeability of biological membranes to protons and alkali-metal cations by forming transient dimeric ionophoric channels through the membrane. See also gramicidin S.

gramicidin S a homodetic cyclic decapeptide antibiotic, cyclo(-Val-Orn-Leu-DPhe-Pro-Val-Orn-Leu-DPhe-Pro-), produced by a strain of Bacillus brevis and active against Gram-positive bacteria. Gramicidin S is more closely related to tyrocidins in its biological and chemical properties than to true gramicidins. Its biosynthesis occurs by a mechanism that is not dependent on the presence of ribosomes or mRNA. It was the first peptide antibiotic to be chemically synthesized, and is so named because it was first isolated in Soviet Russia, where it was widely used.

gram-molecule or **gram-molecular weight** symbol: g-mol; the molecular weight of a compound (or element) expressed in grams; it has now been replaced by the **mole**.

Gram-negative describing a bacterial cell that, during Gram staining, does not retain the basic dye in its cell wall. The walls of Gram-negative organisms are thin, about 10 nm across, but complex, having a lipopolysaccharide layer outside the peptidoglycan layer; they are also resistant to digestion by lysozyme. Compare Gram-positive.

Gram-positive describing a bacterial cell that, during **Gram staining**, retains the basic dye in its cell wall. The walls of Gram-positive organisms are relatively thick, 15-80 nm across, and consist of a network of peptidoglycan; they are readily digested by lysozyme. *Compare* **Gram-negative**.

Gram staining or Gram stain a staining procedure used for bacteria in which the cells are first heat-fixed and stained with a basic dye, e.g. Crystal Violet, then treated with I₂-KI solution to fix the stain, washed with ethanol or acetone, and finally counterstained with another dye, e.g. carbolfuchsin or safranin. Cells that retain the basic dye after this procedure are called Gram-positive; those that do not are called Gram-negative. [After Hans Christian Joachim Gram (1853–1938), Danish physician and bacteriologist, who described the method in 1884.]

grancalcin a Ca²⁺-binding protein containing four **EF hands** and abundant in neutrophils and monocytes. It exhibits strong homology to **sorcin**. It is a homodimer. Example from human: database code A42578, 217 amino acids (23.98 kDa).

β granin see chromogranin.

Granit, Ragnar Arthur (1900-91), Finnish-born Swedish neurophysiologist; Nobel Laureate in Physiology or Medicine (1967) jointly with H. K. Hartline and G. Wald 'for their discoveries concerning the primary physiological and chemical visual processes in the eye'.

granular or granulose or granulate being composed of, or having the character of small particles or grains (def. 1).

granular endoplasmic reticulum or rough endoplasmic reticulum see endoplasmic reticulum.

granulate 1 to make (something) into grains (def. 1). 2 (of a wound, ulcer, etc.) to form granulation tissue. 3 another word for granular.

gram symbol: g; a unit of mass equal to a thousandth part of granular.

granulation

granulation 1 the act or process of subdividing a solid into small, usually rounded grains (def. 1). 2 the formation of one or more small, rounded lumps (grains (def. 1)) in a tissue. 3 the development of granulation tissue.

granulation tissue the mass of young connective tissue and blood vessels formed on the surface of a wound or ulcer in the early stages of healing.

granule any small grain (def. 1), especially any small intracellular particle containing stored material that can be seen by (electron) microscopy, e.g. insulin-containing β granules in the B cells of the islets of Langerhans, starch granules in potato tubers.

granulocyte a category of white blood cells distinguished by the presence of conspicuous cytoplasmic granules. Granulocytes include neutrophils, basophils, and eosinophils.

granulocyte-colony stimulating factor see colony stimulating

granulose 1 another word for granular. 2 an obsolete name for starch or amylose.

granum (pl. grana) a stack of disclike thylakoids resembling a pile of coins. Grana occur in chloroplasts, especially in higher plants.

granzyme A enzyme of sub-subclass EC 3.4.21; other names: cytotoxic T-lymphocyte proteinase 1; Hanukkah factor (HF); granzyme 1; CTL tryptase; fragmentin 1; trypsin-like serine proteinase. An enzyme necessary for target-cell lysis in cellmediated immune responses; it cleaves on the carbonyl side of Lys or Arg. It may be involved in apoptosis. It occurs in cytoplasmic granules. The molecule is a homodimer, disulfide linked. Example (precursor) from human: database code GRAA_HUMAN, 262 amino acids (28.93 kDa).

grape sugar a former name for D-glucose. See glucose.

graph 1 a diagram showing the relation between two variable quantities, or the relation between a mathematical function and different values of one of the variables in the function, usually plotted between axes at right angles to each other. 2 to plot or draw a graph.

+graph comb. form 1 denoting (something) drawn, recorded, or written (in the way specified), e.g. autoradiograph, photograph. 2 denoting an instrument or device that draws or records (observations), e.g. spectrograph. 3 denoting the act or process of producing such a drawing or record. Compare +gram. —+graphic or +graphical adj. comb. form.

graphics (functioning as sing.) 1 the use of diagrams in calculation. 2 the production of diagrams, representations of molecular structures, etc., often by computer.

+graphy comb. form denoting a method, process, or technique that produces a drawing or record, e.g. chromatography. See +araph.

grating see diffraction grating.

Graves' disease or Basedow's disease a disease characterized by diffuse goitre, thyrotoxicosis, and exophthalmia. It is an autoimmune condition associated with the presence of thyroidstimulating antibodies in the blood. [After Robert James Graves (1796-1853), Irish physician.]

Graves' disease carrier protein see GDC.

gravimetric analysis quantitative analysis of the chemical composition of substances or materials based on the separation of each component of interest and weighing either the purified compound or a derivative of it.

gravimetry measurement by weighing. -gravimetric or gravimetrical adi.

gravitation the attractive force that bodies exert on one another as a result of their mass; any process or result caused by such an attractive force. - gravitational adj.

gravitational constant symbol: G; the proportionality constant relating the attractive force, F, between two bodies of mass m_1 and m_2 , and the distance between them, s, in Newton's law of gravitation:

 $G = Fs/m_1m_2 = 6.672 59 (85) \times 10^{-11} \text{ m}^3 \text{ kg}^{-1} \text{ s}^{-2}$.

subunits arranged in a ring; it binds to the groEL protein prod-Ban đang đọc một quyển sách được tăng bởi HUY NGUYÊN. Nếu ban có nhu cầu về sách sinh học, xin liên hê:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

gravitational field any field (def. 1) associated with a mass by which a force is exerted on a second mass placed in this field. gravitational interaction any interaction between bodies or particles that results from their masses.

gravitational mass see mass.

gravity 1 the attractive force that moves or tends to move bodies towards the centre of any celestial body such as the Earth or the Moon. 2 the attribute of having weight. 3 specific gravity. gray symbol: Gy; the SI derived unit of absorbed dose of radiation, equal to one joule per kilogram of living tissue;

$$1 \text{ Gy} = 1 \text{ J kg}^{-1} = 1 \text{ m}^2 \text{ s}^{-2}.$$

Compare sievert. See also rad. [After Louis Harold Gray (1905-65), British physicist and radiobiologist.]

Grb2 growth factor receptor-bound protein 2; also called Ash protein; a cytoplasmic protein, related to sem-5 (see sem-5), that participates in downstream signalling after activation of a variety of cell receptors. It binds directly to activated epidermal growth factor and platelet-derived growth factor receptors; indirectly it can be recruited by G-protein-coupled receptors through tyrosine phosphorylation of Shc (see SHC). Grb2 binds to activated Shc and the complex then recruits Sos (see sos). The Shc-Grb2-Sos complex binds to the plasma membrane where Sos catalyses Ras guanine nucleotide exchange, leading to MAP kinase activation. Example from human (identical in rat): database code GRB2_HUMAN, 217 amino acids (25.18 kDa).

GRE abbr. for glucocorticoid response element.

GRF abbr. (sometimes) for growth hormone releasing factor (i.e. GHRH).

Gri symbol for glyceric acid or glycerate.

grid 1 a framework made up of fine wires arranged in two sets at right angles to each other, especially a device for supporting the specimen in an electron microscope. 2 an electrode controlling the current flowing through a thermionic valve.

griseofulvin [2S]-trans-7-chloro-2',4,6-trimethoxy-6'-methylspiro[benzofuran-2(3H),1'-(2)cyclohexene]-3,4'-dione; a chlorine-containing polyketide metabolite of Penicillium griseofulvum and P. janczewskii. It has antifungal properties and is used therapeutically, e.g. for treatment of ringworm. It inhibits spindle formation in mitosis, microtubule function, and possibly nucleic-acid synthesis.

Grn symbol for glycerone.

gRNA abbr. for guide RNA; small RNA molecules, 60-80 nucleotides long, that may be involved in editing of RNA by supplying information concerning nucleotide deletion or addition. See also editosome.

gro the symbol for any of a group of related genes found in bacteria (especially Escherichia coli), mutations in which affect the growth of phages.

Gro symbol for glycerol.

groEL the symbol for any of a family of bacterial genes encoding chaperonins. They have eukaryotic counterparts. Example of a groEL protein product from Escherichia coli: oligomer of 14 subunits composed of two stacked rings of seven subunits; it has ATPase activity; database code CH60_ECOLI, 547 (57.02 kDa).

groES the symbol for any of a family of bacterial genes encod-

ing chaperonins. They have eukaryotic counterparts. Example

of a groES protein product from Escherichia coli: six to eight

uct to suppress the latter's ATPase activity; database code CH10_ECOLI, 97 amino acids (10.38 kDa)

Grotthus and Draper law a law stating that only those radiations absorbed by a system are effective in producing chemical change in the system.

groundplasm or cytoplasmic matrix the sub-electron-microscopic material of the cytoplasm, excluding the cell organelles, cell particles, and other microscopically resolvable structures. It contains the cytoplasmic enzymes and metabolites together with components of the cytoskeleton.

ground state the state of lowest energy of any system.

ground substance an alternative name for the matrix (def. 2) of connective tissue.

ground tissue a collective term for plant tissue other than the epidermis or peridermis and vascular tissue.

group (in chemistry) or (formerly) radical 1 any defined continuously linked collection of atoms within a molecular entity. In organic chemical nomenclature the meaning within this general sense is restricted to any covalently bonded collection of atoms that behaves as a unit in chemical reactions; functional group, substituent group. 2 any of the columns of chemical elements in the periodic table. 3 a blood group.

group pK the **pK** of a specific group in a molecule with two or more acid groups. In general the term applies only to a particular ionic form of the molecule, because the pK of a group changes when any other group in the molecule changes its ionization state, and thus changes as the substance is titrated. Compare molecular pK, titration pK.

group potential the tendency of a group (def. 1) to escape from

group-transfer potential the Gibbs energy change (free energy change, ΔG) occurring when a group (def. 1) is transferred from a donor compound to the nucleophile water, i.e. when the group is removed by hydrolysis of the donor. It reflects the thermodynamic tendency for the group to be transferred.

group-transfer reaction any chemical reaction in which a group (def. 1) is transferred from a donor compound to an acceptor compound. Such reactions may be catalysed by a transferase enzyme of EC class 2.

group translocation any process in which a substance to be transported across a biological membrane undergoes covalent modification prior to crossing the membrane.

growth curve the change, as a function of time, in the number of cells of a growing culture or in some measure of the size of an organism.

growth factor 1 any specific substance that must be present in a culture medium for multiplication of the cultured cells to take place. 2 a specific substance that is a necessary constituent of the diet for the normal growth of a particular animal, or is required in the soil for the normal growth of a particular plant.

growth factor receptor-bound protein 2 see Grb2.

growth hormone another name for sometotropin.

growth hormone inhibitory factor abbr.: GHIF or GIF; a former name for somatostatin.

growth hormone release-inhibiting hormone abbr.: GH-RIH; a former name for somatostatin.

growth hormone releasing factor abbr.: GHRF or GRF; another name for GHRH.

growth hormone releasing hormone see GHRH.

GRP see Grb2.

GRP 75 see mortalin.

GRS (in clinical chemistry) abbr. for β -glucuronidase.

Grunstein-Hogness procedure an alternative name for colony hybridization.

GSH abbr. for glutathione.

GSSG abbr. for oxidized glutathione (see glutathione).

GST abbr. for glutathione S-transferase (see glutathione trans-

GST fusion protein a fusion protein in which a synthetic oligonucleotide of a defined sequence of the protein of interest

is grafted onto the glutathione transferase (GST) gene. The fused protein is then expressed in a recombinant system, purified by affinity chromatography (making use of the properties of GST), and the GST removed to release the pure protein.

GT-AG rule a rule stating that in RNA there is a requirement for a GT at the 5' side of a splice junction and an AG at the

GTD (in clinical chemistry) abbr. for glutathione reductase.

G-tetrad an alternative name for G-quartet.

GTF abbr. for glucose-tolerance factor.

GTP abbr. for guanosine triphosphate.

GTPase any enzymic activity that hydrolyses GTP to GDP and orthophosphate. It is associated with G-proteins, EF-Ts, and HIV protein.

GTP-binding protein any of various proteins that bind GTP as a regulatory molecule. This binding is frequently associated with a GTPase activity. GTP-binding proteins include elongation and initiation factors (e.g. EF-Tu), G-proteins, G25K GTPbinding protein, Ras proteins, and yeast CDC42 (see CDC markers). Binding of GTP normally activates the protein, an effect that is reversed by hydrolysis of the GTP to GDP. Example from human: database code G25B_HUMAN, 191 amino acids (21.29 kDa).

GTP[S] or GTPyS abbr. for guanosine 5'-y-thiotriphosphate.

GTR1 a representative 12-transmembrane domain transport protein that effects the facilitated diffusion of glucose in certain mammalian tissues. Example from human erythrocytes: database code GTR1_HUMAN, 492 amino acids (54.04 kDa).

GTT abbr. for glucose tolerance test.

Gu symbol for guanidine.

Gua symbol for a residue of the purine base guanine (alternative to G).

GUA a codon in mRNA for L-valine.

guanidine symbol: Gu; the strongly basic substance, iminourea; aminomethanamidine; (H₂N)₂C=NH.

guanidinium the cation, $[C(NH_2)_3]^+$, derived from guanidine by uptake of a hydron.

guanidino the amidinoimino group, -HN-C(=NH)-NH₂, derived from guanidine.

guanidinoacetate N-methyltransferase EC 2.1.1.2; an enzyme of the pathway for de novo synthesis of creatine, by reaction of S-adenosyl-L-methionine with guanidinoacetate releasing S-adenosyl-L-homocysteine. Example from rat: database code GAMT_RAT, 235 amino acids (26.25 kDa).

guanine symbol: G or Gua; 2-amino-6-hydroxypurine; 2amino-1,7-dihydro-6H-purin-6-one; a purine that is one of the five main bases found in nucleic acids and a component of a number of phosphorylated guanosine derivatives whose metabolic or regulatory functions are important.

guanine nucleotide binding protein see GTP-binding protein. guanine nucleotide releasing protein abbr.: GNRP; or guanine nucleotide releasing factor, abbr.: GRF; a protein that binds to a Ras protein (see Ras family of proteins) or Ras-related GTP-binding protein and activates it by stimulating it to release its bound GDP and bind GTP in its place. The C-terminal 310 amino acids show homologies to Cdc25 (see cdc gene) and Sos, the product of sos. Example from Rattus norvegicus: database code GNRP_RAT, 1244 amino acids (142.67 kDa).

guanosine symbol: G or Guo; guanine riboside; 9-β-D-ribofuranosylguanine; a nucleoside with a wide species distribution. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

guanosine

guanosine 2',3'-(cyclic)phosphate see guanosine phosphate. guanosine 3',5'-(cyclic)phosphate or guanosine 3',5'-cyclophosphate see quanosine 3',5'-phosphate.

guanosine 5'-diphosphate symbol: Guo5'PP or ppG; the recommended name for guanosine diphosphate (abbr.: GDP), 5'diphosphoguanosine, 5'-guanylyl phosphate, guanosine 5'-(trihydrogen diphosphate), a universally distributed nucleotide that occurs in both the free state and as a component of guanosinediphosphosugars. It is a metabolic precursor of guanosine 5'-triphosphate, GTP, and is a substrate, a product, or a regulatory agent in many metabolic systems.

guanosine 3'-diphosphate 5'-diphosphate symbol.: ppGpp; see reiA. spoT.

quanosinediphosphomannose or guanosine(5')diphospho(1)α-p-mannose symbol: GuoPPMan; the alternative recommended names for guanosine diphosphate mannose (abbr.: GDPM or GDPmannose); guanosine 5'-(α-D-mannopyranosyl diphosphate); α-p-mannopyranosyl 5'-guanylyl phosphate; the most important quanosinediphosphosugar. It is synthesized from α-D-mannose 1-phosphate and guanosine 5'-triphosphate by the action of mannose-1-phosphate guanylyltransferase (EC 2.7.7.13). It is an intermediate in the synthesis of mannose-containing homo- and heteroglycans in plants. In animal cells GDPmannose is an intermediate in the incorporation of residues of both mannose and fucose into N-linked oligosaccharides of glycoproteins, its conversion to GDP-L-fucose having first taken place in the case of fucose.

guanosinediphosphosugar or guanosine diphosphate sugar abbr. GDPsugar; any of several nucleosidediphosphosugars in which the distal phosphoric residue of guanosine 5'-diphosphate is in glycosidic linkage with a monosaccharide (or a derivative of a monosaccharide). Included are GDP-L-fucose, GDP-D-glucose, GDP-L-guluronic acid, GDP-D-mannose (see guanosinediphosphomannose), and GDP-D-mannuronic acid.

quanosine 5'-[β, y-imido]triphosphate symbol: PP[NH]P or p[NH]ppG; the recommended name for β, γ -imidoguanosine 5'-triphosphate (abbr.: $GTP[\beta, \gamma-NH]$), 5'-guanylyl imidodiphosphate (abbr.: GMP-PNP), 5'-guanylyl iminodiphosphonate, guanosine $(5' \rightarrow 0^3)$ -1,2- μ -imidotriphosphate, a synthetic nonhydrolysable analogue of guanosine triphosphate, GTP, in which the oxy group between the latter's intermediate and terminal phosphorus atoms is replaced by an imido group. It stimulates G-proteins and systems activated thereby.

5'-[β,γ-methylene]triphosphate guanosine Guo $PP[CH_2]P$ or $p[CH_2]ppG$; the recommended name for β, γ methyleneguanosine 5'-triphosphate, (abbr.: $GTP[\beta, \gamma-CH_2]$), 5'-guanylyl methylenediphosphonate (abbr.: GMP-PCP), guanosine $(5' \rightarrow 0^3)$ -1,2- μ -methylenetriphosphate, a synthetic nonhydrolysable analogue of guanosine 5'-triphosphate, GTP, in which the oxy group between the latter's intermediate and terminal phosphorus atoms is replaced by a methylene group. It is an effective activator of ADP-ribosylation factor but not of G_S (see **G-protein**).

guanosine monophosphate abbr.: GMP; an alternative name for any guanosine phosphate, but in particular for guanosine 5'phosphate, especially when its distinction from guanosine (5'-)diphosphate and guanosine (5'-)triphosphate requires

guanosine phosphate symbol: GuoP; guanosine monophosphate (abbr.: GMP); any phosphoric monoester or diester of guanosine. There are three monoesters - guanosine 2'-phosphate, guanosine 3'-phosphate, and guanosine 5'-phosphate and two diesters - guanosine 2',3'-phosphate and guanosine 3',5'-phosphate - although guanosine 5'-phosphate, guanylic acid is the ester commonly denoted (the locant being omitted if no ambiguity may arise). Guanosine 2',3'-phosphate (symbol: Guo-2',3'-P), also named guanosine 2',3'-(cyclic)phosphate or cyclic guanosine 2',3'-monophosphate (abbr.: 2',3'-cyclic GMP), is formed as an intermediate during the alkaline hydrolysis of ribonucleic acid. This diester then readily hydrolyses to a mixture of the two monoesters guanosine 2'phosphate (symbol: Guo2'P), also named guanosine 2'monophosphate (abbr.: 2'GMP) or 2'-guanylic acid or guanylic acid a, and guanosine 3'-phosphate (symbol: Guo3'P), also named guanosine 3'-monophosphate (abbr.: 3'GMP) or 3'-guanylic acid or guanylic acid b.

guanosine 2'-phosphate see guanosine phosphate.

Bạn đảng đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

guanosine 2',3'-phosphate see guanosine phosphate. guanosine 3'-phosphate see guanosine phosphate.

guanosine 3',5'-phosphate symbol: Guo-3',5'-P; the recommended name for cyclic guanosine 3',5'-monophosphate (abbr.: 3',5'-cyclic GMP or cyclic GMP or cGMP), guanosine 3',5'-cyclophosphate, guanosine 3',5'-(cyclic) phosphate, a monophosphoric diester of guanosine found in practically all mammalian tissues. It is a cyclic nucleotide similar in structure and the regulation of its metabolism to adenosine 3',5'-phosphate, cyclic AMP, but the levels in tissues are commonly less than 5 percent of those of cyclic AMP. Also like cyclic AMP, it acts as a second messenger in many systems, and it activates a number of distinct cyclic-GMP-dependent protein kinases that share some of their properties with their cyclic AMP counterparts; in some instances it antagonizes the action of cyclic AMP. Cyclic GMP is produced by the action of guanylate cyclase on guanosine 5'-triphosphate, GTP, and it mediates signal transduction for systems that activate this enzyme.

guanosine 5'-phosphate or 5'-guanylic acid or 5'-phosphoguanosine or 5'-O-phosphonoguanosine symbol: Guo5'P; alternative recommended names for guanosine 5'-monophosphate (abbr.: 5'GMP), guanosine 5'-(dihydrogen phosphate), guanine (mono)ribonucleotide. (The locant is commonly omitted if there is no ambiguity as to the position of phosphorylation.) It is biosynthesized from inosine 5'-phosphate, 5'-inosinic acid, via xanthosine 5'-phosphate and also from free guanine by the salvage pathway.

guanosine 5'- β -thiodiphosphate symbol: Guo5'PP[S] or [S]ppG; the recommended name for guanosine 5'- $(\beta$ -thio]diphosphate (abbr.: GDP β S), guanosine 5'- $(\beta$ -thiodiphosphate) (abbr.: GDP[S]), guanosine (5' \rightarrow 0'2)-1-thiodiphosphate, a synthetic nonhydrolysable analogue of guanosine 5'-diphosphate, GDP, in which an oxygen atom of its terminal phosphoric residue is replaced by a sulfur atom. It is a competitive inhibitor of the activation of G-proteins by guanosine 5'-triphosphate and of the stimulation of adenylate cyclase by guanosine 5'-triphosphate and fluoride.

guanosine 5'-y-thiotriphosphate symbol: GuoPPP[S] or [S]pppG; the recommended name for guanosine 5'-[y-thio] triphosphate (abbr.: GTP-y-S), guanosine 5'-(3-thiophosphate) (abbr.: GTP[S]), guanosine (5' \rightarrow 0³)-1-thiotriphosphate, a synthetic nonhydrolysable analogue of guanosine 5'-triphosphate, GTP, in which an oxygen atom of its terminal phosphoric residue is replaced by a sulfur atom. It is used in membrane studies to stimulate G-proteins and in studies of DNA synthesis.

guanosine 5'-triphosphate symbol: Guo5'PPP or pppG; the recommended name for guanosine triphosphate (abbr.: GTP), 5'-triphosphoguanosine, 5'-guanylyl diphosphate, guanosine 5'-(tetrahydrogen triphosphate), an important coenzyme and enzyme regulator present in all cells. It is formed from guanosine 5'-diphosphate by substrate-level phosphorylation or by transfer of the terminal phosphoric residue from adenosine 5'-triphosphate through the action of nucleoside-diphosphate kinase (EC 2.7.4.6). Reactions in which GTP participates are

often driven in the direction leading to hydrolysis, the free energy change then being utilized for energy-requiring purposes, e.g. microtubule assembly or protein biosynthesis. GTP also participates in various synthetic reactions by the transfer of a phosphoric residue to other metabolites, e.g. to oxaloacetate to form phosphoenolpyruvate in gluconeogenesis.

guanosyl any chemical group formed by the loss of a 2'-, a 3'-, or a 5'-hydroxyl group from the ribose moiety of guanosine. *Compare* guanylyl.

guanyl misnomer for 1 guanylyl. 2 guanylate.

guanylate 1 the mono- or the di-anion of guanylic acid. 2 any mixture of guanylic acid and its anions. 3 any salt or ester of guanylic acid.

guanylate cyclase EC 4.6.1.2; systematic name: GTP pyrophosphate-lyase (cyclizing); other names: guanylyl cyclase (not recommended but often used); guanyl cyclase (incorrect). A phosphorus—oxygen lyase enzyme that catalyses the elimination of pyrophosphate from guanosine 5'-triphosphate, GTP, by formation of guanosine 3',5'-phosphate, cyclic GMP. There are two types: (1) a soluble form, which exists as a heterodimer of α and β chains; human examples: α-3, database code CYG5_HUMAN, 717 amino acids (81.28 kDa); β-1, database code CYG1_HUMAN, 619 amino acids (70.43 kDa); and (2) a membrane-bound form, typical of some receptors; e.g. human atrial natriuretic peptide receptor A (precursor): database code ANPA_HUMAN, 1061 amino acids (118.78 kDa).

guanyl cyclase incorrect name for guanylate cyclase.

guanylic acid the trivial name for any phosphoric monoester of guanosine. The position of the phosphoric residue on the ribose moiety of a given ester may be specified by a prefixed locant. See guanosine phosphate. However, 5'-guanylic acid is the ester commonly denoted, its locant usually being omitted if no ambiguity may arise. 5'-Guanylic acid is also an alternative recommended name for guanosine 5'-phosphate.

guanylin a pentadecapeptide hormone from rat jejunum that activates the **guanylate cyclase** component of the intestinal heat-stable **enterotoxin** receptor.

guanylyl the guanosine[mono]phospho group; the acyl group derived from **guanylic acid**.

guanylylation the process of introducing guanylyl groups into a substance.

guanylyl cyclase see guanylate cyclase.

guaran a mucilaginous galactomannan of ≈ 220 kDa that serves as a storage polysaccharide in the seeds of guar and is the prime constituent of guar gum. It consists of long chains of $(1\rightarrow 4)$ -linked β -D-mannopyranose residues, to every alternate one of which a single α -D-galactopyranose residue is attached in $(1\rightarrow 6)$ -linkage.

guard cell either of a pair of crescent-shaped cells that surround a **stoma** in plants.

guard column a small column fitted in front of the main column as a device to prolong the life of columns in high-performance liquid chromatography by removing from the sample any particulate matter, aggressive agents, or components that bind irreversibly to the column packing.

2.7.4.6). Reactions in which GTP participates are **guar gum** a greyish-white powder consisting predominantly of Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

GUC

the polysaccharide guaran and obtained by grinding the endosperm of the seeds of guar, an Indian leguminous plant, Cyamopsis tetragonoloba (psoralioides), also called cluster bean. It hydrates and disperses readily in cold water to give colloidal solutions of very high viscosity that are stable over a very wide pH range and have very good suspending and lubricating properties. It is used for sizing paper and textiles, and as a stabilizing, suspending, and thickening agent in the food and pharmaceutical industries, etc. It has also been suggested as a nonabsorbable dietary additive to improve glycemic control in diabetes mellitus, possibly by slowing the uptake of ingested absorbable carbohydrate.

GUC a codon in mRNA for L-valine. GUG a codon in mRNA for L-valine.

Guggenheim plot a procedure that makes it possible to obtain rate constants for first-order reactions when neither the initial nor the final reactant concentrations are known. Measurements of the concentration of the reactant (or of some physical quantity that measures it), c_1 , c_2 , c_3 ,... c_n , are made at times t_1 , $t_2, t_3,...t_n$ and also at times $(t_1 + \delta t), (t_2 + \delta t), (t_3 + \delta t),...(t_n + \delta t),$ when the concentrations of the reactant are c_1 , c_2 , c_3 ,... c_n , where δt is a constant time difference, then

$$\ln(c_i - c_i') = \ln(c_0 - c_{\infty})(1 - e^{-k\delta t}) - kt,$$

or

$$ln(c_i - c_i') = a constant - kt_i,$$

hence a plot of $ln(c_i - c_i)$ versus t_i has a slope of -k. [After Edward Armand Guggenheim (1901-70), British physical chemist.] guide RNA see gRNA.

Guillemin, Roger Charles Louis (1924-), French-born US physician and endocrinologist; Nobel Laureate in Physiology or Medicine (1977) jointly with A. V. Schally 'for their discoveries concerning the peptide hormone production of the brain' [prize shared with R. S. Yalow].

guinea pig any of several species of wild or domesticated hystricomorph rodents, or cavies, in the genus Cavia, especially Cavia porcellus, which is widely used in biomedical research and testing.

Guinier plot a method of plotting the results of small-angle Xray scattering to obtain the radius of gyration of a molecule, $r_{\rm G}$, in the absence of information about the relative molecular mass of the component in question. It can be shown that

$$\ln(I_{\theta}/I_0) = -(4\pi r_G \sin\theta/\lambda)^2/3,$$

where I_{θ} and I_0 are the intensities of the scattered radiation at angles θ and 0 respectively, and λ is the wavelength of the radiation; hence a plot of $\ln(I_{\theta}/I_0)$ versus – $(4\pi\sin\theta/\lambda)^2/3$ will yield $r_{\rm G}$.

Gul symbol for a residue (or sometimes a molecule) of the aldohexose gulose.

GulA symbol for a residue (or sometimes a molecule) of the uronic acid guluronic acid.

gulo- prefix (in chemical nomenclature) indicating a particular configuration of a set of (usually) four contiguous >CHOH groups, as in the acyclic form of D- or L-gulose. See monosac-

L-gulonolactone oxidase EC 1.1.3.8; other name: L-gulono-ylactone oxidase; a flavoprotein enzyme that catalyses the oxidation by dioxygen of L-gulono-1,4-lactone to L-xylohexulonolactone (I) and H₂O₂. I isomerizes spontaneously to L-ascorbate. The flavin is FAD. The enzyme is essential for the formation of ascorbate, and a deficiency of the enzyme, as in humans, results in dependency on a dietary supply of ascorbate (see ascorbic acid). Example from rat: GGLO_RAT, 439 amino acids (50.42 kDa).

gulose symbol: Gul; the trivial name for the aldohexose gulohexose; a stereoisomer of glucose in which the configurations at both C-3 and C-4 are inverted. There are two enantiomers. (Illustrated opposite.)

guluronic acid symbol: GulA; the uronic acid resulting from the oxidation of the hydroxymethylene group at C-6 of gulose to a carboxyl group. L-Guluronic acid is a component of alginic acid.

gulose (β-p-pyranose form)

gum any of numerous water-soluble or water-dispersible heteroglycans, frequently containing uronic acids, that are produced as exudates from certain plants, especially trees, following physical injury. Gums are tacky, slimy substances that harden when dry. See also gum arabic, gum ghatti.

gum arabic a gum exuded from trees of the genus Acacia. Structurally it is a heteroglycan containing D-galactose, L-arabinose, L-rhamnose, and D-glucuronic acid. It is used in industry, e.g. in the manufacture of thickening agents, emulsifiers, inks, and pills. It is also used in glues and pastes.

gum ghatti a gum from the tree Anogeissus latifolia. It has a complex structure and contains as major components Dmannose, D-galactose, and L-arabinose, the latter in both furanose and pyranose arrangement. Small amounts of D-xylose and D-glucuronic acid are also present.

Gunn rat any member of a mutant strain of Wistar rats with hereditary hyperbilirubinemia. The defect affects the rate of glucuronidation of a number of substrates, but not equally. [After C. H. Gunn.]

Güntelberg-Müller charging process a method of calculating the electrical energy of an ion. According to the process, only the ion under consideration is supposed to receive a charge; the surrounding ions are assumed to be already charged, and the only change that they undergo during the process is a gradual redistribution as the central ion receives its charge.

Guo symbol for a residue of the ribonucleoside guanosine (alternative to G).

GuoP symbol for guanosine phosphate.

Guo2'P symbol for guanosine 2'-phosphate; see guanosine phosphate.

Guo-2',3'-P symbol for guanosine 2',3'-phosphate; see guanosine phosphate.

Guo3'P symbol for guanosine 3'-phosphate; see guanosine phosphate.

Guo-3',5'-P symbol for guanosine 3',5'-phosphate.

Guo5'P symbol for guanosine 5'-phosphate.

Guo5'PP symbol for guanosine diphosphate (alternative to ppG)

GuoPP[CH₂]P symbol for guanosine 5'-[β , γ -methylene] triphosphate (alternative to p[CH₂]ppG).

GuoPPMan symbol for guanosinediphosphomannose.

GuoPP(NH)P symbol for guanosine 5'- $[\beta, \gamma$ -imido]triphosphate (alternative to p[NH]ppG).

Guo5'PPP symbol for guanosine 5'-triphosphate (alternative to pppG).

Guo5'PPP[S] symbol for guanosine 5'-y-thiotriphosphate.

Guo5'*PP***[S]** symbol for guanosine 5'- β -thiodiphosphate.

gustducin a taste-cell-specific G-protein a subunit closely related to the transducins and comprising 354 amino acids.

gut a term variously used to describe the whole of the alimentary canal or only the intestine, i.e. the part from the stomach to the anus.

gut glucagon (sometimes) an alternative term for enteroglucagon.

gut hormone a general, inaccurate, but widely used term for all the various regulatory peptides of the gut. They are neither confined to the gut, nor are they exclusively hormones.

Guthrie test a microbiological test in which a strain of Bacillus Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

286

gutta-percha gyromagnetic

subtilis that requires phenylalanine for growth is used to test for excessive levels of plasma phenylalanine in conditions such as **phenylketonuria**. [After R. Guthrie (1916-).]

gutta-percha a trans-1,4-polyisoprene derived by coagulation of the latex of various Malayan trees of the genus Palaquium. It has a lower molecular mass than rubber and is thermoplastic.

GUU a codon in mRNA for L-valine.

g-value a factor expressing the size of the magnetic moment of a paramagnetic chemical species. It specifies the position at

which the absorption in electron spin resonance of the paramagnetic species occurs. See electron spin resonance spectroscopy. Gy symbol for gray.

gynaminic acid formerly, a name for a constituent of human milk, now known to be identical with **sialic acid**.

gynogamone see gamone.

gyrase see type II DNA topoisomerase.

gyromagnetic ratio or magnetogyric ratio symbol: γ ; the ratio of the magnetic moment, μ , of a given atomic particle to its angular momentum, L; i.e. $\gamma = \mu/L$. See also proton magnetogyric ratio.

Hh

h symbol for 1 hecto+ (SI prefix denoting 10² times). 2 hour (supersedes hr.).

h symbol for 1 Planck constant. 2 Hill coefficient (alternative to $n_{\rm H}$). 3 height.

h+ or (not recommended) **H+** prefix to abbreviations for peptide hormone (names) denoting human, i.e. of (or as if of) human origin; e.g. hGH (for human growth hormone).

H symbol for 1 hydrogen; see also protium, deuterium, tritium. 2 a residue of the α -amino acid histidine (alternative to His). 3 a residue of an incompletely specified base in a nucleic-acid sequence that may be adenine, cytosine, or either thymine (in DNA) or uracil (in RNA). 4 henry. 5 histone. 6 histamine (see histamine receptor).

H+ see h+.

H1 a DNA-binding protein from Escherichia coli belonging to the H-NS family of proteins.

H7 1-(5-isoquinolinylsulfonyl)-2-methylpiperazine; an inhibitor of protein kinase C ($K_i = 6.0 \mu M$), protein kinase A ($K_i = 3.0$ μ M), and cyclic GMP-dependent protein kinase ($K_i = 5.8 \mu$ M).

H₂ symbol for 1 dihydrogen. 2 the prefix dihydro+ in a trivial chemical name, e.g. H₂folate for dihydrofolate.

H₄ symbol for the prefix tetrahydro+ in a trivial chemical name, e.g. H₄folate for tetrahydrofolate.

H symbol for 1 fluence (alternative to F). 2 enthalpy. 3 magnetic field strength (light italic in nonvector equations; bold italic in vector equations).

-H conformational descriptor designating the half-chair conformation of a six-membered ring form of a monosaccharide or monosaccharide derivative. Locants of ring atoms that lie on the side of the structure's reference plane from which the numbering appears clockwise are indicated by left superscripts and those that lie on the other side of the reference plane by right subscripts; e.g. methyl 2,3-anhydro-5-thio-β-L-lyxopyranoside- 5H_s . See also conformation.

H- or (sometimes) **H** (in chemical nomenclature) symbol for indicated hydrogen (at the position specified by a prefixed loc-

Haber, Fritz (1868-1934), German chemist; Nobel Laureate in Chemistry (1919) 'for the synthesis of ammonia from its elements'.

Haber-Weiss reaction the iron-catalysed reaction of a superoxide anion with hydrogen peroxide to form oxygen, a hydroxyl radical, and a hydroxyl ion. It is thought to proceed as follows:

$$O_2^- + Fe^{3+} \rightarrow O_2 + Fe^{2+}$$

$$H_2O_2 + Fe^{2+} \rightarrow OH^{\bullet} + OH^{-} + Fe^{3+}$$

[After F. Haber and Joseph Weiss.]

HAc abbr. for acetic acid.

HACBP see calreticulin.

haema+ or (before a vowel) haem+ variant spellings (esp. Brit.) of hema+.

haemadin an anticoagulant peptide from the Indian leech, Haemadipsa sylvestris. It is a slow tight-binding inhibitor of thrombin, but does not inhibit trypsin, chymotrypsin, factor Xa, or plasmin. It comprises 57 amino acids.

haemato+ or (before a vowel) haemat+ variant spellings of (esp. Brit.) of hemato+.

haemo+ a variant spelling (esp. Brit.) of hemo+.

haemoglobin a variant spelling (esp. Brit.) of hemoglobin.

Hageman factor an alternative name for factor XII; see blood coagulation.

hairpin any part of a linear molecular structure, e.g. of a polynucleotide strand or a prostaglandin, in which two adjacent segments of the molecule are folded back one on the other and held in that conformation by secondary molecular forces such as hydrogen bonds or van der Waals interactions. Hairpin DNA (or foldback DNA or loopback DNA) contains inverted repeats; when denatured it renatures extremely rapidly by concentration-independent intrachain base-pairing between complementary sequences of the inverted repeat. Similar structures occur in certain large RNA molecules. The hairpin conformation of a prostaglandin molecule is thought to be necessary for expression of its hormonal activity; in this conformation the α and κ chains of each molecule are extended, parallel to one another, at van der Waals contact distance for their full lengths. See also ribozyme, beta bend.

Haldane coefficient the difference, per bound dioxygen molecule, in the number of hydrons bound by oxy- and deoxyhemoglobin, at constant pH. [After John Scott Haldane (1860-1936), British physiologist.]

Haldane effect the observation that oxygenated blood absorbs less carbon dioxide than deoxygenated blood. It is the reciprocal of the Bohr effect.

Haldane gas-analysis apparatus an apparatus once used for the estimation of the carbon dioxide and dioxygen contents of a gas sample.

Haldane relation a relation for reversible enzyme reactions. In the single-substrate, essentially reversible reaction:

$$E + S \frac{k_1}{k_{-1}} ES \stackrel{k_2}{\rightleftharpoons} EP \frac{k_3}{k_{-3}} E + P$$
 the overall equilibrium constant,

$$K = C_P/C_S = k_1k_2k_3/k_{-1}k_{-2}k_{-3}$$

where C_S and C_P are the concentrations of substrate, S, and product, P, respectively. It can further be shown that

$$K = V_{\rm S} K_{\rm mP} / V_{\rm P} K_{\rm mS},$$

where V_S and V_P are the maximum velocities of the reactions $S \rightarrow P$ in the absence of P and of $P \rightarrow S$ in the absence of S, and K_{mS} and K_{mP} are the respective Michaelis constants for these reactions. [After John Burdon Sanderson Haldane (1892-1964), British biochemist, physiologist, and geneticist]

half-boat conformation either of the conformations of a nonplanar monounsaturated six-membered ring compound when the two ring atoms not directly bound to the doubly bonded atoms lie on the same side of the plane containing the other four (adjacent) atoms.

half-cell one half of an electric cell, consisting of one reversible electrode inserted into a solution. Electrical connection between this solution and that in another half-cell is required to complete the electric circuit.

half-chair conformation 1 either of the conformations of a nonplanar monounsaturated six-membered ring compound when the two ring atoms not directly bound to the doubly haem a variant spellings (esp. Brit.) of heme.

half-cystine

handed

other four (adjacent) atoms. 2 any conformation of the sixmembered ring form of a monosaccharide or monosaccharide derivative when four adjacent ring atoms are coplanar and the other two lie on opposite sides of the plane. The conformational descriptor -H may be added to the name of such com-

half-cystine or hemicystine symbol: Cys or Cys; the group formally derived by removal of a hydrogen atom from the thiol group on the side chain in cysteine (or a cysteine residue), or by homolysis of the dithio linkage in cystine (or a cystine residue). It is used in describing or depicting the content or the linear sequence of amino-acid residues in a polypeptide when it contains more than two apparent cysteine residues and the positions of any dithio linkages between them are not known, or when only a coded sequence is being considered.

half-cystyl or hemicystyl the acyl group, S-CH₂-CH(NH₂)-CO-, derived from the half-cystine group. Compare cysteinyl.

half-ester any monoester of a dibasic acid.

half-life 1 symbol: $t_{1/2}$ or $T_{1/2}$; the time for one half of the atoms of an amount of radionuclide to undergo radioactive decay. 2 a similar measure of the stability (i.e. rate of decay) of an excited atom or molecule, a radical, an unstable elementary particle, etc. 3 the time for one half of the amount of an administered substance to be metabolized or excreted. If the substance is radioactive, the time required for one half of the dose to be eliminated biochemically or physiologically is termed the biological half-life and that required for one half to disappear by radioactive decay as well as by the elimination is the effective half-life. 4 or (sometimes) half-time symbol: $t_{1/2}$; the time required for the concentration of a reactant in a chemical reaction to reach a value that is the arithmetic mean of its initial and final (equilibrium) values. 5 the time for one half of the number of cells in a tissue or organ to be replaced by new cells.

half-of-the-sites reactivity or half-site reactivity a phenomenon shown by many enzymes that exhibit negative cooperativity, in which the maximal stoichiometric yield of either an enzyme-substrate intermediate or a product in a single turnover amounts to only half the number of apparently equivalent active sites. This may be caused by the binding of substrate to one site of a dimeric enzyme, e.g., inducing a conformational change in the enzyme so as to abolish completely the binding affinity of the other site.

half-reaction either of the two coupled chemical changes that together constitute an oxidation-reduction reaction. In one half-reaction there is a gain of electrons and in the other halfreaction a corresponding loss of electrons.

half-site reactivity an alternative name for half-of-the-sites reactivity.

half-thickness the thickness of a piece of a specified material that will reduce the intensity of a beam of transmitted electromagnetic radiation to one half that of the incident beam.

half-time an alternative name for half-life (def. 4) for a firstorder process.

half-time of exchange the time taken for one half of the exchangeable atoms (or molecules) to be exchanged in a reaction involving such an exchange.

half-wave potential the electrical potential at the mid-point of the current-voltage curve in polarography.

halide or halogenide 1 an anion of any halogen. 2 a salt of any halogen acid (halogen hydride). 3 any compound containing halogen atoms in organic linkage.

hallucinogen any drug or other substance that causes hallucinations. —hallucinogenic adj.

halo+ or (sometimes before a vowel) hal+ comb. form 1 relating to or containing a halogen. 2 relating to the sea or salt.

halochromism the phenomenon or property of the formation of strongly coloured compounds on the addition of strong acids or certain metallic salts to colourless or faintly coloured substances.

halofantrine 1,3-dichloro- α -[2-(dibutylamino)-ethyl]-6(trifluoromethyl)-9-phenanthrenemethanol; a derivative of 9-phenanthrenemethanol that is effective against chloroquineresistant malarial infections.

halogen any of the monovalent chemical elements of group 17 of the IUPAC periodic table: fluorine, chlorine, bromine, iodine, and astatine.

halogenate to treat or react (a substance) with a halogen; to introduce one or more halo groups into an organic compound. -halogenation n.

halogenide an alternative name for halide.

haloperidol 4-[4-(4-chlorophenyl)-4-hydroxy-1-piperidinyl]-1-(4-fluorophenyl)-1-butanone; one of the butyrophenone group of neuroleptic drugs.

halophile 1 an organism that grows in or tolerates saline conditions, especially concentrations of sodium chloride equal to or greater than that in sea water. 2 describing such an organism. —halophilic adj.

halorhodopsin an energy-transducing pigment identified in membranes of Halobacterium halobium. It is similar to, but distinct from bacteriorhodopsin and is associated with a lightdriven pump for sodium ions.

halothane the trivial name for 2-bromo-2-chloro-1,1,1-trifluoroethane, a widely used, volatile, lipid-soluble general inhalational anesthetic agent.

hamamelose 2-C-(hydroxymethyl)-D-ribose; a substance found principally in tannin of witch hazel (Hamamelis virginiana).

Hamburger shift an alternative name for chloride shift.

Hamiltonian operator symbol: H; a function used to express the total energy of a system in joules: H = T + V, where T is the kinetic energy operator and V the potential energy operator. For a particle of mass m and momentum p,

$$H = p^2/2m + V.$$

[After William Rowan Hamilton (1805-65), Irish astronomer and mathematician.]

hammerhead see ribozyme.

handedness a form of terminology (based on the human left and right hands) for describing objects and compounds that Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

handle 289

are mirror images of each other and hence nonsuperimposable. A pair of **enantiomers** display molecular handedness. See chirality.

handle a colloquial term for any chemical group attached to a specified substance with the purpose of making it more easily identified, more reactive, or more easily operated upon, or one that may serve in targeting or specific binding. The attachment of a handle may be brought about chemically or metabolically.

handle technique a technique used to separate excess alkylating agents from products in peptide synthesis. For instance, the C terminus of a growing peptide chain can be protected with a basic function, e.g. by forming a 4-picolyl ester of the carboxyl group, thereby allowing separation of the products on cation-exchange resin columns or by extraction into aqueous acidic solutions.

Hanes plot a graphical method for treating enzyme kinetic data using the following form of the Michaelis equation (see Michaelis kinetics):

$$s/v = K_{\rm m}/V + s/V$$

where s is the substrate concentration, ν is the velocity of the reaction, and V is the limiting rate. If s/ν is plotted against s, the slope of the resulting straight line is 1/V, the intercept on the s/ν axis is $K_{\rm m}/V$, and the intercept on the s axis is $-K_{\rm m}$. [After Charles Samuel Hanes (1903–90), British biochemist.]

Hanks' balanced salt solution abbr.: HBSS; a balanced salt solution used in tissue culture to provide a suitable ionic and osmotic environment for cell growth and development. It contains, per 100 mL of distilled water, 0.8 g NaCl, 0.04 g KCl, 0.01855 g CaCl₂·1H₂O, 0.02 g MgSO₄·7H₂O, 0.006 g KH₂PO₄, 0.00475 g Na₂HPO₄, 0.0350 g NaHCO₃, 0.1 g glucose, and 0.0017 g sodium Phenol Red. The pH is 7.0-7.2.

Hansch equation an equation relating the differences in the partitions of variously substituted compounds between an organic and an aqueous phase to the **hydrophobicity constant**, π , of the substituent. If P_0 is the ratio of the solubility of the parent compound in an organic phase to that in the aqueous phase, and P is the corresponding ratio for the substituted compound, then: $\pi = \log(P/P_0)$.

Hansenula see methylotrophic yeasts.

H antigen see blood-group substance.

haploid describing a cell, an organism or a nucleus of a cell having a single genome or a single set of homologous chromosomes; i.e. containing half the **diploid** number; having a **ploidy** of one. —haploidy n.

haplotype a set of genes located on a single chromosome; the term is used also to denote the characteristics dependent on those genes. In outbred populations the maternal and paternal chromosomes usually differ, so an individual has two haplotypes, one derived from each parent.

'happiness hormone' a jocular name for any endorphin or enkephalin, so-named because of the supposed ability of such substances to promote a sense of well-being.

hapt+ a variant form of **hapto+** (before a vowel).

hapten any, usually small, substance that can combine specifically with antibody but that is not immunogenic unless bound to a carrier (def. 8). Most haptens carry only one or two antigenic determinants. —haptenic adj.

hapten-inhibition test a serological test for characterizing an antigenic determinant. It involves the use of haptens of known structure to block the combining site of a particular antibody.

hapten-sandwich labelling a variant of the sandwich technique for amplification of an antigen-antibody reaction. In this modification, the primary antibody, specific for the antigen of interest, is combined with a number of residues of a hapten, e.g. p-azobenzene arsonate. The secondary (labelled or marked) antibody is a specific anti-hapten antibody; on reaction of secondary antibody molecules with a molecule of primary antibody, the hapten residues become sandwiched between the large molecules of antibody. By the use of different

haptens and two or more non-cross-reactive anti-hapten antibodies bearing distinguishable markers, two or more antigens on the same or different cells may simultaneously be labelled.

hapticity symbol: η ; the attribute of a ligand entity or group that combines with a central (usually metal) atom to form a coordination entity in which the central atom is bonded to two or more contiguous atoms of the ligand rather than to a specific atom. Such a coordination entity is frequently (but not exclusively) a **pi adduct**. See also **hapto**.

hapto or (less commonly) eta (in chemical nomenclature) the name by which to read the symbol η - (Greek eta), when prefixed to the name of the ligand group in a coordination entity (with added locants if appropriate) to indicate hapticity.

hapto+ or (before a vowel) hapt+ comb. form indicating ability to bind or combine.

haptocorrin a blood cobalamin-binding glycoprotein that may prevent uptake of bacterial cobalamin analogues. Example from *Sus scrofa* (fragment): database code HAPC_PIG, 416 amino acids (46.91 kDa).

haptoglobin abbr.: Hp; any α_2 globulin of blood plasma that can combine with free oxyhemoglobin to form a stable, ≈300 kDa, complex. Such combinations occur when hemoglobin is liberated in the blood, and the complexes so formed, which have weak peroxidase activity and cannot be filtered by the kidney, are rapidly removed and degraded in the tissues. Three human haptoglobin phenotypes are known, designated Hp 1-1, Hp 2-2, and Hp 2-1, each of which contains two pairs of nonidentical polypeptide chains, a and B, joined by disulfide bonds. There are two kinds of α chain, α_1 of 84 amino-acid residues (9 kDa) and α₂ of 143 residues (17 kDa), and a single kind of β chain, of 244 residues (in human). The α_2 chain, found solely in human haptoglobin, is identical in sequence to that of residues 1-71 or 1-72 of an α_1 chain linked to residues 11 or 12 to 84. The basic subunit structure of Hp 1-1 is $(\alpha_1\beta)_2$, that of Hp 2-2, $(\alpha_2\beta)_2$, and that of Hp 2-1, $(\alpha_2\beta)(\alpha_1\beta)$. However, the α_2 chain has an odd number of half-cystine residues, as a consequence of which larger oligomers of Hp 2-2 and Hp 2-1 may arise by formation of disulfide bonds with α_2 chains of other molecules or of $(\alpha_2\beta)$ half-molecules. Example (precursor) from human: database code HPT1_HUMAN, 347 amino acids (38.45 kDa).

haptomer any substance (such as a lectin or the B fragment of diphtheria toxin) that can interact with the cell membrane and that binds or can be bound to an effectomer (such as gelonin or the A fragment of diphtheria toxin), thereby allowing the effectomer to exert its toxic action on intact cells. —haptomeric adj.

haptophore a term introduced by Ehrlich to denote the specific chemical group in a toxin (i.e. antigen) molecule that attaches it to an antitoxin (i.e. antibody) molecule. Unlike the toxophore, it is not destroyed on conversion of the toxin to a toxoid.

H*(aq) symbol for the hydrated hydrogen ion, the normal state of the hydrogen ion in aqueous solutions, consisting of a hydron surrounded by a shell of water molecules held by ion-dipole interaction. Compare oxonium (def. 1).

hard (in radiation physics) describing corpuscular or electromagnetic ionizing radiation (especially beta particles or X- or gamma-radiation) having relatively high energy, hence high ionizing power and long-range or high penetrating power. Hard X- or gamma-radiation has short wavelengths. Compare soft (def. 1).

Harden, (Sir) Arthur (1865–1940), British chemist and biochemist distinguished for his discoveries (with W. J. Young) that fermentation of sugar by yeast juice involved a heat-stable and separable fraction (later named cozymase by H. von Euler), required the presence of phosphate, and (also with R. Robison) resulted in the intermediate formation of two hexose phosphates (see Harden-Young ester, Robison ester); Nobel Laureate in Chemistry (1929), the prize being shared with H. von Euler 'for their investigations on the fermentation of sugar and fermentative enzymes'.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Harden-Young ester a former name for D-fructose 1,6-bisphosphate (before its chemical structure had been elucidated). [After A. Harden and William John Young (1878–1942), British biochemists.]

Hardy-Weinberg law a mathematical statement about the relation between gene frequencies and genotype frequencies within a population. If the genotypes are AA, Aa, and aa, and p is the frequency of allele A in the population, and q the frequency of allele a, so that p + q = 1, then the relative proportions of the three genotypes in the population, AA:Aa:aa, is given by $p^2:2pq:q^2$. [After Godfrey Harold Hardy (1877-1947), British mathematician, and Wilhelm Weinberg (1862–1937), German physician.]

harmaline 4,9-dihydro-7-methoxy-1-methyl-3H-pyrido[3,4b]indole; dihydroharmine; a cardioactive alkaloid from Syrian rue, Peganum harmala that also has hallucinogenic properties. See also harmine.

harmine 7-methoxy-1-methyl-9*H*-pyrido[3,4-*b*]indole; a β -carboline alkaloid found in, e.g., Peganum harmala (Syrian rue). It inhibits monoamine oxidase and is a central nervous system stimulant. See also harmaline.

HART abbr. for hybrid-arrested translation.

Hartley filter funnel a development of the Büchner funnel comprising three pieces, the reservoir, a perforated plate to support the filter disk, and a conical piece to collect the filtrate. [After (Sir) Percival Hartley (1881-1957), British bacteriolo-

Hartline, Haldan Keffer (1903-83), US neurophysiologist; Nobel Laureate in Physiology or Medicine (1967) jointly with R. Granit and G. Wald 'for their discoveries concerning the primary physiological and chemical visual processes in the eye'.

Hartnup disease a rare, autosomal recessively inherited condition of humans in which there is a specific hyperaminoaciduria and indoluria, due to a diminished capacity for renal reabsorption of a group of monoamino-monocarboxylic acids, especially tryptophan. There may also be an impaired transport of the same group of amino acids across the gut wall. The aminoaciduria is often associated with a pellagralike skin rash, due to inefficient tryptophan utilization and metabolism. The pellagra may often be resolved by oral nicotinic acid. The primary defect remains unknown. [After E. Hartnup, the first patient with the condition to be described.] **hashish** a resinous extract obtained from the dried flower tops

of the hemp plant (Cannabis sativa). The term may sometimes be used for various other extracts. See cannabis.

Hassel, Odd (1897–1981), Norwegian physical chemist; Nobel Laureate in Chemistry (1969), the prize being shared with D. H. R. Barton 'for their contributions to the development of the concept of conformation and its application in chemistry'.

HAT abbr. for hypoxanthine-aminopterin-thymidine (medium); a selective medium used in tissue culture. It is of particular use in the production of hybridomas. The medium was originally devised to select against cells deficient in hypoxanthine-guanine phosphoribosyltransferase (HGPRT cells). Amethopterin blocks de novo synthesis of purines and HGPRT- cells are unable to utilize the salvage pathway, and hence are killed.

hatching enzyme see envelysin.

Hatch-Slack pathway or C₄ cycle or C₄ pathway a metabolic pathway for carbon-dioxide translocation occurring in C4 plants. In the mesophyll cells phosphoenolpyruvate carboxylase catalyses the condensation of CO₂ with phosphoenolpyruvate to form oxaloacetate; this is then reduced to malate by lightgenerated NADPH. The malate passes into the bundle-sheath cells where it is oxidatively decarboxylated by the malic enzyme to pyruvate and CO₂; the pyruvate returns to the mesophyll cells and is reconverted to phosphoenolpyruvate by ATP and pyruvate dikinase; the CO2 remains in the bundle-sheath cells where it enters the reductive pentose phosphate cycle. The overall effect of the pathway is to carry CO₂ from the mesophyll cells, which are in contact with air, to the bundle-sheath cells, which are the major sites of photosynthesis.

Haworth, (Sir) Walter Norman (1883-1950), British organic chemist noted for his structural studies on monosaccharides (see also Haworth representation) and polysaccharides and for producing the first chemical synthesis of ascorbic acid, vitamin C; Nobel Laureate in Chemistry (1937) 'for his investigations on carbohydrates and vitamin C' [prize shared with P. Karrer].

Haworth representation a diagrammatic way of unambiguously representing the structural formulae of the cyclic forms of monosaccharides to show on a plane surface the relative configurational arrangements of the atoms and groups in space. Pyranoses are represented by a hexagon (five carbons and one oxygen) and furanoses by a pentagon (four carbons and one oxygen). A Haworth representation is derived from a Fischer projection as follows. The monosaccharide in question is depicted with the carbon-chain horizontal and in the plane of the paper, the potential carbonyl group being to the right. The oxygen bridge is then depicted as being formed behind the plane of the paper. The heterocyclic ring is therefore located in a plane approximately perpendicular to the plane of the paper and the groups attached to the carbon atoms of that ring are above and below the ring. The edge of the ring nearer the viewer is indicated by thickened lines. For clarity, the carbon atoms of the ring and their attached hydrogen atoms are not shown. Groups that, in the Fischer projection, appear to the right of the vertical chain then appear in the Haworth representation below the plane of the ring. However, at the asymmetric carbon atom involved via oxygen in ring formation

(e.g. C-5 in glucopyranose, C-4 in glucofuranose), a rotation about the bond to the preceding carbon atom must be envisaged in order to bring that oxygen atom into the correct orientation to link to the carbon atom of the carbonyl group. Thus, if the hydroxyl group that is engaged in ring formation lies to the right in the Fischer projection, the group that lies below it must point upwards in the Haworth representation, whereas if it lies to the left, it must point down in the Haworth representation. In representing the α and β anomers in the Haworth convention, it should be noted that for the α anomer, the anomeric hydroxyl points in the opposite direction to the R group (see structure); for D-sugars, the R group points upwards, so the α -hydroxyl must point down; conversely, if the R group points down (as in α -L-glucose), the α anomeric hydroxyl must point upwards. The above rules only obtain if the Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Hb heavy-chain st

ring is numbered clockwise from the anomeric carbon, as is frequently the case, and it is important to appreciate that Haworth representations, unlike Fischer projections, cannot be rotated in the plane of the paper but must be reorientated in space.

Hb abbr. and symbol for hemoglobin; hence, e.g., HbO₂ symbolizes oxyhemoglobin, and HbCO symbolizes carbonmonoxyhemoglobin.

Hb A abbr. for adult hemoglobin.

H band an alternative name for H zone (see sarcomere).

HBD (in clinical chemistry) abbr. for α -hydroxybutyrate dehydrogenase, the LD₁ isoenzyme of lactate dehydrogenase, or 'heart-specific' lactate dehydrogenase, which is assayed using 2-hydroxybutanoate as substrate, a substance that does not occur naturally.

Hb F abbr. for fetal hemoglobin.

Hb S abbr. for sickle-cell hemoglobin; see sickle cell.

HBSS abbr. for Hanks' balanced salt solution.

hCG or HCG abbr. for human choriogonadotropin (see choriogonadotropin).

H chain see heavy chain.

HCO symbol for the formyl group (alternative to For).

HCR abbr. for host-cell reactivation.

Hcy symbol for a residue of the α -amino acid L-homocysteine.

HDEL a four-residue motif, His-Asp-Glu-Leu, of similar function to the KDEL motif.

HDH abbr. for histidinol dehydrogenase.

HDL abbr. for high-density lipoprotein.

HDP abbr. for helix-destabilizing protein.

He symbol for helium.

head 1 the foremost or uppermost part of the body of an animal; in vertebrates it comprises the skull containing the mouth, brain, and the organs of hearing, sight, smell, and taste. 2 the part of a molecular structure that bears a specific functional group or that is polar, reactive, bulky, or in some other characteristic way differs from the remainder of the molecule. 3 a common name for a centrifuge rotor.

headgroup of a polar lipid, that part of the molecule that expresses its polar character. For a phospholipid, this comprises the phosphate group together with any polar entity attached to it. For a glycolipid, it comprises the carbohydrate moiety.

headspace analysis a technique used in the identification of microorganisms involving gas-chromatographic analysis of the vapour in the headspace above the specimen or culture.

heat symbol: q or Q; the energy possessed by a system in the form of kinetic energy of atomic or molecular translation, rotation, or vibration. It is measured in joules or calories. Heat energy can be transferred from points of higher temperature to points of lower temperature by conduction, convection, or radiation. When the temperature of a system changes, its enthalpy (heat content) changes by an amount equal to the product of its mass, specific heat capacity, and its change in temperature.

heat capacity symbol: C; the amount of heat required to raise the temperature of a body or a system by 1 kelvin; it is usually measured in joules per kelvin. The **heat capacity at constant pressure**, C_p , is given by: $C_p = (\partial H/\partial T)_p \text{ J K}^{-1}$ and the **heat capacity at constant volume**, C_v , is given by: $C_v = (\partial U/\partial T)_v \text{ J K}^{-1}$ where H is the enthalpy, U the internal energy, and T the thermodynamic temperature.

heat content another name for enthalpy.

heat-labile describing molecules that decompose at elevated temperatures or that lose biological activity when heated to a moderate temperature, e.g. 50 °C.

heat of activation the difference in heat content between a transition state and the state of its reactants.

heat of combustion the amount of heat evolved when a given amount, usually one mole, of a substance is completely burnt in dioxygen.

heat of evaporation an alternative name for heat of vaporization. heat of formation the amount of heat absorbed or evolved when one mole of a substance is formed from its elements.

heat of fusion or heat of melting the amount of heat absorbed or evolved when a specified quantity of substance, usually one mole, is converted from the solid to the liquid state at a specified pressure and a specified temperature. If the pressure is I atm the temperature is the melting point of the substance.

heat of neutralization the amount of heat absorbed or evolved when one mole of an acid or base is completely neutralized.

heat of reaction the amount of heat absorbed or evolved in the course of a (bio)chemical reaction, usually expressed per mole of reacting substances.

heat of solution the amount of heat absorbed or evolved when one mole of a substance is dissolved in a large volume of specified solvent.

heat of vaporization or heat of evaporation the amount of heat absorbed or evolved when a specified amount of substance, usually 1 mole, is converted from the liquid to the vapour state at a specified pressure and a specified temperature. If the pressure is 1 atm the temperature is the boiling point.

heat-shock protein abbr.: hsp; any of a group of specific proteins that are synthesized by both prokaryotic and eukaryotic cells, e.g. bacteria, yeasts, and Drosophila, after they have been exposed to a temperature that is higher than normal. Other stresses, such as free-radical damage, have a similar effect. Many members of the hsp family are not induced but are normally present in all cells. Human cells in culture also produce heat-shock proteins but the induction of heat-shock proteins has not been clearly demonstrated in the human body. The heat-shock proteins are classified, according to their size, in three classes, Hsp60, Hsp70, and Hsp90. They are characterized by their role as molecular chaperones. A major chaperone in the lumen of the endoplasmic reticulum is binding **protein**, a member of the Hsp70 class. These proteins are highly conserved in structure so that the proteins from Escherichia coli and human are 50% identical in primary structure. The Hsp70 proteins possess ATPase and peptide binding domains. The other members of the Hsp70 class are Grp75 in mitochondria and DnaK in bacterial cytosol. In the Hsp60 class is GroEL in bacterial cytosol (see groEL). Example, hsp71: database code HS71_HUMAN, 641 amino acids (69.97 kDa).

heat-shock regulatory element or heat-shock response element abbr.: HSE; a base sequence in prokaryotic and eukaryotic genomes responsible for regulating gene expression in response to heat-shock and related stress situations.

heat-shock response element see HSE.

heat-stable describing something that retains its (bio)chemical activity when heated to a moderate temperature, e.g. 50 °C.

heavy (in physics) of more than the usual mass. Compare light (def. 2).

heavy atom or heavy isotope or heavy nuclide an isotopic form of an atom that contains more than the common number of neutrons and is thus of greater relative atomic mass than the most abundant or most commonly observed isotope.

heavy carbon see carbon-13.

heavy chain or **H** chain the heavier of the two types of polypeptide chain found in **immunoglobulin** molecules. Each heavy chain is linked, usually by disulfide bonds, to a **light chain** and to another, identical heavy chain. Heavy chains differ in relative molecular mass according to the type of immunoglobulin: in humans the M_r is $\approx 50\,000$ in IgG and $\approx 70\,000$ in IgM. Each heavy chain consists of an **Fc fragment** and an **Fd fragment**. Heavy chains carry the antigenic determinants that differentiate the various immunoglobulin classes.

heavy-chain disease a rare disease of humans in which there are tumours of lymphoid tissue associated with the presence of free immunoglobulin fragments in plasma and urine.

heavy-chain switch or H-chain switch the change in the expression of the immunoglobulin heavy chain (H chain) gene system as manifested by the predominance of IgM (μ chain class) in the primary immune response and by the predominance of IgG₂(γ chain class) in the secondary immune response.

e mole of a substance is formed from its elements. IgG (γ chain class) in the **secondary immune response**. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

heavy hydrogen

Truesta)

helper po

heavy hydrogen an alternative name for deuterium.

heavy meromyosin abbr.: H-meromyosin or HMM; a 350 kDa fragment produced when myosin is subjected to tryptic digestion. It contains part of the helical, rod-shaped tail and both the attached globular heads of the original myosin molecule. Heavy meromyosin retains both the ATPase and the actin-binding activity of myosin.

heavy nitrogen the stable nuclide ¹⁵N (nitrogen-15); relative abundance in natural nitrogen 0.37 atom percent. It is used as a tracer in studies of nitrogen metabolism.

heavy oxygen the stable nuclide ¹⁸O (oxygen-18), usually accompanied by the stable nuclide ¹⁷O (oxygen-17); relative abundances in natural oxygen: ¹⁸O, 0.20 atom percent; ¹⁷O, 0.037 atom percent. ¹⁸O is used as a tracer in studies of reaction mechanisms and of oxygen metabolism.

heavy strand or H strand 1 any polynucleotide chain labelled with a heavy isotope, e.g. nitrogen-15. 2 any naturally occurring chain in a polynucleotide duplex that is heavier or has a greater density than the complementary strand.

heavy water deuterium oxide; symbol: 2H_2O or D_2O ; water in which the hydrogen atoms in all of the molecules have been replaced by deuterium; or water in which the hydrogen is appreciably enriched in deuterium. The M_r of pure 2H_2O is 20.028. Heavy water is prepared from natural water by exchange techniques or by fractional distillation or electrolysis. It is used as a tracer in metabolic studies, in investigation of reaction mechanisms, and as a solvent in resonance spectroscopy.

hect+ see hecto+ (def. 2).

hecto+ 1 symbol: h; an SI prefix denoting 10² times. 2 or (before a vowel) hect+ denoting 100 or 100 times.

hedgehog protein a transmembrane protein involved in segment polarity and cell-to-cell signalling during embryogenesis and metamorphosis in *Drosophila melanogaster*. Database code (precursor): HH_DROME, 471 amino acids (52.03 kDa). See also sonic hedgehog protein.

HEDTA abbr. for N-(2-hydroxyethyl)ethylenediamine triacetate, or its trisodium salt, or for its partially or fully protonated forms. It is a chelating agent, especially for ferric ions in the pH range 7.0-10.0.

HEETP abbr. for height equivalent to an effective theoretical plate.

Heidelberger, Michael (1888-1991), US pathologist described as the father of modern immunology. The recipient of numerous awards, he continued to carry out research almost to the end of his life at age 103.

height equivalent to an effective theoretical plate abbr.: HEETP; symbol: H; (in chromatography) the column length divided by the effective theoretical plate number.

height equivalent to a theoretical plate or plate height abbr.: HETP; symbol: h; (in chromatography) the column length divided by the theoretical plate number.

Heisenberg, Werner Karl (1901-76), German theoretical physicist renowned for his work on quantum theory and atomic structure and for advancing (in 1927) the theory known later as the **Heisenberg uncertainty principle**; Nobel Laureate in Physics (1932) 'for the creation of quantum mechanics', the application of which has, *inter alia*, led to the discovery of the allotropic forms of hydrogen'.

Heisenberg uncertainty principle the principle that the simultaneous precise determination of the velocity (or any

related property, e.g. momentum or energy) of a material particle and its position is impossible; the smaller the particle the greater the degree of uncertainty. [After Werner Karl Heisenberg (1901-76), German physicist; Nobel Laureate in Physics (1932).]

HeLa cell an established tissue culture strain of human epidermoid carcinoma cells containing 70-80 chromosomes per cell (compared with 46 in normal cells). It is much used for biochemical work. HeLa cells have been in continuous culture since 8 February 1951, and were derived from tissue removed from a patient named Henrietta Lacks.

helical cross a name sometimes given to the X-shaped pattern of X-ray scattering from a continuous helical molecule.

helicase a name sometimes given to the protein (repA) that promotes the ATP-dependent unwinding of the parental DNA duplex during DNA replication. See also DNA helicase, RNA helicase.

helicorubin a b-type cytochrome that occurs in the hepatopancreas of the snail *Helix pomatia* and related species.

helix (pl. helices) 1 a coiled or spiral structure, e.g. the thread of a bolt or a coil (tubular) spring. See also alpha helix, beta helix, gamma helix. 2 the curve traced on the surface of a cylinder or cone by a point crossing its right sections at a constant angle. 3 a space curve with turns of constant angle to the base and constant distance from the axis. —helical adj.; helicity n.

helix breaker any amino-acid residue that, whenever it occurs in a polypeptide chain, interrupts the α -helical structure; e.g. proline, hydroxyproline, and, sometimes, other residues.

helix-destabilizing protein abbr.: HDP; any of a group of proteins that bind tightly and preferentially to single-stranded DNA. They have, theoretically, the following properties: (1) they lower the melting temperature, $T_{\rm m}$, for thermally induced helix-to-coil transition; (2) they lower the optimum temperature for duplex renaturation; (3) they sterically hinder base pairing and the degradation of single strands by nucleases; (4) they induce a conformation for the single-stranded DNA that is optimal for its function in some processes, e.g. as a template in replication; and (5) they interact with other proteins (enzymes) to potentiate some process involving single-stranded DNA and these proteins.

helix former any amino-acid residue that, whenever it is present in a polypeptide chain, tends to promote an α -helical structure. Compare helix breaker.

helix-loop-helix abbr.: HLH; an alternative term for helix-turn-helix.

helix-to-coil transition the transition of a macromolecule (polypeptide or polynucleotide) from an ordered to a disordered structure; it is equivalent to denaturation. Helix-to-coil transitions are usually detected by monitoring a change in some physical property of the macromolecule such as intrinsic viscosity, optical absorbance, or sedimentation coefficient. See also melting temperature.

helix-turn-helix (abbr.: HTH) or helix-loop-helix (abbr.: HLH) a protein structural feature consisting of two helices separated by a short beta turn. It is found in several DNA-binding regulatory proteins; there are two sequence motifs.

helix winding number see supercoil.

helodermin see exendin.

helospectin I see exendin.

helper cell abbr.: T_H cell; a **T lymphocyte**, carrying the surface markers CD4 and CD5 in the human (L3T4 and Ly1 in the mouse), that acts as an inducer of the effector cells for both humoral and cell-mediated immunity. Helper cells recognize and bind to antigen in combination with class II major histocompatibility complex molecules on the surface of antigen-presenting cells, and generate lymphokines that stimulate effector cytotoxic cells and B cells. Other cells of the helper phenotype, e.g. CD4+ cells, are known as T-suppressor cells and are responsible for suppression, exerting negative feedback control on the helper cells.

eous precise determination of the velocity (or any helper peak-1 abbr.: HP-1; a former name for interleukin 1. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

helper virus

helper virus any virus that supplies one or more of the functions that a defective virus is unable to perform. When a cell is infected with both a defective virus and a helper virus, the former is able to replicate, a property that can be exploited in with hydrogen bromide in glacial acetic acid. various molecular biological techniques.

hem+ or (esp. Brit.) haem+ a variant form of hemo+ (before a

hema+ or (esp. Brit.) haema+ a variant form of hemo+.

hemagglutination or (esp. Brit.) haemagglutination the agglutination of red blood cells.

hemagglutinin or (esp. Brit.) haemagglutinin 1 any agglutinin of red blood cells. 2 any nonantibody substance, e.g. a lectin or a surface component of some virus particles, that can agglutinate red blood cells. 3 a viral envelope glycoprotein responsible for the attachment of virus to cell receptors and the initiation of infection. Example from influenza A virus (strain A/Aichi/2/68) (precursor): database code HEMA_IAAIC, 566 amino acids (63.34 kDa); 3-D structure known (much \beta struc-

hemat+ or (esp. Brit.) haemat+ a variant form of hemato+ (before a vowel).

hematin or (esp. Brit.) haematin 1 or ferriheme hydroxide the trivial name for ferriprotoporphyrin hydroxide (formerly called ferriprotoporphyrin IX hydroxide); hydroxo(protoporphyrinato)iron(III); hydroxoiron(III) protoporphyrinate. Compare heme (def. 1), hemin (def. 1). 2 the generic name for any hydroxo(porphyrinato)iron(III) coordination complex.

hemato+ or (before a vowel) hemat+ comb. form denoting blood. Also (esp. Brit.): haemato+, haemat+. See also hemo+. hematocrit or (esp. Brit.) haematocrit 1 or packed red cell volume the proportion of the volume of a sample of blood that is represented by the red blood cells. 2 an apparatus, essentially a graduated centrifuge tube, used to determine the proportion of the volume of a sample of blood that is represented by the red blood cells.

hematocrit technique or (esp. Brit.) haematocrit technique a method for the rapid isolation of mitochondria or other particles, in which they are separated from the medium by centrifugation through a layer of silicone fluid. The latter is immiscible with water, and of a density intermediate between that of the particles to be separated and that of the medium. A high-density aqueous 'fixative' beneath the silicone layer can be used to stabilize labile compounds in the mitochondria or other particles. Compare hematocrit (def. 2).

hematology or (esp. Brit.) haematology the branch of medicine concerned with diseases of the blood or of the bloodforming tissues.

hematolysis or (esp. Brit.) haematolysis an alternative name for hemolysis.

hematopolesis or (esp. Brit.) haematopolesis an alternative name for hemopoiesis.

hematoporphyrin or (esp. Brit.) haematoporphyrin or (for-

the trivial name for 2,7,12,18-tetramethyl-3,8-bis(1-hydroxyethyl)porphyrin-13,17-dipropionic acid; the porphyrin formed from heme (def. 1) or a heme-containing protein on treatment

hematoside or (esp. Brit.) haematoside a ganglioside, NeuAc(α 2-3)Gal(β 1-4)Glc(β 1-1)Cer, found in red blood cells. hematoxylin or (esp. Brit.) haematoxylin 7,11b-dihydrobenz[b]indeno[1,2-d]pyran-3,4,6a,9,10(6H)-pentol; a dye isolated from the heartwood of logwood, Haematoxylon campechianum L. Colourless or yellowish, it turns red on exposure to light, and is used as a stain in microscopy.

hematuria or (esp. Brit.) haematuria the presence of red blood cells in the urine. It can be due to lesions in the urinary tract, but also to glomerular disease of the kidney.

heme or (esp. Brit.) haem 1 or ferroheme or ferrohaem or protoheme the trivial name for ferroprotoporphyrin (formerly called ferroprotoporphyrin IX); 2,7,12,18-tetramethyl-3,8-divinylporphyrin-13,17-dipropionic acid iron(II) coordination complex. It occurs free and as the prosthetic group of a number of

heme (def. 1)

hemoproteins, e.g. hemoglobins, erythrocruorins, myoglobins, merly) hematoporphyrin IX or (esp. Brit.) haematoporphyrin IX some peroxidases, catalases, and cytochromes b. Compare

heme-heme interaction

hemoa

hematin (def. 1), hemin (def. 1). 2 the generic name for any iron-porphyrin coordination complex irrespective of the valence state of the iron atom (which may be specified). The name of an individual heme is derived from that of the corresponding porphyrin; e.g. cytoheme (from cytoporphyrin) and ferroprotoheme (from protoporphyrin). For biosynthesis, see tetrapyrrole.

heme-heme interaction or (esp. Brit.) haem-haem interaction the cooperative interaction between the various heme binding sites for dioxygen molecules that occurs when dioxygen binds with hemoglobin; as oxygenation proceeds, the combination of additional dioxygen molecules is made easier.

heme pocket or (esp. Brit.) haem pocket a hydrophobic crevice in the tertiary structure of myoglobin, or of a subunit of hemoglobin, into which the heme group fits. The nonpolar vinyl side chains of the heme are buried in the interior of the pocket, while the hydrophilic propionate side-chains project out of the pocket towards the surface of the molecule.

heme protein or (esp. Brit.) haem protein an alternative name for hemoprotein.

hemerythrin or (esp. Brit.) haemerythrin an oxygen carrier found in a few groups of invertebrates, e.g. sipunculid worms, certain molluses, and crustaceans. It is a nonheme iron-containing protein, the subunits of which each contain about 113 amino-acid residues. Each monomer has an active site containing two atoms of Fe(II), 0.34 nm apart, between which a dioxygen molecule is thought to fit. The molecule is a homooctamer. Example from Themiste dyscritum: database code HEMT_THEDY, 113 amino acids (13.30 kDa); 3-D structure

heme synthetase see ferrochelatase.

heme-thiolate protein or (esp. Brit.) haem-thiolate protein

hemi+ prefix denoting half, or affecting one half. Compare semi+.

hemiacetal see acetal.

hemicellulose any or all of the cell-wall polysaccharides that are extractable from wood or other plant material with aqueous alkali (in which cellulose itself is insoluble). Hemicelluloses are chiefly xylans, but other homoglycans or heteroglycans containing hexose and/or pentose residues, uronic acid-containing xylans, and other pectic substances may also be present.

hemicystine an alternative name for half-cystine. hemicystyl an alternative name for half-cystyl.

hemidesmosome a specialized cell junction between an epithelial cell and its underlying basal lamina. These resemble desmosomes morphologically but are chemically and functionally distinct. Between the cell membrane and the underlying connective tissue is a specialized mat of extracellular matrix sometimes known as the linker. The transmembrane linker proteins belong to the integrin family of extracellular matrix receptors rather than the cadherin family of cell-cell adhesion proteins found in desmosomes.

hemidiaphragm a muscle preparation widely used for metabolic studies in vitro, consisting of either of the two excised and separated left and right halves of the diaphragm, usually from a rat.

hemiketal see acetal.

Hemimetabola or Exopterygota one of the two divisions of the subclass Pterygota, comprising those insects, e.g. cockroaches, locusts, and grasshoppers, in which the juvenile forms resemble the adults, except for their lack of fully developed wings. Such insects undergo incomplete metamorphosis. Compare Holometabola.

hemin or (esp. Brit.) haemin 1 or ferriheme chloride or protohemin the trivial name for ferriprotoporphyrin chloride (formerly called ferriprotoporphyrin IX chloride); chloro(protoporphyrinato)iron(III); chloroiron(III) protoporphyrinate. Compare heme (def. 1), hematin (def. 1). 2 the generic name for any chloro(porphyrinato)iron(III) coordination complex.

hemiport a model of translocation of solutes across mem-

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

branes, based on the possibility that there is interaction through the membrane between superficially disposed protein subunits. These subunits are envisaged as being embedded within the bimolecular lipid layer, anchored to the aqueous phase, and perhaps mobile in the plane of each face of the membrane. The subunits bind the solute in question and, when associated with the symmetrical protein at the opposite face of the membrane, transfer the solute across the membrane.

hemithioacetal see acetal.

hemithioketal see acetal.

hemizygous describing an organism in which a gene is present only once in a genotype, as a gene in a haploid cell or organism, a sex-linked gene in the heterogametic sex, or a gene in a segment of chromosome in a diploid cell or organism where its partner segment has been deleted. —hemizygosity n.

hemo+ or hema+ or (before a vowel) hem+ comb. form denoting blood. Also (esp. Brit.): haemo+, haema+, haem+. See also

hemochromatosis or (esp. Brit.) haemochromatosis a disease of humans characterized by an abnormal, widespread, massive accumulation of tissue iron associated with characteristic pathological changes of tissue structure and function. Primary hemochromotosis is a specific genetically determined disease in which hemochromatosis occurs as a result of increased absorption of iron from a normal diet. Secondary hemochromatosis results from an increased intake and accumulation of iron secondary to other causes. Compare hemosiderosis.

hemochrome or (esp. Brit.) haemochrome any iron-porphyrin coordination complex with one or more strong-field axial ligands (e.g. pyridine).

hemochromogen or (esp. Brit.) haemochromogen any compound of heme with a nitrogenous base such as a protein (whether native or denatured) or pyridine, typically with two absorption bands in the green part of the visible spectrum. See also chromogen.

hemocuprein or (esp. Brit.) haemocuprein an alternative name for superoxide dismutase.

hemocyanin or (esp. Brit.) haemocyanin a blue, copper-containing oxygen carrier present in many molluscs and arthropods. It is a nonheme protein that binds one dioxygen molecule for two Cu(I) atoms; the dioxygen molecule is thought to form a bridge between the two copper atoms. The oxygenated compound is very bright blue with an intensity of light absorption 5-10 times that of other known copper complexes. Example from the lobster Panulirus interruptus: hexamer of a number of different chains, of which A, B (88% identity between these two), and C have been identified: chain A, database code HCYA_PANIN, 657 amino acids (75.61 kDa); this contains two copper-binding sites (His ligands); two CuA motifs; two other motifs form an oxygen-binding domain; one CuB motif.

hemocyte or (esp. Brit.) haemocyte any blood cell, especially of an invertebrate animal.

hemocytometer or (esp. Brit.) haemocytometer an apparatus for counting the number of cells in a known volume of blood. It consists of a slide with a chamber of known depth; the base of the chamber is ruled with a graticule over which the cells can be enumerated under a microscope.

hemodialysis or (esp. Brit.) haemodialysis the process of separating low-molecular-mass solutes from blood by dialysis through a semipermeable membrane, as in an artificial kidney machine.

hemoglobin or (esp. Brit.) haemoglobin symbol: Hb; any of a group of red, iron-containing, oxygen-carrying pigments of the blood of vertebrates and some invertebrates; hemoglobin also occurs in the root nodules of leguminous plants. All vertebrate hemoglobins consist of two pairs of associated globin polypeptide chains, each polypeptide chain carrying a heme prosthetic group bound noncovalently, the iron atom of which is in the ferrous state and forms a coordination complex with the pyrrole nitrogens. All normal human hemoglobins contain one pair of 15.7 kDa α chains, of 141 amino-acid residues, and

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

hemoglobin A_{1c} hemosi

a pair of varying 16.5 kDa polypeptide chains, of 146 aminoacid residues and of similar amino-acid sequences. In adult human blood, 98% of the total hemoglobin is Hb A (or Hb A_1), containing a pair of β chains, i.e. it has the composition $\alpha_2\beta_2$, and 2% is Hb A₂, containing a pair of δ chains, i.e. $\alpha_2\delta_2$. In fetal blood, from about 10 weeks to 30 weeks of gestation, >90% of the hemoglobin is Hb F, containing a pair of y chains, i.e. $\alpha_2 \gamma_2$. In embryonic blood, the second pair of chains are ϵ chains, i.e. the structure is $\alpha_2 \epsilon_2$. Each of the four heme groups in a hemoglobin molecule is able to combine reversibly with one dioxygen molecule; the oxygen-saturation curve of hemoglobin is sigmoidal, showing that there is positive cooperativity between the subunits. The hemoglobin molecule has a two-fold axis of symmetry, each half containing one α chain and one non-α chain; the overall shape of the molecule is globular with the heme groups buried in pockets in the polypeptide chains. There are eight helical regions, called A to G. The histidine at position F8 (i.e. the eighth residue in helix F) is the fifth ligand of the heme Fe(11). Upon oxygenation, dioxygen becomes the sixth ligand of Fe(II) and is also hydrogen bonded to HisE7 with an accompanying conformational change. In the absence of the correct bonding with the globin side chains, Fe(II) autooxidizes to Fe(III) and can no longer bind dioxygen. Examples: human and chimpanzee a chain, database code HBA_HUMAN, 141 amino acids (15.11 kDa); among α chain variants are Luxembourg, Ann Arbor, and Hirosaki; β chain, database code HBB_HUMAN, 146 amino acids (15.85 kDa). Among the hemoglobinopathies associated with β -chain variants is sickle-cell anemia. In those invertebrates that have hemoglobin (not hemocyanin) there is a polymeric hemoglobin. Example from earthworm, 12 subunits arranged in a hexagonal bilayer structure of 3.8 MDa; each one-twelfth subunit is composed primarily of disulfide-linked trimers (chains A, B, and C) and monomers (chain D); D chain, database code GLB1_

LUTME, 142 amino acids (16.11 kDa). See also hemoglobin A_{1c}. **hemoglobin A_{1c}** or (esp. Brit.) haemoglobin A_{1c} abbr.: Hb A_{1c} ; the most abundant of the glycated hemoglobins, which are present in normal adult hemoglobin as minor components (together they represent 3-5% of the total hemoglobin of the erythrocyte). Hb A_{1c} is formed from Hb A₁ subsequent to biosynthesis by glycosylation of one of the two \beta chains, by a nonenzymic mechanism involving formation of an N-substituted aldimine (Schiff's base) between the amino group of the peptide chain and the aldehyde group of glucose, followed by an Amadori rearrangement to the corresponding N-substituted ketoimine (aminodeoxyfructose derivative) (see also Maillard reaction). In inadequately controlled diabetes mellitus the steady-state concentration of Hb A_{1c} in serum is 2-3 times higher than normal, possibly reflecting an abnormally high mean blood glucose concentration during the preceding few months. Other glycosylated hemoglobins change very little in concentration in diabetes; thus measurement of serum levels of Hb A_{1c} is considered to be useful in assessing the degree of control of the condition.

hemoglobinopathy or (esp. Brit.) haemoglobinopathy any of many types of genetic disorder involving globin, the protein moiety of hemoglobin. These are divided into thalassemia syndromes, caused by defective synthesis of the component polypeptides of globin, and conditions that arise from mutations leading to amino-acid substitutions in the polypeptide chains. Of the latter there are over 400 known variants, including the classically important sickle cell hemoglobin. Many changes lead to increased oxygen affinity, e.g. Hb Rainier (B-145, Tyr → Cys), while in a few instances decreased oxygen affinity occurs, e.g. Hb Kansas (β -102, Asn \rightarrow Thr). In some cases the substitution leads to an unstable hemoglobin molecule, as in Hb Hammersmith (β -42, Phe \rightarrow Ser) where the important heme contact of the phenylalanine is lost, leading to the formation of ferrihemoglobin, or in Hb Bristol (β -67, Val \rightarrow Asp) where replacement of the nonpolar valine by aspartic acid causes distortion of the E helix.

hemolin or (esp. Brit.) haemolin an insect hemolymph protein that is of the immunoglobulin superfamily. It is induced by bacteria. It contains four internal immunoglobulin-type repeats. Example (precursor) from the moth Hyalophora cecropia: 413 amino acids (45.78 kDa).

hemolymph or (esp. Brit.) haemolymph a fluid occurring in the secondary body cavity (coelom) of some invertebrates, considered as functionally equivalent to the blood and lymph of higher animals.

hemolysate or (esp. Brit.) haemolysate a preparation obtained by lysis of erythrocytes.

hemolysin or (esp. Brit.) haemolysin 1 any substance, e.g. an antibody, that causes hemolysis. 2 any bacterial exotoxin that ruptures blood-cell membranes. Examples are the products of chromosomal genes of certain hemolytic Escherichia coli strains that cause predominantly nongastrointestinal (e.g. urinary tract) infections. There are four genes: hlyA encodes hemolysin (Ca²⁺-binding toxin): database code HLY1_ECOLI, 1023 amino acids (109.75 kDa); hlyB encodes an ABC transporter for HlyA export: database code HLY2_ECOLI, 707 amino acids (79.77 kDa); hlyC encodes a protein involved in hemolysin export: database code HLY3_ECOLI, 170 amino acids (19.70 kDa); hlyD encodes a transmembrane protein component of the HlyA export system: database code HLY4_ECOLI, 478 amino acids (54.53 kDa).

hemolysis or (esp. Brit.) haemolysis the lysis of red blood cells, either in vivo or in vitro. —hemolyse or haemolyse vb.

hemolytic or (esp. Brit.) haemolytic 1 of, or pertaining to hemolysis. 2 an agent or condition that causes hemolysis.

hemopexin or (esp. Brit.) haemopexin a 57 kDa β₁-glycoprotein of human blood serum with one high-affinity binding site for **heme** (def. 1). The heme complex can be reduced with dithionite to give a three-band absorption spectrum characteristic of ferrohemochrome. Hemopexin may be necessary for heme to be taken up and degraded in the liver.

hemophilia or (esp. Brit.) haemophilia any of various hereditary disorders in which there is a deficiency or defect in certain of the blood coagulation factors resulting in prolonged bleeding following injury. Classical hemophilia, or hemophilia A, is a condition in which the blood has a prolonged clotting time due to an abnormally slow conversion of prothrombin to thrombin. It is caused by a functional deficiency of antihemophilic factor (factor VIII), inherited as an X-linked recessive trait. Other deficiencies in the blood coagulation system, e.g. Christmas disease, or hemophilia B, due to a deficiency of factor IX, produce similar clinical pictures.

hemopoiesis or hematopoiesis the process of blood formation, especially the formation of blood cells, occurring mainly in bone marrow. Also (esp. Brit.): haemopoiesis, haematopoiesis. -hemopoietic, hematopoietic or haemopoietic, haematopoietic

hemoprotein or heme protein any protein to which an iron-porphyrin compound is linked in a stoichiometric manner. Hemoproteins include hemoglobins, myoglobins, cytochromes, catalase, and some peroxidases. Also (esp. Brit.): haemoprotein, haem protein.

hemorphin or (esp. Brit.) haemorphin any of a group of hemoglobin-derived peptides with affinity for opioid receptors.

hemorrhage or (esp. Brit.) haemorrhage bleeding; the escape of blood from a ruptured blood vessel, either externally or internally. —hemorrhagic or (esp. Brit.) haemorrhagic adj.

hemorrhagic toxin C and D see atrolysin C.

hemosiderin or (esp. Brit.) haemosiderin an insoluble, granular, ill-defined complex formed by the denaturation of ferritin with associated loss of apoferritin and micellar aggregation; about one third of its mass is iron. Hemosiderin occurs in liver, spleen, and red bone marrow, its amount increasing with increased iron content of the body. It is responsible for the histochemical staining of tissue by the Prussian Blue reaction, a deep-blue ferric ferrocyanide (FeIII[FeII(CN)6]). The distrises distortion of the E helix. hemosiderosis

hepatocyte growth fa

direct correlation with ascorbic acid deficiency. See iron over-

hemosiderosis or (esp. Brit.) haemosiderosis an abnormal increase in tissue iron content due to some defect in the control of iron turnover in the body or to increased iron ingestion. It is not associated with pathological changes in tissue structure and function. Compare hemochromatosis.

hemostasis or (esp. Brit.) haemostasis 1 the stopping of bleeding or the arrest of the circulation to an organ or part.
2 the stagnation of blood in an organ or part.

hemostat or (esp. Brit.) haemostat a device or a chemical agent that stops or retards bleeding.

hemostatic or (esp. Brit.) haemostatic 1 of, relating to, or functioning to cause hemostasis (def. 1). 2 a drug or other agent that retards or stops bleeding.

Hench, Philip Showalter (1896–1965), US physician notable for his demonstration (with E. C. Kendall) that rheumatoid arthritis could be treated with an adrenal hormone (later known as cortisone); Nobel Laureate in Physiology or Medicine (1950) jointly with E. C. Kendall and T. Reichstein 'for their discoveries relating to the hormones of the adrenal cortex, their structure and biological effects'.

Henderson-Hasselbalch equation an equation relating pH to the composition of buffer solutions:

$$pH = pK_A + \log([conjugate base]/[acid]),$$

where pK_A is the common logarithm of the acid dissociation constant of the buffer acid. The following approximation is often used:

$$pH = pK_A + \log([salt]/[acid]).$$

[After Lawrence Joseph Henderson (1878–1942), US physician and biochemist, and Karl A. Hasselbalch (1874–), Danish biochemist, who together formulated the equation in 1910.]

henna a preparation obtained from the dried and powdered leaves of *Lawsonia alba*, *L. inermis*, or *L. spinosa*, widely used for dyeing hair and fingernails. The active ingredient is **lawsone**.

henry (pl. henrys or henries) symbol: H; the SI derived unit of inductance, equal to the inductance of a closed circuit with a magnetic flux of 1 weber per ampere of current,

$$H = Wb A^{-1} s = m^2 kg s^{-2} A^{-2}$$

[After Joseph Henry (1797-1878), US physicist.]

Henry's function a function used in the theoretical treatment of the electrophoretic mobility of macromolecules that is dependent on the radius of the macromolecule, r, and its reciprocal ion-atmosphere radius, κ (derived from **Debye-Hückel theory**). It varies between 1.0 and 1.5 as κr goes from zero to infinity.

Henry's law the principle that the concentration of a gas in solution, at constant temperature, is directly proportional to the partial pressure of the gas in the vapour phase in equilibrium with that solution. It holds with high precision for gases of low solubility at pressures below approximately 10^5 Pa. It may be expressed by: $c_G = kp_G$, where c_G is the molar concentration of the gas in solution, p_G is the partial pressure of the gas in the gas phase, and k is a proportionality constant. [After William Henry (1774–1836), British chemist.]

heparan any polysaccharide derived by desulfation of **heparan** sulfate or heparin.

heparan sulfate any member of a group of glycosaminoglycans that have repeat units consisting of alternating α1→4linked hexuronic acid and glucosamine residues, the former being a mixture of sulfated and nonsulfated D-glucuronic and L-iduronic acids, and the latter being either sulfated or acetylated on its amino group as well as sulfated on one of its hydroxyl groups. They usually occur attached to protein to form proteoglycans, the mode of attachment being through a xylose residue as in chondroitin sulfates. Heparan sulfate accumulates in a number of the mucopolysaccharidoses, e.g. Hunter syndrome, Hurler syndrome, and Sanfilippo syndrome. See mucopolysaccharidosis. See also heparin. heparan sulfate proteoglycan core protein abbr.: HSPG core protein; any of a group of modular heparan sulfate proteoglycan proteins with three heparan sulfate chains. Also known as perlecans, they have domains with homology to the low-density lipoprotein receptor, epidermal growth factor, laminin, and neural cell adhesion molecule, and have 15 immunoglobulin-like domains. Examples from Mus musculus: database code S18252, 3707 amino acids (397.85 kDa), and database code PGBM_MOUSE, 2481 amino acids (270.81

heparin any member of a group of glycosaminoglycans found mainly as an intracellular component of mast cells. They are similar to **heparan sulfates** but are of somewhat higher average $M_{\rm r}$ (6000–20 000) and contain fewer N-acetyl groups and more N-sulfate and O-sulfate groups; they may be attached in the same manner to protein, forming proteoglycans. They consist predominantly of alternating $\alpha 1 \rightarrow 4$ -linked D-galactose and N-acetyl-D-glucosamine-6-sulfate residues. Heparins are secreted into the bloodstream by the mast cells of liver, lung, and other tissues; they act as inhibitors of blood clotting by activating **antithrombin III**.

heparinize or heparinise to treat with a preparation of heparin, usually as its sodium or lithium salt, in order to prevent clotting, either in vivo or in vitro, of blood or blood plasma.—heparinization or heparinisation n.

hepat+ a variant form of hepato+ (before a vowel).

hepatectomy surgical removal of the liver. In **partial hepatectomy**, only some of the lobes of the liver are removed; this causes the remaining lobes to regenerate so that the liver in toto regains its former weight. —**hepatectomize** or **heparectomise** vb.

hepatic of, or pertaining to, the liver.

hepatitis any inflammatory disease of the liver. In humans the most common cause is infection with a virus or an amoeba. The three most common forms of viral infectious hepatitis are designated A, B, and C. Hepatitis A is caused by a singlestranded RNA picornavirus, for which there is now a killed virus vaccine, the virus having been grown in tissue culture. Hepatitis B is caused by a double-stranded DNA virus of the Hepadnaviridae family. The causative agent is a spherical virion with a diameter of 42 nm, often referred to as the Dane particle. This virus is especially virulent and its presence is associated with the development of primary liver tumours - the incidence of these is particularly high in China. The antigens may be in the form of 22 nm diameter, spherical particles designated HBsAg; principal components include gp27, which is a glycosylated form of p24, and a 42 kDa protein, database code VMSA_HPBVA, 389 amino acids (42.73 kDa). HBsAg is produced in recombinant yeast, the 22 nm particles being similar to those found in the plasma of infected individuals. These provide a very effective vaccine. Hepatitis C, formerly called 'non-A non-B', is caused by a single-stranded RNA virus, for which there is as yet no vaccine. Another form, hepatitis D, can be controlled by the vaccine to hepatitis B, and there are probably three other types: E, F, and G, of which G has recently been characterized.

hepato+ or (before a vowel) hepat+ comb. form denoting of or pertaining to the liver.

hepatocarcinogen any **carcinogen** that acts specifically or primarily on liver.

hepatocellular of, or pertaining to hepatocytes.

hepatocyte or (formerly) parenchymal liver cell. the major (but not the only) cell type of the liver. They are arranged in folded sheets facing blood-filled spaces called sinusoids. Hepatocytes are responsible for the synthesis, degradation, and storage of a wide range of substances. They are the site of synthesis of all the plasma proteins, except for antibody, and are the site of storage of glycogen.

ber of the mucopolysaccharidoses, e.g. Hunter synlurler syndrome, and Sanfilippo syndrome. See mucoaridosis. See also heparin.

hepatocyte growth factor receptor

tent **mitogen** for hepatocytes, epithelial cells, keratinocytes, melanocytes, and hematopoietic precursor cells. It is a glycoprotein, with four **kringle** domains and no known protease activity. The molecule is a disulfide-linked dimer of α (463 amino acids) and β (234 amino acids) subunits, which are derived from a common precursor. Example from human: database code HGF_HUMAN, 728 amino acids (83.04 kDa).

hepatocyte growth factor receptor a type I membrane protein that binds hepatocyte growth factor and mediates its intracellular action by a protein tyrosine kinase (EC 2.7.1.112) activity on its intracellular domain. It is encoded by the MET protooncogene, and comprises a dimer of two subunits, α and β. Example (precursor) from human: database code KMET_HUMAN, 1390 amino acids (155.35 kDa). See also tpr-met.

hepatoflavin or hepatoflavine a former name for riboflavin.

hepatolenticular degeneration an alternative name for Wilson's disease.

hepatoma any carcinoma derived from liver cells.

hepatopancreas a digestive gland, found in many invertebrates, that performs functions similar to those of the liver and the pancreas in vertebrates.

hepatosis any noninflammatory disease of the liver.

hepatotoxin any toxin that acts specifically or primarily on the liver.

Hepes or **HEPES** abbr. for (and trivial name of) 4-(2-hydroxyethyl)-1-piperazine-ethanesulfonic acid; a **Good buffer substance**, pK_a (20 °C) = 7.55.

hepoxilin abbr.: Hx; any of various epoxyhydroxy metabolites of 12-hydroperoxyeicosatetraenoate, e.g. 13-hydroxy-14,15-epoxyeicosatetraenoate. A number of sites of formation have been reported, activities including modulation of neurotransmission in brain and release of insulin in pancreatic islets.

hepoxilin-epoxide hydrolase EC 3.3.2.7; an enzyme that converts (5Z,9E,14Z)- $(8\xi,11R,12S)$ -11,12-epoxy-8-hydroxy-eicosa-5,9,14-trienoate **hepoxilin** A₃ to the trioxilin, (5Z,9E,14Z)- $(8\xi,11\xi,12S)$ -8,11,12-trihydroxyeicosa-5,9,14-trienoate (trioxilin A₃).

Hepps or HEPPS or EPPS abbr. for (and trivial name of) 4-(2-hydroxyethyl)-1-piperazinepropanesulfonic acid; a **Good buffer substance**, pK_a (20 °C) = 8.0.

$$N$$
 SO_3H

Heppso or **HEPPSO** abbr. for (and trivial name of) 4-(2-hydroxyethyl)-1-piperazine-(2-hydroxypropanesulfonic acid); a **Good buffer substance**, pK_a (25 °C) = 7.8.

hepsin EC 3.4.21.—; a serine protease, similar to other trypsinlike enzymes, that is a type II membrane protein. It is required for growth and maintenance of cell morphology in many tissues. Example from human: database code HEPS_HUMAN, 417 amino acids (44.96 kDa).

hepta+ or (before a vowel) hept+ comb. form denoting seven. Herring any marine fish of the family Clupeidae, the flesh of Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

ne Jugger

heptanoate 1 the anion, CH₃-[CH₂]₅-COO, derived from heptanoic acid (formerly enanthic acid). 2 any salt or ester of heptanoic acid.

heptanoyl symbol: Hpo; the univalent acyl group, CH₃-[CH₂]₅-CO-, derived from heptanoic acid.

heptitol any alditol having a chain of seven carbon atoms in the molecule.

heptose any **aldose** having a chain of seven carbon atoms in the molecule.

heptulose any **ketose** having a chain of seven carbon atoms in the molecule.

heptyl symbol: Hp; the alkyl group, CH₃-[CH₂]₅-CH₂-, derived from heptane.

heptyl glucoside n-heptyl β -D-glucopyranoside; a nonionic detergent, CMC 79 mM.

heptyl thioglucoside *n*-heptyl 1-thio-β-D-glucopyranoside; a nonionic detergent; the CMC, 30 mM, remains unchanged between 1 and 20 °C.

HER2 see neu.

herbicide any chemical substance that destroys plants or inhibits their growth, especially one used to control weeds.

hereditary of, pertaining to, or caused by heredity; inherited. hereditary disease any pathological condition that is caused by the presence in the organism of an abnormal gene.

hereditary fructose-bisphosphatase deficiency an inherited autosomal recessive condition in humans characterized by less than 20% of normal activity of fructose-bisphosphatase (EC 3.1.3.11). It is characterized in infants by episodic spells of hyperventilation, apnoea, hypoglycemia, ketosis, and lactic acidosis. Surviving infants appear to become normal, but gluconeogenesis in their livers is severely impaired, and when glycogen stores are depleted, amino acids, lactate, and ketones accumulate. Subjects are not sensitive to fructose intake. Compare hereditary fructose intolerance.

hereditary fructose intolerance a condition in humans, inherited as an autosomal recessive character, in which there is a deficiency of the aldolase-B isoenzyme of fructose-bisphosphate aldolase (EC 4.1.2.13) (there is less than 15% normal activity with fructose 1-phosphate as substrate but activity is less depressed with fructose 1,6-bisphosphate as substrate) while the levels of aldolases A and C are normal (see aldolase (def. 2)). The condition is characterized by severe hypoglycemia and vomiting shortly after fructose intake. In this condition prolonged fructose ingestion in infants leads to poor feeding, vomiting, hepatomegaly, jaundice, hemorrhage, proximalrenal-tubule syndrome, and death. The hypoglycemia ensuing after fructose ingestion is caused by fructose 1-phosphate inhibition of glycogenolysis at the phosphorylase level and of gluconeogenesis at the mutant aldolase level. Compare hereditary fructose-bisphophatase deficiency.

heredity 1 the transmission from one generation to another of genetic factors that determine the characteristics of an organism. 2 all of the inherited factors in an organism or all the characteristics determined by them.

heregulin abbr.: HRG; one of several glycoproteins that bind to the transmembrane tyrosine kinase ErbB2 p185 and stimulate its activity. They are secreted by human breast cancer cells in culture. Example heregulin-α precursor from human: database code A43273, 640 amino acids (70.29 kDa).

hermone an alternative term for hormone (suggested by E. Schäfer in 1913 as better expressing the concept of chemical messengers).

heroin see diacetylmorphine, morphine.

herpes virus any of a family (Herpesviridae) of enveloped, icosahedral, double-stranded DNA viruses, many of which infect animals. The family includes human herpesviruses types 1 and 2, Epstein-Barr virus, zoster (varicella) virus, pseudorabies virus, cytomegalovirus, Lucke virus, and Marek's disease virus.

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

Hershey

which is comparatively rich in oils with a high content of long-chain n-3 fatty acids; typical composition (range of major fatty acids, expressed as % of total fatty acids): 16:0, 12-18%; 16:1(n-7), 6-8%; 18:1(n-9), 11-25%; 20:1(n-9), 7-19%; 20:5(n-3), 11-15%; 22:6(n-3), 5-8%.

Hershey, Alfred Day (1908-97), US geneticist; Nobel Laureate in Physiology or Medicine (1969) jointly with M. Delbrück and S. E. Luria 'for their discoveries concerning the replication mechanism and the genetic structure of viruses'.

Hershey-Chase experiment a seminal experiment, reported in 1952, in which it was demonstrated that when an Escherichia coli cell is infected with T2 bacteriophage, the phage DNA is injected into the cell whereas the phage coat protein remains on the outside of the infected bacterial cell. This was shown by demonstrating that most of the 35S-labelled phage protein could be removed from the surface of the bacterial cells by application of a shearing force without removing the ³²P-labelled nucleic acid and without interfering with the course of productive infection. The phage nucleic acid could be shown to have moved into the bacterial cell. It was therefore concluded that only the phage DNA was required for infection, indicating that DNA must be the hereditary material. This confirmed earlier experiments in 1944 by Avery and colleagues (see transforming principle), but was somewhat more readily accepted when Watson and Crick deduced the structure of DNA. [After A. D. Hershey and Martha Chase (1927-).]

Hershey circle a circular duplex DNA structure in which each strand contains one interruption and in which the interruptions are not opposite each other. It is formed by some linear, double-stranded DNA molecules (e.g. from Escherichia coli phage λ) containing short, complementary single strands (cohesive ends) at each end when these cohesive ends base-pair with each other.

Hers's disease an alternative name for type VI glycogen disease. **hertz** symbol: Hz; the SI derived unit of frequency of a periodic phenomenon, equal to 1 cycle per second; i.e. 1 Hz = 1 s⁻¹. [After Heinrich Hertz (1857–94), German physicist.]

Hertz, Gustav (1887–1975), German physicist; Nobel Laureate in Physics (1926) jointly with J. Franck 'for their discovery of the laws governing the impact of an electron upon an atom'.

Hess's law of constant heat summation the statement that the enthalpy change in a chemical reaction is the same whether the reaction takes place in one stage or in more than one stage. [After Germain Henri Hess (1802-50), Genevese-born Russian chemist; known in Russia as German Ivanovich Gess.]

HETE abbr. for hydroxyeicosatetraenoate; see also dihydroxyeicosatetraenoate.

hetero+ comb. form 1 other, different, unusual. Compare allo+ (def. 1), homo+ (def. 1), iso+ (def. 1), xeno+ (def. 1). 2 for, from, or directed towards a different species. Compare allo+ (def. 2), homo+ (def. 2), iso+ (def. 2), xeno+ (def. 2). 3 containing atoms, groups, linkages, residues, or subunits of different kinds. 4 being or pertaining to an atom other than the predominant or significant one, especially of a nitrogen, oxygen, or sulfur atom in a ring containing mainly carbon atoms. Compare homo+ (def. 4).

heteroantibody any antibody (including any autoantibody) that is able to react with an antigen derived from another species. *Compare* isoantibody.

heteroantigen any antigen derived from one species that is able to stimulate an immune response in another species. *Compare* isoantigen.

heteroatom any atom in the chain or ring of an organic compound that is not a carbon atom. —heteroatomic adj.

heteroblfunctional describing any reagent that carries two differing reactive groups. *Compare* homobifunctional.

heterocaryon a variant spelling of heterokaryon.

heterochromatic 1 relating to or possessing more than one colour; relating to light or other electromagnetic radiation of more than one frequency. *Compare* monochromatic. 2 of, relating to, or possessing heterochromatin.

heterogeneous nuclear

heterochromatin a condensed form of chromatin, occurring in the nucleus at interphase, that stains strongly with basophilic dyes. The DNA of heterochromatin is replicated at a later stage in the cell-division cycle than euchromatin. 'Satellite' DNA is associated with heterochromatin, and the sex chromosomes of animals, especially the Y chromosome, contain large regions of heterochromatin. Compare euchromatin.

heteroconjugation the association between a base and the conjugate acid of a different base through a hydrogen bond. See conjugate acid-base pair. Compare homoconjugation.

heterocycle any compound or molecular structure that is heterocyclic (def. 1); a heterocyclic (def. 2).

heterocyclic 1 describing any cyclic molecular structure containing atoms of at least two different elements in the ring or rings; describing any compound having such a structure. Compare carbocyclic (def. 1), homocyclic (def. 1). 2 or heterocycle any such compound.

heterocyst any of the clear cells that occur at intervals on the filaments of certain cyanobacteria. They are thought to be important sites of nitrogen fixation.

heterodetic describing a cyclic peptide in which the ring consists of amino-acid residues only, but the linkages forming the ring are not solely eupeptide bonds; one (or, if nonproximate, more than one) is an isopeptide, disulfide, ester, or other bond. *Compare* homodetic.

heterodimer any molecular structure in which two nonidentical subunits are associated. *Compare* dimer, homodimer.

heteroduplex 1 any double-stranded DNA in which the two strands do not have completely complementary base sequences. In a mutational heteroduplex a mutational event has occurred in one of the polynucleotide chains; such a molecule does not produce uniform progeny on replication. A recombinational heteroduplex is a double-stranded DNA molecule that gives rise to one parental and one recombinant molecule of DNA in the reproductive cycle that immediately follows its production. Heteroduplex DNA may also arise from annealing DNA single strands in vitro. 2 a DNA-RNA hybrid. Compare homoduplex.

heteroduplex mapping the physical mapping of the base sequence homology of two DNA molecules. It is accomplished after the *in vitro* formation of a hybrid double-stranded molecule, in which one polynucleotide strand is from one of the DNA molecules and the complementary polynucleotide strand is from the other. Unpaired single-stranded regions are located and measured by electron microscopy.

heterogametic describing the sex whose cell nuclei contain a pair of dissimilar sex chromosomes. The heterogametic sex is usually male in mammals but is female in the Lepidoptera, birds, reptiles, some amphibians and fishes, and a few plants. Compare homogametic.

heterogeneous 1 differing in kind, as in a heterogeneous population. 2 describing a group of molecules that is not uniform with respect to size, charge, structure, or other property. 3 describing a system consisting of two or more phases. Compare heterogenous.—heterogeneity n.

heterogeneous catalysis any catalytic system in which the catalyst constitutes a different phase from that of the reactants. Compare homogeneous catalysis.

heterogeneous immunoassay any form of immunoassay that involves physical separation, at some stage of the procedure, of antibody-bound antigen from remaining free antigen. It includes radioimmunoassay. Compare homogeneous immunoassay.

heterogeneous nuclear ribonucleoprotein abbr.: hnRNP; particulate complexes of heterogeneous nuclear RNA (hnRNA) with proteins, which are cell-specific and themselves heterogeneous. The protein component may play a role in the processing of the hnRNA to mRNA.

heterogeneous nuclear RNA abbr: hnRNA or HnRNA or H-RNA; a heterogeneous mixture of RNA molecules of high M_r with a rapid turnover rate that occurs in cell nuclei during protein synthesis. It is the form of RNA synthesized in european synthesis.

heterogenesis

karyotes by RNA polymerase II, i.e. that which is translated into protein. It represents the transcription products of both the exons and the introns of a gene or genes and is processed to form mRNA by the removal of the nontranslated portions (corresponding to the introns in the DNA). So-named because heterogeneity in size was one of the first characteristics used to distinguish it from other forms of nuclear RNA.

heterogenesis the production of offspring having different characteristics in successive generations; e.g. the alternation between generations that produce gametes and those that reproduce through agametes or by parthenogenesis.

heterogenetic describing chromosome pairing during meiosis when the pairing partners are derived from different original ancestors. Compare homogenetic.

heterogenic 1 describing a population or a gamete containing more than one allele of a particular gene. 2 describing two genetic elements that are not known to have a common ancestry. 3 an alternative word for heterogenous. Compare homogenic.

heterogenize or xenogenize to introduce a foreign, especially a more potent, antigen into a cell surface in order to enhance the response by T lymphocytes to other cell-surface antigens. heterogenization n.

heterogenous or heterogenic not originating within the organism in question; of foreign origin. Compare heterogeneous.

heteroglycan or heteropolysaccharide any polysaccharide (i.e. glycan) that contains residues of two or more kinds of monosaccharide (i.e. glycose) molecule. Compare homoglycan.

heterograft or heterologous graft an alternative name for xenograft. Compare homograft.

heteroimmune describing a pair of bacteriophages in which each is sensitive to its own repressor but not to that of the other. **heterokaryon** or **heterocaryon** any cell with more than one nucleus, in which the nuclei are not all of the same genetic constitution, or a tissue composed of such cells. Compare homokaryon. —heterokaryotic or heterocaryotic adj.

heterokaryosis or heterocaryosis the association of genetically different nuclei in a common cytoplasm.

heterolactic fermentation a type of fermentation of glucose in which the products include lactate, acetate and/or ethanol, and carbon dioxide. A key enzyme in the pathway is phosphoketolase, which cleaves xylulose 5-phosphate (produced by the pentose phosphate pathway) to D-glyceraldehyde 3-phosphate and acetyl phosphate, the former being then converted to lactate while the latter can form acetate and/or ethanol. Organisms that ferment in this manner include Leuconostoc spp. and some species of *Lactobacillus*; some produce D(-)-lactate while others produce DL-lactate. Compare homolactic fermentation.

heterolipid a former name for any complex lipid.

heterologous 1 consisting of different elements or of like elements in different proportions. 2 or heterospecific derived from another species, e.g. heterologous serum or tissue. Compare homologous, isologous.

heterologous association describing any association between two protomers in which the domain of bonding is made up of two different binding sets. Compare isologous.

heterologous desensitization see desensitization.

heterologous graft or heterograft an alternative name for xenograft.

heterolysin any antibody or other hemolysin formed in response to the introduction of erythrocytes from another species into the bloodstream of an animal. Compare autolysin, homolysin.

heterolysis 1 (in chemistry) the cleavage of a bond in such a manner that both bonding electrons remain within one of the two fragments between which the bond is broken; e.g. $A-B \rightarrow$ $A^+ + B^-$. Compare homolysis. 2 (in biochemistry) the lysis of cells or tissues by the action of exogenous agents, e.g. enzymes, detergents, or lysins. Compare autolysis. —heterolytic adj.

heterolysosome any early secondary lysosome concerned with the digestion of exogenous material (i.e. heterophagy). See hetprophagosome.

héteromorphic or heteromorphous 1 differing from the nor- in meiosis. Compare homeotypic.
Bản đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bản có nhu cấu về sách sinh học, xin liên hệ:

mal form, e.g. in size, shape, or function. 2 describing the members of any pair of homologous chromosomes that differ from each other in size or shape. 3 (especially of insects) having differing forms at different stages of the life cycle. 4 an alternative term for polymorphic. Compare isomorphic. —heteromorphism or heteromorphy n.

heterooligomer any oligomer made up of two or more kinds of constitutional repeating unit. —heterooligomeric adj.

heterophagosome any phagosome containing material exogenous to the cell. Fusion with a lysosome leads to the formation of a heterolysosome. Compare autophagosome.

heterophagy the process by which cells digest exogenous material that they have taken up. Compare autophagy. —heterophagic adi.

heterophilic binding (of adhesion molecules) binding of an adhesion molecule in one cell to a non-identical adhesion molecule in an adjacent cell. Compare homophilic binding.

heteroplasmy the presence of more than one type of mitochondrial DNA in a cell. A mutant mitochondrial DNA may be present in varying amounts so that phenotypic variation between cells is possible.

heteroploid describing a cell that contains any number of chromosomes except the haploid or diploid number. The term includes all aneuploid or polyploid numbers of chromosomes.

heteropolymer any polymer made up of two or more kinds of constitutional repeating unit. Proteins are typical heteropolymers. -heteropolymeric adj.

heteropolysaccharide an alternative term for heteroglycan.

heteroside a former name for any glycoside containing a noncarbohydrate moiety (aglycon).

heterospecific having specificity for or derived from a different species; heterologous (def. 2).

heterotetramer any molecular structure that can be dissociated into four (or two pairs of) nonidentical monomers. —heterotetrameric adi.

heterotope any of two or more chemical elements having atoms of different atomic number and occupying different places in the periodic table. The term includes isobar (def. 1). Compare isotope.

heterotopia or heterotopy the displacement, or unusual position, of a cell, organ, tissue graft, etc.

heterotopic 1 (in chemistry) of, relating to, or being a heterotope or heterotopes. Compare isotopic. 2 (in biology and medicine) or heterotopous displaced or in an unusual anatomical position

heterotopic transplant any tissue graft that is transplanted from its normal position to another in the same organism. Compare orthotopic transplant.

heterotopous a variant form of heterotopic (def. 2).

heterotopy a variant form of heterotopia.

heterotrimer any molecular structure that is dissociable into three nonidentical monomers. —heterotrimeric adj.

heterotroph or heterotrophe or organotroph any organism whose nutritional requirements are not satisfied solely by simple inorganic substances and for which a supply of organic carbon is required for the synthesis of cellular constituents. Heterotrophs may be subdivided into chemoheterotrophs (or chemoorganotrophs) and photoheterotrophs (or photoorganotrophs) according, respectively, to whether they are chemotrophs or phototrophs. Compare autotroph. —heterotrophic adj.; heterotrophy n.

heterotropic 1 describing an allosteric effect in which interaction occurs between nonidentical ligands; the effect may be either cooperative or antagonistic. The term is applied also to such an interaction, to an allosteric enzyme for which different substances act as the substrate and the effector, to the regulation of such an allosteric system, etc. Compare homotropic. 2 describing a chromosome that does not pair with another at meiosis, especially a sex chromosome in the heterogametic sex.

heterotypic pertaining to, or being the first, reductive division

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

heterozygosis hexosamini

heterozygosis 1 the union of genetically different gametes to form a **heterozygote**. 2 or **heterozygosity** the state or condition of being a heterozygote. Compare **homozygosis**.

heterozygosity an alternative term for heterozygosis (def. 2).

heterozygote any cell or organism having two different genes (alleles) at one or more corresponding loci on homologous chromosomes. With respect to such loci a heterozygote will produce two different types of gametes. Compare homozygote.

heterozygous or heterozygotic of, pertaining to, or being a heterozygote; hybrid.

HETP abbr. for height equivalent to a theoretical plate.

heuristic describing any method for solving mathematical or other problems for which no algorithm (or closed method) exists. It involves narrowing down the field of search for a solution by inductive reasoning from past experience of similar problems. Compare stochastic.

HEV abbr. for high-walled endothelium of the post-capillary venules.

hevein an N-acetyl-D-glucosamine and N-acetyl-D-neuraminic acid binding lectin; it is present in the latex of the rubber tree, Hevea brasiliensis and has 56% homology with wheat germ agglutinin. Example (precursor) from H. brasiliensis: database code HEMO_HYACE, 413 amino acids (45.78 kDa).

Hevesy, György (Károly) (1885–1966), also styled, inter alia, as Georg (Karl) von Hevesy or George (Charles) von Hevesy or George (Charles) Hevesy or George (Charles) de Hevesy Hungarian-born Swedish radiochemist, analytical chemist, and biochemist who (with F. A. Paneth in 1913) was the first to recognize the possibility of using natural radioactive elements as indicators and is remembered for his subsequent pioneering researches employing natural and artificial radioisotopes as indicators or tracers in chemical and biological systems and also for the discovery of hafnium; Nobel Laureate in Chemistry (1943) 'for his work on the use of isotopes as tracers in the study of chemical processes'.

hexa+ or (before a vowel) hex+ comb. form denoting six, six-fold, six times.

hexabrachion a six-armed structure, characteristic of the **tenascin** molecule. Regions of the protein radiate outwards like spokes of a wheel. [From L. brachium arm.]

hexadecadienoic acid any straight-chain fatty acid having sixteen carbon atoms and two double bonds per molecule. (all-Z)-Hexadeca-6,9-dienoic acid is found in small amounts in some animal lipids.

hexadecanoic acid the systematic name for palmitic acid; see palmitate.

hexadecenoic acid any straight-chain fatty acid having sixteen carbon atoms and one double bond per molecule. The most common are the 9Z-isomer (palmitoleic acid; see palmitoleate) and the 11Z-isomer, but the 3E-, 6E-, 6Z-, 9E-, and 10Z-isomers are also variously found in animals or plants; the 9E-isomer (i.e. palmitelaidic acid) is a pheromone.

hexaethyleneglycol mono-n-decyl ether a nonionic detergent; see C_xE_y.

hexaethyleneglycol mono-n-dodecyl ether a nonionic detergent; see C_xE_y.

hexagonal phase (of phospholipids) a phase in which the polar headgroups are orientated towards the interior of a phospholipid aggregate, with the fatty acyl carbon chains pointing outwards; a form of inverted micelle. It can occur in lipid bilayers, especially at higher temperatures. Certain phospholipids, such as phosphatidylethanolamine, have a greater tendency to adopt this phase than, e.g., phosphatidylcholine. A hexagonal phase with the polar headgroups oriented towards the exterior of the micelle can also exist. See also liquid-crystalline phase, phase transition.

hexamer 1 any oligomer consisting of six monomers. 2 the group of six capsomeres in an icosahedral virus capsid.

hexanoate or caproate 1 the anion, CH₃-[CH₂]₄-COO, derived from hexanoic acid. 2 any salt or ester of hexanoic acid.

hexanolamino-PAF 1-O-hexadeçyl-2-O-acetyl-sn-glycero-3- chains; form S is a homodimer of two α chains. Tay-Sachs dis-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

phospho-(N,N,N-trimethyl)-hexanolamine; a substance that inhibits the effects induced by **platelet activating factor**, including platelet aggregation, secretion, and inositol phospholipid turnover; superoxide ion and H_2O_2 release from macrophages; hepatic glycogenolysis; and vasoconstriction.

hexanoyl or (formerly) caproyl symbol: Hxo; the univalent acyl group, CH₃-[CH_{2]4}-CO-, derived from hexanoic acid. See caproyl (def. 2).

hexaric acid an addaric acid formally derived from a hexose by oxidation at both C-1 and C-6.

hexitol any alditol having a chain of six carbon atoms in the molecule.

hexokinase EC 2.7.1.1; systematic name: ATP:D-hexose 6phosphotransferase; other name (used for hexokinase IV): glucokinase; the phosphotransferase enzyme that catalyses the phosphorylation by ATP of D-hexose to form D-hexose 6phosphate and ADP. In vertebrates there are four major isoenzymes, designated hexokinase types I, II, III, and IV, also called hexokinases A-D. All of these types are relatively nonspecific with respect to sugar, and phosphorylate a number of hexoses such as glucose, fructose, and mannose. Thus the name glucokinase for type IV may mislead. Types I-III all have $M_r \approx 100$ kDa and are sensitive to the product, glucose 6phosphate (abbr.: Glc-6-P). They differ from hexokinases found in yeast, which have $M_r \approx 50$ kDa, and are not inhibited by Glc-6-P. Type III is inhibited by excess glucose. Type IV, despite being a monomer with only one active site, shows cooperativity with respect to glucose, and reaches physiologically significant activity at higher glucose concentrations than types I-III. In hepatocytes, at less than 5 mM glucose it is present as an inactive enzyme bound to a regulatory protein; a glucose concentration of 15 mM causes translocation and activation of the enzyme. Type II is the major isoenzyme of skeletal muscle and adipose tissue. There are strong sequence similarities between the different types. The mammalian enzymes could have evolved by duplication and fusion of an ancestral 50 kDa hexokinase. Examples: hexokinase IV from human mitochondrial outer membrane: database code HXK1_HUMAN, 917 amino acids (102.39 kDa); the N-terminal and C-terminal halves of the sequence are similar; regulatory function of this monomeric allosteric enyme is associated with the N-terminal half; human brain hexokinase, type I: database code HXK1_HUMAN, 917 amino acids (102.39 kDa); human liver glucokinase isozyme (hexokinase D): database code HXKH_HUMAN, 466 amino acids (52.08 kDa); yeast hexokinase (3-D structure with glucose): database code NRL_1HKG, 457 amino acids (38.89 kDa); also, from yeast: database code HXKG_YEAST, 500 amino acids (55.31 kDa).

hexon a capsomere that is surrounded by six other capsomeres in an icosahedral virus capsid.

hexonic acid any monocarboxylic acid (i.e. aldonic acid) formally derived from a hexose by oxidation at C-1.

hexosamine any aminodeoxysugar with six carbon atoms.

hexosaminidase EC 3.2.1.52; recommended name: β -N-acetylhexosaminidase; systematic name: β -N-acetyl-D-hexosaminide *N*-acetylhexosaminohydrolase; other name: β -hexosaminidase. An enzyme that catalyses the hydrolysis of terminal nonreducing N-acetyl-D-hexosamine residues in N-acetyl-β-D-hexosaminides. It is a lysosomal enzyme in mammals; there are two precursors (human): α, database code HEXA_HUMAN, 529 amino acids (60.62 kDa); and β , database code HEXB_ HUMAN, 556 amino acids (63.04 kDa). The α chain, a glycoprotein, comprises amino acids 109-529 of its precursor; three glycoproteins (all similar to a) are derived from the B precursor: β (amino acids 122-556), β-B (amino acids 122-311), and β-A (amino acids 315-556). There are three forms of the enzyme: form A, responsible for degradation of GM₂ gangliosides, is a trimer composed of one α chain, one β -A chain, and one β-B chain; form B is a tetramer of two β-A and two β-B chains; form S is a homodimer of two a chains. Tay-Sachs dis-

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

high-pressure liquid chromatogi

Bur taget

ease is due to defects of the α chain and Sandoff disease due to defects of the β chain.

hexosan a former name for any of a class of polysaccharides that yield only hexoses on hydrolysis.

hexose any aldose having a chain of six carbon atoms in the molecule.

hexose diphosphate pathway an alternative name for Embden-Meyerhof pathway.

hexose monophosphate pathway or hexose monophosphate shunt an alternative name for pentose phosphate pathway.

hexose phosphate transport protein an integral membrane transport protein responsible for sugar phosphate uptake in bacteria. Example from *Escherichia coli*: database code UHPT_ECOLI, 463 amino acids (50.55 kDa).

hexose-1-phosphate uridylyltransferase see UDPglucose-hexose-1-phosphate uridylyltransferase.

hexulose any **ketose** having a chain of six carbon atoms in the molecule.

hexuronic acid 1 any monocarboxylic acid (i.e. uronic acid) formally derived from a hexose by oxidation at C-6. 2 a historical name originally used for ascorbic acid.

hexyl symbol: Hx; the alkyl group, CH₃-[CH₂]₄-CH₂-, derived from hexane.

hexyl glucoside hexyl β -D-glucopyranoside; a mild nonionic detergent, CMC 250 mM.

Heyrovský, Jaroslav (1890–1967), Czech physical chemist; Nobel Laureate in Chemistry (1959) 'for his discovery and development of the polarographic methods of analysis'.

Hf symbol for hafnium.

HFBA abbr. for heptafluorobutyric acid; a reagent used in automatic peptide sequence analysis. It renders the action of cyanogen bromide specific to the cleavage of tryptophanyl peptide bonds.

HFCS abbr. for high fructose corn syrup.

Hfr abbr. for high-frequency recombinant.

HFT abbr. for high-frequency transduction.

Hg symbol for mercury.

HGF 1 abbr. for hepatocyte growth factor. 2 abbr. for hyper-glycemic-glycogenolytic factor; see glucagon.

HGF receptor see hepatocyte growth factor receptor.

HGG abbr. for human gamma-globulin.

hGH or HGH abbr. for human growth hormone (i.e. human somatotropin).

HGPRT abbr. for hypoxanthine/guanine **phosphoribosyltrans- ferase**; an enzyme that is important for the metabolic activation of purines, e.g. 6-mercaptopurine. Its deficiency is the cause of **Lesch-Nyhan syndrome**.

HHT abbr. for hydroxyheptadecatrienoic acid.

5-HIAA abbr. for 5-hydroxyindoleacetic acid.

hidden (immunological) determinant or cryptodeterminant any antigenic determinant so positioned that it is cryptic, i.e. normally not accessible for recognition by lymphocytes or antibody, but that becomes accessible after some stereochemical change occurs, e.g. by breakage, decomposition, or denaturation of the antigen. See also cryptotope.

hide the skin of an animal, especially the tough, thick skin of larger mammals. Powdered, dried hide is used in assays of some proteinases.

high-density lipoprotein abbr.: HDL; one of the classes of lipoproteins found in blood plasma in many animals (data normally relate to humans). They are also known as α lipoproteins, from having the highest electrophoretic mobility of the lipoproteins. HDL particles are the smallest of the blood lipoproteins: diameter 7.5-10 nm; solvent density for isolation 1.063-1.21 g mL⁻¹; hydrated density 1.21 g mL⁻¹. Their approximate composition (% by weight) is 6% unesterified cholesterol, 13% esterified cholesterol, 28% phospholipid, 3% triacylglycerol, 50% protein. Their apolipoprotein composition (% by weight total apolipoprotein) is 67% A-I, 22% A-II, 5-11% C-I + C-III + C-III, 1-2% E-II + E-III + E-IV, trace of D. They are synthesized in liver as precursor molecules, which

undergo modification in plasma to the mature molecules, especially as a result of the action of lecithin-cholesterol acyltransferase. They appear to function in reverse transport of cholesterol from tissues to liver. See also apolipoprotein for individual apolipoproteins.

high-energy bond symbol: ~; a term formerly sometimes used by biochemists for a chemical bond whose hydrolysis is accompanied by an unusually large (>20 kJ mol ¹) negative standard free energy change. Although long used, the term has been recognized as incorrect and misleading, since it suggests that such a bond actually contains an unusually large amount of energy and fails to take into account the various factors that contribute to the large negative free energy change.

high-energy compound a term formerly sometimes applied by biochemists to any compound containing one or more so-called **high-energy bonds**, e.g. ATP, phosphoenolpyruvate, acetyl-coenzyme A, etc.

high-frequency recombinant any bacterial strain that has a high frequency of recombination because the F plasmid has become incorporated into the bacterial chromosome. See also Hir.

high-frequency transduction abbr.: HFT; any transduction in which the transducing phage(s) constitute a large proportion of the total phage population.

high-fructose corn syrup abbr.: HFCS; a mixture of fructose and glucose used as a sweetener in soft drinks, etc.; it is sometimes called high fructose syrup or, especially in Europe, isoglucose. The breakdown of corn starch to glucose (plus oligosaccharides) is followed by the action of glucose isomerase yielding a mixture consisting mainly of fructose and glucose. The product thus manifests the greater sweetness of fructose compared with glucose. The content is typically 42% fructose, 51% glucose, 5% maltose, and 2% other oligosaccharides.

highly conserved see conserved.

highly repetitive DNA a form of DNA that consists of short tandemly repeated sequences. It is found outside coding regions, and its role is unknown. Such DNA forms a significant proportion of most mammalian genomes.

high mobility group proteins abbr.: HMG proteins; small nuclear proteins that bind to nucleosomal DNA and probably maintain genes in a transcribable conformation. The name derives from their behaviour on electrophoresis. Example, HMG 14 from human: database code HG17_HUMAN, 89 amino acids (9.25 kDa).

high-performance capillary electrophoresis electrophoresis through a long coiled capillary column that gives very high resolution of e.g. peptides. See also capillary electrophoresis.

high-performance liquid affinity chromatography abbr.: HPLAC; a technique that combines the use of bioaffinity supports and high-pressure liquid chromatography.

high-performance liquid chromatography abbr.: HPLC; an alternative name for high-pressure liquid chromatography.

high-potential iron-sulfur protein abbr: Hipip or HiPIP or HiPiP; a type of **ferredoxin**, originally found in the photosynthetic bacterium Chromatium vinosum, that has a very much higher redox potential ($E_o' \approx 0.3$ V) and different magnetic properties compared with other ferredoxins. The term has been used increasingly, but inappropriately, for other ferredoxins that, like the Chromatium protein, are able to form a higher than usual oxidation level but do not have high redox potentials.

high-pressure liquid chromatography or high-performance liquid chromatography abbr: HPLC; a technique of column chromatography that is rapid and provides high resolution. It can be used with the various modes of liquid chromatography, the liquid being forced at high pressure, normally up to 420 kg cm⁻² (6000 psi), through the column (which is usually of stainless steel) and thence through a detector into a fraction collector. Because of the ability to use high pressures, the particles of the support materials used for the stationary phase can be of very small diameter (3–10 μ m), which greatly improves resolution.

D. They are synthesized in liver as precursor molecules, which olution.

high-speed supernatant a jargon term for the supernatant resulting from high-speed centrifugation (≈100 000 g).

high-spin complex any of the complex transition-metal ions having a maximal number of unpaired electrons in the d- or fshell. This state occurs when pairing energy is higher than the crystal field splitting energy. Compare low-spin complex.

high-voltage electron microscope a type of electron microscope that employs accelerating voltages of 1 Mev, ten times that of previous instruments, enabling images of thick sections and even intact cells to be produced without significant loss of resolution.

high-voltage electrophoresis abbr.: HVE; a technique of paper or thin-layer electrophoresis that results in better and more rapid separations (10-60 min) than the standard technique, which suffers from minimal diffusion of low- M_r components. The high-voltage technique employs currents of up to 500 mA and potential gradients of up to 200 V cm⁻¹. The high field strength requires cooling of the support and adequate protection devices to be incorporated into the apparatus.

Hildebrand solubility parameter $symbol: \delta$; a measure of what is commonly called the polarity of a solvent; nonpolar solvents have low δ values while polar solvents have large values. In liquid-liquid chromatography the Hildebrand parameter indicates the relative position of a solvent in an eluotropic series. The parameter is the sum of a number of factors:

$$\delta = \delta_{\rm d} + \delta_{\rm o} + \delta_{\rm a} + \delta_{\rm h},$$

where δ_d is a measure of interactions due to dispersion forces, δ_o is a measure of interactions due to dipole interactions, δ_a is a measure of the ability of the solvent to interact as a hydrogen acceptor, and δ_h is a measure of its interactions as a hydrogen donor. [After Joel Henry Hildebrand (1881-1983), US chemist.1

Hill 1 (Sir) Archibald Vivian Hill (1886-1977), British physiologist and biophysicist; Nobel Laureate in Physiology or Medicine (1922) 'for his discovery relating to the production of heat in the muscle' [prize shared with O. F. Meyerhof]. 2 Robert ('Robin') Hill (1899–1991), British plant biochemist noted for his studies of the mechanism of photosynthesis.

Hill coefficient or Hill constant symbol: h or n_H ; see Hill equation and Hill plot.

Hill equation 1 an equation,

$$y = K[x]^h/(1 + K[x]^h),$$

used to express the binding of a ligand to a (macro)molecule. It may be rearranged to give:

$$\log[y/(1-y)] = -\log K + h\log[x],$$

where y, the fractional saturation, is the fraction of the total number of binding sites occupied by ligand, [x] is the free (unbound) ligand concentration, K is a constant, and h is the Hill coefficient. 2 (in pharmacology) an equation derived from the above relating the effect of a drug to its concentration. For an effect, E, produced when an agent, A, is applied at a concentration [A], then the relationship between E and [A] may often be described empirically by the equation

$$E/E_{\text{max}} = [A]^h/([A]_{50}^h + [A]^h),$$

where E_{max} is the maximal value of E and $[A]_{50}$ is the concentration that produces an effect that is 50% of $E_{\rm max}$. [After A. V. Hill.]

Hill-Langmuir equation (in pharmacology) a variation of the Langmuir absorption isotherm; for a ligand, L, binding to a receptor, R, according to the equilibrium $\begin{array}{c}
K_L \\
L + R \rightleftharpoons LR,
\end{array}$

$$K_L$$

L+R \rightleftharpoons LR,

$$p_{LR} = [L]/(K_L + [L]),$$

where p_{LR} is the fraction (proportion) of binding sites occupied by a ligand at equilibrium and K_L is the dissociation equi-

Hill plot a plot of the Hill equation in the form log[y/(1-y)]Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

and [x] is the free (unbound) ligand concentration. The slope at any one point, h, is the Hill coefficient at that value of y. The values of h along the plot, which usually do not exceed the number of binding sites on each molecule and which tend to unity as y tends to 0 or 1, give an indication of the nature and degree of cooperativity (interaction) between the various binding sites on the molecule. [After A. V. Hill.]

against log[x], where y is the fractional saturation with ligand

Hill reaction the phenomenon in which isolated chloroplasts evolve dioxygen when illuminated in the presence of a suitable electron acceptor, e.g. ferricyanide or ferrioxalate, with a concomitant reduction of the electron acceptor. [After R. Hill.]

Hill reagent any electron acceptor that functions in a Hill reaction, e.g. ferrioxalate or ferricyanide.

hinge region 1 a flexible, proline-rich region of an immunoglobulin molecule, adjacent to the two disulfide bonds linking the two heavy chains together. It probably acts as a hinge on which the Fab fragments can rotate allowing the immunoglobulin molecule to take up a Y-shape when it reacts with antigen. The hinge region is near the sites of action of papain and pepsin. 2 the region in the helical, rod-shaped part of a myosin molecule that is susceptible to cleavage by trypsin to give light meromyosin and heavy meromyosin. 3 a region in any protein about which rigid body motions occur.

Hipip or **HiPiP** or **HiPiP** abbr. for high-potential iron-sulfur

hippocalcin a neuron-specific Ca²⁺-binding protein with EFhands, similar to recoverin. It is expressed exclusively in the pyramidal layer of the hippocampus. Example from human: database code HIPP_HUMAN, 192 amino acids (22.30 kDa).

hirudin a dried extract obtained from leeches and possessing anticoagulant activity. The name is also applied to the purified active component, a 65-amino-acid polypeptide with three disulfide bridges; this has highly specific antithrombin properties, inactivating thrombin by blocking substrate-binding groups. Example from the leech Hirudo medicinalis: database code ITH1_HIRME, 65 amino acids (6.97 kDa).

hirudisin a recombinant hirudin variant engineered to inhibit α-thrombin and exhibit disintegrin activity. Hirudisins have antiplatelet aggregation activity. Replacement of the hirudin sequence Ser-Asp-Gly-Glu (residues 32–35) by Arg-Gly-Asp-Ser (RGDS) yields hirudisin, or by Lys-Gly-Asp-Ser yields hirudisin-1. The integrin-binding RGD motif of hirudisin is implicated in its antiplatelet action.

hirulog any synthetic peptide based on hirudin and designed as an inhibitor of the thrombin catalytic site, and exhibiting specificity for the anion-binding site of thrombin.

hirustasin an antistasin-like serine proteinase inhibitor isolated from the medicinal leech, Hirudo medicinalis.

His symbol for a residue of the α -amino acid L-histidine (alternative to H).

hist+ a variant form of **histo+** (before a vowel).

histaminase see amine oxidase (copper-containing).

histamine 2-(4-imidazolyl)ethylamine; a compound formed by the decarboxylation of L-histidine and present in many mammalian tissues, with especially high concentrations in lung, skin, and intestine; it is stored in the granules of tissue mast cells and circulating basophil cells. Histamine is a potent vasodilator; it also increases capillary permeability, causes contraction of smooth muscle, plays a role in the regulation of gastric secretion, and acts as a mediator in allergic and anaphylactic conditions.

histamine receptor any of the receptors in mammalian tissues that interact specifically with histamine. Histamine receptors

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyenltd.com.

histidase

may be divided into three categories. H1 receptors mediate the stimulating effects of histamine on smooth muscle in the gut and bronchi and most of the depressor effects on blood pressure. They are antagonized (blocked) by such classical antihistamines as pyrilamine (mepyramine) and promethazine. The H₁ receptor has seven transmembrane domains coupled to the phosphatidylinositol-Ca²⁺ second messenger system. Example: database code HHIR_HUMAN, 487 amino acids (55.78 kDa). H2 receptors mediate the stimulation of gastric acid secretion, the increase in the contraction frequency of cardiac muscle, the increase in cyclic AMP stores in basophil and mast cells, the inhibition of release of histamine by mast cells, and the remaining depressor effects on blood pressure. They are antagonized by, e.g., cimetidine. In humans the H2 receptor has seven transmembrane domains, positively coupled to adenylate cyclase. Example: database code HH2R_HUMAN, 359 amino acids (40.1 kDa). H3 receptors have a receptor site characterized pharmacologically by radioligand binding; second messenger coupling and structure are unknown. They are associated with presynaptic nerve terminals and attenuate the release of neurotransmitters, e.g. histamine, acetylcholine, and norepinephrine. They are antagonized and blocked, e.g., by thioperamide and clobenpropit.

histidase an alternative name for histidine ammonia-lyase.

histidinal α -amino- β -4-imidazolepropionaldehyde; 2-amino-3-(1H-imidazol-4-yl)propanal; $(C_3H_3N_2)CH_2-CH(NH_2)-CHO$; the α -amino-aldehyde analogue of histidine. It is the immediate biosynthetic precursor of histidine.

histidinase an alternative name for histidine ammonia-lyase.

histidine anion; anion, (C₃H₃N₂)CH₂-CH(NH₂)-COO⁻, derived from histidine. 2 any salt of histidine anion. 3 any ester of histidine.

histidine the trivial name for β -4-imidazolylalanine; α -aminoβ-imidazole-4-propionic acid; 2-amino-3-(1H-imidazol-4yl)propanoic acid; (C₃H₃N₂)CH₂-CH(NH₂)-COOH; a chiral α -amino acid. L-Histidine (symbol: H or His), (S)-2-amino-3-(1H-imidazol-4-yl)propanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: CAC or CAU. It is also a component of the isopeptide carnosine. In mammals it is an essential dietary amino acid and is glucogenic. D-Histidine (symbol: D-His or DHis), (R)-2-amino-3-(1Himidazol-4-yl)propanoic acid, is not known to occur naturally. N-1 and N-3 of the imidazole ring are designated τ and π respectively.

$$\begin{array}{c|c} H & NH_2 & T \\ NH_2 & N & T \\ NH_3 & 1NH \\ NH_4 & NH_5 \\ NH_5 & 1NH \\ NH_6 & NH_6 \\ NH_6 &$$

L-histidine

histidine ammonia-lyase EC 4.3.1.3; systematic name: L-histidine ammonia-lyase; other names: histidase; histidine α deaminase; histidinase. An ammonia-lyase (deaminase) enzyme that catalyses the deamination of L-histidine to urocanate. It is widely distributed in animals, plants, and microorganisms; in plants it is present in glyoxysomes. The activity of this enzyme is defective in histidinemia.

histidine (base) a histidine residue in which the imidazole group is unprotonated.

histidine decarboxylase abbr.: HDC; EC 4.1.1.22; systematic name: L-histidine carboxy-lyase. A pyridoxal phosphate enzyme that catalyses the decarboxylation of L-histidine to histamine. It is similar to dopa and glutamate decarboxylases. Example from human (homodimer): database code DCHS_ HUMAN, 662 amino acids (74.10 kDa).

used (1884) by Charles Alexander MacMunn (1852-1911) for

histidinemia or (esp. Brit.) histidinaemia a rare, hereditary, hematin.

Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

human metabolic disorder in which abnormally high levels of histidine are found in the blood and urine. It is due to a defect in the activity of histidine ammonia-lyase.

histoher

histidine tail a sequence of (usually) about six histidine residues that is deliberately introduced at the C terminus of certain recombinant proteins. The purpose is to allow purification of the recombinant product by a type of affinity chromatography using a nickel chelating resin. Only the histidinetailed proteins are retained by the column and these may then be eluted using a buffer containing imidazole.

histidinium 1 a term normally used to mean histidinium(1+); the (imidazolinium) monocation of histidine. In theory, the term denotes any ion or mixture of ions formed from histidine and having a net charge of +1, although the species $(C_3H_4N_2^+)CH_2$ -CH (NH_3^+) -COO⁻ generally predominates in practice. 2 the systematic name for histidinium(2+); the dication of histidine.

 N^2 -histidino; the alkylamino histidino (C₃H₃N₂)CH₂-CH(COOH)-NH-, derived from histidine by loss of a hydrogen atom from its α -amino group. 2 either of the two possible groups, N^{π} -histidino or N^{τ} -histidino, HOOC-CH(NH₂)-CH₂-(C₃H₂N₂)-, derived from histidine by loss of a hydrogen atom from its position on one or other of the nitrogen atoms of the imidazole ring.

histidinol 4-(2-amino-3-hydroxypropyl)imidazole; 2-amino-3-(1*H*-imidazol-4-yl)propanol;

 $(C_3H_3N_2)CH_2-CH(NH_2)-CH_2OH$; the α -amino-alcohol analogue of histidine. It is an intermediate, together with its phosphate ester, in the biosynthesis of histidine, and a powerful reversible inhibitor of protein synthesis.

histidinol dehydrogenase abbr.: HDH; EC 1.1.1.23; L-histidinol:NAD+ oxidoreductase. An enzyme that catalyses the oxidation of two molecules of NAD+ of L-histidinol to L-histidine with reduction of the NAD+ to NADH. Example from the his operon of Salmonella typhimurium: database code HISX_SALTY, 434 amino acids (45.85 kDa); the protein is a dimer and bifunctional as it also has an aldehyde dehydrogenase site, histidinol; being an intermediate. See also Salmonella mutagenicity test.

histidyl the acyl group, (C₃H₃N₂)-CH₂-CH(NH₂)-CO-, derived from histidine.

histo+ or (before a vowel) hist+ comb. form denoting tissue.

histochemistry the chemistry of the tissues, as studied with a combination of the methods of chemistry and histology

histocompatibility the extent to which an organism will tolerate a graft of a foreign tissue. -histocompatible adj.

histocompatibility antigen any of the genetically determined isoantigens present on the surface of many animal cells that determine the immune reactions to tissue grafts. If tissue is grafted onto a recipient of the same species that does not carry the same histocompatibility antigens as the graft material, an immune response may be provoked in the recipient leading to graft rejection. See also HLA histocompatibility system, major histocompatibility complex.

histocompatibility gene any gene determining the formation of a histocompatibility antigen. See HLA histocompatibility system, major histocompatibility complex.

histoelectrofocusing a technique in which an unfixed frozen section of tissue, 25-40 μm thick, is applied to a support gel and then subjected to electrofocusing. The proteins and enzymes present in the tissue move into the gel and may be revealed by staining or zymographic techniques.

histogram a diagram representing a frequency distribution. It

consists of a number of contiguous rectangles whose widths

are proportional to the class interval under consideration and

whose heights are proportional to the frequency associated

with each class. histohematin or (esp. Brit.) histohaematin a term originally the pigments now known as cytochromes. It included myo-

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com. histone Hoc

histone any of a group of evolutionarily highly conserved basic proteins, of molecular mass 11-21 kDa, that constitute about half the mass of the chromosomes of all eukaryotic cells, except spermatozoa. They comprise single polypeptide chains with a (lysine plus arginine) content of about 25%, and are concerned in the packing of DNA in **chromatin**. The principal histones may be classified into five types as shown in the table.

Type	Other names	Lys/Arg ratio	$M_{\rm r}$	Location
H1	F1,Ia	20.0	21 000	linker
H2A	F2a2,IIb1	1.25	14 500	core
H2B	F2b,IIb2	2.25	13 800	core
H3	F3,III	0.72	15 300	core
H4	F2a1,IV	0.79	11 300	core

The octomer (H2A,H2B,H3,H4)₂ forms the **nucleosome** core. Examples from yeast: H2A.2, database code H2A2_YEAST, 131 amino acids (13.84 kDa); H2B.1, database code H2B1_YEAST, 130 amino acids (14.10 kDa); H3, database code H3_YEAST, 135 amino acids (15.21 kDa); H4, database code H4_YEAST, 102 amino acids (11.22 kDa). H1 is associated with nucleosomes, especially the linking DNA; example H1A (human): database code H1A_HUMAN, 222 amino acids (22.15 kDa). See also **H-NS**.

hitchhiking 1 a jargon term for the sequence of events in which a genetic element (or transposon) inserts into an active secondary site on a replicon which is then transferred to a recipient, the transposon then coming immediately to occupy its normal primary site in the DNA of the recipient organism. 2 the spread of a neutral allele through a population due to its linkage with a beneficial allele that is subject to selection.

Hitchings, George Herbert (1905–98), US biochemist and pharmacologist distinguished for his introduction, largely in collaboration with his colleague G. B. Elion, of a range of widely used synthetic drugs designed as antimetabolites, including the antifolate bactericidal agent co-trimoxazole, the immunosuppressants mercaptopurine and its derivative azathioprine, and the xanthine-oxidase inhibitor allopurinol; Nobel Laureate in Physiology or Medicine (1988) jointly with J. W. Black and G. B. Elion 'for their discoveries of important principles for drug treatment'.

HIV abbr. for human immunodeficiency virus; a retrovirus, the causative agent of AIDS. Two such viruses are known: HIV-1, found worldwide, and HIV-2, which is much less common, being found mainly in West Africa. In terms of the gene structure of the viral envelope sequences (see HIV protein) HIV-1 and HIV-2, although both members of the Lentivirus family of retroviruses, are not closely related. HIV-2 is closely related to a simian immunodeficiency virus (SIV) common in sooty mangabeys and probably originated there. HIV-1, which probably originated from a non-human primate in Africa, is closely related to SIV from chimpanzees. However, since the rate of SIV infection in chimpanzees is very low, it is not clear that they represent the natural host of these viruses. HIV is subclassified into eight alphabetical subtypes or clades, plus one orphan clade. The reverse transcriptase enzyme of HIV is highly error-prone, leading to a high mutation rate. Thus these viruses evolve very quickly even within single patients, and drug-resistant mutations appear rapidly. For HIV-1 to enter its target cells, it must not only bind to the cell-surface protein CD4 but also to one or more chemokine receptors. One of these, named CCR5, is effective in the early stages of infection. Patients with defective CCR5 cannot be infected with HIV-1. During the later stages of infection, another chemokine receptor, CXCR4 (former name: fusin) dominates.

HIV-1 protease an aspartyl protease that is a homodimer of two subunits each containing 99 amino acids, with cysteines at positions 67 and 95. Its proteolytic function is essential for the life cycle of human immunodeficiency virus (HIV) and is, therefore, a target for the design of inhibitors as therapeutic drugs, several examples of which are in use.

HIV protein any of the proteins encoded by the human immunodeficiency virus (HIV). The HIV-1 genome (9.5 kb) is transcribed to give 12 different mRNAs generated by alternative splicing. The proteins are conventionally named for the gene and/or their size (kDa) with the convention that p = protein and gp = glycoprotein. The primary translation products are: Gag precursor (p53); Pol precursor; Env precursor (gp160); Nef (p27; negative regulator); Vif (p23); Tat (p14; regulatory protein); Rev (p19; regulatory protein); Vpr (p18); and Vpu (p15). The Gag precursor is cleaved to myristoylated Gag protein (p17), structural protein (p24), and p15; p15 is the precursor for RNA-binding protein (p7) and proline-rich protein (p9). The Pol precursor is cleaved to protease (p10), reverse transcriptase (p51), and endonuclease (p32). The Env precursor is cleaved to extracellular protein (gp120) and transmembrane protein (gp41). Protease, reverse transcriptase, and endonuclease are synthesized as part of a polyprotein: database code POL_HV1BR, 1015 amino acids (115.03 kDa). See also retrovirus.

HLA abbr. for human leukocyte-associated antigen. See also histocompatibility antigen, major histocompatibility complex.

HLA histocompatibility system a family of histocompatibility antigens encoded by the complex of genetic loci known as the major histocompatibility complex (MHC). It is the major histocompatibility system in humans, equivalent to the H-2 histocompatibility system in mice. The MHC genes control the presence of HLA isoantigens on cell surfaces. These antigens are of primary importance in tissue grafting since HLA-incompatible grafts are more likely to be rejected than incompatible grafts of other isoantigen groups.

HLH abbr. for helix-loop-helix (see helix-turn-helix).

hly genes see hemolysin.

HMC abbr. for 5-hydroxymethylcytosine.

H-meromyosin abbr. for heavy meromyosin.

hMG or **HMG** abbr. for human menopausal gonadotropin (i.e. human urogonadotropin).

HMG 1 abbr. for 2-hydroxy-2-methylglutaryl. 2 abbr. for high mobility group of nuclear proteins. 3 see hMG.

HMG-CoA abbr. for hydroxymethylglutaryl-CoA.

HMG-CoA lyase abbr. for hydroxymethylglutaryl-CoA lyase. **HMG-CoA reductase** abbr. for hydroxymethylglutaryl-CoA reductase.

HMG-CoA synthase *abbr. for* hydroxymethylglutaryl-CoA synthase.

HMM abbr. for heavy meromyosin.

HMMA abbr. for hydroxymethoxymandelate.

HMP abbr. for hexose monophosphate.

HMP pathway or **HMP shunt** abbr. for hexose monophosphate pathway (shunt) (i.e. pentose phosphate pathway).

HNPCC a human gene that may normally function in the repair of regions of mismatch of DNA. It is named from hereditary nonpolyposis colorectal cancer, a condition associated with mutations in this gene.

hnRNA or HnRNA abbr. for heterogeneous nuclear RNA (alternatives to H-RNA).

hnRNP abbr. for heterogeneous nuclear ribonucleoprotein.

hnRNP particles abbr. for heterogeneous nuclear ribonucleoprotein particles; particles in the nucleus containing **hnRNA** bound to protein.

H-NS bacterial proteins of several families that are basic DNA-binding proteins, possibly the prokaryotic counterparts of histones in eukaryotic chromatin. Their role remains unclear. They have the ability to bind to curved DNA and may have a role in transcriptional regulation. The N-terminal tetrapeptide, consensus Ser-Glu-Xaa-Leu, is characteristic. Example from Escherichia coli: protein H1, dimer, database code HNS_ECOLI, 136 amino acids (15.39 kDa). The name derives from an isolation procedure extracting them from the 30S ribosomal native subunit.

Ho symbol for holmium.

veral examples of which are in use. **Hodgkin 1 (Sir) Alan Lloyd** (1914–98) British physiologist Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Hoechst 33258 homeoti

chnique a technique in which bundles of semiow fibres with pores of controlled dimensions s molecular sieves are used for concentrating,

renowned for his researches on nerve-impulse conduction; Nobel Laureate in Physiology or Medicine (1963) jointly with J. C. Eccles and A. F. Huxley 'for their discoveries concerning the ionic mechanisms involved in excitation and inhibition in the peripheral and central portions of the nerve cells membrane'. 2 Dorothy (Mary) Crowfoot-Hodgkin née Crowfoot, (1910–94), British chemist and crystallographer renowned for her elucidation by X-ray crystallography of the molecular structures of benzylpenicillin (formerly termed penicillin G) and cyanocobalamin (a version of vitamin B_{12}) and in particular of the complete three-dimensional structure of crystalline zinc insulin (announced in 1969, having – as D. M. Crowfoot – first observed its diffraction pattern in 1934); Nobel Laureate in Chemistry (1964) 'for her determination by X-ray techniques of the structures of important biochemical substances', e.g. penicillin, vitamin B_{12} , and insulin.

Hoechst 33258 see bisbenzimide. Hoechst 33342 see bisbenzimide.

Hoff see van't Hoff.

Hofmeister series or **lyotropic series** an arrangement of either the simple anions or the simple cations (or of the salts of such ions) in order of their ability to remove lyophilic substances from colloidal solutions. Each series is an index of, *inter alia*, the relative abilities of the ions to salt-out proteins from solution. The order for anions is: citrate³⁻ > tartrate²⁻ > acetate⁻ > $NO_3^- > CIO_4^- > CNS^-$, and that for cations is: $Mg^{2+} > Ca^{2+} > Sr^{2+} > Ba^{2+} > Li^+ > Na^+ > K^+ > Rb^+ > Cs^+$. [After Franz Hofmeister (1850–1922).]

Hofstee plot see Eadie-Hofstee plot.

Hogness box an alternative name for TATA box.

hol+ a variant form of (before a vowel) **holo+**.

holandric inherited solely in the male line. Compare hologynic. holdback agent or holdback carrier any nonradioactive substance that is added to a sample to prevent either coprecipitation or adsorption of some soluble radioactive substance.

hold-up volume symbol: $V_{\rm M}$; (in chromatography) the volume of eluent required to elute a component whose concentration in the stationary phase is negligible relative to that in the mobile phase. In gas chromatography, the volume of carrier gas (eluent) is specified at the same temperature and pressure as the total retention volume.

hole (in physics) the absence of an electron in a normally filled valency structure of a crystalline **semiconductor** that behaves as a carrier of charge and is mathematically equivalent to a positron.

Holley, Robert William (1922-93), US biochemist and molecular biologist noted for his establishment of the structure of alanine transfer RNA, this being the first occasion on which the sequence of a nucleic acid had been determined; Nobel Laureate jointly with H. G. Khorana and M. W. Nirenberg (1968) for their 'interpretation of the genetic code and its function in protein synthesis'.

Holliday junction or Holliday structure one of the junctions between four strands of DNA that are important intermediates in genetic recombination. They are part of the mechanism for crossing over during the long prophase of meiotic cell division I, when four strands of DNA are aligned. The process involves breaking the DNA double helix in a maternal chromatid and in a homologous paternal chromatid and then exchanging fragments between the two non-sister chromatids in a reciprocal fashion. At this point, in each four strands, a paternal strand links across to a maternal strand, forming the junction known by the name of its proposer. [After Robin Holliday (1932—), British biologist.]

hollow-cathode discharge lamp a radiation source used in atomic absorption spectrophotometry to produce a spectrum of radiation specific to the element being assayed. A sample of the element in question is held in a metal cup-shaped cathode, which, together with a tungsten anode, is enclosed in a glass or quartz envelope filled with argon at low pressure. A high voltage is used to produce an arc spectrum of the element.

hollow-fibre technique a technique in which bundles of semipermeable, hollow fibres with pores of controlled dimensions that function as molecular sieves are used for concentrating, desalting, dialysing, and fractionating macromolecules in solution. Compare capillary filtration.

holo+ or (before a vowel) hol+ comb. form whole, entire, complete; wholly, entirely, completely.

holocellulose the complex mixture of polysaccharides remaining after the removal of lignin from tree-wood by treatment with sodium chlorite solution. It consists of a mixture of cellulose and hemicellulose.

holocrine 1 describing a type of secretion that involves disintegration of the entire secretory cell to release the secretory products. 2 describing a gland made up of such cells. *Compare* apocrine, eccrine, merocrine.

holoenzyme a catalytically active complex comprising the protein part of an enzyme (**apoenzyme**) combined with the appropriate cofactor or cofactors.

hologram 1 the pattern produced when light, or other electromagnetic radiation, that has been reflected, diffracted, or transmitted by an object placed in a coherent beam, interferes with a reference beam related in phase to the first beam. 2 a photograph of such a pattern.

holograph 1 to make a **hologram** (def. 1, 2). 2 any book or other document handwritten by its author.

holography the process of making and using **holograms** (def. 1, 2). —**holographic** adj.

hologynic inherited solely in the female line. Compare holandric.

Holometabola or Endopterygota one of the two divisions of the subclass Pterygota, comprising those insects, e.g. butterflies, moths, flies, and beetles, in which the juvenile forms (larvae) are very different from the adults. Such insects undergo complete metamorphosis during a resting stage (pupa). Compare Hemimetabola.

holoprotein the functional form of a protein containing a protein part (apoprotein) together with any appropriate ligand or ligands.

holorepressor a functional repressor protein consisting of an aporepressor plus corepressor complex.

homeo+ or homoeo+ or homoio+ comb. form denoting like or similar.

homeobox a short (180 bp) conserved DNA sequence that encodes a DNA-binding motif famous for its presence in genes that are involved in orchestrating the development of a wide range of organisms. See also homeotic gene.

homeodomain the DNA-binding motif of 60 amino acids encoded by a **homeobox**.

homeomorphism or homoeomorphism (in chemistry) the property shown by certain substances of having the same crystal form but different compositions.—homeomorphic, homeomorphous, or homoeomorphic, homoeomorphous adj.

homeostasis or homoeostasis the maintenance of a relatively constant internal environment in the bodies of higher animals by means of a series of interacting physiological and biochemical processes. —homeostatic or homoeostatic adj.

homeotic gene or homeodomain-encoding gene or homeobox-encoding gene or Hox gene; any of the genes that are allelic for mutations resulting in the conversion of one body part into another. Homeotic genes were first discovered in Drosophila; a mutation in such a gene could, e.g., result in a leg replacing an antenna. While Drosophila has only two Hox clusters, in nematodes there is one, and in vertebrates four clusters of 9 to 11 genes each located on a separate chromosome and spanning more than 100 kb. The vertebrate Hox genes are expressed in specific patterns and at particular stages in embryogenesis. They are activated by retinoic acid and sonic hedgehog protein. In the limb these are active in concert with fibroblast growth factor. The degree of homology of the Hox genes in different species is remarkably high. The structure of some homeodomains has been determined, as has their interaction with DNA.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

Surgest de la constant de la constan

homeothermic the usual US spelling of homoiothermic.

homeotypic pertaining to, or being the second, reductive division in meiosis. Compare heterotypic.

homo+ comb. form 1 the same, similar, alike. Compare allo+ (def. 1); hetero+ (def. 1); iso+ (def. 1); xeno+ (def. 1). 2 from, or directed towards, the same species. Compare allo+ (def. 2); hetero+ (def. 2); iso+ (def. 2); xeno+ (def. 2). 3 containing atoms, groups, linkages, residues, or subunits of the same kind. Compare hetero+ (def. 3). 4 denoting the next higher homologue of a specified chemical compound, especially one whose molecules contain, in a hydrocarbon chain or ring, one more methylene, -CH₂-, than those of of the parent compound, e.g. homocysteine, homoserine, homo-5α-pregnane. Compare nor+ (def. 2).

Homo a genus of primates that includes modern man (*Homo sapiens*) and a number of more primitive, fossil species.

homoarginine (sometimes) a trivial name for N^6 -amidino lysine.

homobifunctional describing a chemical reagent that carries two identical reactive groups. Compare heterobifunctional.

homocarnosine (sometimes) a trivial name for N^{α} -(4-aminobutyryl)histidine.

homochromatic a less common term for monochromatic (def. 1). homochromatography a chromatographic technique for the separation of labelled oligonucleotides, in which a mixture of unlabelled oligonucleotides is used to displace the labelled components according to differences in size.

homocitrate 2-hydroxybutane-1,2,4-tricarboxylate; the (R) enantiomer is a component of the **aminoadipic pathway** and is formed by **homocitrate synthase**.

homocitrate synthase EC 4.1.3.21; systematic name: 2-hydroxybutane-1,2,4-tricarboxylate 2-oxoglutarate-lyase (CoAacetylating). An enzyme that catalyses the formation of homocitrate from 2-oxoglutarate and acetyl-CoA and $\rm H_2O$. See also aminoadipic pathway.

homoconjugation the association between a base and its conjugate acid through a hydrogen bond. See conjugate acid-base pair. Compare heteroconjugation.

homocyclic 1 describing any cyclic molecular structure containing atoms of a single element in the ring or rings; describing any compound having such a structure. The term is preferred to its synonym isocyclic; it includes carbocyclic (def. 1). Compare heterocyclic (def. 1). 2 any such compound.

homocysteine symbol: Hcy; α -amino- γ -mercaptobutyric acid; 2-amino-4-mercaptobutanoic acid; an important intermediate in the metabolic reactions of its S-methyl derivative, methionine. Its concentration in human serum is raised after stroke.

L-homocysteine

homocysteine methyltransferase one of several enzymes, e.g. the two alternative forms of enzyme synthesizing methionine: (1) 5-methyltetrahydrofolate-homocysteine S-methyltransferase. (EC 2.1.1.13); other name: tetrahydropteroylglutamate methyltransferase; it catalyses a reaction between

5-methyltetrahydrofolate and L-homocysteine to form tetrahydrofolate and L-methionine; cobalamin is a cofactor. Example, metH gene product in Escherichia coli: database code METH_ECOLI, 1226 amino acids (135.81 kDa). (2) 5-methyltetrahydropteroyltriglutamate—homocysteine S-methyltransferase (EC 2.1.1.14); other name: tetrahydropteroyltriglutamate methyltransferase; it catalyses a reaction between 5-methyltetrahydropteroyltri-L-glutamate and L-homocysteine to form tetrahydropteroyltri-L-glutamate and L-methionine. Example, metE gene product in E. coli: database code METE_ECOLI, 752 amino acids (84.91 kDa).

homocystine 2,2'-diamino-4,4'-dithiobis(butanoic acid); the disulfide oxidation product of homocysteine.

homocystinemia or (esp. Brit.) homocystinaemia inherited biochemical abnormality of humans, characterized by an abnormally high concentration of homocystine in the blood; this may be accompanied by a corresponding elevation of homocystine in the urine (homocystinuria); alternatively, homocystinuria may be the chief presenting sign. Either condition may be due to either: (1) a deficiency of cystathionine β -synthase (EC 4.2.1.22) activity (the deficiency preventing the condensation of homocysteine with serine to form cystathionine); or (2) a deficiency of the 5-methyltetrahydrofolate-dependent pathway for the remethylation of homocysteine to methionine.

homodetic describing a cyclic peptide in which the ring consists solely of amino-acid residues in eupeptide linkage. *Compare* heterodetic.

homodimer any macromolecular structure in which two identical subunits (monomers or protomers) are noncovalently associated. See also dimer. Compare heterodimer.

homoduplex hybrid DNA involving two strands that are complementary. Compare heteroduplex.

homoeo+ a variant form of homeo+.

homogametic describing the sex whose cell nuclei contain a pair of similar sex chromosomes. The homogametic sex is usually female, but is male in the Lepidoptera, birds, some amphibians and fishes, and a few plants. Compare heterogametic.

homogenate any disrupted tissue preparation in which cell disruption is maximal while the destruction of intracellular organelles is kept to the minimum.

homogeneic an alternative term for allogeneic. Compare heterogeneic.

homogeneous 1 being uniform in kind, as in a homogeneous population. 2 (describing a group of molecules) uniform in structure or composition. 3 (describing a system) consisting of only a single chemical phase. Compare heterogeneous, homogenous.—homogeneity n.

homogeneous catalysis any catalytic action or process in which the catalyst is uniformly distributed in the same chemical phase as the reactants. Compare heterogeneous catalysis.

homogeneous enzyme immunoassay or enzyme-multiplied immunoassay technique (abbr.: EMIT) a technique of homogeneous immunoassay in which an enzyme is covalently coupled to the substance to be assayed. The enzymic activity of the complex is inhibited by an antiserum specific for the substance and this inhibition is relieved by the presence of free molecules of the substance to be assayed. The enzyme acts as a molecular amplifier.

homogeneous immunoassay any immunoassay that does not involve physical separation of antibody-bound antigen from antigen molecules that remain free. Labels that may be attached to the antigen include: enzymes, cofactors, prosthetic groups or substrates of enzymes, chemiluminescent or fluorescent molecules, stable free radicals. Compare heterogeneous immunoassay.

homogeneously staining region a region in a chromosome that stains homogeneously, rather than with the banding pattern normally seen. The region contains massively amplified numbers of copies of a small segment of the genome. The amplified DNA may often consist of multidrug resistance gene DNA (see MDR).

homogenesis

homogenesis the production of offspring having the same characteristics in successive generations. Compare heterogenesis.

homogenetic describing chromosome pairing during meiosis when the pairing partners are derived from one of the original ancestors. *Compare* **heterogenetic**.

homogenic or congenic 1 describing a gamete that contains only one allele of a particular gene. 2 describing two genetic elements that are descended from a common ancestor by a known sequence of steps. 3 an alternative word for homogeneous. Compare heterogenic.

homogenize or homogenise produce a homogenate. —homogenization or homogenisation n.

homogenizer or homogeniser any apparatus for producing a homogenate.

homogenous 1 of, pertaining to, or exhibiting **homogeny**. 2 an alternative word for **homogeneous**.

homogentisate or (formerly) alcapton 2,5-dihydroxyphenylacetate; an intermediate in the catabolism of tyrosine and in the biosynthesis of plastoquinone and tocopherol. It is excreted in abnormally large quantities in the urine in alcaptonuria. See also homogentisate 1,2-dioxygenase.

homogentisate 1,2-dioxygenase EC 1.13.11.5; systematic name: homogentisate:oxygen 1,2-oxidoreductase (decyclizing); other names: homogentisicase; homogentisate oxygenase; homogentisic acid oxidase. An enzyme that catalyses the oxidation by dioxygen of homogentisate to 4-maleylacetoacetate; iron(II) is a cofactor. In the catabolism of L-tyrosine, homogentisate is formed from 4-hydroxyphenylpyruvate; maleylacetoacetate is converted to fumarylacetoacetate, which is split to fumarate and acetoacetate.

homogeny (in biology) similarity in the structure of organisms or parts of organisms because of common ancestry.

homoglycan or homopolysaccharide any polysaccharide (i.e. glycan) that contains residues of only one kind of monosaccharide (i.e. glycose) molecule. *Compare* heteroglycan.

homograft an old term for allograft. Compare heterograft.

homoio+ a variant form of homeo+.

homoiosmotic describing organisms with a constant internal osmotic pressure. *Compare* **poikilosmotic**.

homoiothermic or homoiothermal or (esp. US) homeothermic or homeothermal describing an organism (poikilotherm) that sustains a relatively constant body temperature, usually higher than that of its surroundings. Compare poikilothermic.—homoiothermy or (esp. US) homeothermy n.

homokaryon or **homocaryon** any cell with more than one nucleus, and in which the nuclei are all of the same genetic constitution; a tissue composed of such cells. Compare **heterokaryon**. —**homokaryotic** or **homocaryotic** adj.

homokaryosis or **homocaryosis** the condition of having a **homokaryon** or homokaryons. Compare **heterokaryosis**.

homolactic fermentation a type of fermentation of glucose to lactate via the Embden-Meyerhof pathway. Compare heterolactic fermentation.

homolog (sometimes) the US spelling of homologue.

homologous 1 having a related or similar position, structure, etc.; corresponding; exhibiting homology. 2 (in chemistry) describing compounds that form a series with successive constant differences in composition. 3 (in biology) of common ancestry; especially of organs and tissues that have a similar anatomical position and structure in different species by virtue of their common evolutionary origin, even though their functions may have come to differ; e.g. the wing of a bird and the forelimb of a reptile. Compare analogous. 4 (in genetics) describing chromosomes that pair during meiosis, each member of a homologous pair being a duplicate of one of the chromosomes contributed at syngamy by the mother or the father. 5 (in biochemistry) a (of sequences of residues in encoded macromolecules) having the same or similar residues at corresponding positions (see also conserved). With respect to proteins the term is used to imply a common evolutionary origin.

not merely a similarity of protein structure. **b** (of proteins from different species) having identical or similar functions. Compare heterologous. —homology n.

homologous antibody the antibody elicited by a specified antigen.

homologous antiger the antigen that has elicited a specified antibody.

homologous desensitization see desensitization.

homologue or (sometimes) US homolog 1 (something) exhibiting homology. 2 (in chemistry) any member of a homologous (def. 2) series of compounds. 3 (in biology) any one of a series of homologous (def. 3) organs or structures. 4 (in genetics) a either members of a pair of homologous (def. 4) chromosomes. b either one of two genes in corresponding loci in homologous chromosomes.

homology domain any of the regions in an immunoglobulin involved in forming the **immunoglobulin fold**.

homolysis (in chemistry) the cleavage of a covalent bond in such a manner that each of the fragments between which the bond is broken retains one of the bonding electrons; e.g. $A-B \rightarrow A + B \cdot$.—homolytic adj.

homooligomer any **oligomer** made up of only one kind of constitutional repeating unit. —**homooligomeric** adj.

homophilic binding (of adhesion molecules) binding of an adhesion molecule in one cell to an identical molecule in an adjacent cell. Compare heterophilic binding.

homopolymet any polymer made up of only one kind of constitutional repeating unit. For example, cellulose contains only glucose as the monomeric unit. —homopolymeric adj.

homopolymer tailing a jargon term for a procedure useful in joining two types of duplex DNA molecules to form mixed dimeric circular DNA. In this procedure, homopolymer sequences of one type, e.g. poly(dA), are added to the 3'-ends of one of the populations of DNA molecules, while complementary homopolymer sequences, e.g. poly(dT), are added to the 3'-ends of the other population of DNA molecules. The two types of molecules are then annealed to form mixed dimeric circles. homopolysaccharide an alternative name for homoglycan.

homoserine symbol: Hse; α-amino-γ-hydroxybutyric acid; an intermediate in the biosynthesis of cystathionine, threonine, and methionine. It also occurs in bacterial peptidoglycans and, as its O-guanidino derivative, in canavanine. The term normally implies the L enantiomer.

homoserine deaminase see cystathionine y-lyase. homoserine dehydratase see cystathionine y-lyase.

homoserine dehydrogenase EC 1.1.1.3; systematic name: L-homoserine: NAD(P)+ oxidoreductase; an enzyme of the pathways for the biosynthesis of methionine and threonine. It catalyses the formation of L-homoserine and NAD(P)+ from L-aspartate 4-semialdehyde and NAD(P)H. Example, a homotetrameric bifunctional enzyme from Escherichia coli: database code AK1H_ECOLI, 820 amino acids (89.02 kDa). Amino acids 1-249 form the aspartokinase I domain, amino acids 250-470 form a large 'interface', and 471-820 form homoserine dehydrogenase; regulation is by L-Thr. Another example is from Corynebacterium glutamicum and Brevibacterium lactofermentum: database code DHOM_CORGL, 445 amino acids (46.39 kDa). See also aspartokinase/homoserine dehydrogenase.

homoserine lactone symbol: Hsl; α-amino-γ-butyrolactone; a substance formed by the cleavage of methionine-containing peptides by cyanogen bromide.

homosterism or homostery the phenomenon in which a second molecule of normal substrate, or a structurally similar compound, combines at the catalytic site of an enzyme leading to a modification in the reaction of the bound intermediate. Compare allosterism.—homosteric adj.

homostery an alternative term for homosterism.

macromolecules) having the same or similar residues at corresponding positions (see also conserved). With respect to proteins the term is used to imply a common evolutionary origin.

Specifically this requires evidence based on gene structure and Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

ns ns.

homot

homothallic switching endonuclease a sequence-specific endonuclease, with a site on yeast chromosome III, that is involved in mating-type switching. It is a zinc finger protein. Database code HO_YEAST, 586 amino acids (66.06 kDa).

homotherm an alternative word for homoiotherm.

homotope any residue that can take the place of another residue in a particular position in a polymer; e.g. the serine and glycine residues at position 9 of the A chain of bovine and ovine insulin, respectively, are homotopes.

homotransplant 1 an alternative term for homograft. 2 to effect such a transplant.

homotropic describing an allosteric effect in which interaction occurs between identical ligands; the effect appears to be always cooperative. The term is applied also to such an interaction in the case of an allosteric enzyme for which the same substance acts as both the substrate and the allosteric effector, etc. Compare heterotropic (def. 1).

homovanillic acid 4-hydroxy-3-methoxyphenylacetic acid; a metabolite of catecholamine metabolism, found in human urine. It is the principal urinary metabolite of dopa and dopamine. It is used as a reagent in the fluorometric determination of glucose oxidase and other oxidases.

homozygosis 1 the union of gametes identical for one or more pairs of genes to form a **homozygote**. 2 or **homozygosity** the state or condition of being a homozygote. Compare **heterozygosis**.

homozygosity an alternative term for homozygosis (def. 2). homozygote any cell or organism having identical genes (alleles) at one or more corresponding loci on homologous chromosomes. With respect to such loci, a homozygote will produce two identical gametes. Compare heterozygote.

homozygotic or homozygous adj.

Hoogsteen base pair a nucleic-acid base pair that differs from the Watson-Crick base pair. In the Hoogsteen adenine-thymine base pair the 6-NH₂ and N-7 of the adenine are hydrogen bonded respectively to the 4-O and H-1 of the thymine. The Hoogsteen guanine-cytosine pair requires that N-1 of the cytosine is protonated. In this base pair the 6-O and N-7 of the guanine are hydrogen bonded respectively to the 4-NH₂ and the protonated N-1 of cytosine. In Watson-Crick base pairs the glycosidic bond of both nucleotides has the anti conformation, but in the Hoogsteen pairs the glycosidic bond of the purine nucleotide has the syn conformation. Hoogsteen base pairs are particularly important in the structure of DNA triple helices, where the third strand forms Hoogsteen pairs to bases in the DNA duplex. [After Karst Hoogsteen (1923-), Dutch-American biochemist, who first described it.]

hopane the pentacyclic triterpene hydrocarbon parent of hopanone and derivatives found in plant resins. See also hopanoids.

hopanoids pentacyclic sterol-like molecules based on the **hopane** nucleus. They are found in bacteria, some plants and lichens, and in sediments and crude oils, and are said to be the most abundant organic molecules in the biosphere (estimated total biomass 10¹¹ to 10¹² tonnes), thus outranking **cellulose**.

Hopkins, (Sir) Frederick Gowland (1861–1947), British biochemist renowned for his discoveries of essential amino acids and accessory food factors (later termed vitamins), for his isolation of glutathione and tryptophan, and for playing an important part in establishing biochemistry as an independent discipline; Nobel Laureate in Physiology or Medicine (1929) 'for his discovery of the growth-stimulating vitamins' [prize shared with Christiaan Eijkman].

Hopkins-Cole reaction a colour reaction for free or combined tryptophan, in which a violet colour is produced when a solution containing tryptophan is treated with glyoxylic acid (present in impure glacial acetic acid) and subsequently layered onto a solution of pure, concentrated sulfuric acid. [After F. G. Hopkins and Sydney William Cole (1877–1951).]

HOQNO or HQNO abbr. for 2-n-heptyl-4-hydroxyquinoline N-oxide; an inhibitor of the mitochondrial respiratory chain at cytochrome bc_1 and of photosynthetic electron flow immediately before cytochrome b_{559} LP.

hordein a type of glutelin found in barley.

hormone any substance formed in very small amounts in one specialized organ or group of cells and carried (sometimes in the bloodstream) to another organ or group of cells, in the same organism, upon which it has a specific regulatory action; an endocrine (def. 2). The term was originally applied to agents with a stimulatory physiological action in vertebrate animals (as opposed to a chalone, which has a depressant action). Usage is now extended to regulatory compounds in lower animals and plants, and to synthetic substances having comparable effects. Compare autacoid, hermone. See also secretin.—hormonal adj.

hormone cascade see cascade sequence.

hormone-sensitive lipase any enzyme of the sub-subclass EC 3.1.1 that, when activated in adipose tissue, catalyses the mobilization of fatty acids into the circulation. Such enzymes are activated by cyclic AMP-dependent phosphorylation under the influence of catecholamines, and are inactivated by insulin-dependent dephosphorylation. Example from human: database code LIPS_HUMAN, 786 amino acids (85.38 kDa).

hormonotoxin any conjugate of a peptide hormone and a peptide toxin, e.g. ovine luteinizing hormone-gelonin.

host 1 any organism in which another organism, especially a parasite or symbiont, spends part or all of its life cycle and from which it obtains nourishment and/or protection. 2 any organism that harbours a pathogenic or nonpathogenic infectious agent. 3 the recipient of a transplanted tissue or organ graft.
4 a cell or organism that contains recombinant DNA.

host cell any cell whose metabolism is used for the growth and reproduction of a virus.

host-cell reactivation abbr.: HCR; the restoration of activity in a UV-damaged DNA bacteriophage by the excision-repair mechanisms of the host cell in which it multiplies.

host-controlled modification or host-controlled variation or host-induced modification or host-induced variation any non-heritable change in the properties of a DNA bacteriophage re-

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

host-controlled modification

sulting from the phage DNA assuming the DNA modification pattern characteristic of the host bacterium. It is usually recognized by **restriction** in the efficiency of plating of the newly modified phage on its former host strain. Similar phenomena have been described for viruses infecting eukaryotic cells.

host-induced modification or host-induced variation see host-controlled modification.

host range the spectrum of host organisms that can be infected by a specified infectious agent or parasite.

host-vector system a compatible combination of host and vector (def. 3) that allows propagation of DNA.

hot (in physics) an informal term describing a substance or material that contains a radionuclide, especially if carrier-free or at a dangerously high activity or specific activity. Compare

hot laboratory or **hot lab** an informal term for a laboratory reserved and equipped for the manipulation of radioactive substances or materials of (dangerously) high activity.

hot room 1 a room (or laboratory) maintained at a constant, higher-than-ambient temperature. 2 an informal term for a room (or laboratory) that is specially equipped to deal with high levels of radioactivity.

hot spot any site at which mutations are observed with an unusually high frequency. Such sites have a highly enhanced, inherent susceptibility to mutation that cannot be ascribed to the type of base pair involved, the way in which it is altered, or the resulting change in any protein encoded by the DNA

hour symbol: h or hr; a non-SI unit of time equal to 3600 s.

housekeeping genes see constitutive genes.

Houssay, Bernardo Alberto (1887–1971), Argentinian physiologist and endocrinologist noted for his researches on diabetes and on the internal secretions of the adrenal, anterior pituitary, and thyroid glands; Nobel Laureate in Physiology or Medicine (1947) 'for his discovery of the part played by the hormone of the anterior pituitary lobe in the metabolism of sugar' [prize shared with C. F. and G. T. Cori].

Houssay animal a pancreatectomized animal which has also undergone hypophysectomy. The latter ameliorates the diabetic state that results from pancreatectomy by abolishing the secretion of somatropin. [After B. A. Houssay.]

Hox gene see homeotic gene.

Hp 1 symbol for the heptyl group, $CH_3-[CH_2]_5-CH_2-$. 2 abbr. for haptoglobin.

HP-1 abbr. for helper peak-1 (now called interleukin 1).

HPCE abbr. for high performance capillary electrophoresis.

HPETE abbr. for hydroperoxyeicosatetraenoate.

hPL or **HPL** abbr. for human placental lactogen.

HPLAC abbr. for high-performance liquid affinity chromato-

HPLC abbr. for high-pressure liquid chromatography or highperformance liquid chromatography.

Hpo symbol for the heptanoyl group, CH₃-[CH₂]₅-CO-.

HPODE abbr. for hydroperoxyoctadecadienoate.

HPR abbr. for H protein; a low-M_r, heat-stable, cytoplasmic phosphocarrier protein found in some bacterial species and concerned in the phosphoenolpyruvate (PEP)-hexose transferase system for the transport of hexoses across the cell membrane. The phosphate of PEP is transferred transiently to HPR. Example from Escherichia coli (identical sequence for Salmonella typhimurium): database code PTHP_ECOLI, 85 amino acids (9.11 kDa). See enzyme I, enzyme II.

H+ pump see hydrogen ion pump.

HQNO see HOQNO.

hr abbr. for hour (now superseded by h).

H1, H2, H3 receptors see histamine receptor.

H-RNA abbr. for heterogeneous nuclear RNA (alternative to hnRNA or HnRNA).

HRT abbr. for hybrid-released translation.

HSA abbr. for human serum albumin.

Hse symbol for a residue of the α -amino acid L-homoserine.

HSE abbr. for heat-shock regulatory element or heat-shock response element.

 α_2 -HS-glycoprotein or fetuin an α -globulin found in fetal calf serum, where it accounts for up to 45% of the total protein. It has a low isoelectric point and contains up to 35% carbohydrate, having three oligosaccharide chains each of M_r 3400; it comprises various glycoproteins that differ in M_r . It is a growth factor for a variety of cell types. It also promotes endocytosis, possesses opsonic properties, and influences the mineral phase of bone. The amino-acid sequence has cystatin features; two peptides are cleaved from a precursor to form chains held together by a single disulfide bond. Example precursor (human): database code A2HS_HUMAN, 367 amino acids (39.28 kDa).

Hsl symbol for a residue of the α -amino lactone L-homoserine lactone.

HSPG core protein abbr. for heparan sulfate proteoglycan core protein. See also syndecan.

hst/KS see KS/hst.

H strand abbr. for heavy strand.

5-HT abbr. for 5-hydroxytryptamine (i.e. serotonin).

HTH abbr. for helix-turn-helix.

HTLV abbr. for human T-cell lymphotropic virus; a retrovirus that causes a rare leukemia.

H*-transporting ATP synthase EC 3.6.1.34; systematic name: ATP phosphohydrolase (H⁺-transporting); other names: H⁺-transporting ATPase; mitochondrial ATPase; chloroplast ATPase; coupling factors $F_0 \cdot F_1$, $C_0 \cdot F_1$. The enzyme that is responsible for the phosphorylation of ADP to ATP in mitochondria, during oxidative phosphorylation. In in vitro preparations it can function as an ATPase. The 3-D structure is known for the major components of bovine heart mitochondrial enzyme (the following examples refer to this enzyme). The enzyme comprises an intrinsic membrane domain, F₀, linked by a stalk to a globular catalytic domain, F₁, and hence is sometimes termed F₀F₁ complex. Energy released by hydron flux through F₀ leads to ATP synthesis by F₁; the stoichiometry is approximately 3H⁺ per ADP phosphorylated. F₁ (371 kDa) has the subunit composition: $3\alpha, 3\beta, \gamma, \delta, \epsilon$; the subunit sequences (precursors) are: a, database code ATP0_BOVIN, 553 amino acids (59.65 kDa); β, database code ATPB_BOVIN, 528 amino acids (56.22 kDa); γ, database code ATPG_BOVIN, 297 amino acids (32.92 kDa); δ, database code ATPD_ BOVIN, 168 amino acids (17.59 kDa); ε (from rat), database code ATPE_RAT, 50 amino acids (5.63 kDa). The γ chain forms a core, the α and β (catalytic) subunits are arranged round it alternately; the three β subunits have different structures during the synthesis cycle. The N- and C-terminal regions of γ form an antiparallel coiled coil; the α and β proteins are essentially β barrels. There are several proteins in the F_0 component, the main subunits of which in eukaryotes are named A to G. The C chain is the protein that accumulates in ceroid lipofuscinosis (Batten's disease). It is a proteolipid encoded by two genes which code for two precursor proteins, P₁ and P2, having different signal peptides for locating the proteins in mitochondria, but the same structure in the mature protein. Example, subunit C precursor P₁ (bovine): database code ATPM_BOVIN, 143 amino acids (15.01 kDa). Other proteins of F₀ include the A chain, database code ATP6_ BOVIN, 226 amino acids (24.8 kDa); the B chain, database code ATPF_BOVIN, 214 amino acids (24.64 kDa); and the D chain, database code ATPQ_BOVIN, 160 amino acids (18.56) kDa). (The last named chain has no apparent homologue in bacteria.)

huangosome a colloquial term for a bilayered liposome. Compare bangasome.

Huber, Robert (1937-), German biochemist notable for his crystallographic, immunological, and structural studies of proteins; Nobel Laureate in Chemistry (1988) jointly with J. Deisenhofer and H. Michel 'for the determination of the threepol for a residue of the α-amino acid L-homoserine. dimensional structure of a photosynthetic reaction centre'. Hudson's convention

Hudson's convention a convention, no longer used, for designating anomeric configurations in monosaccharides. The anomer in the D-series with the highest positive rotation (or lowest negative rotation) was designated the α form and the anomer with the lowest positive rotation was called the β form. The reverse applied in the L-series, the anomer with the lowest positive rotation (or the highest negative rotation) being designated the α form. The α and β descriptors now refer to the absolute structural relationships. See anomer, Haworth representation.

Hughes press a device to disrupt microorganisms. It consists of a steel cylinder in which a paste of the microorganisms in question, mixed with abrasives, is subjected to sudden blows by a steel piston driven by a fly-press; the piston forces the crushed material out of the cylinder into a reservoir. At temperatures below -20 °C no abrasives are needed, ice crystals taking their place. See also French pressure cell. [After D. E. Hughes (1922-), who published the design in 1951.]

HUGO abbr. for Human Genome Organization; an international organization of scientists involved in the Human Genome Project, the global initiative directed at mapping and sequencing the human genome. It was established in 1989, and carries out a coordinating role, supporting data collection for constructing genetic and physical maps of the human genome, organizing the Single Chromosome Workshops and other workshops and promoting consideration of ethical, legal, social, and intellectual property issues. It fosters exchange of data and biomaterials. The Human Genome Project is, however, not under the central control or direction of any individual, group, or organizing committee, the work being done in many countries being coordinated by the scientists carrying out the work.

human abbr. (in bionomenclature): h or (formerly) H; of, relating to, characteristic of, obtained from, or being a member of the species Homo sapiens. For names of substances or products beginning with the word human (e.g. human choriogonadotropin, human serum albumin) see at the corresponding general entry.

Human Genome Project see HUGO human immunodeficiency virus see HIV. human T-cell lymphotropic virus see HTLV.

humectant 1 producing moisture. 2 any substance added to another substance or material to keep it moist.

humic acid any of the mixture of complex macromolecules having polymeric phenolic structures and extractable from soils and peat. It is produced by the oxidative degradation of lignin and has the ability to chelate metals, especially iron.

humidity cabinet or humidity chamber an enclosure in which the humidity is maintained at a constant, often high level. It is useful for keeping experimental samples or materials moist or at a predetermined moisture content.

humin the very dark-brown or black insoluble material that is produced when carbohydrate-containing proteins are subjected to acid hydrolysis.

humor the US spelling of humour.

humoral of, contained in, or involving the blood or other body fluid; consisting of, relating to, or involving some chemical agent or substance contained in a body fluid, especially

humoral immunity any specific immunity mediated by antibodies (i.e. humoral antibodies) present in blood plasma, lymph, and tissue fluids, and that may also become attached

humour or (US) humor a former name for any of the body fluids, e.g. blood, lymph.

humulin 1 human insulin made using cDNA technology. 2 the bitter aromatic principle of hops (lupulin).

humus the dark-brown or black complex mixture of colloidal organic material that results from the decomposition of plant and animal material in the soil. It is of great importance for plant growth.

hunchback a segmentation protein in insects. Similar to ikaros, it is a zinc-finger protein and is encoded by a gap gene. Example from Drosophila melanogaster: database code HUNB_ DROME, 758 amino acids (83.02 kDa). Compare Krüppel.

hyalurc

Hunter syndrome an alternative name for mucopolysaccharidosis II. See mucopolysaccharidosis. [After Charles Hunter (1872-1955), British physician.]

Huntington's disease or Huntington's chorea an autosomal dominant genetic disease characterized by involuntary (choreic) movements and dementia over a 10-20 year course. It is inevitably fatal. Linking studies using a variety of RFLPs have localized the defective gene to a site on the short arm of chromosome 4. There is a selective loss of a group of neurons; the biochemical basis for their loss is unknown. The gene, which encodes a 3145-residue product, huntingtin, of unknown function, contains a polymorphic trinucleotide repeat of the codon for glutamine, CAG, within the coding sequence. Normals have 35-37 of these repeats. In no case has any individual with more than 41 repeats been found to be free of the disease. [After George Huntington (1850-1916), US physician.]

HU protein an abundant bacterial histone-like protein that has the ability to wrap and bend DNA in vitro, and is thought to play a role in chromosome DNA topology, probably by facilitating the action of gyrase. See DNA topoisomerase type II.

Hurler-Scheie compound syndrome an alternative name for mucopolysaccharidosis I H/S.

Hurler syndrome an alternative name for mucopolysaccharidosis I H; see mucopolysaccharidosis. [After Gertrude Hurler (1889-1965), Austrian physician.]

HUT (in clinical chemistry) abbr. for UDPglucose-hexose-1phosphate uridylyl transferase (EC 2.7.7.12).

Huxley 1 (Sir) Andrew Fielding (1917-), British physiologist renowned for his researches on the ionic basis of contraction of muscle and of impulse conduction by nerve; Nobel Laureate in Physiology or Medicine (1963) jointly with J. C. Eccles and A. L. Hodgkin 'for their discoveries concerning the ionic mechanisms involved in excitation and inhibition in the peripheral and central portions of the nerve cell membrane'. 2 Hugh Esmor Huxley (1924-), British biophysicist noted for his study of the relation of ATP hydrolysis to the mechanics of muscle contraction.

HVA abbr. for homovanillic acid.

HVE abbr. for high-voltage electrophoresis.

Hvidt-Nielsen mechanism a proposed mechanism to account for the kinetics of hydrogen exchange between protein molecules in solution and solvent water molecules. It is considered that protein molecules exist in solution in more than one conformational state and that hydrogen atoms in the interior of the protein molecule in the most stable conformational state are inaccessible to exchange; these hydrogen atoms may become transiently externalized, and hence accessible to exchange, in one or more of the other conformational states. [After Aasa Hvidt and S. O. Nielsen.]

Hx abbr. for hepoxilin.

Hx^c symbol for the cyclohexyl group (alternative to cHx).

hyal+ a variant form of **hyalo+** (before a vowel).

hyaladherin a name sometimes used for proteins in the extracellular matrix that bind to hyaluronate.

hyaline clear, transparent; with no inclusions.

hyalo+ or (before a vowel) hyal+ comb. form denoting glassy, transparent.

hyaluronan an alternative name for hyaluronate.

hyaluronate or hyaluronan the naturally occurring anionic form of hyaluronic acid; any member of a group of glycosaminoglycans, the repeat units of which consist of $\beta 1 \rightarrow 4$ linked D-glucuronyl- $(\beta \hat{1} \rightarrow 3)$ -N-acetyl-D-glucosamine. Most preparations contain 1-2% by mass of protein, and have M_r values in the range 5×10^4 to 8×10^6 depending on source and methods of preparation and determination. Hyaluronates are widely distributed in many tissues, especially in the vitreous owth. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyenltd.com.

hyaluronidase

have an important role in the formation of proteoglycan aggregates. Hyaluronates form very viscous solutions and gels in water, a property that may be important in protecting animal organisms against invasion by bacteria.

hyaluronidase or mucinase or spreading factor a trivial name for either of the glycosidases hyaluronoglucosaminidase (EC 3.2.1.35) and hyaluronoglucuronidase (EC 3.2.1.36), and for the carbon-oxygen lyase hyaluronate lyase (EC 4.2.2.1). These enzymes have in common the ability to depolymerize hyaluronidate by cleavage of glycosidic bonds; e.g. hyaluronoglucosaminidase catalyses the random hydrolysis of 1,4-linkages between N-acetyl-β-D-glucosamine and D-glucuronate residues in hyaluronate. Hyaluronidases occur in certain animal tissues, e.g. sperm acrosome, and in some bacteria, e.g. Clostridium spp., and enhance the penetration of various substances and pathogens through the extracellular matrix (hence the name 'spreading factor'). Example, mu Clostridium perfringens: database code NAGH_CLOPE, 1042 amino acids (117.49 kDa).

hyamine hydroxide methylbenzethonium hydroxide; a watersoluble organic base, useful biochemically because it and some of its salts are soluble in organic solvents such as chloroform and toluene. It is therefore used to absorb radioactive CO₂ released during metabolic incubations; the resultant hyamine carbonate can then be dissolved in a scintillation cocktail for counting. It is also used as a topical anti-infective agent.

hybrid 1 something derived from heterogeneous sources or composed of different or incongruous elements. 2 (in genetics) the offspring of two animals or plants of different species, or (less strictly) different varieties. 3 (in chemistry) a bond or valence orbital obtained by the linear combination of two or more different atomic orbitals.

hybrid antibody any artificially produced immunoglobulin molecule in which the combining sites are of different speci-

hybrid-arrested translation abbr.: HART; a method for analysing the relationship between a DNA sequence, its corresponding messenger RNA (mRNA), and the protein for which it codes, based on the observation that mRNA when hybridized with its complementary DNA is not translated in eukaryotic cell-free systems whereas heat-induced dissociation of the hybrid completely restores translational activity. The method has been used to map precisely specific protein-coding regions in restriction fragments of DNA. See also hybrid-released translation.

hybrid cell any cell containing the nuclei and cytoplasms from differing cells, formed artificially by cell fusion.

hybrid DNA 1 artificial duplex DNA produced by collinear (i.e. covalent) union of two (or more) fragments of duplex DNA (i.e. recombinant DNA; see also plasmid chimera). 2 artificial duplex DNA produced by collateral (hydrogen bonded) union of two incompletely complementary, single strands of DNA. Compare DNA-RNA hybrid.

hybridization or hybridisation 1 the act or process of forming a genetic hybrid (def. 2) by cross-breeding, or other unnatural recombination. 2 the act or process of forming a macromolecular hybrid (def. 1) by the artificial recombination of subunits, and as various salts. See also hydrazinolysis.

Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

e.g. of polynucleotide strands or polypeptide chains. 3 the mathematical combination of atomic orbitals to form an orbital hybrid (def. 3).

hybridization analysis a method of testing for complementarity in the base sequences of two polynucleotides from different sources, based on the ability of complementary single-stranded DNA molecules to form duplex DNA molecules on being annealed together, and the ability of single strands of DNA and RNA similarly to form DNA-RNA hybrids.

hybridization probe see probe (def. 3).

hybrid myeloma see hybridoma.

hybridoma any permanent cell line derived from an artificial somatic cell hybrid formed between a cultured neoplastic lymphocyte and a normal primed B or T lymphocyte, all the cells of which express the specific immune potential of the normal parental cell. The term is derived from a contraction of 'hybrid' and 'myeloma'. Hybridomas are produced by the technique of cell fusion, using, e.g., a suspension of mouse myeloma or thymoma cells from a selected established cell line to which is added a preparation of spleen cells (predominantly normal lymphocytes) from mice or other animals that have been immunized against a specified antigen. After cell fusion, selection is aided by the use of HAT medium, which kills HGPRT myeloma cells, and lymphocytes that have not fused do not survive in culture. This treatment thus selects for the immortalized hybridoma cells that retain the lymphocyte HGPRT. Such hybrid cells are both permanently adapted to growth in culture and capable of forming specific antibodyproducing tumours in vivo. A B-cell hybridoma continuously secretes pure monoclonal antibody of a predetermined specificity and may thus be used for the facile large-scale production of such antibody.

hybrid-released translation abbr.: HRT; a method in which cloned DNA is bound to a nitrocellulose filter and hybridized with unfractionated mRNA, or even total cellular RNA. After washing the filter, any mRNA that has hybridized with the DNA is eluted and translated in a cell-free translation system, thus revealing the product that is encoded by the DNA. See also hybrid-arrested translation.

hydantoin generic name for 2,4-imidazolidinedione or its derivatives. A hydantoin is formed by the reaction of an isocyanate, commonly phenylisocyanate, with the free amino group of an amino acid and the cyclization of the hydantoic acid derivative initially formed. When an isocyanate reacts with the N-terminal amino group of a peptide, the corresponding hydantoin is formed with simultaneous cleavage of the substituted N-terminal amino-acid residue from the peptide.

hydr+ a variant form of **hydro+** (sometimes before a vowel).

hydrase an obsolete term for hydratase.

hydratase see dehydratase.

hydrate 1 any adduct of water with another compound or element, usually in definite molecular proportions. 2 to form a hydrate (def. 1); to undergo hydration. 3 to cause to take up or to combine with water. 4 to maintain or restore the normal proportion of water in the body (of someone or something). -hydrated adi.

hydration 1 the act or process by which water molecules surround and bind to molecular entities. 2 the addition of H and OH to a chemical species. 3 the formation of a hydrate (def. 1). 4 the quality or state of being hydrated. 5 the introduction of additional water into the body (of something or someone). Compare anhydrous, dehydration, solvation.

hydration shell the layer of water molecules surrounding an ion or molecule in aqueous solution.

hydraulic 1 operated by pressure transmitted through a liquid, e.g. through water or oil. 2 of or concerning hydraulics (i.e. fluid mechanics).

hydrazine H₂N-NH₂; an oily liquid, fuming in air, that is very toxic and possibly a carcinogen. It is available as a hydrate

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Mur thought

hydrazinolysis the cleavage of amide and peptide bonds by heating at 100 °C with hydrazine in anhydrous conditions to form the corresponding acyl hydrazides. This reaction is useful in the determination of C-terminal amino-acid residues in peptides and proteins as all the other amino-acid residues will be converted to their hydrazides and only the C-terminal amino acid will be set free in an underivatized form.

hydrazone any condensation product of the type R'R"C=N-NHR, formed between carbonyl compounds (R'R"=CO) and hydrazine or a substituted hydrazine. See also osazone, phenylhydrazone.

hydride 1 the ion H⁻, hydrogen anion. It has an independent existence only in the salt-like hydrides formed by strongly electropositive elements (see def. 2) but is also sometimes regarded as participating in the formation of complex hydrides (see def. 4) and in certain oxidation-reduction reactions (see hydride-ion transfer). 2 any stoichiometric binary compound of hydrogen with one of many (but not all) of the elements in groups 1, 2, and 3 of the IUPAC periodic table, e.g. NaH or CaH₂. Such hydrides are salt-like ionic compounds, are solids at ambient temperatures, and on fusion can be electrolysed (dihydrogen then being liberated at the anode). They are readily decomposed by water and are potent reducing agents. 3 Any stoichiometric compound of hydrogen with one (or sometimes more than one) of many of the elements in other groups of the periodic table, and also with boron. Such hydrides are volatile covalent compounds containing one atom of the element per molecule, e.g. PbH₄, or sometimes more than one, e.g. Si₃H₈; in the latter type certain of the hydrogen atoms may be present as bridges, as in B₂H₆. 4 any salt-like compound containing a complex anion that may be considered as formed by coordination of a hydride ion to an uncharged hydride, e.g. KBH4 (see borohydride) or LiAlH4; such compounds are widely used in organic chemistry as reducing agents or for introduction of tritium, ³H. 5 any (frequently nonstoichiometric) product formed by uptake of dihydrogen by certain transition metals, especially palladium.

hydride-ion transfer term conventionally often applied to a chemical or enzyme-catalysed oxidation-reduction reaction involving the transfer from one molecule to another of a hydrogen atom together with its associated pair of bonding electrons. Such a reaction may notionally be considered to involve the transfer of a hydride ion without such an ion ever existing as a free entity. Examples include the Cannizzaro reaction and reactions of the general type

$$NADH + M + H^+ \rightleftharpoons NAD^+ + MH_2$$

where M is a substrate molecule undergoing enzymic reduction, to which a hydride ion is transferred from NADH.

hydrindantin the reduced form of **ninhydrin**. It is sometimes used in conjunction with ninhydrin in the chromogenic determination or visualization of amino or imino groups.

hydrion a former name for hydrogen ion.

hydro+ or (sometimes before a vowel) hydr+ comb. form 1 indicating or denoting water, liquid, or fluid. 2 indicating the presence of hydrogen in a compound.

hydrocarbon 1 any organic compound composed exclusively of hydrogen and carbon. 2 of, pertaining to, or being a hydrocarbon (def. 1) or a chemical group or side chain composed of hydrogen and carbon only.

hydrocarbyl any univalent group formed from a hydrocarbon by removal of a hydrogen atom; e.g. methyl (from methane).

hydrocolloid any colloidal substance for which the dispersing liquid is water or an aqueous solution.

hydrocortisone an alternative name for cortisol.

hydrodynamic 1 of or concerned with the mechanical properties of fluids. 2 of, pertaining to, or concerned with hydrodynamics.

hydrodynamic particle the entity formed by any (macro)molecule in solution together with its solvation shell

ecule in solution together with its solvation shell.

hydrodynamic radius the radius of a (macro)molecule or

other particle in solution as determined by a hydrodynamic method, e.g. sedimentation equilibrium.

hydrodynamics the branch of physics concerned with the forces acting on or exerted by fluids.

hydrodynamic shear the microscopic shear force caused by the motion of different layers in a fluid, where the layers move at different velocities. This acts to break any molecule sufficiently long to bridge the layers, e.g. DNA.

hydrodynamic volume (of a molecule in solution) the sum of the time-average of the molecular volume and the volume of the solvent molecules associated with it.

hydrogel any **gel** (def. 1) in which water is the liquid component. *Compare* **hydrosol**.

hydrogen symbol: H; the lightest of the elements and the most abundant in the universe. It exists as an odourless, colourless, flammable diatomic gas, dihydrogen, H₂, and forms compounds with most of the elements, being present in water and all organic compounds. There are two naturally occurring isotopes, hydrogen-1 (protium) and hydrogen-2 (deuterium), and one artificial isotope, hydrogen-3 (tritium), which is radioactive. hydrogenase 1 the recommended name for an enzyme, EC 1.18.99.1, also known as hydrogenlyase, that catalyses the reaction:

$$2 \text{ ferredoxin}_{red} + 2H^+ = 2 \text{ ferredoxin}_{ox} + H_2.$$

This enzyme recycles H_2 produced by **nitrogenase** to increase the production of ATP and to protect nitrogenase against inhibition or damage by O_2 . It is a heterodimer. Example from Azotobacter vinelandii: small subunit (precursor): database code MBHS_AZOVI, 358 amino acids (39.21 kDa); large subunit: database code MBHL_AZOVI, 602 amino acids (66.66 kDa). 2 an alternative name for hydrogen dehydrogenase. 3 EC 1.12.2.1; recommended name: cytochrome c_3 hydrogenase; an enzyme that catalyses the reaction:

 $H_2 + 2$ ferricytochrome $c_3 = 2H^+ + 2$ ferrocytochrome c_3 .

hydrogenate to undergo or cause to undergo reduction by addition of the hydrogen atoms of dihydrogen, usually with the aid of a catalyst such as finely divided forms of nickel, palladium, or platinum. The process is of industrial importance in petroleum refining, the petrochemical industry and the hardening of fats. —**hydrogenated** adj.; **hydrogenation** n.

hydrogen bond an association between an electronegative atom, e.g. fluorine, oxygen, nitrogen, or sulfur, and a hydrogen atom attached to another such electronegative atom. Although hydrogen bonding is due to interaction between dipoles, the force of attraction is large enough to permit formation of aggregates of small molecules or to stabilize the conformation of many macromolecules. The spatial relation of the donor and acceptor atoms is such that the hydrogen atom lies very close to the straight line between them.

hydrogen carrier a name sometimes used for any electron carrier that undergoes oxidation-reduction reactions by the loss or gain of hydrogen atoms, e.g. NADH, FADH.

hydrogen dehydrogenase the recommended name for the enzyme, EC 1.12.1.2, also known as hydrogenase, that catalyses the reaction:

$$H_2 + NAD^+ = H^+ + NADH.$$

It is a flavoprotein; iron and nickel are cofactors; the molecule is heterotetrameric. It may form part of a system involving **hydrogenase** (def. 1). Examples from Alcaligenes eutrophus: α subunit, database code HOXF_ALCEU, 602 amino acids (66.71 kDa); γ subunit, database code HOXU_ALCEU, 233 amino acids (26.01 kDa); the α and γ subunits form one dimer (FMN, 4Fe-4S cluster, NADH oxidoreductase); β subunit (contains Ni), database code HOXH_ALCEU, 487 amino acids (54.69 kDa); δ subunit, database code HOXY_ALCEU, 209 amino acids (22.85 kDa); the β and δ subunits form the other dimer which exhibits **hydrogenase** activity with artificial electron acceptors.

hydrogen-deuterium exchange see hydrogen exchange.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

hydro

hydrogen electrode an electrode that is reversible to hydrogen ions and dihydrogen molecules. It is formed by bubbling pure dihydrogen gas over a metal wire or a piece of foil whose surface is able to catalyse the reaction:

$$0.5H_2(g) = H^+ + e \tag{1}$$

where e represents an electron. The most useful catalyst is platinum black on a platinum substrate. Hence the catalyst establishes an equilibrium between dihydrogen molecules (or hydrogen atoms) and the hydrogen ions (i.e. hydrons) in the solution in which the metal electrode is immersed. If the partial pressure (in atm) of dihydrogen gas at the electrode is $p_{\rm H_2}$, the half-cell potential, $E_{\rm H}$, of reaction (1) is given by:

$$E_{\rm H} = E^{\rm o}_{\rm H} - (RT/F) \ln(a_{\rm H+}/p_{\rm H_2})$$

where R is the gas constant, F the Faraday constant, T the thermodynamic temperature, and $a_{\rm H^+}$ the hydrogen-ion activity. $E^{\rm o}_{\rm H}$, the standard potential of the hydrogen electrode, is, by convention, zero at all temperatures, hence at $p_{\rm H_2} = 1$, the usual standard state, equation (2) becomes:

$$E_{\rm H} = -(RT/F) \ln a_{\rm H}^*.$$

Thus the hydrogen electrode is the ultimate reference electrode for the determination of pH values. It should be noted that the potential of any single electrode cannot be determined by itself; another electrode must be connected to the solution.

hydrogen exchange or hydrogen-deuterium exchange a technique useful for demonstrating conformational differences between samples of the same protein and for providing insight into the dynamics of protein conformations in solution. It can be observed using nuclear magnetic resonance spectroscopy. The method is based on observation of the kinetics of the noncatalysed exchange of hydrogen atoms in peptides and proteins with protons or other hydron isotopes in aqueous solutions and the effects of pH (or p²H), temperature, etc. on the process.

hydrogen ion or (formerly) hydrion the cation, H^+ , derived from the hydrogen atom. In aqueous solution it is mostly in the hydrated form, oxonium (H_3O^+) . In nonaqueous solution it is likely, by analogy, that it is attached particularly to one solvent molecule, e.g. ROH_2^+ in an alcohol, R_2COH^+ in a ketone, RNH_3^+ in an amine, etc. See also hydron, proton (defs 1, 2).

hydrogen-ion concentration see pH.

hydrogen-ion pump any of a number of membrane proteins that transport hydrogen ions through membranes. The H⁺-transporting ATPase of fungi and plants (EC 3.6.1.35) has an action similar to that of the H⁺-transporting ATP synthase of mitochondria but without coupling factors; it is an integral membrane glycoprotein. The hydron gradient it generates drives the active transport of nutrients by H⁺-symport. Example from yeast: database code ATH1_YEAST, 918 amino acids (99.42 kDa). The vaculoar ATPase is another type.

hydrogenlyase see hydrogenase (def. 1).

hydrogen lamp or hydrogen discharge lamp a high-voltage discharge tube with a quartz window and containing dihydrogen at low pressure, in which the glow produced by excitation of the dihydrogen molecules is concentrated in a long capillary tube joining the two electrodes; this arrangement gives increased intensity. It produces a continuous emission spectrum over the range 180–350 nm. See also deuterium (discharge) lamp.

hydrogenosome any microbody-like particle occurring in the cytoplasm of some anaerobic flagellate protozoans. They are chromatic granules of high density containing enzymes, including hydrogenase, that catalyse the conversion of pyruvate to acetate, CO₂, and H₂. These organelles may substitute for mitochondria (which are absent from such organisms).

hydrolase any enzyme of class EC 3 that catalyses the hydrolysis of various bonds, e.g. C-O, C-N, C-C, phosphoric anhydride bonds, etc. Often the name of a hydrolase is formed from the name of the substrate and the suffix '-ase'.

hydrolysate or (sometimes US) **hydrolyzate** any substance or mixture of substances produced by hydrolysis.

hydrolyse or (sometimes US) hydrolyze to subject to, to undergo, or to effect hydrolysis. —hydrolysable or (US) hydrolyzable adj.; hydrolysation or (US) hydrolyzation n.

hydrolysis (pl. hydrolyses) the rupture of one or more chemical bonds by reaction with, and involving the addition of, the elements of water; solvolysis by water.

hydrolytic of, pertaining to, producing, or produced by hydrolysis.

hydrolyzate an alternative US spelling of hydrolysate.

hydrolyze an alternative US spelling of hydrolyse.

hydrometer an instrument used to measure the density, or relative density, of a liquid. It usually consists of a glass (or plastic) bulb, weighted at the bottom so that it floats upright, and fitted with a stem carrying a scale. The point on the scale that is level with the surface of the liquid indicates the (relative) density of the liquid.

hydron symbol: H⁺; the recommended name for the cation devised from an atom of hydrogen in its natural isotopic abundance. See also hydrogen ion, proton (defs 1, 2).

hydronate to combine with a hydron or hydrons. —hydronation n. hydronium ion an alternative name (now disfavoured) for oxonium (def. 1).

hydroperoxide any organic compound in which one hydrogen atom of a hydrocarbon is replaced by the -O-OH group.

hydroperoxyeicosatetraenoate abbr.: HpETE; any of various related products of the action of lipoxygenase on arachidonate, (all-Z)-eicosa-5,8,11,14-tetraenoate. The most notable are 5(S)-HpETE, (6E, 8Z, 11Z, 14Z)-(5S)-5-hydroperoxyeicosa-6,8,11,14-tetraenoate; 12(S)-HpETE, (5Z,8Z,10E,14Z)-(12S)-12-hydroperoxyeicosa-5,8,10,14-tetraenoate; HpETE, (5Z,8Z,11Z,13E)-(S)-15-hydroperoxy-5,8,11,13-eicosatetraenoate. Their species distribution follows that of the lipoxygenases. HpETEs function as precursors of hydroxyeicosatetraenoates, leukotrienes, dihydroxyeicosatetraenoates, hepoxilins, and lipoxins, but they also have biological activity in their own right, e.g. regulation of electrolyte flux, release of histamine, regulation of eicosanoid and corticosterone synthesis, and regulation of oocyte maturation. 12-HpETE inhibits platelet thromboxane synthase and prostaglandin-endoperoxide synthase, and acts as a second messenger in Aplysia sensory neurons.

5(S)-HpETE

12(S)-HpETE

hydroperoxyoctadecadienoate abbr.: HpODE; any of various related products of the action of lipoxygenase on linoleate, (all-Z)-octadeca-9,12-dienoate. The most notable are 9(S)-HpODE, (10E,12Z)-(9S)-octadeca-10,12-dienoate; and 13(S)-HpODE, (9Z,11E)-(13S)-octadeca-9,11-dienoate.

hydrophilic 1 tending to dissolve in water; having a strong affinity for water; readily mixing with or wetted by water. See also lyophilic. 2 polar. Compare hydrophilicity n.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

hydrophobic 1 tending not to dissolve in water; having a low affinity for water; not readily mixing with or wetted by water. 2 nonpolar. Compare hydrophilic. See also lyophobic. —hydrophobicity n.

hydrophobic bond a term sometimes used incorrectly for a hydrophobic interaction.

hydrophobic chromatography or hydrophobic affinity chromatography or hydrophobic interaction chromatography a technique for the separation and purification of proteins and other substances by adsorption chromatography on polysaccharide or other gels containing lipophilic substituents (which may or may not bear terminal ionizable groups). These hydrophobic centres on the gel interact with nonpolar amino-acid residues exposed on the surface of the protein molecules being separated.

hydrophobic interaction or (discouraged) apolar bond the tendency of hydrocarbons (or of lipophilic hydrocarbon-like groups in solutes) to form intermolecular or intramolecular aggregates in polar solvents. See also apolar interaction.

hydrophobic pocket (in a protein) a binding site (crevice, pocket) that contains mostly hydrophobic amino acids. For example, the binding site for the aromatic side chains of the specific substrates in chymotrypsin is a hydrophobic pocket, consisting of a slit in the enzyme, 100-120 nm deep and 35-40 nm by 55-65 nm in cross section, lined with nonpolar aminoacid side chains.

hydrophobic residue any building block of a polymer, the residue of which in that polymer is hydrophobic. The term is applied especially to amino-acid residues exhibiting such properties in polypeptides.

hydroquinone 1 1,4-benzenediol; p-dihydroxybenzene; quinol. Compare p-benzoquinone, pyrocatechol. See also quinhydrone. 2 any member of a class of aromatic p-diols derivable from p-quinones (see quinone (def. 2)) by reduction of two CO groups to COH groups with any necessary rearrangement of double bonds; any compound containing a quinol nucleus. See also quinol (def. 2), semiquinone. Compare catechol (def. 2).

hydrosol any sol in which water is the liquid component. Compare hydrogel.

hydrous (of a chemical compound) containing combined water (usually in stoichiometric proportions).

hydroxide 1 or (formerly) hydroxyl the ion OH-. 2 any inorganic or organic compound containing or dissociating to give this ion. Hydroxides that are soluble in water, and can dissociate, give aqueous solutions with an alkaline reaction (pH > 7).

hydroxo+ comb. form indicating the presence of a OH- ligand in a coordination compound.

hydroxocobalamin or vitamin B_{12b} a form of vitamin B_{12} in which a hydroxide ion is in coordinate linkage to the sixth (i.e. β) position on the cobalt atom in a molecule of **cobalamin**; the conjugate base of aquacobalamin.

hydroxonium ion an alternative name (now disfavoured) for oxonium (def. 1).

hydroxy denoting the presence in a compound of one or more hydroxyl groups.

hydroxy+ comb. form (in chemical nomenclature) denoting the presence of one or more hydroxyl groups; the number of hydroxyl groups may be specified, e.g. dihydroxy+ (two), trihydroxy+ (three), etc.

hydroxy acid any organic acid containing one or more hydroxyl

2-hydroxy-acid oxidase EC 1.1.3.15; systematic name: (S)-2-hydroxy-acid:oxygen 2-oxidoreductase; other name: glycolate oxidase; an enzyme that catalyses the oxidation by dioxygen of (S)-2-hydroxy-acid to 2-oxo-acid and H₂O₂. It is a peroxisomal enzyme in plants that is involved in the conversion of glycolate to glycine in photorespiration. The coenzyme is FMN. Example from Spinacia oleracea: database code GOX_SPIOL, 369 amino acids (40.28 kDa).

3-hydroxyacyl-CoA dehydrogenase EC 1.1.1.35; systematic name: (S)-3-hydroxyacyl-CoA:NAD+ oxidoreductase; other

names: β -hydroxyacyl dehydrogenase; β -keto-reductase; an enzyme of the **beta-oxidation system**. It catalyses the oxidation by NAD⁺ of S-3-hydroxyacyl-CoA to 3-oxoacyl-CoA with formation of NADH; example (rat liver): database code RATD2D3COA, 287 amino acids (31.88 kDa); for another example (Escherichia coli): see fatty-acid oxidation complex. See also peroxisomal bifunctional enzyme.

hydroxyallysine 5-hydroxy-6-oxonorleucine; 2-amino-5-hydroxyadipaldehyde. An α -amino acid not normally found in proteins but enzymically formed from 5-hydroxylysine in situ as an intermediate in the creation of covalent cross-links between adjacent polypeptide strands during the maturation of certain connective tissue proteins, e.g. collagen, elastin. See also allysine.

11 β -hydroxy-4-androstene-3,17-dione 4-androsten-11 β -ol-3,17-dione; a 17-oxo steroid formed from androstenedione by steroid 11 β -monooxygenase (EC 1.14.15.4).

hydroxyapatite or hydroxylapatite a crystallized form of calcium orthophosphate hydroxide, Ca₁₀(PO₄)₆(OH)₂, virtually insoluble in water and in many aqueous solvents; it occurs as a mineral in phosphate rock. The main mineral component of bone, cartilage, and tooth approximates in composition to hydroxyapatite, small proportions of Ca²⁺ and OH⁻ being replaced respectively by Mg²⁺ and F⁻; trace amounts of other ions may be present as well. Hydroxyapatite may also occur in granules in mitochondria. Chemically prepared hydroxyapatite is useful in the separation of proteins or nucleic acids by adsorption chromatography. It is used in orthopedic and dental prostheses and in the prevention of osteoporosis.

Mo-hydroxy-L-arginine abbr.: L-NHA; a derivative of L-arginine in which one of the guanidine nitrogens is oxidized to an N-hydroxy group. It is an intermediate in the formation of nitric oxide from L-arginine; it may function as an intercellular NO carrier and a vasodilator in its own right.

p-hydroxybenzoic acid 4-hydroxybenzoic acid; an intermediate in the synthesis of **ubiquinone** from tyrosine in mammals.

3-hydroxybutyrate cycle or 3-hydroxybutyrate shuttle an intracellular metabolic cycle that can transfer reducing equivalents from the cytoplasm to the mitochondria in liver. Extramitochondrial NADH is oxidized to NAD⁺ by acetoacetate, which is reduced to D(-)-3-hydroxybutyrate; the latter then passes into the mitochondria where it is reoxidized to acetoacetate by intramitochondrial NAD⁺. The acetoacetate passes out into the cytoplasm thereby completing the cycle.

ý)-3-hydroxyacyl-CoA:NAD+ oxidoreductase; *other 3-hydroxybutyrate dehydrogenase EC 1.1.1.30; <i>other* Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Sur Leage

name: $D-\beta$ -hydroxybutyrate dehydrogenase; an enzyme that catalyses the reaction:

(R)-3-hydroxybutanoate + NAD⁺ = acetoacetate + NADH. Example (fragment) from human: database code BDH_HUMAN, 343 amino acids (38.09 kDa).

 α -hydroxybutyrate (2-hydroxybutanoate) dehydrogenase an alternative name for the LD₁ isoenzyme of lactate dehydrogenase (EC 1.1.1.27).

hydroxyeicosatetraenoate abbr.: HETE or mono-HETE; any of various related products arising, either spontaneously or by the action of glutathione peroxidases, from reduction of hydroperoxyeicosatetraenoates. The main forms are the 5-, 12-, and 15-HETEs, resulting from the action of 5-, 12-, and 15lipoxygenase enzymes, but 8-, 9-, 11-, 16-, 17-, 18-, 19-, and 20-HETEs are known. The hydroxy group in most HETEs is of the S configuration, but those of R configuration are known, e.g. 12(R)-HETE from psoriatic lesions; 12(R)-HETE and 11(R)-HETE are found in sea-urchin eggs. The three main HETEs are: (6E,8Z,11Z,14Z)-(5S)-5-hydroxyeicosa-6,8,11,14tetraen-1-oate, 5(S)-HETE; (5Z, 8Z, 10E, 14Z)-(12S)-12-hydroxyeicosa-5,8,10,14-tetraen-1-oate, 12(S)-HETE; (5Z,8Z,11Z,13E)-(15S)-15-hydroxyeicosa-5,8,11,13-tetraen-1oate, 15(S)-HETE. Their tissue distribution follows that of **lipoxygenases.** 15(S)-HETE can act as a precursor for 5(S), 15(S)-dihydroxyeicosatetraenoate and lipoxins. 5-HETE and 12-HETE are chemoattractants, 12(R) being more potent than 12(S), but 5(S) being more potent than 5(R); 8(R)-HETE, synthesized by starfish oocytes, is orders of magnitude more potent than 8(S)-HETE in inducing oocyte maturation.

5(S)-HETE

12(S)-HETE

15(S)-HETE

hydroxy fatty acid any member of a class of fatty acids having a hydroxyl group, usually at the 2- or 3-position. 2-D(-)-hydroxy fatty acids are widespread minor constituents of plant and some animal (wool, skin) lipids; 3-L(+)-hydroxy fatty acids are found in low amounts in plant and bacterial lipids (e.g. in mycolic acids). Mid-chain hydroxy acids and polyhydroxy acids also occur in plant lipids.

5-hydroxyindoleacetic acid abbr.: 5-HIAA; a metabolite of **5-hydroxytryptamine**, produced by oxidative deamination catalysed by the enzyme **monoamine oxidase**, followed by oxidation to 5-HIAA. See also **5-hydroxyindole metabolism**.

5-hydroxyindole metabolism the metabolism of 5-hydroxytryptophan and its derivatives; it is of particular interest because it is concerned with the synthesis and degradation of the neurotransmitter 5-hydroxytryptamine (i.e. serotonin). Serotonin is converted to 5-hydroxy-3-indoleacetaldehyde by monoamine oxidase, and thence to either 5-hydroxytryptophol (3%) or 5-hydroxy-3-indoleacetic acid (5-HIAA) (97%), and these are excreted in the urine. Urinary 5-HIAA is measured as a diagnostic aid in cases of carcinoid syndrome, as the tumour converts large amounts of dietary tryptophan to serotonin.

hydroxyl 1 the (covalently linked) -OH group in any chemical compound. 2 a former name for the hydroxide ion; see hydroxide (def. 1).

hydroxylamine 1 NH₂-OH; a chemical mutagen that causes the deamination of cytosine residues in DNA so that, during subsequent replication of the DNA, the altered cytosine pairs with adenine rather than with guanine, causing G-C to A-T transitions. Hydroxylamine is an intermediate in the oxidation of ammonium in nitrifying bacteria, and in the reverse reaction in denitrifying bacteria. It may be used to cleave specifically Asp-|-Gly bonds in peptides. 2 any organic compound of the type RNH-OH.

hydroxylapatite an alternative name for hydroxyapatite.

hydroxylase the common name for many monooxygenase and a few **diooxygenase** enzymes that catalyse hydroxylation reactions.

hydroxylate to introduce one or more **hydroxyl** (def. 1) groups into a compound, often by the replacement of hydrogen atom(s). —**hydroxylation** n.

hydroxylation-induced migration an alternative name for NIH shift

hydroxylysine the trivial name for δ-hydroxylysine; δ-hydroxy-α,ε-diaminocaproic acid; 5-hydroxy-2,6-diaminohexanoic acid; H₂N-CH₂-CHOH-[CH₂]₂-CH(NH₂)-COOH; a chiral α-amino acid. Because the molecule of hydroxylysine possesses two chiral centres, four isomeric forms are possible, comprising an enantiomeric (D_s and L_s) pair of each of two (erythro and threo) diastereoisomers (the pair of threo enantiomers are sometimes known as allohydroxylysine). L-Hydroxylysine (symbol: 5Hyl or Hyl or Lys(5-OH) or (formerly) Hylys), erythro-5-hydroxy-L_s-lysine, is a noncoded amino acid found in peptide linkage in proteins (mainly collagen). In collagen 15-20% of the lysine residues are enzymically converted to hydroxylysine residues while the growing peptide chains are still attached to ribosomes; some of the hydroxyl groups of the hydroxylysine side chains are subsequently glycosylated.

L-allohydroxylysine

(e.g. in mycolic acids). Mid-chain hydroxy acids and polyhydroxy acids also occur in plant lipids.

5-hydroxyindoleacetaldehyde see 5-hydroxyindole metabolism.

hydroxypr

catecholamine catabolism, and is excreted in the urine. In clinical chemistry the measurement of HMMA in urine is used to detect excessive biosynthesis of catecholamines, as, e.g., in pheochromocytoma.

hydroxymethylbilane synthase EC 4.3.1.8; systematic name: porphobilinogen ammonia-lyase (polymerizing); other names: porphobilinogen deaminase; pre-uroporphyrinogen synthase. An enzyme that catalyses the conversion of four molecules of porphobilinogen to hydroxymethylbilane and four molecules of ammonia; dipyrromethane is a cofactor. Together with uraporphyrinogen-III synthase it is responsible for the step in heme biosynthesis in which four porphobilinogen molecules are condensed to form uroporphyrinogen III. Example from Escherichia coli: database code HEM3_ECOLI, 313 amino acids (33.81 kDa); 3-D structure known.

5-hydroxymethylcytosine abbr.: HMC; a minor base occurring in some types of DNA, e.g. in T4 bacteriophage.

hydroxymethylglutaryl-CoA abbr: HMG-CoA; β -hydroxy- β -methylglutaryl-CoA; (S)-3-hydroxy-3-methylglutaryl-CoA; an important intermediate in the synthesis of cholesterol, farnesyl and geranyl derivatives, and ketone bodies. See also hydroxymethylglutaryl-CoA reductase, hydroxymethylglutaryl-CoA lyase.

hydroxymethylglutaryl-CoA lyase abbr.: HMG-CoA lyase; EC 4.1.3.4; systematic name: (S)-3-hydroxy-3-methylglutaryl-CoA acetoacetate lyase. An enzyme that catalyses the formation of acetyl-CoA and acetoacetate from (S)-3-hydroxy-3methylglutaryl-CoA.

In mammals, a mitochondrial enzyme that converts hydroxymethylglutaryl-CoA to acetoacetate in the synthesis of ketone bodies. Example from Pseudomonas mevalonii: database code MVAB_PSEMV, 301 amino acids (31.57 kDa).

hydroxymethylglutaryl-CoA reductase (NADPH) abbr.: HMG-CoA reductase; EC 1.1.1.34; systematic name: (R)mevalonate:NADP+ oxidoreductase (CoA-acylating). An enzyme that catalyses a reaction between (S)-3-hydroxy-3-methylglutaryl-CoA and two molecules of NADPH to form (R)-mevalonate, CoA, and two molecules of NADP+. Its function is to reduce HMG-CoA to (R)-mevalonate. In mammals it is an integral membrane glycoprotein of endoplasmic reticulum and peroxisomes. It catalyses a rate-limiting step and is an important regulatory enzyme in pathways for the synthesis of cholesterol and other sterols. It is the target for therapeutic strategies for reducing plasma cholesterol. Example from human: database code HMDH_HUMAN, 888 amino acids (97.36 kDa). See also dephospho-[reductase kinase] kinase.

[hydroxymethylglutaryl-CoA reductase (NADPH)] kinase EC 2.7.1.109; other name: reductase kinase; an enzyme that catalyses the phosphorylation by ATP of [3-hydroxy-3methylglutaryl-CoA reductase (NADPH)] with release of ADP. It thereby inactivates the latter enzyme.

[hydroxymethylglutaryl-CoA reductase (NADPH)]-phosphatase EC 3.1.3.47; other name: reductase phosphatase; an enzyme that hydrolyses phosphate from [hydroxymethylglutaryl-CoA reductase (NADPH)] phosphate. It thereby activates the latter enzyme.

hydroxymethylglutaryl-CoA synthase abbr.: HMG-CoA synthase; EC 4.1.3.5; systematic name: (S)-3-hydroxy-3methylglutaryl-CoA acetoacetyl-CoA-lyase (CoA-acetylating). An enzyme that catalyses a reaction between acetyl-CoA + H₂O and acetoacetyl-CoA to form (S)-3-hydroxy-3-methylglutaryl-CoA and CoA. In mammals it is a cytoplasmic and mitochondrial enzyme, catalysing the formation of hydroxymethylglutaryl-CoA from acetoacetyl-CoA and acetyl-CoA in cytoplasm for sterol biosynthesis, or in mitochondria for ketone body synthesis. Example from human: database code HMCS_HUMAN, 520 amino acids (57.29 kDa).

5-hydroxynorleucine an older name (no longer recommended) for 2-amino-5-hydroxyhexanoic acid; a nonprotein (noncoded) amino acid found in plants, e.g. Crotolaria juncea.

(R)-4-hydroxyphenyllactate dehydrogenase EC 1.1.1.222; other name: (R)-aromatic lactate dehydrogenase; an enzyme that catalyses the reaction:

(R)-3-(4-hydroxyphenyl)lactate + NAD(P)⁺ =

3-(4-hydroxyphenyl)pyruvate + NAD(P)H.

hydroxyphenylpyruvate reductase EC 1.1.1.237; an enzyme that catalyses the reaction:

 $3-(4-hydroxyphenyl)lactate + NAD^+ =$

3-(4-hydroxyphenyl)pyruvate + NADH.

17 α -hydroxypregnenolone 3 β ,17-dihydroxy-5-en-20-one; an intermediate in the synthesis of androgens, estrogens, and glucocorticoid hormones from cholesterol in the adrenal cortex. It is formed from **pregnenolone** by steroid 17α -monooxygenase (EC 1.14.99.9).

17 α -hydroxyprogesterone 17-hydroxypregn-4-one; an intermediate in the synthesis of androgens, estrogens, and glucocorticoid hormones from cholesterol in the adrenal cortex. It is formed from progesterone by steroid 17α -monooxygenase (EC 1.14.99.9).

hydroxyproline symbol: Hyp or (formerly) Hypro; either of EC 3.1.3.47; other name: reductase phosphatase; an the two constitutional isomers 3-hydroxyproline and 4-hy-Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

hydroxyprolinemia

droxyproline, HO-(C₄H₆NH)-COOH, both of which are chiral cyclic N-alkylated α -amino acids. Each constitutional isomer possesses two chiral centres; each can therefore exist as an enantiomeric (D and L) pair of each of two (cis and trans) diastereoisomers, making eight possible isomeric structures for hydroxyproline in all. Both trans-3-hydroxy-L-proline (symbol: 3Hyp or Pro(3-OH)), (2S,3S)-3-hydroxypyrrolidine-2-carboxylic acid, and trans-4-hydroxy-L-proline (symbol: 4Hyp or Pro(4-OH)), (2S,4R)-4-hydroxypyrrolidine-2-carboxylic acid, are noncoded amino acids found in peptide linkage in proteins. In collagen nearly 50% of the proline residues are hydroxylated to 4Hyp and a small proportion to 3Hyp; hydroxyproline residues are also found in elastin, enamel of the teeth, in the Cla moiety of the Cl component of complement, and in extensin. In collagen formation, enzymic hydroxylation of proline residues occurs while the growing peptide chains are still attached to ribosomes. Residues of both the cis-(2S,3R)-, and the trans-(2S,3S)-isomers of 3-hydroxy-L-proline, one of each per molecule, occur in the peptide antibiotic telomycin. One residue per molecule of cis-4-hydroxy-L-proline, the (2S,4S)-isomer, occurs in every member of the amatoxin group of toxic fungal octapeptides. None of the D series of isomers is known to occur naturally.

trans-(2S,3S)-3-hydroxy-L-proline

trans-(2S,4R)-4-hydroxy-L-proline

cis-(2S,4S)-4-hydroxy-L-proline

hydroxyprolinemia or hyperhydroxyprolinemia a metabolic disorder of humans characterized by high levels of free 4-hydroxyproline in the blood plasma and urine. It is probably due to a deficiency in the activity of so-called hydroxyproline oxidase, i.e. the enzyme 4-oxoproline reductase (EC 1.1.1.104).

15-hydroxyprostaglandin dehydrogenase (NAD+) EC 1.1.1.141; an enzyme involved in the inactivation of prostaglandins E_2 , $F_{2\alpha}$, and B_1 , by oxidizing the 15-hydroxyl group to a keto group. It catalyses a reaction between (5Z,13E)-(15S)- 11α ,15-dihydroxy-9-oxoprost-5,13-dienoate and NAD⁺ to form (5Z,13E)-11 α -hydroxy-9,15-dioxoprost-5.13-dienoate (15-keto PGE₂) and NADH. Example from human: database code PGDH_HUMAN, 266 amino acids (28.94 kDa).

5-hydroxytryptamine abbr.: 5-HT; an alternative name for serotonin

proteins that bind 5-hydroxytryptamine (i.e. serotonin) and mediate its intracellular effects. The receptors are classified pharmacologically into seven main subtypes or families; the members of these are designated 5-HT_{1A}, 5-HT_{1B}, 5-HT_{1D}, 5- HT_{1E} , 5- HT_{1F} , 5- HT_{2A} , 5- HT_{2B} , 5- HT_{2C} , 5- HT_{3} , 5- HT_{4} , 5- HT_{5A} , 5- HT_{5B} , 5- HT_{6} , and 5- HT_{7} . The members of the 5- HT_{1} family all have seven transmembrane domains and are negatively coupled to adenylate cyclase through G-proteins, but the 5-HT_{1A} receptor also increases K⁺ conductance; example, 5-HT_{1A} from rat: database code 5HIA_RAT, 422 amino acids (46.43 kDa). 5-HT_{1C} is now classified as a 5-HT₂ receptor. 5-HT_{2A}, 5-HT_{2B}, and 5-HT_{2C} have seven transmembrane domains and activate the phosphatidylinositol cycle; example, 5-HT_{2C} from rat: database code 5H2C_RAT, 460 amino acids (51.92 kDa). 5-HT₃ opens a Cl channel; 5-HT₄ has four transmembrane domains and is positively coupled to adenylate cyclase; 5-HT₅ has seven transmembrane domains but the main effector is unknown; example, 5-HT_{5A} from rat: database code 5H5A_RAT, 357 amino acids (40.67 kDa). 5-HT₆ and 5-HT₇ are both of the seven-transmembrane-helix type and are positively coupled to adenylate cyclase.

5-hydroxytryptophan a nonprotein amino acid found in plants; it is formed in legumes by hydroxylation of tryptophan. It is also formed in animals. See also serotonin.

hydroxyurea NH₂CONHOH; an analogue of urea with antineoplastic activity, possibly through inhibition of DNA synthesis.

hygro+ comb. form denoting moisture, especially that due to

hygrometer any instrument for measuring the relative humidity of a gas.

hygromycin B an aminoglycoside antibiotic from Streptomyces hygroscopicus; the inclusion of genes conferring resistance to hygromycin B in certain fungal recombinant DNA vectors allows selection of recombinants when these are plated out on medium containing this antibiotic.

hygroscopic (of a substance) tending to absorb water from the surrounding atmosphere. Compare deliquescent.

Hyl or (formerly) Hylys symbol for a residue of any of the hydroxy derivatives of the α -amino acid L-lysine, especially 5-hydroxy-L-lysine. See hydroxylysine.

5Hyl symbol for a residue of the α -amino acid 5-hydroxy-L-lysine (preferred alternative to Lys(5-OH) or Hyl). See hydroxylysine.

Hylys former symbol for a residue of (5-)hydroxy-L-lysine (5Hyl or Hyl now recommended).

hyoscine or scopolamine an alkaloid found, e.g., in Datura stramonium (thorn apple) and related to atropine in its structure and effects; it is a tertiary ammonium compound noted for its actions as a muscarinic receptor antagonist. It has found use as a sedative and preanesthetic and for prevention of motion sickness.

hyoscyamine 3α-tropanyl S-(-)-tropate; an anticholinergic material obtained from Atropa belladonna and other plants. It undergoes partial racemization on isolation; this process is completed by alkali treatment, and the racemic mixture is known as atropine. (Illustrated on p. 318.)

5-hydroxytryptamine receptor any of several membrane hyp+a variant form of hypo+ (before a vowel).

hyperimmuniz

(-)-hvoscvamine

Hyp 1 or (formerly) Hypro symbol for a residue of either the 3-hydroxy or the 4-hydroxy derivative of the α -amino (strictly, α -imino) acid L-proline, usually 4-hydroxy-L-proline. See hydroxyproline. See also 3Hyp, 4Hyp. 2 symbol for a residue of the purine base hypoxanthine.

3Hyp symbol for a residue of the α -amino acid 3-hydroxy-L-proline (preferred alternative to Pro(3-OH) or Hyp). See hydroxyproline.

4Hyp symbol for a residue of the α -amino acid 4-hydroxy-t-proline (preferred alternative to Pro(4-OH) or Hyp). See hydroxyproline.

hypelcin A a 20-residue peptide of microbial origin containing 10 α -aminoisobutyric acid residues. The N terminus is acylated and the C terminus amidated with **leucinol**. It modifies the permeability of phospholipid bilayers.

hyper+ prefix indicating over, beyond, excessive, or in excess; above the normal range. Compare hypo+, normo+.

hyperaldosteronism an elevated level of aldosterone in the blood. In primary aldosteronism, there is overproduction of aldosterone due to a lesion of the adrenal(s), e.g. an adrenal tumour as in Conn's syndrome. In secondary aldosteronism the overproduction is caused by excessive levels of stimulatory hormones, especially increased renin secretion.

hyperammonemia or (esp. Brit.) hyperammonaemia the presence of excess ammonia in the blood (the normal range is $10-47 \, \mu mol \, L^{-1}$). It occurs in a number of conditions including inherited disorders of the urea cycle, organic acidemias, liver disease, and severe systemic illness. See also ornithine-urea cycle.

hyperbaric of, relating to, or operating at higher than normal pressures.

hyperbilirubinemia or (esp. Brit.) hyperbilirubinaemia the presence of higher than normal concentrations of bilirubin in the blood; it may involve unconjugated or conjugated bilirubin. It occurs in liver disease or biliary obstruction, and is characteristic of neonatal hemolytic jaundice, where the bilirubin is mainly unconjugated.—hyperbilirubinemic or hyperbilirubinaemic adj.

hyperbola one of the conic sections; a plane curve in which the focal distance of any point bears to its distance from the directrix a constant ratio greater than unity. It has two foci and two asymptotes. Compare rectangular hyperbola. —hyperbolic adi.

hyperbolic function any one of a group of functions of an angle, analogous to the trigonometric functions, expressed as a relationship between the distances of a point on a hyperbola to the origin and to the coordinate axes. The group includes sinh (hyperbolic sine), defined as $\sinh x = (e^x - e^{-x})/2$; $\cosh (hyperbolic cosine)$, defined as $\cosh x = (e^x + e^{-x})/2$; and $\tanh (hyperbolic tangent)$, defined as $\tanh x = (\sinh x)/(\cosh x)$. The corresponding reciprocal functions are cosech (hyperbolic cosecant), sech (hyperbolic secant), and coth (hyperbolic cotangent), respectively.

hyperbolic kinetics curve a description sometimes used of the $\nu/[S]$ plot obtained for enzymes exhibiting **Michaelis-Menten kinetics**. The axes of the plot are not those of the rectangular hyperbola that results, but are rotated 45° (and displaced) from the true axes of the hyperbola.

hypercalcemia or (esp. Brit.) hypercalcaemia the presence of higher than normal concentrations of calcium in the blood. Clinical features include tiredness, muscle weakness, anorexia, weight loss, cardiac arrhythmia, and hypertension. It arises from a multiplicity of causes including malignancy, primary hyperparathyroidism, hyperthyroidism, acute adrenal insufficiency, familial hypocalciuric hypercalcemia, vitamin D or A overdose, or sarcoidosis. —hypercalcemic or hypercalcaemic adi

hypercapnia or hypercarbia the presence of greater than normal amounts of carbon dioxide in a vertebrate or in its blood. Compare hypocapnia.—hypercapnic or hypercarbic adj.

hyperchlorhydria the presence of greater than normal amounts of hydrochloric acid in the gastric juice. **hyper-chlorhydric** adj.

hypercholesterolemia or (esp. Brit.) hypercholesterolaemia the presence of higher than normal concentrations of cholesterol in the blood. See also hyperlipidemia —hypercholesterolemic or hypercholesterolaemic adj.

hyperchromatic 1 of, relating to, or exhibiting hyperchromatism. 2 an alternative word for hyperchromic (def. 1).

hyperchromatism the condition or property (of a cell or cell organelle) of staining more intensely than normal; the presence of a greater than normal amount of chromatin.

hyperchromic 1 or hyperchromatic more highly coloured than normal; intensely coloured. 2 of, pertaining to, exhibiting, or resulting from hyperchromism. 3 (of a substance) displaying a hyperchromic effect. 4 describing erythrocytes that contain, or appear to contain, more hemoglobin than normal.

hyperchromic effect the large increase in absorption of ultraviolet light, usually measured at 260 nm, shown by a solution of any natural or synthetic polynucleotide with a hydrogen-bonded structure when it is denatured or degraded. The effect is due to alterations in the electronic interactions between the initially stacked and hydrogen-bonded bases.

hyperchromicity a measure of the increase in absorption of electromagnetic radiation at a specific wavelength, usually that of the absorption maximum, due to hyperchromism, or to the hyperchromic effect. It is equal to the reciprocal of the hypochromicity minus unity.

hyperchromism the increased absorption of electromagnetic radiation exhibited by an ordered structure above that predicted on the basis of its constitution.

hyperfine splitting the splitting of a spectral line into multiplets of closely spaced lines. In electron spin resonance spectra hyperfine splitting is due to the interaction of unpaired electrons with neighbouring nuclei and can be used to determine the structure of a free radical or to identify the ligands of a paramagnetic ion and to measure the degree of covalent binding that exists between them. In nuclear magnetic resonance spectra hyperfine splitting, sometimes called spin-spin splitting, is due to the interaction of the nuclear magnetic moment with those of neighbouring nuclei and can be used to assign particular nuclear resonances and to determine molecular conformations.

hyperfine structure the presence in a spectrum of multiplets of closely spaced lines resulting from **hyperfine splitting**.

hyperglycemia or (esp. Brit.) hyperglycaemia an abnormally high blood glucose concentration, especially in relation to the fasting value. See also glycemia. —hyperglycemic or hyperglycaemic adj.

hyperglycemic factor or hyperglycemic-glycogenolytic factor a former name for glucagon.

hyperhydroxyprolinemia see hydroxyprolinemia.

hyperimmune describing the state of an animal in which very high concentrations of specific antibody are present in the serum, brought about by **hyperimmunization**.

hyperimmunization or hyperimmunisation any method of immunization designed to stimulate the production in the animal immunized of very large quantities of specific antibody. It typically involves the repeated administration of immunogen, often in increasing amounts.

hyperkalemia hypocak

hyperkalemia or (esp. Brit.) hyperkalaemia the presence in the blood of an abnormally high concentration of potassium. There are many causes including excessive K⁺ intake (infusion, transfusion), increased transcellular movement (tissue damage, systemic acidosis), and decreased K⁺ loss (renal failure, mineralocorticoid deficiency). —hyperkalemic or hyperkalaemic adi.

hyperlactatemia or (esp. Brit.) hyperlactataemia a clinical condition characterized by a persistent raised blood lactate concentration, usually below 5 mmol L⁻¹, and not accompanied by a lowered blood pH. The normal range is between 0.5 and 2.2 mmol L⁻¹. Compare lactic acidosis. —hyperlactatemic or hyperlactataemic adj.

hyperlipidemia or hyperlipemia or (esp. Brit.) hyperlipidaemia or hyperlipaemia the presence in the blood of an abnormally high concentration of fats (or lipids). Hyperlipidemias have been classified into various types according to which lipoprotein class is found to be elevated in the blood. The Fredrickson classification scheme designates: type I, elevated chylomicrons; type II, elevated low-density lipoprotein; type III, elevated intermediate-density lipoprotein; type IV, elevated very-low-density lipoprotein; type V, elevated chylomicrons and very-low-density lipoprotein. A simpler distinction, of use in treatment, is between elevated cholesterol levels (type II, hypercholesterolemia) and elevated triacylglycerol levels (types I, III-V, hypertriglyceridemia, an older term still often used). Hyperlipidemia may be secondary to other conditions; several drugs cause or exacerbate hyperlipidemia, including thiazides, beta blockers lacking intrinsic sympathomimetic activity, and corticosteroids. Estrogens may lower hypercholesterolemia, but may cause or exacerbate hypertriglyceridemia; hypothyroidism is commonly associated with hypercholesterolemia; high alcohol intake causes hypertriglyceridemia, but modest alcohol intake may have a beneficial effect on cholesterol status, as it tends to increase high-density lipoprotein concentration. -hyperlipidemic, hyperlipemic or hyperlipidaemic, hyperlipaemic adi.

hypermodified base any extensively modified nucleic-acid base occurring adjacent to the 3' end of the anticodon in many tRNA molecules. Examples are N^6 - $(\delta_2$ -isopentenyl)adenosine (symbol: iA) and N^6 -(threonylcarbamoyl)adenosine (symbol: tA). Hypermodified bases are thought to be important for proper binding of tRNA molecules to ribosomes.

hypernatremia or (esp. Brit.) hypernatraemia the presence in the blood of an abnormally high concentration of sodium. It may be associated with conditions in which body water is depleted. —hypernatremic or hypernatraemic adj.

hyperoxaluria the presence of oxalate in the urine in abnormally high amounts. Primary hyperoxaluria is a rare inherited metabolic disorder of which there are two types: one results in increased oxalate synthesis, the other in increased oxalate excretion by the kidney. More usually, hyperoxaluria results from increased absorption of oxalate from the intestine. It is associated with the formation of renal calculi.

hyperoxia the presence of greater than normal amounts of dioxygen in a vertebrate or in its blood. *Compare* **hypoxia**. — **hyperoxic** *adj*.

hyperparathyroidism the increased production of parathyroid hormone. It may be primary, as a result of a tumour of the parathyroid gland, or secondary, as a result of a disturbance in calcium metabolism.

hyperphosphatemia or (esp. Brit.) hyperphosphataemia an excessive level of phosphate in the blood. It occurs most commonly in renal insufficiency, but may also accompany hypoparathyroidism, vitamin D intoxication, or excessive administration of phosphate. —hyperphosphatemic or hyperphosphataemic adj.

hyperplasia the increase in size of a tissue or organ resulting from an increase in the total number of cells present. The part thus affected retains its normal form. Compare hypertrophy.—
hyperplastic adj.

hyperprolactinemia or (esp. Brit.) hyperprolactinaemia the presence in the blood of abnormally high levels of prolactin, due to excessive secretion of the hormone. The most common example of pituitary hyperfunction, it results from pituitary adenoma, and also from treatment with dopamine receptor blockers. It can be treated with dopamine agonists, e.g. bromocriptine. —hyperprolactinemic or hyperprolactinaemic adj. hypersecretion excessive secretion by any endocrine or exocrine gland.

hypersensitive having an abnormally great sensitivity, especially to an allergen, drug, or other agonist.

hypersensitivity 1 the state or condition of being hypersensitive. 2 (in immunology) an immune response that occurs in an exaggerated or inappropriate form. Such responses may result from agents including pollen or drugs, or from genuine pathogens. Also of importance are the different kinds of tissue damage seen in autoimmune diseases. In general terms the reactions may be classified into four types, although they do not occur in isolation from each other: type I, immediate hypersensitivity; type III, antibody-mediated hypersensitivity; type III, antibody-mediated hypersensitivity; and type IV, delayed hypersensitivity.

hypersharpening the formation of a 'sharper' boundary in sedimentation and moving boundary electrophoresis experiments than would be expected as a result of diffusion-broadening, because molecules in the trailing portion of the boundary tend to move at a greater velocity per unit field than molecules on the leading edge or in the plateau region.

hypertension the state or condition of having a higher than normal arterial blood pressure. —hypertensive adj.

hyperthyroidism or thyrotoxicosis a clinical state resulting from excessive secretion of thyroid hormones. The most common cause is Graves' disease; other causes include goitre and solitary toxic adenoma. The clinical manifestations include nervousness, irritability, fatigue, and heat intolerance; exophthalmia is present in some cases. Most symptoms derive from exaggeration of normal responses to thyroid hormones. See also thyroxine.—hyperthyroid adj.

hypertonic 1 (of a solution) having a higher osmotic pressure than that of some given solution, especially that of the fluid in or surrounding a given type of cell or a body fluid. 2 (of a muscle) showing or characterized by excessive tone or tension. Compare hypotonic.—hypertonicity n.

hypertriglyceridemia or (esp. Brit.) hypertriglyceridaemia see hyperlipidaemia.

hypertrophy the increase in the size of a tissue or organ resulting from an increase in the size of the cells present. Compare hyperplasia.—hypertrophic adj.

hyperuricemia or (esp. Brit.) hyperuricaemia the presence of abnormally high amounts of uric acid in the blood. This may be due to increased purine synthesis arising from a metabolic disorder, inherited or otherwise, or it may be due to reduced excretion – this may result from renal disease, the effect of drugs (e.g. salicylates) on the kidney, or the presence of organic acids (e.g. lactate) that competitively inhibit urate excretion. Hyperuricemia is associated with gout.

hypervariable regions regions in an immunoglobulin molecule where the amino-acid residues show a high degree of variation between one molecule and another. There are three hypervariable regions, two in the V region and one in the D region.

hypo a common name for sodium thiosulfate, especially when used in photographic processing.

hypo+ or (before a vowel) hyp+ prefix denoting under, beneath, below, less than, or in deficit; below the normal range. Compare hyper+, normo+.

hypoalphalipoproteinemia see hypolipoproteinemia.

hypobaric of, relating to, or operating at pressures lower than

hypobetalipoproteinemia see hypolipoproteinemia.

cted retains its normal form. Compare hypertrophy. — hypocalcemia or (esp. Brit.) hypocalcaemia the presence of a lower than normal concentration of calcium in the blood. It Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

hypocapnia hyp

may be associated with disorders of vitamin D metabolism, hypoparathyroidism, magnesium deficiency, or pancreatitis. Clinical features include behavioural disturbances, stupor, numbness, paresthesia, muscle cramps or spasms, and convulsions. —hypocalcemic or hypocalcaemic adj.

hypocapnia or hypocarbia the presence of less than the normal amount of carbon dioxide in a vertebrate or in its blood. Compare hypercapnia. —hypocapnic or hypocarbic adj.

hypochlorhydria the presence of less than the normal amount of hydrochloric acid in the gastric juice. —hypochlorhydric adj.

hypocholesterolemia or (esp. Brit.) hypocholesterolaemia the presence of a lower than normal concentration of cholesterol in the blood. —hypocholesterolemic or hypocholesterolaemic adi.

hypochromatic 1 of, relating to, or exhibiting hypochromatism. 2 an alternative word for hypochromic (def. 1).

hypochromatism the condition or property (of a cell or cell organelle) of staining less intensely than normal; the presence of an abnormally low amount of chromatin.

hypochromic 1 or hypochromatic less highly coloured than normal; weakly coloured. 2 of, pertaining to, exhibiting, or resulting from hypochromism. 3 (of a substance) displaying a hypochromic effect. 4 describing erythrocytes that contain, or appear to contain, less hemoglobin than normal.

hypochromic effect the observed decrease in absorption of certain frequencies of electromagnetic radiation by solutions of some macromolecules when the structure of the molecules becomes more ordered.

hypochromicity a measure of the decrease in absorption of electromagnetic radiation at a specific wavelength, usually that of the absorption maximum, due to **hypochromism**.

hypochromism the decreased absorption of electromagnetic radiation exhibited by an ordered structure below that predicted on the basis of its constitution.

hypoglycemia or (esp. Brit.) hypoglycaemia the presence of an abnormally low blood glucose concentration, especially in relation to the fasting value. See also glycemia.—hypoglycemic or hypoglycaemic adj.

hypoglycin or hypoglycine A β-(methylenecyclopropyl)alanine; 2-amino-3-(methylenecyclopropane)propanoic acid. A non-protein α-amino acid identified as the hypoglycemic and toxic principle of the unripe fruit of the ackee (Blighia sapida), where it is present both in the fleshy aril and in the seeds. In the latter it occurs also as the N-L-glutamyl derivative, hypoglycin B. Certain other fruits also contain hypoglycin. It is degraded in animals to methylenecyclopropylacetate, either free or conjugated to glycine or coenzyme A. Methylenecyclopropylacetyl-CoA is a potent and specific inhibitor of the oxidation of short-chain acyl-CoAs, particularly of butyryl-CoA. In hypoglycin poisoning butyryl-CoA undergoes hydrolysis to yield free butyrate, which accumulates in the blood to abnormal concentrations. See also Jamaican vomiting sickness.

Hyp(3-OH) symbol for a residue of the α -amino acid 3-hydroxy-L-proline (alternative to 3Hyp or Hyp). See hydroxyproline.

Hyp(4-OH) symbol for a residue of the α -amino acid 4-hydroxy-L-proline (alternative to 4Hyp or Hyp). See **hydroxyproline**.

hypokalemia or (esp. Brit.) hypokalaemia the presence in the blood of an abnormally low concentration of potassium. It may result from alkalosis, insulin administration, primary or secondary aldosteronism, or administration of drugs that are aldosterone antagonists.—hypokalemic or hypokalaemic adj.

hypolipoproteinemia the partial or total absence of any lipoprotein, or the presence of a defective lipoprotein, in the plasma. Several types of this condition are recognized. Hypobetalipoproteinemia is arbitrarily defined as a low density lipoprotein (LDL) cholesterol level below the fifth percentile for a given sex- and age-matched population. Such patients also have low triacylglycerol levels. In this condition, LDL cholesterol is always detectable, in contrast to homozygous abetalipoproteinemia, in which it is entirely absent. Hypobetalipoproteinemia appears to be due to a low rate of synthesis of

LDL from very-low-density lipoprotein. Abetalipoproteinemia is a rare autosomal recessive disorder. It probably results from an abnormality in the synthesis or secretion of apo B, and it is accompanied by fat malabsorption, as chylomicron formation requires apo B. In the homozygote, levels of triacylglycerols, cholesterol, and phospholipids are extremely low. Heterozygotes may present with hypobetalipoproteinemia. Hypoalphalipoproteinemia is in some cases familial, and may result from defective apo A-I. In another disorder, known as fish-eye disease (due to severe corneal opacity) the structure of apo A-I is normal, but high-density lipoprotein (HDL) levels are only 10% of normal. In analphalipoproteinemia, or Tangier disease, HDL is virtually absent.

hyponatremia or (esp. Brit.) hyponatraemia the presence in the blood of an abnormally low concentration of sodium. It can occur as a result of incorrect administration of fluid intravenously or in parenteral feeding, after administration of diuretics, in congestive heart failure, or in protein imbalance.

—hyponatremic or hyponatraemic adj.

hypoparathyroidism underactivity of the parathyroid glands.

hypophase the lower layer of a two-phase system. Compare epiphase. —hypophasic adj.

hypophosphatemia or (esp. Brit.) hypophosphataemia the presence of an abnormally low level of phosphate in the blood. It occurs in vitamin D deficiency, primary hyperparathyroidism, incorrect parenteral nutrition, and during recovery from diabetic ketoacidosis.

hypophysectomy surgical removal of the pituitary gland (i.e. hypophysis). —**hypophysectomize** or **hypophysectomise** vb.

hypophysiotropic factor or hypophysiotropic hormone an alternative name for hypothalamic (regulatory) factor.

hypophysis or hypophysis cerebri an alternative name for pituitary gland. See also adenohypophysis, neurohypophysis. —hypophyseal or hypophysial adj.

hypopituitarism total or (more often) partial loss of pituitary function, usually due to destructive lesions of the pituitary.

hypoplasia underdevelopment or defective formation of an organ or tissue. —**hypoplastic** adj.

hypoprothrombinemia or (esp. Brit.) hypoprothrombinaemia the presence of abnormally low (inadequate) levels of plasma prothrombin (factor II). It is commonly linked with vitamin K deficiency.

hyposecretion lesser than normal secretion by any endocrine or exocrine gland.

hypotension the state or condition of having a lower than normal arterial blood pressure. —**hypotensive** adj.

hypothalamic (regulatory) factor or hypothalamic hormone or hypophysiotropic factor or hypophysiotropic hormone any peptidic substance that is synthesized in the mammalian hypothalamus and released into the hypophyseal-portal circulation in response to neural and/or chemical stimuli, and that regulates the secretion (and perhaps also the synthesis) of a specific polypeptide hormone by the anterior lobe of the pituitary gland (i.e. adenohypophysis). These specific factors may be either releasing or release-inhibiting factors (or hormones); their recommended names are now formed by replacing the word-ending 'tropin' (or '-in' in prolactin) in the name of the corresponding pituitary hormone by the word-ending '-liberin' (for a releasing factor) or '-statin' (for a release-inhibiting factor).

hypothalamus (pl. hypothalami) the region of the vertebrate brain lying below the thalamus and around the floor of the third ventricle, just posterior to the attachment of the cerebral hemispheres. It lies just above the pituitary gland, to which it supplies various hypothalamic (regulatory) factors. —hypothalamic adj.

hypothyroidism deficient secretion by the thyroid gland, for whatever reason. In infants it leads to cretinism; in adults the consequences include low metabolic rate, lethargy, menstrual disorders, and in extreme cases myxedema. —hypothyroid adj.

einemia appears to be due to a low rate of synthesis of **hypotonic 1** (of a solution) having a lower osmotic pressure Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

hypovolemia

d Juy House

than that of some given solution, particularly the fluid in or surrounding a given type of cell or a body fluid. 2 (of a muscle) showing or characterized by diminished tone or tension. Compare hypertonic.—hypotonicity n.

hypovolemia or (esp. Brit.) **hypovolaemia** a reduction in the volume of circulating blood. It may be due to hemorrhage or to redistribution of fluid from the plasma to the extravascular tissues and spaces.

hypox abbr. for hypophysectomized. See hypophysectomy.

hypoxanthine symbol: Hyp; purin-6(1H)-one; 6-hydroxy purine; an intermediate in the degradation of adenylate. Its ribonucleoside is known as inosine and its ribonucleotide as inosinate. Compare xanthine. See also hypoxanthine phosphoribosyltransferase.

hypoxanthine-guanine phosphoribosyltransferase abbr.: HGPRT; see hypoxanthine phosphoribosyltransferase.

hypoxanthine phosphoribosyltransferase EC 2.4.2.8; systematic name: IMP: pyrophosphate phospho-D-ribosyltransferase; other names: hypoxanthine-guanine phosphoribosyltransferase (abbr.: HGPRT); IMP pyrophosphorylase. An enzyme that catalyses a reaction between 5-phospho-α-D-ribose 1-diphosphate and either hypoxanthine or guanine to form IMP or GMP respectively, with release of pyrophosphate. It is an enzyme of the purine salvage pathway, and a deficiency is associated with Lesch-Nyhan syndrome and gout. Example from human: database code HPRT_HUMAN, 217 amino acids (24.45 kDa); many mutations leading to deficiency diseases have been identified.

hypoxia the presence of less than normal amounts of dioxygen in a vertebrate or in its blood. *Compare* hyperoxia. —hypoxic adj.

Hypro (formerly) symbol for a residue of (4-)hydroxy-L-proline (4Hyp or Hyp now recommended).

hypsochromic describing the shift of an absorption band in the direction of shorter wavelengths. *Compare* bathochromic.

hypusine N^{ε} -[4-amino-2-hydroxybutyl]lysine; an amino acid uniquely formed by post-translational modification of one of the lysyl residues of eukaryotic translation initiation factor 5A (eIF-5A). It is formed by deoxyhypusine synthase, an enzyme that transfers the butylamine portion of spermidine to the ε -NH₂ group of a specific lysine of the eIF-5A precursor, followed by addition of the hydroxyl group by deoxyhypusine hydroxylase.

hysteresis the delay between the effect on a system and the cause producing the effect. —**hysteretic** adj.

hysteretic enzyme any enzyme that responds slowly (in terms of some kinetic characteristic) to a rapid change in ligand (either substrate or modifier) concentration. Such slow changes, defined in terms of their rates relative to the overall catalytic reaction, result in a lag in the response of the enzyme to changes in the ligand level.

Hz symbol for hertz.

H zone see sarcomere.

i symbol for 1 iso (def. 3); (as a prefix or superscript in symbols and abbreviations for iso compounds or groups; e.g. isopropyl can be symbolized as iPr or Pri). 2 the chemical group 2isopentenyl; 3,3-dimethylallyl (as a prefix to a single-letter symbol for a nucleoside residue to designate substitution of the base, as in iA). 3 the square root of -1.

i symbol for 1 electric current (alternative to I). 2 van't Hoff fac-

I symbol for 1 iodine. 2 an iodo group in an organic compound. 3 a residue of the α -amino acid L-isoleucine (alternative to Ile). 4 a residue of the ribonucleoside inosine (alternative to

I symbol for 1 electric current (preferred alternative to i). 2 intensity; the subscripts e (for energetic), p (for photon), or v (for visible) may be added to distinguish between radiant intensity, photon intensity, and luminous intensity, respectively. 3 ionic strength; the subscripts c or m may be added to indicate whether it is expressed based on concentration or molality respectively. 4 the inductive effect of a particular chemical group in an organic compound.

iA symbol for N^6 -(2-isopentenyl)adenosine, a hypermodified base.

IAA abbr. for indole-3-acetic acid or indoleacetate.

IAN abbr. for indoleacetonitrile.

IAP abbr. for islet-activating protein; see pertussis toxin.

iatrogenic describing a condition or disease induced unintentionally by a physician through his or her diagnosis, manner, or therapy. —iatrogenicity n.

I-band abbr. for isotropic band. The I-bands of striated muscle contain the thin filaments and correspond to the light bands. The name derives from the fact that they are isotropic in polarized light. See also sarcomere.

IBMX abbr. for isobutylmethylxanthine.

ibuprofen 2-(4-isobutylphenyl)propionic acid; a nonsteroidal anti-inflammatory agent of the substituted propionic acid type; others of this type are flurbiprofen, ketoprofen, and naproxen. They inhibit the cyclooxygenase activity of prostaglandin-endoperoxide synthase, reversibly over short time intervals, followed by time-dependent irreversible inactivation, due probably to conformational rather than covalent changes. The racemic mixture is present in many over-the-counter drugs, but the (S)-enantiomer is the active form. Proprietary names include: Advil; Brufen; Motrin.

(S)-ibuprofen

ic or i.c. abbr. for intracutaneous or intracutaneously.

IC abbr. for internal conversion.

IC₅₀ 1 the median inhibitory concentration (in mol L⁻¹) of an antagonist, i.e. the concentration that reduces a specified response to 50% of its former value; compare EC₅₀. 2 the median inhibitory concentration (in mol L-1) of an agent (agonist or antagonist), i.e. the concentration that causes a 50% reduction in the specific binding of a radioligand.

ICAM abbr. for intercellular adhesion molecule; any of several type I membrane glycoproteins of the immunoglobulin superfamily. They act as ligands for leukocyte adhesion to target cells, in conjunction with LFA-1; in fact LFA-1-ICAM links mediate adhesion between many cell types. There are three subclasses. ICAM-1 (or CD54), of molecular mass 90-115 kDa, are expressed on B and T cells, endothelial, epithelial, and dendritic cells, fibroblasts, keratinocytes, and chondrocytes. They are inducible in 12-24 hours by cytokines such as gamma interferon, interleukin-1\beta, and tumour necrosis factora. Example (human, precursors): ICAM-1 major group rhinovirus receptor: database code ICA1_HUMAN, 532 amino acids (57.76 kDa). ICAM-2 (or CD102), of molecular mass 55-65 kDa, are constitutively expressed on endothelial cells, some lymphocytes, monocytes, and dendritic cells. Example (human): database code ICA2_HUMAN, 275 amino acids (30.62 kDa), ICAM-3 (or CD50), of molecular mass 116-140 kDa, are constitutively expressed on monocytes, granulocytes, and lymphocytes; upon physiological stimulation they become rapidly and transiently phosphorylated on serine residues. Example (human): database code ICA3_HUMAN, 547 amino acids (59.32 kDa).

ICD (in clinical chemistry) abbr. for isocitrate dehydrogenase (EC 1.1.1.41).

ice the solid form of water that can exist at temperatures below the triple point of water (273.16 K at 101 325 Pa).

iceberg a metaphor used to describe an interpretation of the anomalous entropies of solution of noble gases and other nonpolar substances in water, suggesting that water tends to organize itself into quasi-solid supramolecular structures around the molecules of such substances. In the case of alkyl compounds, this tendency increases markedly with the length of the alkyl chain.

ICE-like protease any of a family of endopeptidases that structurally resemble interleukin-18 convertase (ICE). They are involved in apoptosis, being implicated in the proteolysis that causes cell death.

I cell 1 or CCK cell any of a group of cells, widely distributed in the duodenal and jejunal mucosa, that produce cholecystokinin. So named because their histological features are intermediate between those of S cells and L cells. 2 abbr. for inclusion cell. See also I-cell disease.

I-cell disease or inclusion-cell disease or mucolipidosis II an autosomal recessive disease in which most of the lysosomes in the connective tissue (fibroblasts) contain large inclusions of glycoaminoglycans and glycolipids as a result of the absence of several lysosomal hydrolases. These enzymes, which are synthesized in the endoplasmic reticulum, are secreted into the extracellular medium rather than being directed to the lysosomes. This is due to the absence of a mannose 6-phosphate marker on the carbohydrate moieties of these hydrolases because of a deficiency in an enzyme required for mannose phosphorylation. The failure of the phosphorylation in the cis Golgi network means that the enzymes are not segregated by the mannose 6-phosphate receptors into the appropriate transport vesicles in the trans Golgi network. The patients have an abnormally high level of lysosomal enzymes in their sera and body fluids. A milder form of I-cell disease is Hurler's polydystrophy (Hurler syndrome).

ice point the temperature at which ice melts. It is taken as the temperature (273.15 K) at which ice and water are in equilibrium at standard pressure (101 325 Pa). It was used as a reference temperature on the Celsius scale, but the kelvin is based instead on the temperature at the triple point of water (273.16 K). ICF abbr. for intracellular fluid.

ichthyotocin an alternative name for isotocin.

icosa+ or (before a vowel) icos+ comb. form recommended for denoting twenty or twenty times. Also (formerly): eicosa+, eicos+. (Note: the eicos(a)+ variant is still always used for the C₂₀ fatty acids and skeletally related compounds, e.g. the eicosanoids.)

icosadeltahedron (pl. icosadeltahedra) any solid geometrical Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

figure obtained by dividing the triangular faces of an **icosa-hedron** into smaller triangles. If divided into more than four smaller triangles, the original faces will not be flat, in which case the 12 pentameric vertices will be supplemented by hexameric vertices.—**icosadeltahedral** adj.

icosahedral symmetry a form of cubic symmetry, being the crystallographic symmetry displayed by an icosahedron and by the capsid of some types of virus.

icosahedron (pl. icosahedra) any solid geometrical figure having 20 triangular faces, 30 edges, and 12 pentameric vertices. A regular icosahedron has faces that are congruent plane equilateral triangles; there is twofold rotational symmetry about an axis through the midpoint of each edge, threefold rotational symmetry about an axis through the centre of each face, and fivefold rotational symmetry about an axis through each vertex.—icosahedral adj.

icosanoate or (formerly) eicosanoate the systematic name for arachidate.

icosanoid the recommended name for eicosanoid, but not generally used.

ICRO abbr. for International Cell Research Organization.

ICSH abbr. for interstitial cell-stimulating hormone (i.e. luteinizing hormone).

ICSU abbr. for International Council of Scientific Unions.

ictorus (in pathology) an alternative name for jaundico.

icterogenic causing jaundice.

id or i.d. abbr. for 1 intradermal, or intradermally (alternative to ID). 2 inside diameter.

ID 1 (in clinical chemistry) abbr. for idital dehydrogenase (EC 1.1.1.14). 2 abbr. for intradermal, or intradermally (alternative to id).

ID50 or ID50 abbr. for median infectious dose.

idaric acid the aldaric acid derived from idose.

IDDM abbr. for insulin-dependent diabetes mellitus (see diabetes mellitus)

+ide suffix (in chemical nomenclature) denoting a lactide. It replaces the terminal '+ic acid' of the trivial name of the parent hydroxy acid, and a multiplying prefix indicates the number of molecules of hydroxy acid involved; e.g. dilactide (formed from two molecules of lactic acid).

ideal describing any object, process, or system that is perfect, or that behaves exactly in accordance with some simple law or theory. See also **ideal gas**, **ideal solution**. —**ideality** n.

ideal gas any gas whose behaviour is accurately described by the gas laws.

ideal solution any solution in which, for each component,

$$d\mu_i = RT \, d\ln x_i$$

where μ_i is the chemical potential of the *i*th component and x_i is its mole fraction, R is the universal gas constant, and T is the thermodynamic temperature. Integration of the above equation gives:

$$\mu_i = \mu_i^{\,o} + RT \ln x_i,$$

where μ_i^o is the standard chemical potential of the *i*th component.

idio+ comb. form denoting 1 peculiar, distinct, one's own, separate. 2 self-produced, arising within.

idiogram or karyogram a diagrammatic representation of the karyotype of a cell, based on measurement of the chromosomes in several or in many cells.

idiom (in immunology) the group of idiotypes to which the epitopes carried by components of one individual animal belong.

idiopathic 1 (in pathology) describing a disease arising by itself, not consequent upon, or symptomatic of, another disease; of the nature of a primary morbid state; essential. 2 of the nature of a particular affection or susceptibility. —idiopathy n.

idiopathic pentosuria see pentosuria (def. 1).

idiotope 1 the group of epitopes carried by components of one individual animal. 2 as originally defined by Jerne, an individual

ual determinant (i.e. site) on an antibody molecule; together, the idiotopes constitute the idiotype.

idiotype 1 an antigenic specificity, particularly of antibodies directed against a single antigen. 2 any class or group of related antigenic characteristics or idiotopes; an epitype that is characteristic of a particular animal. —idiotypic adj.

iditol the hexitol derived formally by reduction of the aldehyde group of idose. L-Iditol is a rare natural product accompanying sorbitol in the fermented juice of berries of mountain ash (Sorbus aucuparia).

IDL abbr. for intermediate-density lipoprotein.

iDNA abbr. for intercalary DNA.

IDNPAP abbr. for isethionyl-3-(N-2,4-dinitrophenyl)amino propioimidate; a reagent useful in the isolation of plasma membranes. It reacts with, but does not penetrate, the membranes and leaves the net charge on the proteins unaltered.

ido- prefix (in chemical nomenclature) indicating a particular configuration of a set of four (usually) contiguous >CHOH groups, as in the acyclic form of D- or L-idose. See monosaccharide.

Ido symbol for a residue (or sometimes a molecule) of the aldohexose idose.

IdoA symbol for a residue of iduronic acid.

idose symbol: Ido; ido-hexose; an aldohexose whose D- and L-enantiomers are epimeric at C-2, C-3, and C-4 with D- and L-glucose, respectively.

β-D-idose

idoxuridine 5-iodo-2'-deoxyuridine; a pyrimidine analogue, metabolized to the triphosphate, that inhibits DNA replication by substituting for thymidine in viral and mammalian DNA incorporation. It is used as an antiviral agent.

IDP abbr. for 1 the ribonucleotide inosine (5'-)diphosphate. 2 isopentenyl diphosphate (formerly called Δ^3 -isopentenyl pyrophosphate).

IDU abbr. for 5-iodo-2'-deoxyuridine (see idoxuridine).

IdUrd symbol for 5-iodo-2'-deoxyuridine (see **idoxuridine**) (preferred to IDU, IUdR, or IUDR).

iduronate 1 the anion of iduronic acid. 2 any salt or ester of iduronic acid.

iduronate-2-sulfatase EC 3.1.6.13; other name: chondroitinsulfatase; an enzyme that hydrolyses the 2-sulfate groups of the L-iduronate 2-sulfate units of dermatan sulfate, heparan sulfate, and heparin. Example (precursor) from human: database code IDS_HUMAN, 550 amino acids (61.80 kDa).

al animal. 2 as originally defined by **Jerne**, an individidirentic **acid** symbol: IdoA; the **uronic acid** formally derived Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

L-iduronidase

from idose by oxidation to a carboxyl group of the hydroxymethylene group at position 6. In nature α -linked L-iduronicacid residues, sulfated at position 2, occur in terminal positions in dermatan sulfate and heparan sulfate; these iduronic-acid residues are formed by epimerization of the configuration at C-5 of D-glucuronic-acid residues in these heteropolysaccharides.

L-iduronidase EC 3.2.1.76; an enzyme that hydrolyses α -L-iduronosidic linkages in desulfated dermatan. Example (precursor) from human: database code IDUA_HUMAN, 653 amino acids (72.58 kDa).

iduronosyl the glycosyl group formed by removal of the anomeric hydroxyl group from iduronic acid or iduronate.

IE abbr. for immunoelectrophoresis (alternative to IEP).

IEC abbr. for ion-exchange cellulose.

IED abbr. for individual effective dose. IED₅₀ denotes the median of the IEDs within a group of subjects.

IEF abbr. for isoelectric focusing.

IEP abbr. for 1 immunoelectrophoresis (alternative to IE). 2 or i.e.p. isoelectric point (pI preferred).

IF abbr. for initiation factor. Suffixed numerals are added to designate individual factors, e.g. **IF-1**, **IF-2**, **IF-2**a, **IF-3**. Eukaryotic initiation factors are generally denoted by the prefix 'e', e.g. eIF-2, eIF-3.

IF-1 an Escherichia coli initiation factor.

IF-2 an Escherichia coli initiation factor.

IF-3 an Escherichia coli initiation factor.

IFCC abbr. for International Federation of Clinical Chemistry. **IFN** abbr. for interferon. Suffixed Greek letters are added to differentiate the main classes, e.g. IFN-α, IFN-β, IFN-γ.

Ig symbol for immunoglobulin.

IgA symbol for immunoglobulin A.

IgA protease another name for IgA-specific serine endopeptidase. IgA-specific serine endopeptidase EC 3.4.21.72; other name: IgA protease; an enzyme that catalyses the cleavage of immunoglobulin A molecules at certain Pro-|-Xaa bonds in the hinge region. No small molecule substrates are known. It is an excreted bacterial serine proteinase. A signal peptide guides the enzyme precursor to the periplasmic space, and the C-terminal helper domain associates with the outer membrane to form a pore for excretion of the protease domain. The helper domain is then released by autoproteolysis. Example from Neisseria gonorrhoeae: database code IGA_NEIGO, 1532 amino acids (168.79 kDa).

IG cell the intestinal gastrin cell, a small, granulated, gastrin-producing cell occurring in the human upper small intestine. IG cells react both with gastrin-specific antisera and with antisera recognizing the C-terminal pentapeptide sequence common to gastrin and cholecystokinin (CCK). IG cells are smaller than, and ultrastructurally different from, CCK-producing I cells, gastrin-producing G cells of the gastric pylorus, and TG cells.

IgD symbol for immunoglobulin D.

IgE symbol for immunoglobulin E.

igensin a neutral cytosolic serine proteinease, activated by sodium dodecyl sulfate and found in a number of mammalian tissues.

IGF abbr. for insulin-like growth factor.

IGFBP abbr. for insulin-like growth factor binding protein.

IgG symbol for immunoglobulin G. Suffixed numerals are added to designate individual subclasses, e.g. IgG1, IgG2, IgG3, IgG4.

Ig-like domain see immunoglobulin fold.

IgM symbol for immunoglobulin M.

BIG-M1 see connective tissue growth factor.

BIG-M2 see connective tissue growth factor.

ignose the name first proposed for ascorbic acid by A. Szent-Györgyi, before he knew its structure. See also godnose,

IGT abbr. for impaired glucose tolerance.

li system a blood group system in which the antigenic determinant is an oligosaccharide structure. It is structurally related to the ABH system (see ABH antigens), anti-I and anti-i antibodies being inhibited by ABH and Lewis glycoproteins. Anti-I and anti-i are the major cold autoantibodies; the anti-I factors occur in the transient anemia accompanying viral or Mycoplasma pneumoniae infections; the i-specific antibodies are characteristic of the so-called chronic cold agglutinin disease, accompanying chronic lymphoproliferative diseases of the non-Hodgkin type. The structures of the determinants are: i determinant, $GlcNAc(\beta1-3)Gal(\beta1-4)GlcNAc(\beta1-3)Ga$

imidazc

ikaros a protein that binds and activates the enhancer of a gene CD3-δ involved in T-lymphocyte specification and maturation. Similar to hunchback, it is a zinc-finger protein. Example from mouse: database code IKAR_MOUSE, 431 amino acids (48.13 kDa).

L abbr. for interleukin. Various distinct interleukins are distinguished by suffixed numerals, e.g. IL-1, IL-2, IL-3, etc.

ILA abbr. for insulin-like activity.

He symbol for a residue of the α -amino acid L-isoleucine (alternative to I).

ileum the lower part of the small intestine, extending from the jejunum to the large intestine. —**ileal** adj.

illegitimate transcription transcription at a low level of a normally tissue-specific transcribing gene in nonspecific cells. **IM** or i.m. abbr. for intramuscular, or intramuscularly.

imidate 1 any salt or ester of an **imidic acid. 2** to convert an oxo diacid into its corresponding **imide.**—**imidation** *n*.

imidazole or (formerly) glyoxaline or iminazole 1,3-diazole; 1,3-diaza-2,3-cyclopentadiene; a weak base, $pK_a \approx 6.95$. The numbering and tautomerism of the imidazole ring are described at histidine.

imidazole 4-acetate a product of histamine metabolism; it results from the action of monoamine oxidase on histamine to form imidazole 4-acetaldehyde, which is then oxidized by an NAD⁺-dependent aldehyde dehydrogenase to imidazole 4-acetate. See also histidine.

imidazoline receptor any of a class of mitochondrial or plasma membrane binding sites for compounds from the generic groups imidazoles, imidazolines, imidazolidines, guanidines, and oxazolines, and having a putative endogenous ligand, agmatine. They occur throughout the brain, where they are possibly associated with glial cells, and in peripheral tissues. Two subtypes (at least) have been characterized pharmacologically: I1 receptors, which have high affinity for p-aminoclonidine and are localized in plasma membranes, and I2 receptors, which have high affinity for idazoxan and are localized in mitochondrial membranes. The latter are known alternatively as nonadrenergic imidazoline binding sites (NAIBSs). Photoaffinity labelling to at least three proteins occurs: two, of M_r 55 000 and 61 000, are found in rat liver and differ in their binding affinity for the guanidium, amiloride; a third, of M_r 61 000, is found in PC-12 cells and has high affinity for amiloride but low affinity for idazoxan. These proteins may represent different I₂ receptors. Subtypes of I₂ receptors are also suggested pharmacologically. The function of imidazoline receptors is not yet known, but many of the effects of imidazoline compounds, formerly attributed to their binding to α_2 receptors (e.g. hypotension) are now attributed to NAIBSs.

imidazolium 1 the cation formed by addition of a proton (hydron) to a molecule of **imidazole**. 2 the cationic chemical group formed by addition of a proton (hydron) to an **imidazolyl** group.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

imidazolyl

Bur Harte

immunoadso

imidazolyl the chemical group derived formally by removal of one hydrogen atom from imidazole. The position from which the hydrogen atom has been removed may be indicated, e.g. 2-imidazolyl. The imidazolyl group is present in histidine and its derivatives.

imide any secondary organic amide (i.e. any diacyl derivative of ammonia or a primary amine), especially any that is a cyclic compound in which both of the acyl groups (which may be the same or different) are derived formally or actually from a diacid. (Note: Noncyclic symmetrical secondary organic amides are generically termed diacylamines.)

+imide suffix (in chemical nomenclature) designating any organic compound that is an imide. The nitrogen atom may be substituted with a named alkyl or other group. An example is succinimide:

succinimide

imidic acid any derivative of a carboxylic acid in which the carbonyl oxygen atom of the carboxyl group has been replaced by an **imino** (def. 1) or alkylimino group; i.e. any containing the -C(=NR)-OH group. *Distinguish from* **imino acid**.

imido+ comb. form designating any inorganic oxo acid (including the anions, salts, and esters) in which =O has been replaced by =NH or =NR (where R is a named substituent), or any derived di-, tri-, etc. acid in which a bridging oxygen atom, -O-, has similarly been replaced by -NH- or -NR-; e.g., adenosine 5'-[β,y-imido]triphosphate.

lmigran see sumatriptan.

iminazole a former name for imidazole.

imine 1 any organic compound having the general structure R₂C=NR where R may be any organyl group or H. See also aldimine, azomethine, ketimine, Schiff base. 2 an obsolete term for azacycloalkane.

iminium the bivalent quaternary nitrogen-containing cationic group = *NR₂ attached to carbon in a chemical compound, where the R groups may each be hydrogen or any organyl group.

imino the bivalent group =NH attached to carbon in a chemical compound.

imino+ comb. form denoting the presence in a chemical compound of one or more **imino** groups; the number of imino groups in the molecule may be specified, e.g. diimino+.

imino acid any carboxylic acid in which an imino substituent replaces two hydrogen atoms. In biochemistry the term is commonly applied also to certain cyclic alkylamino (especially α -alkylamino) derivatives of aliphatic carboxylic acids, e.g. **proline**, although such compounds are now preferably classed as azacycloalkane carboxylic acids. Compare imidic acid.

iminodipeptidase see Pro-X dipeptidase.

imipenem a carbapenem β -lactam antibiotic that is a semisynthetic derivative of thienamycin produced by *Streptomyces cattleya*. Its broad-spectrum antibiotic actions resemble those of penicillins, i.e. inhibition of bacterial peptidoglycan synthesis.

immediate gene or immediate-early gene see early gene.

immediate hypersensitivity or type I hypersensitivity a type of hypersensitivity responsible for asthma, hayfever, and some types of eczema. It occurs within minutes of exposure to antigen and is dependent on the activation of mast cells and the release of mediators of acute inflammation. The mast cells bind immunoglobulin E (IgE) via their surface Fc receptors and when antigen cross-links the IgE, the mast cells degranulate releasing vasoactive amines that mediate the symptoms.

immobilize or immobilise to render any agent, whether a micro- or macrosolute, a particle, or an intact cell, nondispersible in an aqueous medium with retention of its specific ligating, antigenic, catalytic, or other properties. Immobilization may be achieved by, e.g., encapsulation, entrapment in a small-pore gel, adsorption on, or covalent linkage to, an insoluble supporting material (matrix), or through formation of aggregates by cross-linkage.

immobilized enzyme see solid-phase technique.

immortalization or immortalisation the transformation of a cell population with a finite life span to one possessing an infinite life span. It is a characteristic of cancer cells, and is of practical importance in, e.g., the creation of monoclonal antibodies. Immortalization of eukaryotic cells may be effected experimentally by infection with certain viruses, or by fusion of the cell with a neoplastic cell to form a hybridoma. —immortalize or immortalise vb.

immune 1 relating to or possessing immunity. 2 regarding or describing an animal that has been immunized. 3 an alternative word for immunological.

immune adherence the **complement**-dependent adherence of antibody-antigen complexes, or of antibody-coated bacteria (or other particles), to primate erythrocytes, causing the agglutination of the latter.

immune clearance an alternative term for immune elimination.
immune complex an alternative term for antigen-antibody complex.

immune complex-mediated hypersensitivity or type III hypersensitivity a type of hypersensitivity caused by the deposition of antigen-antibody complexes in tissue and blood vessels. The complexes activate complement and attract polymorphs and macrophages to the site.

immune cytolysis the **complement**-dependent lysis of cells by antibody molecules. When the cells concerned are erythrocytes the process is termed **immune hemolysis**.

immune elimination or **immune clearance** the accelerated, exponential removal of antigen from an immune animal as a result of complexing with antibody molecules.

immune globulin (sometimes) an alternative name for immunoglobulin.

immune hemolysis see immune cytolysis.

immune response the total immunological reaction of an animal to an immunogenic stimulus. It includes antibody formation, the development of hypersensitivity, and immunological tolerance.

immune serum an alternative term for antiserum.

immunity freedom and protection from 'infection'. Two forms of immunity can be recognized: (1) innate, meaning non-specific anti-microbial systems (e.g. phagocytosis) that are innate in that they are not intrinsically affected by prior contact with the infectious agent; and (2) the state of an animal that has an enhanced ability, above the nonimmune state, to respond to some (specific) antigen in which the antigen is bound and rendered inactive or eliminated from the body. See also active immunity, passive immunity.

immunization or **immunisation** any procedure carried out on an animal, e.g. the administration of antigen or antibody, that leads to an increased reactivity of the animal's immune system towards an antigen or antigens. —**immunize** or **immunise** vb.

immuno+ comb. form indicating immune or immunity.

immunoadsorbent any insoluble preparation of an antigen

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hễ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

immunoadsorption

immunogen

(or antibody) suitable for use in immunoadsorption. See also immunosorbent.

immunoadsorption the use of an insoluble antigen (or antibody) to remove specifically unwanted antibodies (or antigens) from a mixture so as to make the antibody (or antigen) more specific. Compare adsorption (def. 2). See also immunosorp-

immunoaffinity chromatography a type of affinity chromatography in which one of the two components of an antigen-antibody system is coupled to an insoluble matrix and used for the separation and purification of the other compon-

immunoaffinity column a chromatographic column used in immunoaffinity chromatography.

immunoassay 1 any of a group of techniques for the measurement of specific biochemical substances, commonly at low concentrations and in complex mixtures such as biological fluids, that depend upon the specificity and high affinity shown by suitably prepared and selected antibodies for their complementary antigens. A substance to be measured must, of necessity, be antigenic - either an immunogenic macromolecule or a haptenic small molecule. To each sample a known, limited amount of specific antibody is added and the fraction of the antigen combining with it, often expressed as the bound:free ratio, is estimated, using as indicator a form of the antigen labelled with a radioisotope (radioimmunoassay), fluorescent molecule (fluoroimmunoassay), stable free radical (spin immunoassay), enzyme (enzyme immunoassay), or other readily distinguishable label. The amount of the antigen in the sample is found by comparison with standards containing known amounts. See also heterogeneous immunoassay, homogeneous immunoassay, saturation analysis. 2 an alternative name for radioimmunoassay. 3 to carry out or to estimate (something) by an immunoassay (def. 1, 2).

immunobiology the branch of biology dealing with the activities of the cells of the immune system and their relationship to each other and to their environment. —immunobiological adj.

immunochemical 1 of or relating to immunochemistry. 2 any specific immunological reagent that consists of or incorporates an antigen or an antibody, especially one of commerce.

immunochemistry the branch of biochemistry dealing with the chemical nature of antigens, antibodies, and their interactions, and with the chemical methods and concepts as applied to immunology.

immunochromatogram the pattern of precipitation bands formed in immunochromatography.

immunochromatography any of various techniques for separating and identifying soluble antigens. In one method, analogous to immunoelectrophoresis, the antigens are first fractionated through a thin-layer chromatogram, e.g. of Sephadex; the fractions are then diffused against a trough containing a solution of antibodies (antiserum). In another method a small drop of antigen-antiserum mixture is applied to filter paper, or resin-impregnated paper, and the chromatogram developed with buffer; any antigen-antibody complex remains at the point of application and can be detected with a protein stain, while the other proteins are washed away from the origin.

immunocompetent cell an immunologically competent cell. immunocyte any immunologically competent cell.

immunocytochemistry cytochemistry using appropriately labelled antibody preparations to detect specific cellular components. —immunocytochemical adj.

immunodeficiency any condition in which there is a deficiency in the production of humoral and/or cell-mediated immunity. —immunodeficient adj.

immunodeterminant an alternative name for antigenic determi-

immunodiagnosis the diagnosis of disease by immunological

immunodiagnostic 1 of or relating to immunodiagnosis. 2 any specific immunological reagent used in diagnosis.

immunodiffusion any of various analytical methods by which components of soluble antigen or antibody mixtures may be distinguished. Essentially, the antigens and antibodies are allowed to diffuse towards each other in a translucent gel, wherein they react to gives lines or bands of precipitation in characteristic positions. Such methods include: double immunodiffusion, electroimmunodiffusion, immunochromatography, immunoelectrophoresis, immunorheophoresis, and single radial immunodiffusion. —immunodiffuse vb.

immunodominance the attribute of a part of an epitope that contributes a disproportionately great portion of the binding energy; e.g. the immunodominance shown by a monosaccharide residue in determining the antigenic specificity of a polysaccharide. —immunodominant adj.

immunoelectrofocusing or immunoisoelectric focusing a technique that is analogous to immunoelectrophoresis but with the preliminary fractionation of one of the reactants being effected by electrofocusing instead of electrophoresis.

immunoelectron microscopy a form of electron microscopy in which structures are stained with specific antibodies labelled with an electron-dense material.

immunoelectropherogram (sometimes) the record of an immunoelectrophoresis experiment, either the electrophoretic support itself or a tracing derived therefrom.

immunoelectrophoresis abbr.: IE or IEP; a technique for separating and identifying soluble antigens. It consists of zone electrophoresis, in a reasonably transparent gel, in one direction followed by immunodiffusion against a solution of antibodies (antiserum) placed in a trough parallel to the direction of electrophoresis. In suitable conditions each antigen shows up as an arc of precipitation in a characteristic position. —immunoelectrophoretic, immunoelectrophoretical adj.

immunoenzymatic of or pertaining to the particular techniques used in immunoenzymology.

immunoenzymology the subspeciality of immunochemistry in which the activity of enzymes coupled to antigens or antibodies is utilized as a molecular amplifier of antigen-antibody reactions.

immunofixation or immunofixation electrophoresis a variant of immunoelectrophoresis, or immunoelectrofocusing, in which proteins of a single immunological species are anchored to the support by treatment with monospecific antibodies, allowing the other proteins to be washed out of the support. It is useful in the identification of proteins in complex mixtures or of minor proteins obscured in electrophoretic patterns.

immunofluorescence or immunofluorescence microscopy a technique in which an antigen or antibody is made fluorescent by conjugation to a fluorescent dye and then allowed to react with the complementary antibody or antigen in a tissue section or smear. The location of the antigen or antibody can then be determined by observing the fluorescence by microscopy under ultraviolet light. - immunofluorescent adj.

immunogelfiltration a variant of radial single immunodiffusion in which antigen is first fractionated according to its molecular size by permeation, in a buffer solution, into a thin layer of an appropriate cross-linked dextran gel. The dextran layer is then covered with a layer of agarose gel containing antibody. Rings or spots of antigen-antibody precipitate develop in the agarose gel over the complementary antigens.

immunogen 1 any substance that, when introduced into the body, elicits humoral or cell-mediated immunity, but not immunological tolerance. 2 any substance that is able to stimulate an immune response, as distinct from substances (antigens) that can combine with antibody. 3 any substance that is able to stimulate protective immunity against a pathogen, as distinct from an immune response that is of no intrinsic value to the animal immunized. —immunogenic adj.

immunogenetics (functioning as sing.) the branch of biology that combines immunology and genetics. It includes the use of immunological methods and knowledge in the study of genet-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

immunogenicity immunor

ics, and the use of genetics in the study of immunological phenomena and substances. —immunogenetic adj.

immunogenicity an alternative term for antigenicity.

immunoglobulin symbol: Ig; any member of a group of proteins occurring in higher animals as major components of the immune system. They are produced by cells of the lymphocyte series, and virtually all possess specific antibody activity. Each immunoglobulin molecule essentially comprises four polypeptide chains, two identical heavy chains and two identical light chains, linked together by disulfide bonds; all contain in addition differing amounts of attached oligosaccharide. There are five classes, IgA, IgD, IgE, IgG, and IgM. The primary structures of the heavy chains differ among the various classes, being designated α , δ , ϵ , γ , and μ , respectively for the classes listed above, and there are two types of light chain, κ and λ . IgA and IgM molecules contain multiples of the four-chain unit. The homology units form a characteristic motif, the immunoglobulin fold. See also immunoglobulin A, immunoglobulin D, immunoglobulin E, immunoglobulin G, immunoglobulin M.

immunoglobulin A symbol: IgA; an immunoglobulin found in human plasma, where its role is uncertain. It occurs mostly as a 170 kDa monomer of the basic four-chain immunoglobulin structure or, as a 400 kDa dimer, together with an extra 15 kDa polypeptide, the **J chain**, linked to **secretory piece**. It is the major immunoglobulin of seromucous secretions, in which it is concerned in the defence of external body surfaces against attack by microorganisms. It has the structure $(\alpha_2 l_2)_n J$, where α is the heavy chain, 1 is the light chain $(\kappa$ or $\lambda)$, J is the J chain, and n is 1 or 2. Example, α_1 C region: database code ALC1_HUMAN, 353 amino acids (37.61 kDa). See also IgAspecific serine endopeptidase.

immunoglobulin D symbol: IgD; a 185 kDa immunoglobulin that is very susceptible to proteolytic degradation and has a very short half-life in plasma. It is found in large amounts on the surface of B lymphocytes together with immunoglobulin M; it is probable that these two immunoglobulins function as mutually interacting antigen receptors and play a part in the control of lymphocyte activation and suppression. It has the structure δ_{2l_2} where δ is the heavy chain and l is a light chain (κ or λ). Example, heavy chain (C region): database code DTC HUMAN, 383 amino acids (42.08 kDa).

immunoglobulin E symbol: IgE; a 200 kDa immunoglobulin of high carbohydrate content, normally found in very low concentrations in plasma, although its concentration there is elevated in a number of allergic conditions. IgE is synthesized mainly in lymphoid tissue of gut and respiratory tract. It binds strongly to mast cells and contact with antigen leads to degranulation of the mast cells and release of inflammatory mediators. It has the structure ε_{21} where ε is a heavy chain and 1 is a light chain (κ or λ). Example, heavy chain C region: database code EPC_HUMAN, 428 amino acids (46.97 kDa).

immunoglobulin fold a series of β strands, arranged as two antiparallel β sheets packed tightly against each other, that is highly characteristic of immunoglobulin structure. In the constant region, the two β sheets are formed from four and three β strands respectively. In the variable region there are nine β strands (five and four) rather than seven. This type of structure is found in many other proteins, especially cell surface receptors, and is often referred to as an Ig-like domain.

immunoglobulin G symbol: IgG; the principal immunoglobulin of human plasma and other internal body fluids. It is a 150 kDa protein and is the major immunoglobulin synthesized during the period of secondary response to an antigen. In the tissue fluids it neutralizes bacterial toxins and binds to microorganisms thereby enhancing their phagocytosis. Complexes of IgG with microorganisms activate complement by the classical pathway. IgG binds to macrophages and polymorphonuclear lymphocytes and can cross the placenta. It has the structure $\gamma_2 l_2$ where γ is a heavy chain and l is a light chain (κ or λ). There are subclasses of IgG depending on different types of γ chain. Example, IgG γ -1 C region: database code

GC1_HUMAN, 330 amino acids (36.06 kDa); 3-D structure known.

immunoglobulin M symbol: IgM; a 900 kDa immunoglobulin consisting of a star-shaped polymer of five basic four-chain structures, each heavy chain bearing an extra constant domain. Polymerization is dependent on the presence of **J chain**, which may act to stabilize the sulfhydryl groups in the constant portion of the heavy chains during IgM synthesis. IgM is produced early in the immune response and is mainly found intravascularly. Because of its high antigen-combining valency it is very effective in binding microorganisms and mediating complement-dependent cytolysis. It has the structure (µ2l2)5J where μ is a heavy chain, l is a light chain (κ or λ), and J is a J chain. Virgin B lymphocytes have an altered sequence at the C terminus of μ and the switch is effected by alternative splicing. Example, the protein from heavy chain disease, which has no C and CH1 regions due to deletion: database code MUCB_ HUMAN, 391 amino acids (43.00 kDa).

immunoglobulin superfamily a superfamily of proteins that have similarities of sequence and structure to immunoglobulins. The superfamily has been divided into three sets, based on immunoglobulin domains: one with variable-like domains, the V set, and two with different variants of the constant-like domains, the C1 and C2 sets.

immunogram (sometimes) the pattern of bands or lines of precipitation formed in a gel by **immunodiffusion**.

immunohistochemistry a form of **histochemistry** in which appropriately labelled antibody preparations are used to detect specific structures in tissues. —**immunohistochemical** adj.

immunoliposome a **liposome** bearing a chemically coupled monoclonal antibody.

immunolocalization or **immunolocalisation** the use of appropriately labelled antibody (or antigen) preparations to detect the position of specific structures or components that contain or are the complementary antigens (or antibodies).

immunological or (esp. US) immunologic of, concerned with, or pertaining to immunity or immunology. —immunologically adv

immunologically competent (of cells, tissues, etc.) qualified for and capable of giving an **immune response**.

immunological paralysis an alternative name for acquired tolerance.

immunological rejection the destruction, by a specific immune reaction, of foreign cells or tissues transplanted or inoculated into a recipient animal from a donor animal.

immunological response any specific response to an antigen. It includes cell-mediated immunity, humoral immunity, and immunological tolerance.

immunological surveillance the postulated monitoring of the cells of large, long-lived animals by their immunological systems so that aberrant cells arising from somatic mutations, and so containing new antigens, are destroyed.

immunological tolerance a type of immunological response in which there develops a specific nonreactivity of the lymphoid tissues towards a given antigen, one that in other circumstances is able to induce cell-mediated or humoral immunity. Immunological tolerance may follow contact with the antigen in fetal or early postnatal life or the administration of the antigen to adults (acquired tolerance). The reaction towards other, unrelated antigens is unaffected.

immunology the study of immunity and related phenomena. The science of immunology grew out of the study of resistance to infectious disease, and now encompasses the study of antigens, antibodies, and their interactions both in vivo and in vitro, and the cellular phenomena of recognition of, and responsiveness to, foreign substances. Related disciplines include immunobiology and immunochemistry.

the structure γ₂l₂ where γ is a heavy chain and l is a light chain (κ or λ). There are subclasses of IgG depending on different types of γ chain. Example, IgG γ-1 C region: database code Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

immunomodulation

immunomodulation the alteration of an immune response by an agent other than the antigen.

immunomodulator any agent that alters the extent of the immune response to an antigen, by altering the antigenicity of the antigen or by altering in a nonspecific manner the specific reactivity or the nonspecific effector mechanisms of the host. Immunomodulators include adjuvants, immunostimulants, and immunosuppressants.

immunoosmophoresis an alternative term for counter-(immuno)electrophoresis.

immunophenotyping the typing of cells with immunological markers such as monoclonal antibodies.

immunophilin any member of a family of receptors that includes the major FK506 binding protein FKBP and cyclophilin. These two proteins are unrelated in amino-acid sequence, but both possess peptidyl-prolyl isomerase activity which is blocked by immunosuppressants that block signal-transduction pathways leading to T-cell activation such as FK506 and rapamycin, which block FKBP, or cyclosporin A, which blocks cyclophilin. Example, the rapamycin-selective 25 kDa human immunophilin: database code FKB2_HUMAN, 224 amino acids (25.15 kDa).

immunoprecipitate 1 the precipitate formed in an antigenantibody reaction. 2 to precipitate (something) by reaction with a specific antibody or antigen.—**immunoprecipitation** n.

immunoradiometric assay abbr.: IRMA; an alternative method to radioimmunoassay for the measurement of very small amounts of nonradioactive material. An excess amount of a specific antibody labelled with a radioactive isotope is added to the sample containing the substance to be assayed. After equilibration, unreacted antibody is removed and the amount of radioactive material remaining is measured.

immunoreactive capable of reacting with a specific antibody. The term is used especially of substances that react with an antibody directed against a particular peptide hormone (or part of such a hormone) but that do not necessarily exhibit the expected physiological or pharmacological activity. —**immunoreactivity** n.

immunosorbent any sorbent used in, or useful for, immunosorption. See also immunoadsorbent.

immunosorption the use of antigens (or antibodies) immobilized on a solid matrix to remove specifically the complementary antibodies (or antigens) from a mixture and their subsequent elution from the solid phase. It is used in, and is useful for, purification of antibodies (or antigens). See also immunoadsorption.

immunostimulant any agent that nonspecifically enhances the immunologically specific reactivity of an animal to an antigen and also the animal's nonspecific effector mechanisms. —**immunostimulatory** adj.

immunosuppressant or (sometimes) **immunosuppressive** any agent that causes **immunosuppression**.

immunosuppressed describing an organism that is incapable of showing an immune response to an antigen.

immunosuppression the suppression of immune responses to antigens. This can be achieved by various means, including physical (e.g. X-irradiation), chemical (e.g. antimetabolic drugs), or biological (e.g. antilymphocyte serum). After transplant surgery azathioprine is commonly used. This drug has a preferential effect on T-cell-mediated reactions. It is degraded in the body first to mercatopurine and is then converted to the active agent, the ribotide, which inhibits nucleic-acid synthesis. Methotrexate, cyclophosphamide, cyclosporin A, and FK506 are also highly effective immunosuppressants, the latter two being used extensively. Infection by HIV-1 eventually leads to a reduction in the population of helper T-cells and macrophages. This immunosuppression of the system is associated with occurrence of Kaposi's sarcoma and allows infection by agents such as Pneumocystis carini, cytomegalovirus, and tuberculosis. Compare immunodeficiency. See also suppressor cell.

immunosuppressive 1 able to cause immunosuppression. 2 an alternative term for immunosuppressant.

immunosympathectomy the destruction of some or all of the neurons of the sympathetic nervous system by injections into a newborn animal of an antiserum to the appropriate **nerve** growth factor.

immunotoxin any of a class of therapeutic drugs consisting of a monoclonal antibody linked to a toxic protein (e.g. ricin, diphtheria toxin).

iMP abbr. for 1 inosine monophosphate; i.e. inosine phosphate.2 ion-moderated partition.

impaired glucose tolerance abbr.: IGT; the term recommended to denote a clinical state or condition of humans that is intermediate between the normal one and the overtly diabetic. Characteristically, in a standard oral glucose-tolerance test in non-pregnant adults, the glucose concentration in capillary whole blood or venous plasma taken at 2 hours is in the range 8-11 mmol L⁻¹ (1.4-2.0 g L⁻¹); the corresponding values for venous whole blood are 7-10 mmol L⁻¹ (1.2-1.8 g L⁻¹). In addition, the fasting plasma glucose must be below 8 mmol L⁻¹, and plasma glucose during the test must be greater than 11 mmol L⁻¹ at 30, 60, and 90 min.

IMP cyclohydrolase EC 3.5.4.10; other names: IMP synthetase; inosinicase; an enzyme of the pathway for de novo purine biosynthesis that cyclizes 5-formamido-1-(5'-phosphoribosyl)imidazole-4-carboxamide to IMP with elimination of H₂O. For an example, see phosphoribosylaminoimidazolecarboxamide formyltransferase.

IMP dehydrogenase EC 1.1.1.205; other name: inosine-5'-monophosphate dehydrogenase; an enzyme that catalyses the conversion of inosine 5'-phosphate, NAD⁺, and H₂O to xanthosine 5'-phosphate and NADH. The reaction involves the introduction of an oxo group at the purine C-2. Xanthosine 5'-phosphate is then converted to guanosine 5'-phosphate by GMP synthase (glutamine hydrolysing). Examples from human, in which there are two isoenzymes: database code IMP1_HUMAN, 514 amino acids (55.39 kDa); database code IMP2_HUMAN, 514 amino acids (55.74 kDa).

impedance symbol: Z; the quality determining the amplitude of the current flowing in a circuit for a given applied alternating electric potential. It depends upon the electric resistance, self-inductance, and capacitance of the circuit.

impeller 1 the vaned, rotating disk of a centrifugal pump.2 any device incorporating an impeller (def. 1).

impermeable (of a substance or structure) not permitting the passage through it of a fluid or of a particular solute in a fluid; not permeable. —**impermeability** n.

impermeant (of a fluid or a solute in a fluid) incapable of passing through a particular substance or structure.

imprinting (in genetics) the differential degree to which the effects of maternally and paternally derived DNA are exerted. For example, the onset of Huntington's disease is earlier if the defective allele is inherited from the father rather than the mother.

impulse 1 (in physics) a vector quantity equal to the integral of the force, F, acting on a body with respect to the time, t, over which the force acts: |Fdt. If the force is constant the expression reduces to the product Ft. It also equals the total change of momentum of the body induced by the applied force. 2 (in physics) an electrical surge of unidirectional polarity. 3 (in physiology) or nerve impulse an all-or-none signal propagated along the axons of neurons by which information is transmitted rapidly and precisely through the nervous system. It consists of a sequence of changes in ionic permeability of the neuronal membrane that gives rise to ionic currents and associated changes in transmembrane electrical potential.

impure not pure, lacking purity; (of a substance or material) containing contaminants.

uch as *Pneumocystis carini*, cytomegalovirus, and impurity 1 the state or quality of being impure. 2 any or all of cosis. *Compare* immunodeficiency. *See also* suppressor cell.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

impurity quenching

impurity quenching chemical quenching due to an impurity (def. 2)

In symbol for indium.

inappropriate secretion a clinical syndrome in which the secretion of a specified hormone, commonly antidiuretic hormone, is abnormally high relative to the state of the normal regulatory mechanisms. It is so termed because it results from an unknown or unmistakably abnormal cause and serves no recognizable homeostatic function.

inborn error of metabolism any of the genetically determined biochemical variations occurring in humans. They are highly specific and represent many diverse metabolic phenomena, resulting in very varied effects on the viability of the individual.

inbred strain or **inbred line** a group of organisms obtained by repeated inbreeding over several successive generations, e.g. by self-pollination in plants or by repeated brother × sister matings in animals. Eventually, all individuals will possess identical sets of **autosomes**, and all the chromosome pairs will become homozygous.

inclusion (in cytology) 1 any discrete body or particle within a cell, especially a passive product of cell activity such as a starch or volutin granule. 2 an alternative (less common) name for inclusion body.

inclusion body or inclusion 1 any discrete assembly of virions and/or viral particles that may be visualized in virus-infected cells, either in the nucleus or in the cytoplasm. 2 (in bacteriology) any one of a number of bodies found within bacterial cells, e.g. storage granules, gas vacuoles, carboxysomes.

inclusion cell abbr.: I cell; a type of cell that is seen in tissues from patients with mucolipidosis II (I-cell disease) and that contains inclusions consisting of very large lysosomes whose contents are heterogeneous, comprising mucopolysaccharide, whorls of membrane, and other material.

inclusion-cell disease or mucolipidosis II see I-cell disease.

inclusion complex or inclusion compound any chemical complex in which one component (the host molecule) forms a crystal lattice containing tunnel- or channel-shaped spaces in which molecular entities of a second species (the guest molecule) are located. There is no bonding between the host and the guest molecules.

incompatibility 1 a criterion for classifying bacterial plasmids; two plasmids of the same incompatibility group cannot coexist in one host cell. The molecular basis is that the incompatible plasmids share sites during plasmid segregation (def. 3). 2 the state of being incompatible.

incompatibility group a group to which plasmids are said to belong if they cannot coexist in the same bacterial host over several generations without selection.

incompatible 1 (in immunology) having antigenic nonidentity between a donor and a recipient, e.g. in blood transfusion or tissue transplantation. 2 (in therapeutics) (of two drugs) incapable of being used together or combined; antagonistic.

incomplete antibody 1 any antibody whose activity in an agglutination test can only be demonstrated indirectly, e.g. by an antiglobulin test. 2 (sometimes) a univalent antibody fragment produced enzymically, e.g. a Fab fragment.

incomplete Freund's adjuvant see Freund's adjuvant.

incorporation 1 the act or process of including (something) as a part of a whole. 2 (in biochemistry) the inclusion of (isotopically labelled) metabolites, by covalent linkage, into biopolymers by living cells or cell-free preparations; often taken as an index of biosynthesis. —incorporate vb.

incretin a putative insulinogenic principle secreted from the duodenum and jejunum in response to the presence of glucose. Its effects are now generally considered to be attributable to glucose-dependent insulinotropic peptide.

incubate 1 to maintain at an appropriate temperature so as to favour growth, development, or continued survival (e.g. of cells); by extension, to maintain under specified conditions in a controlled or artificial environment (e.g. in studies of en-

zymic or antigen—antibody reactions), especially at a particular ambient temperature (which may be above or below that of the environment). 2 a material or preparation that has been incubated. —incubation n.

incubation mixture any reaction mixture that is maintained at a controlled temperature and/or in a controlled, artificial environment.

incubation period 1 (in pathology) the time interval between the invasion of an organism by a pathogenic virus or microorganism and the overt manifestation of disease. 2 (in microbiology) the period of development of a culture of bacteria or other microorganisms.

incubator any closable, heat-insulated cabinet that is maintained at a constant internal temperature (and, sometimes, humidity and/or atmosphere) and that is used for the growth or maintenance of cells, cultures, tissues, or organisms, or for the hatching of eggs.

Inderal see propranoiol.

index of refraction see refractive index.

Indian tobacco see lobelia.

indican 1 metabolic indican indol-3-yl hydrogensulfate; 3-indoxylsulfuric acid; a so-called ethereal sulfate, formed in the gut by bacterial action on tryptophan and excreted in the urine, where its level may be taken as an index of intestinal stagnation. 2 plant indican indol-3-yl- β -D-glucopyranoside; indoxyl- β -D-glucoside; a substance isolated from Indigofera spp., members of the Leguminosae, and Polygonium tinctorium. The glucoside is hydrolysed during extraction by water or dilute acid, and the indoxyl is liberated spontaneously, oxidizing to the blue dye indigo.

indicated hydrogen symbol: H- (or sometimes H) (with a prefixed locant); (in chemical nomenclature) an atom of hydrogen whose position in the molecular structure of an unsaturated cyclic organic compound or group requires to be explicitly stated in order to make the name of the compound or group specific to a particular structural isomer (or tautomer) if otherwise the name would apply equally to two or more isomers (or tautomers). The compound or group in question commonly consists of or is derived from a condensed ring system with the maximum number of non-cumulative double bonds, although the notation is applied also to certain monocyclic systems. The symbol (with its locant) ordinarily precedes the name or the relevant part of the name, e.g. 1H-purin-6-amine or 6-amino-1H-purine (alternative semisystematic names for one of the tautomers of adenine); however, where the insertion of a substituent into a cyclic structure has necessitated the addition of a hydrogen atom at another position the symbol is placed in parentheses after the locant for the substituent, e.g. purin-6(1H)-one (a semisystematic name for one of the tautomers of hypoxanthine).

indicator 1 any substance used in a chemical operation to indicate by a colour change the completion of a reaction or the attainment of a desired state. 2 any substance that by a characteristic colour change indicates the presence of another particular substance. 3 (in saturation analysis) the labelled substance whose distribution between the reactants of the system is used to determine the amount of analyte present. 4 an isotope, often a radioactive one, that is used as a tracer.

indicator enzyme an alternative name for marker enzyme.

indicator organism or indicator species any species of organism whose presence or population characteristics in a particular habitat are used to provide information about the nature of that habitat, especially regarding its degree of pollution.

indicator yellow the original name for N-retinylidene opsin. It was so called because its colour changes between yellow and orange according to the pH of its aqueous solution. It spontaneously hydrolyses into opsin and (all-trans-)retinal. See rhodopsin.

indigo a blue dye prepared from the same plants as plant indican, Its major blue component is indigotin.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

infe

indigotin $[A^{2,2'}$ -biindoline]-3,3'-dione; the major blue component of **indigo**.

indirect antagonism a form of antagonism (def. 2) arising as a consequence of competition by the antagonist for the binding site of an intermediate that links receptor activation to the observed effect.

INDO-1 1-[2-amino-5-(6-carboxyindol-2-yl)phenoxy-2-(2-amino-5-methylphenoxy)ethane-N,N,N',N'-tetraacetic acid; a fluorescent calcium chelator, named from the indolyl moiety, that can be used as an indicator of Ca²⁺ concentration; it has a large shift in fluorescence emission, from 480 to 400 nm, on binding Ca²⁺.

indole 2,3-benzopyrrole; a compound formed by the degradation of tryptophan.

indoleacetate abbr.: IAA; the anion of indole-3-acetic acid. Formed from L-tryptophan, it is a plant hormone, and the main auxin of higher plants.

indoleacetonitrile abbr.: IAN; an auxin, second in abundance to indoleacetate.

indole-3-glycerol-phosphate synthase see trp genes.

indole test a test used for the identification of certain microorganisms, e.g. members of the Enterobacteriaceae. It determines the ability of the organism to produce indole from tryptophan.

indolicidin a bactericidal and fungicidal 13-residue peptide amide from the cytoplasmic granules of bovine neutrophils. It contains five tryptophan residues, hence its name. Some therapeutic success has been achieved in animals against the fungus, Aspergillus fumigatus, using liposomally encapsulated indolicidin, indicating that neutrophil-derived antimicrobial peptides may have therapeutic value.

indoluria the presence in (human) urine of compounds containing an indole ring.

indomethacin 1-(p-chlorobenzoyl)-5-methoxy-2-methylin-dole-3-acetic acid; an inhibitor of prostaglandin-endoperoxide synthase. It is useful as an anti-inflammatory drug.

INDOR abbr. for internuclear double resonance spectrometry. **induced enzyme** or **inducible enzyme** any enzyme that is synthesized in a cell only in very small amounts except when induced by the presence of its substrate or a closely related compound. Compare constitutive enzyme.

induced-fit theory a possible explanation, first proposed by D. E. Koshland, of enzyme specificity. It suggests that reaction between an enzyme and its substrate can occur only following a change in the enzyme's structure, induced by the substrate itself. It is proposed that: (1) a precise orientation of catalytic groups is required for enzyme action; (2) the substrate may cause an appreciable change in the three-dimensional relationship of the amino-acid residues at the active site; and (3) the changes in enzyme structure caused by a substrate will bring the catalytic groups into the proper orientation for reaction, whereas a nonsubstrate will not. It is similar to the zipper model of hormone-receptor interaction. Compare lock-and-key model.

inducer any compound that causes cells to produce larger amounts of the particular enzymes involved in its uptake and/or metabolism (or in the uptake and/or metabolism of a structurally similar compound), than are found in cells when the inducer is absent.

inducible capable of being induced.

inducible enzyme an alternative name for induced enzyme.

induction 1 see Jacob-Monod model. 2 (in physics) any physical effect brought about (i.e. induced) in an object by the action of a field without any direct physical contact with the inducer. It may be electrostatic, magnetic, or electromagnetic. See also induced enzyme.

induction coil a device for producing a rapid succession of large pulses of induced emf in a secondary coil from an intermittent low emf in a primary coil.

induction motor an electric motor in which an alternating current is supplied to the winding of the stator, arranged in such a manner as to produce in effect a rotating magnetic field. This in turn induces electric currents in the winding of the rotor, and interaction between these currents and the magnetic flux exerts a torque on the rotor. Induction motors are useful in situations where sparks caused by moving electric contacts are undesirable.

inductive effect (in chemistry) symbol: I; an experimentally observable effect (on reaction rates, etc.) caused by the transmission of charge through a chain of atoms by electrostatic induction. It is symbolized by +I or -I, according to whether the group in question is left with a small positive or a small negative charge

+ine suffix designating 1 an organic compound that is either an amine (including any monoamino monocarboxylic acid other than tryptophan), or a nitrogen-containing heterocycle other than one containing four or five atoms in the ring. 2 a halogen. 3 any of a group of certain inorganic binary hydrogen compounds, namely arsine, bismuthine, phosphine, and stibine; also hydrazine.

inert 1 having little or no ability to react chemically or physiologically. 2 having no inherent ability to move or resist being moved. —inertness n.

inertia 1 (in physics) the tendency of an object to resist changes to its state of rest or uniform motion; by analogy extended to other physical qualities that resist change. 2 the state of being inert or inactive. —inertial adj.

inertial mass see mass.

infect 1 to cause infection in (an organism, wound, etc.), especially with pathogenic microorganisms. 2 to affect or become affected with a communicable disease.

infection 1 the invasion of a cell or organism by other (especially pathogenic) organisms. 2 the act or process of infecting; the state of being infected. 3 any agent or process that infects.

infectious 1 (of a disease) caused by pathogenic (micro)organisms. 2 causing or transmitting infection. 3 (of a disease) capable of being transmitted to another organism. —infectiously adv.; infectiousness n.

infectious mononucleosis see Epstein-Barr virus.

infectious viral nucleic acid a purified viral nucleic acid that, when it infects a host cell, causes the production of progeny viral particles.

d. Compare constitutive enzyme. infective 1 capable of causing infection. 2 an alternative (less Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

initial ve infinite

common) word for infectious. —infectively adv.; infectiveness or infectivity n.

infinite having no limits in extent, magnitude, space, or time; immeasurably numerous or great. —infiniteness n.; infinitely

infinite dilution a hypothetical state (of a solution) in which the solute concentration is considered to be zero and the activity coefficient unity.

infinitely thick (of a radioactive sample) having a thickness no less than infinite thickness for the particular radionuclide to be measured.

infinitely thin (of a radioactive sample) having a thickness no greater than infinite thinness for the particular radionuclide to be measured.

infinite thickness the thickness of a sample containing a particular radionuclide, especially a soft beta-emitter, beyond which, because of self-absorption, any increase results in no further increase in recordable disintegrations. Under these conditions the (radio)activity is proportional to the specific (radio)activity of the substance.

infinite thinness the thickness of a sample containing a particular radionuclide at or below which self-absorption is negligible. Under these conditions the (radio)activity is proportional to the amount of the radionuclide present.

inflammable very liable to catch fire and produce flame; flammable.

inflammation the immediate defensive reaction of vertebrate tissue to infection or to injury by chemical or physical agents. The part affected is characterized by pain, heat, redness, swelling, and loss of function; there is local vasodilatation, extravasation of plasma into the intercellular spaces, and accumulation of white blood cells and other macrophages in the injured part. Plasma enzyme systems are important sources of inflammatory mediators. These include the complement, blood coagulation, fibrinolytic, and kinin systems. Also active are the mediators released by mast cells, basophils, and platelets, as well as the eicosanoids generated by many cells at inflammatory sites. —inflame vb.

informatics the science concerned with the structure and properties of scientific information, its theory, history, methodology, and organization. Compare information science. -- informatical adj.; informatician n.

informatin see informofer.

information 1 communicated or communicable factual knowledge; data; news. 2 genetic information. 3 (in computing) the results obtained by processing raw data according to programmed instructions.

informational 1 of, pertaining to, giving, or carrying information. 2 (in biochemistry) describing any biological macromolecule that contains or transmits genetic information in the form of specific sequences of nucleotides or amino acids.

information retrieval the selective tracing and recovery of information stored in printed works, computers, etc.

information science the science concerned with the procedures by which information, especially scientific or technical information, is stored, retrieved, and disseminated. Compare informatics.

information theory the quantitative theory of the coding and transmission of signals and information.

informofer a specific, 30S macroglobular particle consisting of the protein informatin. Informofers are present in the cell nucleus, tightly packed along molecules of heterogeneous nuclear RNA.

informosome a cytoplasmic mRNA-carrying ribonucleoprotein particle of relatively low buoyant density. Informosomes are believed to function in the protection of mRNA from nuclease attack and in the transport of mRNA from the nucleus to the cytoplasm.

infra+ prefix denoting below, beneath, coming after, within.

infradian describing any biological activity that occurs, or varies cyclically, more often than once every 24 hours. Compare circadian, ultradian.

infranatant 1 lying below. 2 a solid or liquid lying below a supernatant liquid. Compare subnatant.

infrared of, pertaining to, or being infrared radiation.

infrared dichroism the dichroism of polarized infrared radiation. It is used in studies of polypeptide structure.

infrared radiation abbr.: IR or i.r.; electromagnetic radiation of wavelengths in the range 730 nm to 1 mm (frequencies 300 GHz to 410 THz). This range lies between those of visible light and microwaves.

infrared spectrophotometer any instrument for infrared spectrophotometry.

infrared spectrophotometry the measurement of the absorption or emission of infrared radiation at particular wavelengths or frequencies. See infrared spectrum.

infrared spectrum any absorption spectrum or emission spectrum of infrared radiation. It includes photons that are absorbed or emitted during vibrational and rotational transitions in a molecule. Infrared spectra are widely used in organic chemistry to identify particular groups of atoms by their characteristic vibrational frequencies.

infuse 1 to introduce gradually, as of a solution into a vein or body cavity. 2 to make an infusion (def. 2).

infusion 1 the process of infusing. 2 an extract, e.g. of meat or leaves, obtained by soaking in water.

ingest to take material, e.g. food or liquid, into a cell or organism. —ingestible adj.; ingestion n.; ingestive adj.

inhibin one of several polypeptides (another is activin of the transforming growth factor β family) that participate in differentiation and growth of diverse cell types. Inhibin and activin are glycoproteins, secreted by the gonads. Inhibin inhibits secretion of follicle-stimulating hormone by the pituitary. It is present in seminal plasma and follicular fluid. It has an M_r of 31 000, and consists of two subunits crosslinked by disulfide bridges. There are two isoforms, A and B, with the same a subunit but different β subunits. Inhibin A is a dimer of α and β_A subunits, and inhibin B is a dimer of α and β_B subunits. Example of the a chain, from Mus musculus: database code IHA_MOUSE, 366 amino acids (39.54 kDa). The inhibin/activin precursor is a protein generated by alternative splicing of a gene for subunits for both activin and inhibin. Examples of B chains, inhibin β_A chain (precursor) from human (other name: erythroid differentiation protein; abbr.: EDF): database code IHBA_HUMAN, 426 amino acids (47.39 kDa); amino acids 311-426 are the inhibin β_A chain; inhibin β_B chain (precursor) from Bos taurus: database code IHBB_BOVIN, 408 amino acids (44.89 kDa).

inhibit 1 to restrain or hinder. 2 to stop, prevent, or reduce the rate of (some process, e.g. the growth or functioning of an organism or part of an organism, or a chemical or enzymic reaction)

inhibition constant symbol: K_i ; the equilibrium (dissociation) constant for the reaction: EI \rightleftharpoons E + I. It is given by K_i = [E][I]/[EI], where E is the enzyme and I the inhibitor, the square brackets indicating concentrations.

inhibition index an inverse measure of the potency of an antimetabolite. It is the ratio of the concentration of antimetabolite that is required to inhibit the biological effect of unit concentration of corresponding metabolite.

inhibitor 1 any agent that inhibits. 2 (in biochemistry) any substance that inhibits an enzymic reaction. See also competitive inhibition, noncompetitive inhibition, uncompetitive inhibition.

initial velocity or initial steady-state rate symbol: v_0 or v; the reaction velocity in the earliest stage of an enzyme-catalysed reaction. It is given by the tangent at the origin to the curve of reaction velocity as a function of time. In practice it is often measured over the period when the initial substrate concentra-

Compare sub+, supra+, ultra+ (def. 1). tion has diminished by <5%. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

332 initiation

initiation 1 the formation of initiation complex(es) at the start of ribosome-mediated translation of mRNA into polypeptide. 2 the first stage in carcinogenesis, in which a normal cell is converted to a precancerous one. 3 the first step in a chain reaction. —initiate vb.; initiatory adj.

initiation codon or initiator codon the codon AUG (or, sometimes in prokaryotes, GUG) that binds N-formylmethionyltRNA_f^{Met} in prokaryotes or initiator methionyl-tRNA_f^{Met} in eukaryotes, and serves as a signal for the start of polypeptide synthesis at the ribosome.

initiation complex any of the complexes formed at the start of ribosome-mediated translation of mRNA into polypeptide. They contain mRNA, initiation factors, initiator fMet-tRNA $_{\rm f}$ or Met-tRNA $_{\rm f}^{\rm Met}$, one or two ribosomal subunits, and sometimes GTP. See initiation factor.

initiation factor abbr.: IF (in prokaryotes) or eIF (in eukaryotes); any of a group of soluble proteins that function in the initiation of ribosome-mediated translation of mRNA into polypeptide. Among prokaryotic initiation factors, those of Escherichia coli are well characterized. This organism has three principal initiation factors, each consisting of a single polypeptide chain. IF-1 is a basic, stable protein of M_r 9000. It is a stimulator of IF-2 and IF-3. Example: database code IF1_ECOLI, 71 amino acids (8.11 kDa). There are two forms of IF-2: IF-2a, which is acidic, unstable, and of M_r 115 000 and the almost equally active artefactual product, IF-2b, formed by limited proteolysis of IF-2a. It is a GTP-binding protein, protects formylmethionyl-tRNA_f^{Met} from spontaneous hydrolysis, and promotes its binding to the 30S ribosomal subunits; it is also involved in the hydrolysis of GTP during the formation of the 70S ribosomal complex. By using alternative initiation codons in the same reading frame, the gene is translated to give three isozymes, α (example), β, and β', having different N termini. Example: database code IF2_ECOLI, 894 amino acids (97.74 kDa). IF-3 is a basic, stable protein of M_r 22 000. It binds to the 30S ribosomal subunit and shifts the equilibrium between 70S ribosomes and their subunits in favour of the free subunits, thus enhancing the availability of 30S subunits on which protein synthesis initiation begins. It is also a translational repressor of its own gene. Example: database code IF3_ECOLI, 180 amino acids (20.54) kDa). IF-1, IF-2, and IF-3 bind cooperatively to a 30S ribosomal subunit to form a 30S·IF-1·IF-2·IF-3 particle in which the three initiation factors are bound contiguously near the 3' end of 16S RNA in a 30S ribosomal subunit. This particle subsequently binds mRNA at a site that includes the initiation codon AUG (or GUG), initiator fMet-tRNA_f^{Met}, and GTP with concomitant release of IF-3 to form a 30S initiation complex, 30S·IF-1·IF-2·mRNA·GTP·fMet-tRNAfet. Joining of a 50S ribosomal subunit with concomitant release of IF-1, IF-2, GDP, and P_i forms a 70S initiation complex, mRNA·70S· fMet-tRNAf Met.

In eukaryotes there are more initiation factors and many have been characterized in lysates of rabbit reticulocytes, they include: eIF-1 (single polypeptide chain, M_r 15 000); eIF-2 (three nonidentical polypeptide chains, M_r 150 000); eIF-3 (nine nonidentical polypeptide chains, M_r 700 000); eIF-4A (single chain, M_r 49 000); eIF-4B (single chain, M_r 80 000); eIF-4C (single chain, M_r 17 500); eIF-4D (single chain, M_r 16 500); eIF-5 (single chain, M_r 190 000); Co.eIF-2 (single chain, $M_{\rm r}$ 22 000); cap-binding protein (single chain, $M_{\rm r}$ 24 000). eIF-2, initiator Met-tRNA $_{\rm f}^{\rm Met}$, and GTP form a ternary complex; eIF-3 promotes ribosomal dissociation and stabilizes binding of ternary complex to a 40S ribosomal subunit to form the complex 40S·eIF-2·eIF-3·Met-tRNA_f^{Met}·GTP. Then eIF-1, eIF-4A, eIF-4B, eIF-4C, and cap-binding protein promote binding of mRNA and ATP-dependent formation of a 40S initiation complex, 40S·eIF-2·eIF-3·Met-tRNAf MetmRNA. Factor eIF-5 is required for formation of an 80S initiation complex, 80S Met-tRNA, from a 40S complex, together with hydrolysis of the bound GTP and release

of initiation factors. Co.eIF-2 stimulates ternary complex for-

initiation signal 1 any of the purine-rich regions of mRNA on the 5' side of the initiation codon that serve to distinguish the latter from other similar codons. 2 any of the promoter regions of DNA on the 5' side of the start of transcription to form mRNA.

initiator 1 a gene product that interacts specifically with the replicator site on a replicon resulting in the initiation of a new round of DNA replication. 2 a starting point for either nucleicacid transcription or translation. 3 a carcinogen that initiates the first stage of carcinogenesis. 4 any compound that, when added to monomer, initiates a polymerization reaction.

initiator codon see initiation codon.

initiator transfer RNA abbr.: tRNAfet; any of the tRNA molecules that, when aminoacylated, specifically binds to an initiation codon (usually AUG) in mRNA at the start of ribosome-mediated translation of mRNA into polypeptide. In prokaryotes it is N-formylmethionyl-tRNA_f^{Met}, and in eukaryotes it is methionyl-tRNA_f^{Met}; neither is able to promote the insertion of methionine residues at internal sites.

innate being an essential characteristic of an organism or thing; inborn.

innervation the nerve supply to an organ or part.

Ino symbol for a residue of the ribonucleoside inosine (alterna-

inoculate 1 to introduce cells, microorganisms, or viruses into or onto a culture medium. 2 to introduce causative agents of disease (alive, dead, or attenuated) into an animal or person for the purpose of immunization. —inoculation, inoculator n.; inoculative adj.

inoculum (pl. inocula) a quantity or suspension of cells, microorganisms, or viruses used to start a new culture or to infect another culture; something used to inoculate.

Ino-3',5'-P symbol for inosine 3',5'-phosphate.

Ino5'P symbol for inosine 5'-phosphate.

Ino5'PP symbol for inosine 5'-diphosphate (alternative to ppI). Ino5'PPP symbol for inosine 5'-triphosphate (alternative to

inorganic not having the characteristics of living organisms; not organic.

inorganic biochemistry the branch of biochemistry concerned with the role of inorganic substances in biochemical systems. Compare bioinorganic chemistry.

inorganic chemistry the branch of chemistry dealing with the elements and all their compounds other than ones containing carbon, except for carbon itself and some simple compounds of carbon, e.g. oxides, sulfides, and cyanides.

inorganic diphosphate symbol: PPi; any of the anions formed from diphosphoric acid, (HO)₂PO-O-PO(OH)₂, or any mixture of the acid and its anions. The older term inorganic pyrophosphate may be retained but is now less preferable.

inorganic phosphate or inorganic orthophosphate symbol: Pi; any of the anions formed from [ortho]phosphoric acid, PO(OH)₃, or any mixture of the acid and its anions.

inorganic pyrophosphatase an enzyme, EC 3.6.1.1, often less precisely termed pyrophosphatase; systematic name: pyrophosphate phosphohydrolase. It catalyses the hydrolysis of pyrophosphate by two molecules of orthophosphate. Example from Escherichia coli: database code IPYR_ECOLI, 175 amino acids (19.55 kDa).

inorganic pyrophosphate another (less preferred) term for inorganic diphosphate.

iNOS see nitric-oxide synthase.

inosinate 1 either the mono- and/or the di-anion of inosinic acid. 2 any mixture of the acid and its anions. 3 any salt or ester of inosinic acid.

inosine symbol: I or Ino; hypoxanthosine; hypoxanthine riboside; $9-\beta$ -D-ribofuranosylhypoxanthine; a nucleoside found free, especially in meat, sugar beet, and yeast, but not in comether with hydrolysis of the bound GTP and release bination in nucleic acids except in the anticodons of some Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. inosine 3',5'-(cyclic)phosphate

transfer RNAs. It may be formed by the action of adenosine deaminase (EC 3.5.4.4) in the first step of the breakdown of adenosine to uric acid, and it occurs as an intermediate in the recycling of both adenosine and inosine 5'-phosphate by salvage pathways.

inosine 3',5'-(cyclic)phosphate or inosine 3',5'-cyclophosphate see inosine 3',5'-phosphate.

inosine 5'-diphosphate symbol: Ino5'PP or ppI; recommended name for inosine diphosphate (abbr.: IDP), 5'-diphosphoinosine, 5'-inosinyl phosphate, inosine 5'-(trihydrogen diphosphate). It is an intermediate in the formation of inosine 5'-triphosphate from inosine 5'-phosphate.

inosine monophosphate abbr.: IMP; an alternative name for any inosine phosphate, but particularly for inosine 5'-phosphate, especially when its distinction from inosine (5'-)diphosphate and inosine (5'-)triphosphate requires emphasis.

inosine-5'-monophosphate dehydrogenase see IMP dehy-

inosine phosphate inosine monophosphate (abbr.: IMP); any phosphoric monoester or diester of inosine. Of the three possible monoesters - the 2'-phosphate, the 3'-phosphate, and the 5'-phosphate - only inosine 5'-phosphate is of any importance (the locant being omitted if no ambiguity may arise). The only diester of significance is inosine 3',5'-phosphate.

inosine 3',5'-phosphate symbol: Ino-3',5'-P; the recommended name for cyclic inosine 3',5'-monophosphate (abbr.: 3',5'-cyclic IMP or cyclic IMP or cIMP), inosine 3',5'-cyclophosphate, inosine 3',5'-(cyclic)phosphate; a monophosphoric diester of inosine. It is a cyclic nucleotide similar in structure and metabolism to adenosine 3',5'-phosphate (i.e. cyclic AMP) but only rarely encountered.

inosine 5'-phosphate or 5'-inosinic acid or 5'-phosphoinosine or 5'-O-phosphonoinosine symbol: Ino5'P; alternative recommended names for inosine monosphosphate (abbr.: IMP), inosine 5'-(dihydrogen phosphate), hypoxanthine ribonucleotide. (The locant is commonly omitted if there is no ambiguity as to the position of phosphorylation.) It is the initial biosynthetic product containing an intact purine nucleus, its immediate precursor being 4-carbamoyl-5-formamidoimidazole riboside 5'-phosphate. Hence IMP is a key intermediate in the biosynthesis of all other purine nucleotides and in the formation of purine nucleosides and free purines. In addition, resynthesis of IMP from hypoxanthine can be effected via a salvage pathway by the action of hypoxanthine phosphoribosyltransferase (EC 2.4.2.8) (see phosphoribosyltransferase).

inosine 5'-triphosphate symbol: Ino5'PPP or pppI; the recommended name for inosine triphosphate (abbr.: ITP), 5'triphosphoinosine, 5'-inosinyl diphosphate, inosine 5'-(tetrahydrogen triphosphate). ITP can substitute for adenosine 5'triphosphate or guanosine 5'-triphosphate in certain enzymic reactions. It is formed from inosine 5'-diphosphate by transfer of the terminal phosphoric residue from adenosine 5'-triphosphate through the action of nucleoside-diphosphate kinase (EC 2.7.4.6).

inosinic acid the trivial name for any phosphoric monoester of inosine. The position of the phosphoric residue on the ribose

inositol-1,4,5-trisphosphate 5-phosphate

moiety of a given ester may be specified by a prefixed locant (see inosine phosphate). However, 5'-inosinic acid is the ester commonly denoted, its locant usually being omitted if no ambiguity may arise. 5'-Inosinic acid is also an alternative recommended name for inosine 5'-phosphate.

inosinyl the inosine [mono]phospho group; the acyl group derived from inosinic acid.

inositol 1 symbol: Ins; the common name for the cyclitol myoinositol (formerly called meso-inositol or i-inositol or bios I or muscle sugar); 1,2,3,5/4,6-cyclohexanehexol; a growth factor for animals and microorganisms, widely distributed in nature. Inositol occurs free, as various phosphates, or as a constituent of certain phospholipids (see phosphatidylinositol); in plants it also occurs as its hexaphosphate phytate. Note: whereas myoinositol itself is achiral, its phosphorylated derivatives are chiral and the numbering of their carbon atoms can be confusing. For a proposed solution of the problem, see Agranoff's turtle. 2 generic name for any member of a subclass of cyclitols comprising the nine possible 1,2,3,4,5,6-cycloxanehexols, of which inositol (def. 1) is the most prevalent and most important.

inositol-1,4-bisphosphate 1-phosphatase EC 3.1.3.57; systematic name: D-myo-inositol-1,4-bisphosphate 1-phosphohydrolase; other name: inositol polyphosphate 1-phosphatase; an enzyme involved in the degradation of inositol phosphates that hydrolyses D-myo-inositol 1,4-bisphosphate to D-myoinositol 4-phosphate and orthophosphate. Example (bovine): database code INPP_BOVIN, 400 amino acids (43.88 kDa).

inositol phosphate any phosphoric ester of an inositol, but normally referring to the esters of myo-inositol (abbr.: Ins). Of particular interest are those formed as a result of the hydrolysis of membrane phosphoinositides following activation of phosphoinositide-specific phospholipase C (see phospholipase). The abbreviation Ins is reserved for myo-inositol, and the generalized abbreviation for phosphorylated myo-inositols follows the convention Ins(numbers of the carbons bearing phosphorylated hydroxyls) P_x , where P_x indicates the number of phosphates. They include inositol 1,4,5-trisphosphate (abbr.: $Ins(1,4,5)P_3$), formed by phospholipase C action on phosphatidylinositol 4,5-bisphosphate. $Ins(1,4,5)P_3$ has a number of physiological actions related to the phosphatidylinositol cycle. It can be phosphorylated to $Ins(1,3,4,5)P_4$, which is also physiologically active in calcium metabolism. Other inositol phosphates are intermediates in the degradation of $Ins(1,4,5)P_3$ and $Ins(1,3,4,5)P_4$. $Ins(1,4,5)P_3$ is hydrolysed to $Ins(1,4)P_2$, which is hydrolysed to Ins(4)P and thence to $Ins. Ins(1,3,4,5)P_4$ is hydrolysed to $Ins(1,3,4)P_3$ which is hydrolysed to either $Ins(1,3)P_2$ or $Ins(3,4)P_2$ these being hydrolysed to Ins(1)P or Ins(3)P respectively and thence to Ins.

inositol-1,3-bisphosphate 3-phosphatase EC 3.1.3.65; an enzyme that hydrolyses D-myo-inositol 1,3-bisphosphate to Dmyo-inositol 1-monophosphate and orthophosphate.

inositol-1,3,4,5-tetrakisphosphate 3-phosphatase EC 3.1.3.62; an enzyme that hydrolyses D-myo-inositol 1,3,4,5tetrakisphosphate to D-myo-inositol 1,4,5-trisphosphate and orthophosphate.

inositol-1,4,5-trisphosphate 1-phosphatase EC 3.1.3.61; an enzyme that hydrolyses D-myo-inositol 1,4,5-trisphosphate to D-myo-inositol 4,5-bisphosphate and orthophosphate.

inositol-1,4,5-trisphosphate 5-phosphatase EC 3.1.3.56; systematic name: D-myo-inositol-1,4,5-trisphosphate 5-phos-Bạn đang đọc một quyển sách được tặng bởi HUY NGÚYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

inosyl

phohydrolase; other names: inositol trisphosphate phosphomonoesterase; inositol polyphosphate 5-phosphatase; 5PTase; an enzyme that hydrolyses D-myo-inositol 1,4,5-trisphosphate to D-myo-inositol 1,4-bisphosphate and orthophosphate. The enzyme has two types, I and II, with different activities; type I (but not type II) hydrolyses inositol 1,3,4,5-tetrakisphosphate to inositol 1,3,4-trisphosphate; neither enzyme acts on the latter or on inositol 1,4-bisphosphate. Example (precursor, fragment) from human: database code IT5P_HUMAN, 672 amino acids (76.96 kDa).

inosyl any chemical group formed by the loss of a 2'-, 3'-, or 5'hydroxyl group from the ribose moiety of inosine.

inotropic influencing contractility of muscles, especially car-

Ins symbol for a residue of the cyclitol 1-D-myo-inositol (see inositol (def. 1)).

insect any small air-breathing arthropod of the class Insecta, typically having a segmented body with an external, chitinous covering, three pairs of legs, and in most groups two pairs of

insecticide any substance or agent that kills insects. —insecticidal adi.

(insect) moulting hormone (or US) (insect) molting hormone a common name for ecdysterone.

insectorubin any member of a group of red or red-brown eye pigments of insects derived from oxidation products of tryptophan. See also ommin.

insectoverdin any member of a group of green pigments of insects formed of mixtures of carotenoids and biliverdin.

insert (in genetics) a fragment of DNA that has been linked into a cloning vector. The term can also be used as a modifier as, e.g., in insert DNA.

insertional inactivation the inactivation of a gene in a plasmid cloning vector by insertion of foreign DNA at endonuclease-sensitive sites. It is useful for distinguishing DNA chimeras from cleaved plasmid molecules that have selfannealed.

insertional mutagenesis the induction of a mutation by the insertion of DNA into a gene using recombinant DNA techniques. One approach, known as restriction enzyme-mediated integration (REMI), utilizes a plasmid that is cut with a restriction enzyme. Then the cut plasmid, together with the restriction enzyme, is introduced into cells (e.g. Dictyostelium) by electroporation. The restriction enzyme cuts the genomic DNA at sites into which the plasmid can integrate through its sticky ends. If the plasmid contains a suitable marker, transformants can be isolated. The gene affected can be identified because it is effectively tagged with the plasmid. If the plasmid also contains an additional marker conferring drug resistance, the gene from the transformant can be readily cloned.

insertion mutation any mutation caused by insertion of an extranumerary nucleotide residue between two successive nucleotide residues in a DNA molecule.

insertion sequence abbr.: 1S; see transposon.

insertion vector (in recombinant DNA technology) any vector (def. 3) that has been cut with a restriction enzyme having a single target site in the centre of the vector, so that two 'arms' are generated between which foreign DNA may be inserted.

insertosome an 800-1400 bp stretch of DNA that can insert itself randomly into the chromosome of Escherichia coli, thereby causing polar mutations analogous to those caused by phage Mu-1.

inside-out vesicle any vesicle formed from disrupted cell or other membranes that has sealed up so that the face of the membrane that was originally on the outside is now on the in-

in situ Latin in the normal, natural, original, or appropriate position.

in situ hybridization a technique of hybridization analysis in which chromosomes in situ are used as the target for hybridization with radioactive or fluorescent putative complementary DNA or RNA.

insolubilize or insolubilise to render insoluble (def. 1), especially by coupling covalently to an insoluble matrix. —insolubilization or insolubilisation n.

insoluble 1 incapable of being dissolved (in water unless otherwise specified); of extremely low solubility. 2 incapable of being solved; having no solution.

Ins (3,4)P₂ symbol for 1D-myo-inositol 3,4-bisphosphate. Ins (1,3,4)P₃ symbol for 1D-myo-inositol 1,3,4-trisphosphate. Ins (1,4,5)P₃ symbol for 1D-myo-inositol 1,4,5-trisphosphate. Ins $(1,3,4,5)P_4$ symbol for 1D-myo-inositol 1,3,4,5-tetrakisphosphate.

instructive theory of immunity a theory ascribing to an antigen the function in immunity of instructing or directing uncommitted cells to form new antibodies that reflect the nature of the antigen itself. Compare selective theory of immunity.

insulate to prevent, or reduce, the passage of electricity, heat, or sound to or from (something) by interposition of a (relevant) nonconducting material.

insulin or (formerly) insuline the hypoglycemic, antidiabetic, and anabolic polypeptide hormone of the endocrine portion of the mammalian pancreas or of homologous organs of lower vertebrates. In mammals, it is elaborated in the B cells of the islets of Langerhans and stored within them in the B granules prior to release by exocytosis. Insulin is a slightly acidic protein that readily aggregates to form dimers, hexamers, and higher multimers. It is very poorly soluble in aqueous media around its isoelectric point (pH = 5.4), especially in the presence of certain divalent metal ions, typically Zn²⁺, with which it can form crystals, usually containing two or four metal ions per insulin hexamer, depending on conditions. It does, however, dissolve without denaturation in organic solvents in an acid medium, a property that can be exploited in its isolation. The monomer of insulin is one of the smallest known proteins, with M_r values such as 5733 (bovine), 5777 (porcine), or 5807 (human). Bovine insulin was the first protein to have its primary sequence determined, by Sanger in 1955. The sequences of a large number of insulins are now known, all of which consist of two polypeptide chains, commonly termed the A chain and the **B** chain, with three disulfide bridges formed between half-cystine residues; two of these bridges are interchain, forming A7-B7 and A19-B20 links, and the third is intrachain, linking positions A6 and A11 to form a heterodetic ring in the A chain. The numbers of amino-acid residues vary slightly with the species of origin, commonly being 21 and 30 in the A and B chains, respectively; six amide groups are present per molecule of the monomer if insulin is carefully isolated. The three-dimensional structure is known: chains A and B have two motifs each. Insulin is structurally related to relaxin and insulin-like growth factor. Insulin is biosynthesized by post-translational modification of preproinsulin via its single-chain precursor preproinsulin. In preproinsulin, residues 1-24 are the signal sequence. When this is removed, proinsulin is formed. In the Golgi apparatus, prohormone convertases PC2 and PC3 cleave proinsulin on the carboxyl side of a pair of basic amino-acid residues (Arg⁵⁵-Arg⁵⁶ and Lys⁸⁸-Arg⁸⁹). This excises the C peptide; (residues 57-87, leaving the A and B chains (two Arg residues (55 and 56) must first be cleaved from the B chain by carboxypeptidase H for the mature B chain to be formed). Residues 55-87 are known as the connecting peptide. Example (human): database code INS_ HUMAN, 110 amino acids (11.97 kDa); the A chain is derived from residues 90-110, and the B chain from residues 25-54.

Insulin stimulates glucose uptake by muscle and adipose tissue, and promotes glycogenesis, lipogenesis, and synthesis of protein and nucleic acid. Deficiencies in the secretion or action of insulin in humans result in the overproduction and increased urinary excretion of glucose (see glucose-tolerance test, diabetes mellitus); continuing therapeutic administration of insulin is necessary in type I (insulin-dependent) diabetes Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cẩu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Bur to stay

mellitus. Commercial insulin for therapeutic use is extracted mostly from bovine or porcine pancreas; human insulin is now also being made by recombinant DNA technology. The international unit for insulin is defined as the activity contained in 0.041 67 mg of the Fourth International Standard for Insulin, Bovine and Porcine, for Bioassay (which is defined as crystalline zinc insulin derived from a mixture of 52% bovine insulin and 48% porcine insulin).

insulinase

insulinase EC 3.4.99.45; other names: insulin-degrading enzyme; insulin protease; an enzyme that catalyses the degradation of insulin and glucagon, progressively cleaving a number of peptide bonds in insulin, but only Arg¹⁷-|-Arg¹⁸ in glucagon.

insulin-dependent diabetes mellitus abbr.: IDDM; see dia-

insulin-like activity abbr.: ILA; a provisional name given to material thought to be present in plasma or serum that showed apparently higher insulin levels when measured by the rat epididymal fat-pad assay than when other in vitro assay methods were used; it was found to be due to insulin-like growth factor.

insulin-like growth factor abbr.: IGF; any member of a group of polypeptides that are structurally homologous to insulin and share many of its biological activities but are immunologically distinct from it; they are mitogens of the insulin/relaxin family. They include substances now named insulin-like growth factor-I (IGF-I), which is a monomer of 70 amino acids, and insulin-like growth factor-II (IGF-II), which is a monomer of 67 amino acids; together these were formerly known as nonsuppressible insulin-like activity (NSILA). The insulin-like growth factors also include somatomedin C, which is IGF-I, and possibly also somatomedins A_1 and A_2 , and multiplication-stimulating activity. They appear to be more potent than insulin as growth-promoting factors but less potent in stimulating glucose utilization. Brain IGF is a truncated form of IGF-I, in which the N-terminal tripeptide sequence is lacking. Example, (precursor) human IGF-II: database code IGF2_ HUMAN, 180 amino acids (20.12 kDa). See also insulinrelated growth factor, somatomedin.

insulin-like growth factor binding protein abbr.: IGFBP; any of several proteins that bind insulin-like growth factors (IGFs) and are found in serum, amniotic and other body fluids, and in conditioned media from a variety of cell types. They are believed to prolong the half-life and regulate the endocrine effects of IGFs. Six IGFBPs (IGFBP-1 to -6) have been identified in humans, their complementary DNA having been cloned and sequenced. IGFBP-1 was originally identified as a placental protein, placental protein-12 (PP-12) and as α -1 pregnancy-associated globulin; it is a nonglycosylated protein of M_r 25 000; IGFBP-2 has been identified in human and rat central nervous systems; it is a nonglycosylated protein of M_r 31 000. IGFBP-1 and IGFBP-2 both have the RGD motif, a recognition site for integrins. IGFBP-3 is the principal IGFBP in human serum; it is a glycoprotein of M_r 28 500, and circulates as a complex with IGF peptide (y subunit). For IGFBP-5 see skeletal growth factor.

insulinogenesis the formation of insulin.

insulinogenic resulting from the administration of insulin.

insulinoma any neoplasm (benign or malignant), originating in the B cells of the pancreatic islets (or sometimes from nonislet tissue), that autonomously secretes insulin and/or biosynthetic precursors of insulin. Such lesions are frequently recognized by their metabolic consequences.

insulinotropic stimulating insulin secretion.

insulinotropic effect see gastric inhibitory peptide.

insulinotropin a peptide containing residues 7-37 of glucagonlike peptide I, coencoded with glucagon in preproglucagon. It is a potent stimulator of insulin release from the perfused rat pancreas. See glucagon-like insulinotropic peptide.

insulin receptor a type I membrane protein with tyrosine kinase (EC 2.7.1.112) activity. The protein is derived from a precursor: after being transported from the endoplasmic retic-

ulum to the Golgi apparatus, the single glycosylated precursor is further glycosylated and then cleaved to α and β chains. In the plasma membrane the receptor is a disulfide-bonded heterotetramer, $\alpha_2\beta_2$; the α chains are entirely extracellular, while each β chain has one transmembrane domain. The ligand binds to the α -subunit extracellular domain and the kinase is associated with the β -subunit intracellular domain; it is partly regulated by autophosphorylation. Associated diseases include various forms of insulin resistance, including type 2 diabetes mellitus and leprechaunism. Example (human precursor): database code INSR_HUMAN, 1382 amino acids (156.10 kDa); amino acids 28–762 form the α subunit, 763–1382 form the β subunit

insulin-related growth factor (sometimes) any of a group of vertebrate and invertebrate protein or polypeptide hormones or growth factors (including relaxin, nerve growth factor, insulin-like growth factors, silkworm prothoracicotropic hormone, and possibly others) that share with insulin certain features of primary and three-dimensional structure and may also display some similarities to insulin as regulators of growth and/or metabolism.

insulin-tolerance test a sensitive and accurate test of the integrity of the hypothalamic-pituitary-adrenal axis and its ability to respond to stress, and also of somatotropin responsiveness. The test is performed after an overnight fast with measurement of plasma cortisol, glucose, and somatotropin levels before and periodically after intravenous administration of insulin. The hypoglycemia induced by insulin elicits a potent stress response via the central nervous system, stimulating the release of corticotropin releasing hormone and consequently, of corticotropin.

Int the product of phage gene int, involved in the integration of phage DNA into host DNA during transition from the lytic to the lysogenic states of the phage. Compare Int-2. See also retroregulation.

Int-2 an oncogene first identified as a transforming gene following the integration of mouse mammary tumour virus into the mouse DNA. Its product has been shown to be a fibroblast growth factor (FGF3). Example (precursor): database code FGF3_HUMAN 239 amino acids (26.89 kDa). Compare Int.

integer any rational whole number.

integral 1 of, or being an essential part of a whole; entire, complete. 2 (in mathematics) of, or denoted by, an integer; of or involving an integral (def. 3). 3 (in mathematics) the sum of a large number of infinitesimally small quantities, denoted \int , summed either between specified limits (definite integral) or within indeterminate limits (indefinite integral).

integral (cell membrane) protein or intrinsic protein an operational term for any protein that can only be dissociated from a cell membrane by drastic treatment with a reagent such as detergent, bile salt, protein denaturant, or organic solvent. Such proteins have one or more domains that traverse the cell membrane. Compare peripheral (cell membrane) protein.

integrase a protein of lambdoid phages that catalyses integration of phage DNA during establishment, probably by forming a transient DNA-protein link. Example from phage lambda: database code VINT_LAMBD, 356 amino acids (40.26 kDa). The same enzyme is one subunit of the excisase activity that reverses this; the other subunit is the Xis protein, known as excisionase. Example from phage lambda: database code VXIS_LAMBD, 72 amino acids (8.60 kDa).

integrate 1 to combine or be combined into a whole; to complete (something imperfect) by the addition of parts. 2 (in mathematics) to find the integral (def. 3) of (quantities, expression, etc.).—integrable, integrative adj.; integrability n.

integrated rate equation a general expression for the interpretation of a single enzyme-catalysed reaction. The expression for the velocity of a reaction at time t is:

$$v = d[P]/dt = V([S]_0 - [P]_t)/\{K_m + ([S]_0 - [P]_t)\}.$$

precursor; after being transported from the endoplasmic reticBan đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

 $Vt = [P]_t + K_m \ln\{[S]_0/([S]_0 - [P]_t)\},\,$

or

$$\ln\{[S]_0/([S]_0 - [P]_t)\}/t = V/K_m - [P]_t/K_m t,$$

where [S] and [P] are the concentrations of substrate and product, ν is the velocity of the reaction, V is the limiting rate, and $K_{\rm m}$ is the Michaelis constant. The subscripts indicate the concentrations at zero time and at time t. A plot of $\ln\{[S]_0/([S]_0 - [P]_t)\}/t$ against $[P]_t/t$ will have a slope of $-1/K_{\rm m}$ and an intercept of $V/K_{\rm m}$.

integration 1 the act or process of uniting or adding parts to make a whole. 2 the process of determining and/or indicating the mean value or total sum of (some physical quantity, area, etc.). 3 (in mathematics) the process of determining the integral (def. 3) of a function or a variable. Compare differentiation.
4 (in genetics) the act or process of forming a cointegrate.

integrator any device (mechanical or electronic) or any person that determines the value of an **integral** (def. 3).

integrin any member of the large family of transmembrane proteins that act as receptors for cell-adhesion molecules. Integrins are heterodimeric molecules in which the α and β subunits are noncovalently bonded. The subunits are named from α_1 to α_8 , α_L (for LFA-1), α_M (for Mac-1), α_v (for vitronectin receptor), and from β_1 to β_7 . Both subunits penetrate the cellmembrane lipid bilayer; the α subunit has four Ca²⁺-binding domains on its extracellular chain, and the \beta subunit bears a number of cysteine-rich domains extracellularly. The integrins are grouped into families: the VLA family, having the β_1 subunit; the LEUCAM family, which includes LFA-1 and Mac-1, having the β_2 subunit; and a group of other integrins having subunits β_3 - β_8 . The type of integrin expressed on the cell surface determines which adhesion molecules (and thus which other cells) the cell will bind, and can be varied in different circumstances. For example, transforming growth factor-\$\beta\$ increases expression of $\alpha_1\beta_1$, $\alpha_2\beta_1$, $\alpha_3\beta_1$, and $\alpha_5\beta_1$ integrins on fibroblasts and the $\alpha_{\nu}\beta_3$ integrin on fibroblasts and osteosarcoma cells; interleukin-1 β enhances β_1 expression on osteosarcoma cells; and in response to wounding, the keratinocyte, which normally expresses integrin $\alpha_6\beta_4$, will express $\alpha_5\beta_1$ (VLA-1, the fibronectin receptor) so that the keratinocyte will then migrate over fibronectin in the cell matrix, thus covering the wound. Example, integrin al precursor from Rattus norvegicus: database code ITA1_RAT, 1180 amino acids (130.81 kDa); residues 1-28 are the signal peptide, 29-1180 integrin a1. See also adhesion molecules (for details of the integrins to which they bind).

intein a proposed term for an internal peptide sequence of a protein precursor that is spliced out by transpeptidation during processing to form the mature protein. The peptide sequences that are spliced together are termed exteins. The terms are derived, respectively, by analogy from introns, the nucleotide sequences that are removed during mRNA processing in eukaryotes, and exons, the coding sequences that are spliced together to form the mature mRNA transcript.

intensify (in photography) to increase the opacity (of a film or plate). —intensification, intensifier n.

intensity (in physics) the magnitude of an energy flux, field strength, or force. See luminous intensity, radiant intensity.

intensity millicurie an obsolete name for sievert (def. 2).

intensive property any of the properties of a substance or object that describe a specific characteristic of the substance or object in a given state. Intensive properties are independent of the amount of the substance or the size of the object being considered, e.g. density, specific volume, temperature, etc. Compare extensive property. See also intensive.

inter+ comb. form signifying between, within, or among. Comnare intra+

interaction 1 any reciprocal or mutual action or effect. 2 (in physics) the transfer of energy between elementary particles, between particles and a field, or between two or more fields.
—interact vb.

interaction broadening the concentration-dependent broadening of lines in an electron spin resonance spectrum caused by magnetic interactions between paramagnetic molecular or atomic species.

interactive (of two or more forces, fields, processes, etc.) acting reciprocally or in close and/or continuing relation with each other; interacting.

interallelic complementation interaction between products of two mutant alleles to form a functional protein. It can occur in the case of multimeric proteins, for which subunits are encoded by two alleles. If products from only one mutant allele compose the protein, an inactive protein results, but in certain cases, if the products from the two alleles (each of which codes for an inactive protein) are combined in the protein, an active protein results. This was first shown in in vitro experiments by taking two inactive proteins of alleles encoding glutamate dehydrogenase (NADP⁺), and recombining them by freezing and thawing in the presence of NaCl to form an active enzyme. There is some evidence that it can also occur in vivo.

interband any DNA-poor region between two (DNA-rich) bands in a polytene chromosome.

intercalary deletion see deletion.

intercalary DNA abbr.: iDNA; moderately repetitive DNA sequences occurring between structural genes in chromosomal DNA.

intercalation (in molecular biology) the insertion of additional material between the parts of an existing series, especially the insertion of molecules of antibiotic substances (e.g. actinomycin D) or acridine dyes (e.g. proflavine) between adjacent base pairs in a DNA duplex, thereby interfering with replication, etc.—intercalate vb; intercalation n; intercalary or intercalative adj.

intercalator or intercalating agent (in molecular biology) any substance capable of being intercalated.

intercellular between cells. Compare intracellular.

intercept (in mathematics) a point at which two figures intersect; the point at which a line, curve, or surface cuts a coordinate axis.

interchain (of any interaction or linkage) between two chains of a biopolymer.

interconvertible enzyme any enzyme that exists in at least two well-defined reversibly convertible forms, produced by covalent modifications of amino-acid side chains under biological conditions (covalent modifications occurring as intermediates in the catalytic process are excluded). Compare isoenzyme.

intercrine an alternative name for chemokine.

interdomain (of any interaction or linkage) between two domains of a protein or other biopolymer.

interface 1 any surface forming a common boundary between two bodies, molecules, liquids, or phases. 2 any device, instrument, or method connecting two systems or processes; used especially of connections between computer systems. 3 to connect with or by an interface (def. 2). —interfacial adj.

interfacial tension the surface tension occurring at the interface between two mutually saturated liquids that tends to contract the area of the interface.

interference 1 (in physics) the process in which two or more wave trains of the same frequency and phase are superimposed to form a wave train in which there are alternate bands (called interference fringes) of no energy (due to destructive interference) or higher energy than that of the individual wave trains (due to constructive interference). 2 (in virology) the partial or complete prevention of the replication of one virus in a cell or tissue by the concomitant interaction between the given cell or tissue and another virus.

interference (light) filter a type of (light) filter with which a transmitted band-width of 10-20 nm can be obtained with a peak transmission of about 40%. It is possible to make inter-

interference fringe

interlet ______

ference filters in which the position of the centre of the transmitted band can be set within 1-2 nm.

interference fringe see interference (def. 1).

interference optics a system of optics, based on the Rayleigh interferometer, that is sometimes fitted to analytical ultracentrifuges. A double-sector ultracentrifuge cell is used, one sector containing only solvent and the other the solution being examined. The pattern of interference fringes produced by light passing through both sectors is a function of the refractive index at each point in the cell, each fringe tracing a curve of the refractive index against distance. Interference optics allows smaller changes in concentration to be detected than is possible by the Schlieren method.

interferogram a photographic record of a pattern of interference fringes.

interferometer an instrument that divides a beam of electromagnetic radiation into a number of beams and reunites them to produce interference fringes. It is useful for accurate measurement of the wavelength of the radiation, examination of the hyperfine structure of spectral lines, the testing of the flatness of surfaces, etc. —interferometric adj.; interferometrically adv.; interferometry n.

interferon abbr.: IFN; any member of a group of proteins that form a closely related group of nonviral proteins, of M_r in the range 15 000 to 30 000, that are produced and liberated by animal cells following exposure to a variety of inducing agents; they are not normally present in uninduced cells. They exert nonspecific, antiviral activity, at least in homologous cells, through cellular metabolic processes involving the synthesis of both RNA and protein. Viruses are the most potent inducing agents, but interferons can also be induced by exposure of cells to a wide variety of microorganisms, bacterial endotoxins, phytohemagglutinins, and other substances. Interferons do not prevent viral penetration into cells but induce within the cells a complex of inhibitors of protein synthesis that block translation of viral mRNA, but not the cell's own mRNA. Among the interferon inhibitors are a protein kinase, which phosphorylates an initiation factor in protein synthesis, and an oligonucleotide synthetase, which catalyses the synthesis of pppA2'p5'A2'p5'A (abbr.: 2,5-A) - this trinucleotide activates a latent cellular endonuclease that degrades the viral mRNA. Interferons are classified into three types. IFN-α (formerly leukocyte interferon) comprises many examples; they are produced by macrophages, have antiviral activities, and stimulate production of two enzymes: a protein kinase and an oligoadenylate synthetase; they exist as monomers. Example, (human) α-4B precursor: database code INA4_HUMAN, 189 amino acids (21.78 kDa). IFN-\$\beta\$ (formerly fibroblast interferon) has antiviral, antibacterial, and anticancer activities. It is related to the α family (three motifs). Example (human, precursor): database code INB_HUMAN, 187 amino acids (22.27 kDa). IFN-y (formerly immune interferon) is produced by lymphocytes activated by specific antigens or mitogens. In addition to antiviral activity it has important immunoregulatory functions: it is a potent activator of macrophages, it has antiproliferative effects on transformed cells, and can potentiate the antiviral and antitumour effects of the type I interferons (α and β). It is a glycoprotein and exists as a homodimer. Example (human, precursor): database code ING_HUMAN, 166 amino acids (19.33 kDa). Interferons are produced commercially either by in vitro culture of human leukocytes or by recombinant DNA or RNA technology, γ interferon requiring a system that effects glycosylation.

intergenic suppression see suppression.

interjacent RNA a 26S single-stranded RNA found in cells infected with certain togaviruses, e.g. Semliki forest virus. It codes for all the virus coat proteins.

interleukin abbr.: IL; any member of a heterogeneous group of cytokines that have the ability to act as signalling molecules between different populations of leukocytes. Several classes

have been defined; each is designated by a suffixed arabic numeral, e.g. interleukin 1 (IL-1), interleukin 2 (IL-2), etc.

interleukin 1 abbr.: IL-1; former names: lymphocyte-activating factor (LAF); mitogenic protein (MP); helper-peak-1 (HP-1); T-cell-replacing factors III and m (TRF-III; TRF-m); B-cell-activating/differentiation factor (BAF; BDF). An interleukin of M_r 12 000–18 000, produced mainly by activated macrophages. It is not able to promote and maintain in vitro long-term cultures of T cells, but stimulates thymocyte proliferation by inducing interleukin 2 release. It is involved in the inflammatory response, and is identified as an endogenous pyrogen. Example, IL-1 β (human): database code NRL1_6I1B, 153 amino acids (17.36 kDa); 3-D structure data obtained by NOESY.

interleukin 2 abbr.: IL-2; other names: thymocyte-stimulating factor (TSF); thymocyte mitogenic factor (TMF); T-cell growth factor (TCGF); co-stimulator; killer-cell helper factor (KHF); secondary cytotoxic T-cell-inducing factor (SCIF). An interleukin of $M_{\rm r}$ 30 000–35 000, produced by T cells in response to antigenic or mitogenic stimulation. Translocation involving the IL-2 gene causes one form of acute lymphoblastic leukemia. IL-2 promotes and maintains in vitro long-term cultures of T cells. Example, human (precursor): database code IL2_HUMAN, 153 amino acids (17.61 kDa).

interleukin 3 abbr.: IL-3; other names: multipotential colony-stimulating factor; hematopoietic growth factor; P-cell-stimulating factor; mast-cell growth factor. A class of interleukins that are granulocyte/macrophage colony-stimulating cytokines; they act in hematopoiesis by controlling the production, differentiation, and function of granulocytes and the monocytes/macrophages. They are glycoprotein monomers. Example, human (precursor): database code IL3_HUMAN, 152 amino acids (17.21 kDa).

interleukin 4 abbr.: IL-4; other names: B-cell stimulatory factor 1; lymphocyte stimulatory factor 1. An interleukin that participates in at least several B-cell activation processes as well as those of other cell types. It is a co-stimulator of DNA synthesis and is a glycoprotein. Example: database code NRL_1RBC, 129 amino acids (14.95 kDa); 3-D structure known

interleukin 5 abbr.: IL-5; other names: T-cell-replacing factor; eosinophil differentiation factor. An interleukin that induces terminal differentiation of late-developing B cells to immunoglobulin-secreting cells. It is a homodimer, with subunits linked by a disulfide bond. Example, human (precursor): database code IL5_HUMAN, 134 amino acids (15.22 kDa).

interleukin 6 abbr.: IL-6; other names: B-cell stimulatory factor 2; interferon β-2; hybridoma growth factor. An interleukin that induces myeloma and plasmacytoma growth, and nervecell differentiation. In hepatocytes it induces acute-phase reactants. It is a glycoprotein. Example, human (precursor): database code IL6_HUMAN, 212 amino acids (23.69 kDa).

interleukin 7 abbr.: IL-7; other name: hematopoietic growth factor. An interleukin that stimulates proliferation of lymphoid progenitor cells. It is produced by monocytes, T cells, and NK cells. Example, human (precursor): database code IL7_HUMAN, 177 amino acids (20.16 kDa).

interleukin 8 abbr.: IL-8; other names: monocyte-derived neutrophil chemotactic factor (MDNCF); T-cell chemotactic factor; neutrophil-activating protein 1 (NAP-1); lymphocyte-derived neutrophil-activating factor; protein 3-10C. An interleukin that acts as a chemotactic factor, attracting neutrophils, basophils, and T cells, but not monocytes. It is released from several cell types in response to an inflammatory stimulus. Example, human (precursor): database code NRL_311, 68 amino acids (7.96 kDa); 3-D structure obtained from a combination of crystallography and NMR.

interleukin 9 abbr.: IL-9; other names: T-cell growth factor; p40 precursor. An interleukin that supports IL-2/IL-4-independent growth of helper T cells. Example, human (precursor): database code IL9_HUMAN, 144 amino acids (15.89 kDa).

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

interleukin 10

International interleukin 10 abbr.: IL-10; other names: cytokine synthesis mammalian epithelial cells; desmin filaments found in cells of inhibitory factor (CSIF); cytokine glycoprotein. An intermuscles of all types; vimentin filaments found in mesenchymal leukin that appears to be a suppressor factor for Th1 immune cells; neurofilaments of neurons; and glial filaments found in responses. Example, human (precursor): database code all types of glial cells. Compare microfilament, microtuble.

IL10_HUMAN, 178 amino acids (20.48 kDa). interleukin 11 abbr.: IL-11; other name: adipogenesis inhibitory factor (AGIF). An interleukin that acts as both cytokine and growth factor. It stimulates plasmacytoma proliferation, and the T-cell-dependent development of immunoglobulin-producing B cells. Example, human (precursor): database code IL11_HUMAN, 199 amino acids (21.40 kDa).

interleukin 12 abbr.: IL-12; other name: cytotoxic lymphocyte maturation factor. An interleukin that can act as a growth factor for activated T and natural killer (NK) cells, enhance the lytic activity of NK/lymphokine-activated killer cells, and stimulate the production of interferon-y by resting PMBC. It is a disulfide-linked heterodimer of 40 kDa and 35 kDa subunits. NK stimulatory factor (NKSF) is essentially a complex of cytokine and soluble receptor. Examples, human; precursor for the 35 kDa (α) subunit: database code I12A_HUMAN, 219 amino acids (1-22 signal) (24.82 kDa); precursor for the 40 kDa β subunit: database code I12B_HUMAN, 328 amino acids (1-22 signal) (37.13 kDa). Both subunits are glycoproteins; α has some similarity to interleukin 6; β has an immunoglobulin-like domain.

interleukin 13 abbr.: IL-13; an interleukin that inhibits inflammatory cytokine production. It synergizes with interleukin 2 in regulating interferon-y synthesis. Example, human (precursor): database code IL13_HUMAN, 199 amino acids (21.40 kDa).

interleukin 16 convertase EC 3.4.22.36; other name: interleukin -1β converting enzyme (abbr.: ICE); a proteolytic enzyme that cleaves the interleukin-1ß precursor specifically at Asp¹¹⁶-|-Ala¹¹⁷ and Asp²⁷-|-Gly²⁸ in the precursor, producing the mature cytokine. It is a cysteine endopeptidase. Example from human: database code IIBC_HUMAN, 404 amino acids (45.16 kDa).

intermediary metabolism the chemical pathways by which molecules and structures found in living cells are synthesized from molecules that are taken into the cells, and subsequently broken down to molecules that are eliminated from the cells.

intermediate 1 occurring, or situated between two things in time, place, or order. 2 (in chemistry or biochemistry) any compound that takes part in a reaction, or sequence of reactions, occurring between the starting materials and the products. In metabolism, intermediates occur between the nutrients taken in and cellular material synthesized, or between cellular material and excretory products.

intermediate body a former name for amboceptor.

intermediate-density lipoprotein abbr.: IDL; one of the classes of lipoproteins found in blood plasma in many animals (data normally relate to humans). These lipoprotein particles have diameter 19.6-22.7 nm, solvent density for isolation (g mL⁻¹) 1.006-1.019, hydrated density (g mL⁻¹) 1.003. Their approximate composition (% by weight) is 8% unesterified cholesterol, 22% esterified cholesterol, 25% phospholipid, 30% triacylglycerol, 15% protein. Their apolipoprotein composition (% by weight total apolipoprotein) is 50-70% B-100, 5-10% C-I + C-II + C-III, 10-20% E-II + E-III + E-IV. They are formed in the plasma from very-low-density lipoproteins as a result of the action of lipoprotein lipase, and represent an intermediate stage in the conversion of very-low-density lipoproteins to low-density lipoproteins. See also apolipoprotein for individual apolipoproteins.

intermediate filament a distinct elongated structure, characteristically 10 nm in diameter, that occurs in the cytoplasm of higher eukaryotic cells. Intermediate filaments form a fibrous system, composed of chemically heterogeneous subunits and involved in mechanically integrating the various components of the cytoplasmic space. Intermediate filaments may be divided into five chemically distinct classes: keratin filaments of intermediate lobe or intermediate part or pars intermedia (hypophyseos) the part of the pituitary gland lying between the anterior and the posterior lobes. It is absent in adult humans but is present in fetal humans and in certain other species.

intermedin a former name for β-melanocyte-stimulating hormone (so-called because of its occurrence in the intermediate lobe of the pituitary gland). See melanocyte-stimulating hormone.

internal compensation the phenomenon of the existence of internally compensated molecular entities in general, or the property of such a molecular entity in a particular instance.

internal conversion abbr.: IC; a mode of radioactive decay of an excited atomic nucleus (formed by a nuclear transformation) in which, in a proportion of instances, excess energy released from the nucleus is not radiated from the atom as a quantum of low-energy gamma radiation but is imparted to one of the inner orbital electrons, which is thereupon ejected as a conversion electron; the electron emission is homoenergetic. The filling of the vacant orbital in the resultant excited ion causes emission also of either an Auger electron or a quantum of the characteristic X-radiation of the daughter atom.

internal energy symbol: U or E; a function of state that describes the sum of the kinetic and potential energy of a system. For closed systems, a change in internal energy, ΔU , usually results in a transfer of work or heat between the system and the surroundings. Thus $\Delta U = q + w$, where q is the heat gained by the system and w is the work done on the system.

internal indicator any indicator substance used to follow a reaction, or other process, that is placed in the reaction mixture, or system.

internalize or internalise to render internal; especially to take a substance into a cell or organism. —internalization or internalisation n.

internally compensated describing any molecular entity that possesses equal numbers of structurally identical groups of opposite chirality. If no other chiral groups are present the overall entity is achiral and is designated by the prefix meso+. internal secretion a former name for endocrine (def. 2).

internal standard any standard used as a reference in an assay that is added to the samples and subjected to the whole of the procedures applied to them.

internal-standard method (of quench correction) or internal standardization a method of correcting for quenching in liquid scintillation counting. After the sample has been counted a measured small amount of a (nonquenching) standard preparation, of known activity, of the radionuclide in question is added to it and the sample is recounted. From the increment in the count rate the counting efficiency within the sample, and hence the degree of quenching, may be calculated. The method is simple and reliable and corrects adequately for all types of quenching but is more time-consuming than the external-standard method and has other disadvantages.

International Biological Standard any of the numerous internationally agreed standards of activity or potency of antisera, hormones, vitamins, antibiotics, and other biologicals. Each has been defined in terms of a mass of an appropriate standard preparation, prepared and stored under specified conditions.

International Practical Temperature Scale abbr.: IPTS; see temperature.

International System of Units the English translation of Système International d'Unités; see \$1.

International Unit abbr.: IU (preferred) or i.u. or u; any unit of activity or potency of an antiserum, hormone, vitamin, antibiotic, or other biological defined in terms of the activity of an appropriate International Biological Standard or International Biological Reference Preparation. International Units are useful for quantifying a specific biological activity of a

intrinsic visc Internet

material before the chemical nature of the substance responsible for the activity has been fully characterized, or before pure preparations with reproducible activity are available.

Internet a protocol for allowing communication between computers, including those at distant sites. More loosely 'the internet' is used to refer to the worldwide network of such computers, including the providers of database services, discussion forums, and other communication media. See also Appendix D.

internuclear double resonance spectrometry abbr.: INDOR; a technique used in nuclear magnetic resonance spectrometry as an aid to assignment of resonances. It involves monitoring a single frequency, f_1 (usually one corresponding to a single transition), while sweeping a perturbing (decoupling) frequency, f_2 , through a selected range of frequencies. Signals, negative or positive, will only appear in the INDOR spectrum when f_2 passes through a transition that has an energy level in common with the transition at f_2 , making it possible to determine otherwise inaccessible chemical shifts and coupling constants.

interphase the state of a eukaryotic cell when not undergoing mitosis or meiosis. It covers the G_1 , S_2 , and G_2 phases of the cell-division cycle.

interpolate (in mathematics) to estimate a value of a function between data values already obtained or known either graphically or by calculation. Compare extrapolate. —interpolation n.

intersegment transfer a proposed mechanism for the transfer of a repressor of gene expression in a nonspecifically bound state to its target site. It involves the rapid and direct transfer of repressor from one segment of a DNA molecule to another as a consequence of the relative diffusion of these segments within the domain of the molecule.

interstice any minute space or crevice that intervenes between structures, e.g. between cells, organs, or tissues, or between atoms in a crystal lattice. —interstitial adj.

interstitial cell a connective tissue cell lying in the interstices between other cells in a tissue and serving to bind the tissue cells. Examples include the neuroglial cells and the testosterone-producing Leydig cells lying between the seminiferous tubules in the testis of vertebrates.

interstitial cell-stimulating hormone abbr.: ICSH; a former name for luteinizing hormone.

interstitial collagenase EC 3.4.24.7; other names: vertebrate collagenase; matrix metalloproteinase 1; an enzyme that cleaves preferentially one bond in native collagen and catalyses the cleavage of the triple helix of collagen at about threequarters of the length of the molecule from the N terminus, at \hat{G} ly⁷⁷⁵-|-Ile⁷⁷⁶ in the α -1(I) chain. It cleaves synthetic substrates and a-macroglobulins at bonds where P1' is a hydrophobic residue. Zinc is a cofactor. Example (precursor) from human fibroblasts: database code COG1_HUMAN, 469 amino acids (53.95 kDa).

interstitial deletion the loss of DNA or part of a chromosome that occupies an interstitial (i.e. nonterminal) position.

interstitial fluid the portion of the extracellular fluid, consisting mainly of water, that occurs outside the blood vessels and the lymphatics. In a 70 kg man its volume is approximately 12 L and it represents approximately 17% of body mass. It has a higher content of sodium, chloride, and bicarbonate and a lower content of potassium, magnesium, sulfate, and phosphate than intracellular fluid.

intertrabecular space the space within cells lying between the elements of the microtrabecular lattice.

intervening sequence an alternative name for intron.

intimin an actin-polymerization-inducing protein produced by enteropathogenic and enterohemorrhagic strains of enteric bacteria. It is an outer membrane protein of Escherichia coli, necessary for attachment of the bacterium to epithelial cells. Example from Hafnia alvei: database code HAFEAEA, 280 amino acids (30.11 kDa).

intracellular fluid abbr.: ICF; the portion of the total fluid content of a multicellular organism that occurs within the

intracellular within a cell or cells.

also endo+. Compare inter+.

cells, especially as distinct from extracellular fluid. In a 70 kg man the volume of ICF is approximately 26.5 L, and it represents approximately 38% of body mass. It has a higher content of potassium, magnesium, sulfate, and phosphate, and a lower content of sodium, chloride, and bicarbonate than interstitial

xenobiotic to a toxic product. 2 poisoning, especially with ethanol, manifested in behavioural change of the subject.

intra+ prefix signifying within, on the inside, or during. See

intrachain (of any interaction or linkage) between different parts of a single chain of a biopolymer.

intradermal abbr. (in medicine): ID or i.d.; within the layers of

intradomain (of any interaction or linkage) within a single domain of a protein or other biopolymer.

intragenic suppression see suppression.

intramolecular within the same molecule.

intramolecular chaperone a domain of a protein that mediates conformation (i.e. exercises a chaperone function) of the protein within which it resides. Trypsingen, e.g., contains such a domain.

intramuscular abbr. (in medicine): IM or i.m.; within a muscle or muscles; used especially of an injection.

intraperitoneal abbr.: IP or i.p.; within the peritoneum; used especially of an injection, infusion, or aspiration.

intrapleural within the pleura or pleurae; used especially of an injection or aspiration.

intrathecal within the intradural or subarachnoid space; used especially of an injection or aspiration.

intravenous abbr. (in medicine): IV or i.v.; within a vein; used especially of an injection, infusion, transfusion, or aspiration.

intrinsic 1 of or pertaining to the essential nature of something; inherent. 2 (in morphology) peculiar to, or situated in a part. —intrinsically adv.

intrinsic association constant or intrinsic binding constant see intrinsic constant.

intrinsic activity an alternative name for maximal agonist effect.

intrinsic birefringence the optical anisotropy of an individual molecule.

intrinsic constant any association, binding, or dissociation constant that describes the association, binding, or dissociation of a ligand to (or from) a particular site on a polyvalent molecule, when all the sites of this type are identical, present in the same molecule, and noninteracting.

intrinsic dissociation constant see intrinsic constant.

intrinsic efficacy symbol: ε ; an expression introduced by Furchgott that denotes the notional efficacy of a drug associated with a single receptor. It is given by $\varepsilon = e/[R_t]$, where e is the efficacy and [Rt] indicates the total concentration of active receptors of a certain type.

intrinsic factor a glycoprotein, secreted by the parietal cells of the gastric mucosa, that is necessary for the adequate absorption of dietary cobalamins. Intrinsic factor binds cobalamins in the intestinal lumen to form a complex that is subsequently bound by a specific receptor on the mucosa of the ileum. Cobalamin is then dissociated from the complex by a releasing factor and actively transported across the mucosa into the bloodstream. Congenital pernicious anemia seems to be due to a defect of intrinsic factor. Example (precursor) from human: database code IF_HUMAN, 417 amino acids (45.37 kDa).

intrinsic pathway (of blood coagulation) see blood coagula-

intrinsic protein less common term for integral (cell membrane)

intrinsic viscosity symbol: η_{int} ; the limiting value of the spe**intoxication** 1 any metabolic process that converts a nontoxic Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

intron

cific viscosity, η_{sp} , of a solution as the concentration of the solute tends to zero. The units are cm³ g⁻¹. Its value depends on the specific volume of the (solvated) solute, V, and on a shape-dependent factor, ν , as follows: $\eta_{\text{int}} = \nu V$. The value of ν is 2.5 for a sphere and its value increases for solutes of other shapes. The name limiting viscosity number has been recommended for this attribute.

intron or intervening sequence any intragenic region of DNA in eukaryotes that will not ultimately be expressed in a mature RNA molecule. Such sequences of deoxyribonucleotide residues intervene between coding sequences (exons); this arrangement of introns alternating with exons constitutes a transcription unit. By customary usage, the term is extended to the corresponding regions of the primary transcript of RNA. In RNA, four general types of introns are distinguishable: (1) yeast nuclear tRNA; (2) group I introns; (3) group II introns; and (4) nuclear mRNA precursor. Group I and II introns were originally described for fungal mitochondrial genes; group I introns are characterized by a lack of conserved sequences at splicing junctions but have short conserved sequences internally, while group II introns have conserved sequences at the splicing junctions. The introns of different RNA types are spliced by different mechanisms (see splicing). With respect to the function of introns it has been customary to describe them as derived from 'junk DNA', i.e. DNA for which no function can be found, but this concept must be modified. In the case of 'self-splicing introns' in the pre-rRNA of Tetrahymena many of the self-splicing introns double as mRNAs from which proteins are expressed that assist self-splicing and/or mediate intron translocation to new DNA sites. In the expression of a gene coding for small, stable RNAs that accumulate in the nucleolus, certainly of humans and mouse, it is the introns that give rise to RNA rather than the exons. Hence the terms intron and exon should simply signify RNA sequences that become physically separated during the process of RNA splicing. -intronic adj.

inulin a slightly soluble polysaccharide, of ≈6 kDa, found in members of the Compositae and Campanulaceae, in which it partially or completely replaces starch as a reserve carbohydrate. It is a linear glycan composed of about 35 ($\beta 2 \rightarrow 1$)linked p-fructofuranose residues terminating in an $(\alpha 1 \rightarrow 2)$ -D-glucopyranosyl residue. Inulin is useful in the measurement of renal clearance, as inulin is neither reabsorbed nor secreted by the renal tubular cells. It is also useful in the measurement of extracellular fluid volume (inulin space), since it can pass through the blood capillary walls but is not taken up by cells. inulobiose the disaccharide 2-O-β-D-fructofuranosyl-D-fruc-

inulosucrase EC 2.4.1.9; an enzyme concerned in inulin biosynthesis. See also sucrase (def. 3).

in utero Latin within the uterus.

in vacuo Latin in a vacuum.

invaginate 1 to infold, especially to form a sheathlike or saclike enclosure. 2 describing an organ or part that is folded back upon itself. —invagination n.

invariant residue any amino-acid residue that always occurs in equivalent positions in the polypeptide chains of homologous proteins from different species, or in genetic variants of the protein from a given species.

invasin an alternative name for hyaluronidase.

invasive (in pathology) tending to penetrate into healthy tissue and grow within the host away from the site of entry or origin. It is used especially of a pathogenic organism, cell, or group of cells, e.g. cancer cells. —invasiveness n.

inverse agonist any ligand that by binding to receptors reduces the fraction of them in an active conformation, thereby having biological effects opposite to those produced by an agonist (as in benzodiazepine inverse agonist). This can occur if some of the receptors are in the active form even in the absence of a conventional agonist. Compare partial inverse agoinverse-square law a law according to which the magnitude of a physical quantity, e.g. the intensity of electromagnetic or other radiation, is proportional to the reciprocal of the square of the distance from the source of the property.

inversion 1 configurational inversion the process of changing the configuration about a chiral centre into that with the opposite configuration. See also Walden inversion. 2 the hydrolysis of sucrose to an equimolar mixture of glucose and fructose. It is so-called because of the accompanying reversal of direction of optical rotation by the solution. 3 chromosomal inversion the deletion of a chromosomal segment followed by its reinsertion at the same position after having been turned through 180°.

inversion isomer an alternative name for invertomer.

invert 1 to turn or cause to turn inward, or upside down. 2 to reverse in direction, sequence, effect, etc. See also inversion.

invertase or saccharase EC 3.2.1.26; recommended name: βfructofuranosidase; systematic name: β -D-fructofuranoside fructohydrolase. An enzyme from yeast and other sources that catalyses the inversion (def. 2) of sucrose. See also saccharase.

invertase another name for β -fructofuranosidase.

invertebrate 1 any animal lacking a vertebral column (backbone) and internal skeleton. 2 of, pertaining to, or designating any such animal.

inverted repeat or indirect repeat abbr.: IR; either of a pair of sequences in duplex DNA that exhibit two-fold rotational symmetry around a centre, the two sequences being complementary to each other. The sequence of the two repeats together is called a palindrome, e.g.

> **GGTACC** CCATGG.

The repeats need not be contiguous, e.g.

GGTNNACC CCANNTGG.

Inverted repeats promote the formation of cruciform structures. Their function is unknown. However, they are found flanking transposable elements, which may indicate an associated role. See also cruciform, dyad symmetry, hairpin.

invertin a ferment (enzyme preparation) from yeast used by Fischer in work that led to his lock-and-key model. The major component is an α -glucosidase activity. See also emulsin.

invertomer or inversion isomer either of two conformers that interconvert by inversion at an atom possessing a nonbonding electron pair.

invert sugar an equimolar mixture of D-glucose and D-fructose formed by the hydrolysis, i.e. inversion (def. 2), of sucrose. It is sweeter than its parent disaccharide. See also high-fructose corn syrup.

in vitro Latin (of any biological process, reaction, or experiment) occurring or made to occur outside an organism, e.g. in extracts or cultures; literally it means 'in glass'. Compare in vivo.

in vivo Latin (of any biological process, reaction, or experiment) occurring or made to occur within a living organism; literally it means 'in life'. Compare in vitro.

involucrin a protein of keratinocytes and other stratified squamous epithelia that first appears in the cell cytosol, but ultimately becomes cross-linked to membrane proteins by the action of transglutaminase. Example from human: database code INVO_HUMAN, 585 amino acids (68.39 kDa).

involute 1 involved, intricate. 2 spiral, having whorls wound closely around the axis. 3 having edges that roll under or inwards. 4 to be subjected to a process involving the inward rolling of the surrounding tissue

iod+ a variant form of iodo+ (sometimes before a vowel).

iodate 1 the anion, IO₃-, derived from iodic(v) acid. 2 any salt of iodic(v) acid.

iodide 1 the anion, I⁻, of the element iodine. 2 any salt of Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyenltd.com.

hydriodic acid. 3 any compound containing an iodine atom in organic linkage.

iodimetry a volumetric method of analysis applicable to substances with a redox potential appreciably lower than that of the iodine-iodide system ($E^{\circ} = +0.535 \text{ V}$ at 25 °C). Such substances are oxidized by iodine and may therefore be titrated in acid solution with a standard solution of iodine. Compare iodometry. —iodimetric adj.; iodimetrically adv.

iodinatable capable of being converted into an iodo derivative. The term may be used of an organic compound or a particular part of one, such as a residue in a peptide.

iodinate 1 to treat or react (a substance) with iodine. 2 to introduce one or more iodo groups into (an organic compound), whether by addition or substitution. —**iodination** n.

iodine 1 symbol: I; a nonmetallic element of group 17 of the IUPAC periodic table and one of the halogens; proton number 53; it exists naturally as a single stable nuclide, iodine-127, of relative atomic mass 126.904. It is widely distributed in nature, although never found as the free element, and is an essential dietary element. Numerous (about 29 unstable and seven metastable) artificial radioactive nuclides are known. Of these, the most widely used in biochemistry and molecular biology are iodine-125 and iodine-131. 2 symbol: I2; the common name for the substance correctly known as diiodine, a bluishblack solid that sublimes at room temperature into a violetcoloured irritating vapour. An ethanolic solution is useful as a mild topical antiseptic.

iodine-125 the artificial radioactive nuclide [53]. It decays to the stable nuclide tellurium-125 by capture to the nucleus of an orbital electron from the K (i.e. innermost) shell, emitting low-energy gamma radiation (35.5 keV, 7% emitted and 93% internally converted) and characteristic tellurium K X-radiation (27-32 keV, 140%), but no beta radiation. It has a halflife of 59.6 days.

iodine-127 the stable nuclide ¹²⁷₅₃I. Its relative abundance in natural iodine is 100 atom percent.

iodine-131 the artificial radioactive nuclide $^{131}_{53}$ I. It decays to the stable nuclide xenon-131, emitting a moderate-energy electron or beta particle of various energies (0.25-0.81 MeV max., mainly 0.61 MeV max.) plus gamma radiation of various energies (0.08-0.72 MeV, mainly 0.36 MeV), 1.3% of nuclides decaying via the metastable nuclide xenon-131m. It has a half-life of 8.04 days.

iodine-labelling a widely used procedure for labelling a compound or material by introducing into it, directly or indirectly, one or more atoms per molecule of iodine, especially radioactive isotopes (i.e. radioiodine). See also radioiodinate.

iodine number or iodine value a measure of the degree of unsaturation of a fat or fatty acid, defined as the number of grams of iodine capable of reacting with 100 g of the sample. It is usually determined indirectly by measuring the amount of an iodine-containing reagent, e.g. iodine monobromide, that remains after excess has been added and reaction is complete. The iodine number of saturated fatty acids is zero, that of oleic acid is 90, of linoleic acid 181, and of linolenic acid 274.

iodo of, relating to, or describing a compound that contains an iodine atom in organic linkage.

iodo+ or (sometimes before a vowel) iod+ comb. form denoting 1 an iodine atom in organic linkage. 2 violet-coloured. See

iodoacetamide I-CH2-CONH2; a compound that acts as an inhibitor of an enzyme containing -SH groups, Enz-SH, by reacting irreversibly to give Enz-S-CH2-CONH2, with elimination of HI.

lodo-Gen a proprietary name for 1,3,4,6-tetrachloro-3α,6αdiphenylglycouril; a solid-phase reagent that oxidizes low concentrations of inorganic iodide to iodine and hence is useful for the rapid and efficient labelling of proteins with radioactive iodine. Being very stable and virtually insoluble in water, reaction vessel containing aqueous solutions of iodide ion and protein.

iodogorgoic acid a former name for 3,5-diiodotyrosine.

iodometry a volumetric method of analysis applicable to substances with a redox potential appreciably higher than that of the iodine-iodide system ($E^{o'} = +0.535 \text{ V}$ at 25 °C). Such substances are reduced by iodide, which is added in excess to acidified solutions and the liberated iodine titrated with a standard solution of thiosulfate. Compare iodimetry. —iodimetric adj.; iodimetrically adv.

iodopsin any of three light-sensitive visual pigments in the cone cells of the retinas of vertebrates other than freshwater and migratory fishes and some amphibians. They consist of different cone-type opsins combined (as Schiff's bases) with 11-cis-retinal. Each individual cone cell contains one of the three pigments, which have absorption maxima at ≈430 nm, ≈540 nm, and ≈575 nm. The iodopsins were once thought to be a single pigment, termed visual purple or visual violet. See also cyanopsin, retinal.

ion any atom or other molecular entity that has acquired an electric charge by loss or gain of one or more electrons. An anion is negatively charged, and a cation is positively charged.

ion atmosphere the region surrounding a charged molecular entity in which there is a statistical preference for ions of opposite charge.

ion chamber another name for ionization chamber.

ion channel any of several types of channels in cell membranes that allow the passage of specific inorganic ions through the membrane. They may be ligand-gated, or voltage-gated. In other cases, an ion channel may be opened by mechanical stress (mechanically gated channels). For ligand-gated channels, the ligand may be an extracellular mediator such as a neurotransmitter (transmitter-gated channel), or an intracellular mediator such as an ion (ion-gated channel) or a nucleotide (nucleotide-gated channel). Ion channels are common direct or indirect targets for the action of drugs, which may either potentiate or inhibit channel opening.

ion exchange the process in which ions of like charge, which may be the same or different chemically, are exchanged between two phases, such as two solutions separated by a semipermeable membrane or a solution and an insoluble material, e.g. a resin.

ion-exchange cellulose abbr.: IEC; any derivatized cellulose containing cationic or anionic substituents used in ion ex**change**, especially for the separation of charged biopolymers.

ion-exchange chromatography any form of chromatography that depends on the process of ion exchange to effect the separation.

ion exchanger any anion exchanger or cation exchanger.

ion-exchange resin any insoluble polymer of high molecular mass and carrying groups with like charges that is used in ion exchange.

ion-exclusion chromatography a chromatographic technique by which strong electrolytes can be separated from nonelectrolytes and weak electrolytes by passage of the mixture through an ion-exchange resin in a buffer of ionic strength and pH that can be varied in the course of the separation. At low salt concentrations particularly, ionic repulsive forces tend to exclude from the resin those ions that have the same charge as the functional groups on the resin so that these ions, together it can be used in the form of a prior coating on the walls of a with, an equivalent number of counterions, pass rapidly Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

onot Just

through the column while nonelectrolytes and weak electrolytes enter the resin and thus pass more slowly through the column at a rate determined in part by the pK of their ionizable groups.

ion-gated channel see ion channel.

ionic 1 of, pertaining to, existing as, or characterized by ions.2 using or operated by ions.

ionic atmosphere the cloud of ions of one charge type that tend to accumulate by interionic attraction around an ion of the other charge type in a solution of an electrolyte. The cloud is symmetrical about the charge on the central ion unless the solution is subjected to a shearing force conducive to flow or is exposed to an applied electric field. In the latter event the central ion and its surrounding counterions migrate in opposite directions, the resultant asymmetric disposition of the ionic atmosphere effecting retardation of the central ion in a concentration-dependent manner.

ionic bond any bond formed by attraction between a positively and a negatively charged group on different parts of the same molecule or on different molecules.

ionic conduction the passage of electricity due to the movement of ions.

ionic detergent any anionic detergent or cationic detergent.

Compare nonionic detergent.

ionic double layer the region surrounding a charged molecular entity together with the layer of counterions that surrounds it

ionic mobility a measure of the velocity at which an ion moves through a liquid under the influence of an applied electric potential.

ionic product see ion product.

ionic strength symbol: I or I_m (molality basis) or I_c (concentration basis); a physical quantity equal to half the summation over all ions in a solution of the concentration of each ion multiplied by the square of its charge. Hence,

$$I_{\rm m}=0.5(\Sigma m_i z_i^2)$$

and

$$I_{\rm c} = 0.5(\Sigma c_i z_i^2),$$

where m_i and c_i are the molal and molar concentrations of the *i*th ion, respectively, and z_i is its charge.

ionizable group or ionisable group any uncharged group in a molecular entity that is capable of dissociating by yielding an ion (usually an H⁺ ion) or an electron and itself becoming oppositely charged, or of associating with an ion (usually an H⁺ ion) and itself assuming the ion's charge. The extent to which an ionizable group becomes an ionizing group depends on the constitution of the molecular entity and upon the environment.

ionization or ionisation any of the processes by which one or more ions are generated. It may occur, e.g., by loss or gain of a hydron by a solute in response to changes in pH, or by the loss of an electron from a neutral chemical species by unimolecular heterolysis of such a species into two or more ions. Further, a gas may become ionized by the passage through it of fast charged particles or electromagnetic radiation.

ionization chamber or ionisation chamber or ion chamber a chamber containing a gas and two electrodes between which an electric potential difference is maintained. It is used to detect ionizing particles or electromagnetic radiation by virtue of the current that flows following ionization of the gas.

ionization constant or ionisation constant the dissociation constant for a reversible reaction in which the products are ionic.

ionization energy or ionisation energy symbol: $E_{\rm I}$; the minimum energy (enthalpy) required to remove an electron from an isolated molecular entity (in its vibrational ground state) in the gaseous phase. It was formerly, and misleadingly, termed ionization potential.

ionization potential or ionisation potential a former term for ionization energy.

ionize or ionise to convert, or to become converted, wholly or in part, into ions; to cause ionization of (something). —ionizable adi.

ionizing particle or ionising particle any charged particle of sufficient energy to enable it to dislodge an orbital electron from an atom or other molecular entity. See ionizing radiation.

ionizing power or ionising power or (sometimes) polarity a qualitative term used to denote the tendency of a particular solvent to promote ionization of an uncharged solute.

lonizing radiation or ionising radiation any radiation, corpuscular or electromagnetic, that is capable of causing ionization (directly or indirectly) of matter through which it passes. For ionization to occur, the kinetic or photon energy, respectively, must be greater than the ionization energy of the irradiated substance. Ultraviolet radiation, X-radiation, alpha particles, and high-energy electrons (including beta particles) are more effective than gamma radiation or neutrons. It is commonly known simply as radiation.

ionogen 1 any compound that can dissociate into ions in a suitable environment; an electrolyte. 2 any atom or group that is capable of becoming ionized chemically. —**ionogenic** adj.

ionography an alternative name for zone electrophoresis.

ionomycin a nonfluorescent antibiotic ionophore derived from *Streptomyces conglobatus*. It is highly specific for divalent cations and exhibits greater selectivity for Ca²⁺ over Mg²⁺ than **A23187** (calcimycin). It complexes with Ca²⁺ between pH 7 and 9.5 with intense UV absorption, and thus may be used as a carrier of Ca²⁺ and for measurement of cytoplasmic Ca²⁺ concentration.

ionone either of two terpene compounds, α-ionone and β-ionone, found in a number of plants. β-Ionone is an intermediate in the synthesis of vitamin A; its odour is reminiscent of cedarwood or, in dilute alcohol solution, of violets.

ionophore or ionophorous agent any member of a varied group of both natural and synthetic substances, cyclic or linear and of greatly differing relative molecular masses, that are capable of binding metal ions in solution and transporting them across lipid barriers in natural or artificial membranes. They may be classed as cage carriers, when the ionophore surrounds the metal ion during transport, or as channel carriers, when the ionophore forms an ion-conducting pore in the membrane. — ionophorous or ionophoric adj.

ionophoresis electrophoresis, especially of relatively small ions. See also iontophoresis.

ionotropic describing a type of receptor that mediates its effects by regulating ion channels, in distinction from receptors that act by regulating enzymes such as adenylate cyclase or in-

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

ositide-specific phospholipase C. Compare metabotropic. See also excitatory amino-acid receptor.

ion pair a pair of oppositely charged ions held together by coulombic attraction. See also ionic bond.

ion product or (sometimes) ionic product symbol: K_{ij} a measure of the tendency of an amphiprotic solvent, XH, to take up or to lose a hydron in the reaction:

$$XH + XH = XH_2^+ + X^-.$$

In such a reaction, $K_i = a_{XH_2^+} \times a_X$ where $a_{XH_2^+}$ and a_{X^-} are the activities of XH_2^+ and X^- , respectively. The ion product of water, K_{W} , is given by

$$K_{\rm W} = a_{\rm H_3O^+} \times a_{\rm OH^-}; K_{\rm W} \approx 1 \times 10^{-14} \, \rm mol^2 \, dm^{-6} \, at \, 25 \, {}^{\circ}{\rm C}.$$

It has a large positive temperature coefficient.

ion-selective electrode or ion-selective microelectrode any electrode (or microelectrode) whose potential responds in a reproducible manner to changes in the concentration (strictly, in the activity) of a specific kind of ion in the solution in which the electrode is immersed and that is insensitive, or essentially so, to changes in the concentrations (strictly, in the activities) of all other kinds of ion in the solution. The electrode has at its surface a thin membrane of electrically conducting material, separating the internal and external solutions, across which an electric potential difference develops. The membrane consists of or contains an electroactive material responsive to the ions to be determined.

iontophoresis 1 the introduction of drugs and other substances through plasma membranes of cultured cells by the transfer of ions brought about by the application of a small electrical potential through electrodes placed on the membrane. 2 a less common word for ionophoresis.

iota symbol: 1 (lower case) or I (upper case); the ninth letter of the Greek alphabet. For uses see Appendix A.

IP or i.p. abbr. for intraperitoneal or intraperitoneally.

IP₂ abbr. for 1D-myo-inositol 3,4-bisphosphate.

IP3 abbr. for 1D-myo-inositol 1,3,4- (or 1,4,5-) triphosphate.

IP₄ abbr. for 1D-myo-inositol 1,3,4,5-tetrakisphosphate.

ipecacuanha or ipecac the dried root of the South American shrub, Cephaelis ipecacuanha; it contains the alkaloids cephaeline and emetine. Ipecacuanha preparations are used as emetics and expectorants.

IPP abbr. for Δ^3 -isopentenyl pyrophosphate. This compound is now preferably called isopentenyl diphosphate (abbr.: IDP).

iPr symbol for the isopropyl group, (CH₃)₂CH- (alternative to

iproniazid 1-isonicotinoyl-2-isopropylhydrazine; a derivative of isoniazid that is a monoamine oxidase inhibitor.

Ips symbol for the pipsyl group.

IPTG abbr. for isopropyl β -D-thiogalactoside.

IPTS abbr. for International Practical Temperature Scale. **Ir** symbol for iridium.

IR 1 or i.r. abbr. for infrared (radiation). 2 abbr. for inverted

IRE abbr. for iron response element.

 l_1 , l_2 receptors see imidazoline receptor.

IRG abbr. for immunoreactive glucagon.

IRMA abbr. for immunoradiometric assay.

iron symbol: Fe; a metallic element of group 8 of the IUPAC

atomic mass of 55.847 and is a mixture of stable nuclides of nucleon numbers 54 (5.8 atom per cent), 56 (91.7 atom per cent), 57 (2.2 atom per cent), and 58 (0.3 atom per cent). About 12 artificial radioactive nuclides are known; of these, iron-59 is the one most widely used in biochemistry and molecular biology. Iron is a transition element and hence forms ionic salts and numerous complexes in the oxidation states +2, i.e. iron(II) (ferrous iron), or +3, i.e. iron(III) (ferric iron). Iron is one of the most important elements in biology; it is essential in substantial quantities to all cellular organisms from bacteria to mammals, particularly for the synthesis of hemoproteins such as cytochromes, hemoglobins and related proteins, myoglobin, catalase, and some peroxidases. Important iron-transport proteins include ferritin and transferrin; iron is taken up into mammalian cells, bound to transferrin, by the transferrin receptor. There is no physiological excretory mechanism for iron, but it is lost from females during menstruation.

iron-59 the artificial radioactive nuclide ³⁹Fe. It decays to the stable nuclide cobalt-59 with emission of a beta particle (i.e. an electron) in two moderate-energy ranges (0.27 MeV max., 48%, and 0.48 MeV max., 51%) plus gamma radiation of various energies (mainly 1.10 MeV, 56%, and 1.29 MeV, 43%). It has a half-life of 44.5 days.

iron-molybdenum cofactor abbr.: FeMo-co; see nif, nitrogenase.

iron overload a condition of humans in which iron is taken up in excess over a prolonged period. As there is no excretory mechanism for iron, it accumulates in Kupffer cells in the liver as hemosiderin, a form of ferritin complexed with other proteins and iron. The condition is known as hemosiderosis. It is sometimes referred to as Bantu siderosis, being very prevalent in these peoples owing to their use of iron cooking pots. It also occurs as a result of repeated blood transfusions, e.g. in treatment for the hemoglobinopathies.

iron response element or iron regulatory element abbr.: IRE; a base sequence in eukaryotic genomes responsible for regulating gene expression of proteins involved in iron metabolism. ironophore an alternative name for siderochrome.

iron-sulfur protein abbr.: Fe-S protein; any member of a group of proteins to which iron is bound via sulfur-containing ligands (excluding hemoproteins containing iron linked only through axial sulfur ligands). Iron-sulfur proteins are characterized by a relatively low molecular mass and the possession of nonheme bound iron, as well as one or more of the following: (1) acid-labile sulfur; (2) absorption bands between 300 and 600 nm; (3) the capability of transferring electrons at low redox potential; and (4) paramagnetism in one or more oxidation states. They may be classified as simple if they contain one or more Fe-S clusters only (see ferredoxin, rubredoxin), and complex where additional active groups such as flavin, heme, or another metal are present.

irradiate to subject to or treat with electromagnetic radiation or beams of particles. —irradiation n.

irreversible competitive antagonist (in pharmacology), an antagonist for which the dissociation rate is so low that antagonist molecules cannot be replaced by increasing the concentration of an agonist for the same receptor.

irreversible process any process occurring in an isothermal system without change of internal energy but with an increase in entropy.

IS abbr. for insertion sequence.

islet any small group of cells that is structurally distinct from the surrounding tissue, especially the islets of Langerhans.

islet-activating protein abbr.: IAP; a former name for pertussis toxin (so-called because it stimulates release of insulin from the islets of Langerhans).

islets of Langerhans or (sometimes) islands of Langerhans or pancreatic islets the numerous small, spherical or oval, highly vascular clusters of endocrine cells that lie scattered throughout the acinar (i.e. exocrine) tissue of the pancreas of gnathoperiodic table; proton number 26; natural iron has a relative stome (i.e. jaw-bearing) vertebrates and are readily distin-Bạn đáng đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

guishable microscopically from it. The normal adult human pancreas contains about 2 million islets, which together comprise under 2% of its total volume. Islets commonly consist of three main types of cells, all granule-containing: the glucagonsecreting A cells; the insulin-secreting B cells; and the somatostatin-secreting **D** cells. Some other types of hormone-secreting cells may be present also. [After Paul Langerhans (1847-88), German physician and anatomist, who first described such clusters of cells (1869).]

iso+ or (sometimes before a vowel) is+ comb. form 1 equal, the same, uniform, homogeneous. Compare allo+ (def. 1), homo+ (def. 1), hetero+ (def. 1), xeno+ (def. 1). 2 (in immunology and genetics) a in or of some individual or ones that are genetically identical (e.g. isogenic). b in or of another, genetically differing individual of the same species (e.g. isoantigen); allo+ (def. 2) is now usually preferred. c in or of all normal individuals of the same species (e.g. isotypic). Compare allo+ (def. 2), hetero+ (def. 2), homo+ (def. 2), xeno+ (def. 2). 3 (in chemical nomenclature) a signifying isomer of (formerly 'iso' was italicized and often hyphenated). b symbol: i (as a prefix or superscipt); signifying the isomer of a straight-chain alkane or alkane derivative that differs only in having a terminal $(CH_3)_2CH$ group (leucine and isoleucine are exceptions). Compare allo+ (def. 3), nor+ (def. 1). 4 (in names of certain classes of macromolecules) signifying irrespective of location or origin, one of two or more structural variants with the same specificity of activity or action (e.g. isoacceptor tRNA, isohormone; see also isoenzyme).

ISO abbr. for International Standards Organization.

isoacceptor tRNA or isoaccepting tRNA any of two or more transfer RNA species obtainable from a given organism that can be acylated by the same amino acid; they may differ in their anticodons.

isoagglutinin any antibody formed in one individual that causes agglutination of cells derived from another individual of the same species.

isoalloxazine benzo[g]pteridine-2,4(1H,3H)dione; the hypothetical tricyclic parent compound from which is derived any N^{10} -substituted alloxazine. The 7,8-dimethyl derivative is the heterocyclic ring structure in riboflavin and flavin mononucleotide, and one of the heterocyclic ring structures in flavinadenine dinucleotide.

isoamylase EC 3.2.1.68; other name: debranching enzyme; an enzyme that catalyses the hydrolysis of 1,6-α-D-glucosidic branch linkages in glycogen, amylopectin, and their β -limit dextrins. It does not attack pullulan, and is limited in action on α-limit dextrins. Example (precursor) from Pseudomonas amyloderamosa: database code ISOA_PSEAY, 771 amino acids (83.24 kDa).

isoantibody any antibody formed in one individual in response to an antigen derived from another individual of the same species.

isoantigen any antigen occurring in an individual that is capable of eliciting an immune response in genetically different individuals of the same species but not in the individual itself.

isoasparagine the trivial name for the α -amide of aspartic acid, aspartic 1-amide; β-aminosuccinamic acid; 3-amino-3carbamoylpropanoic acid; H₂N-CO-CH(NH₂)-CH₂-COOH; a chiral α-aminoacylamide. L-Isoasparagine (symbol: Asp-NH₂) can occur as an N-terminal amidated residue of pro-

H₂N-CO-CH(NH₂)isoasparaginyl the acyl group, CH2-CO-, derived from isoasparagine. Compare asparaginyl. isoaspartyl the former name for $oldsymbol{eta}$ -aspartyl.

isobar 1 any of two or more nuclides having the same mass number (nucleon number) but different atomic numbers (proton numbers) and hence of differing chemical properties. See also heterotope. 2 any curve or equation relating quantities measured at the same pressure; any line joining points on a graph or map that have equal pressures. —isobaric adj.

isobutylmethylxanthine abbr.: IBMX; 3-isobutyl-1-methylxanthine; an inhibitor of cyclic AMP phosphodiesterase; it raises cyclic AMP levels in cells and tissues.

isocaloric (of foodstuffs) having the same calorific value. **isochorismate** 5-[(1-carboxylatoethenyl)oxy]-6-hydroxy-1,3cyclohexadiene-1-carboxylate; the dianion of isochorismic acid; an isomer of chorismate and an important precursor to some compounds in the shikimate pathway.

isochorismic acid

isochromosome any chromosome having homologous, genetically identical arms that are mirror images of each other.

isocitrate 1 any of the anionic forms of isocitric acid, 1-hydroxy-1,2,3-propanetricarboxylic acid. (1R,2S)-1-hydroxypropane-1,2,3-tricarboxylate (also termed (2R,3S)-isocitrate or threo-Ds-isocitrate) is an important intermediate in the tricarboxylic-acid cycle and the glyoxylate cycle. 2 any mixture of free isocitric acid and its ionized forms. 3 any (partial or full) salt or ester of isocitric acid.

(1R,2S)-1-hydroxypropane-1,2,3-tricarboxylate

isocitrate dehydrogenase 1 isocitrate dehydrogenase (NAD+)

EC 1.1.1.41; other names: isocitric dehydrogenase; β -ketoglutaric-isocitric carboxylase; an enzyme that catalyses the oxidation of isocitrate to 2-oxoglutarate and CO₂, with reduction of NAD⁺ to NADH. The isomer of isocitrate involved is (1R,2S)-1-hydroxypropane-1,2,3-tricarboxylate. Examples from yeast, in which there are two mitochondrial isozymes (precursors): database code IDH1_YEAST, 360 amino acids (39.28 kDa); teins. Compare asparagine.
database code IDH2 YEAST, 369 amino acids (39.69 kDa). In
Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nêu ban có nhu câu về sách sinh học, xin liên hế:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

mammalian tissues, this enzyme is localized exclusively in the mitochondria. 2 Isocitrate dehydrogenase (NADP+) (EC 1.1.1.42); an enzyme that is localized in both mitochondria and cytosol.

[isocitrate dehydrogenase (NADP+)] kinase EC 2.7.1.116; other names: isocitrate dehydrogenase kinase/phosphatase (abbr.: IDH kinase/phosphatase); an enzyme that catalyses the phosphorylation by ATP of isocitrate dehydrogenase (NADP+) with formation of ADP. The phosphorylated protein is the inactive form of the enzyme. Example from Escherichia coli in which a bifunctional enzyme contains this and isocitrate dehydrogenase kinase/phosphatase (EC 3.1.3.-) activities: database code ACEK_ECOLI, 578 amino acids (67.51 kDa).

isocitrate lyase EC 4.1.3.1; systematic name: isocitrate glyoxalate-lyase; an enzyme, present in the glyoxysomes of seeds, that converts (1R,2S)-1-hydroxypropane-1,2,3-tricarboxylate (the isomer of isocitrate involved) to succinate and glyoxylate. See glyoxylate cycle.

isocratic (in chemistry) describing any chromatographic procedure or separation in which the composition of the eluent is maintained constant. Compare gradient elution.

isocyanate any organic compound containing the univalent group -N=C=O. Compare cyanate, isothiocyanate.

isocyclic see homocyclic (def. 1).

isodalt a type of very-high-resolution two-dimensional electrophoresis system for the analysis of small (1-2 mg) samples of complex mixtures of proteins. It employs isoelectric focusing in cylindrical gels in the first dimension, followed by slabgel electrophoresis in the presence of sodium dodecyl sulfate in the second dimension. Such systems are considered to be capable of resolving mixtures containing 10⁴ or more individual proteins within the range 10-200 kDa.

isodesmosine the 2-(4-amino-4-carboxybutyl)-1-(5-amino-5-carboxypentyl)-3,5-bis(3-amino-3-carboxypropyl)pyridinium ion; a tetra(α -amino acid) isolated from hydrolysates of the fibrous protein elastin. See desmosine.

isodiametric 1 (of cells) having similar diameters in all planes. 2 (of a crystal) having three equal axes.

isodynamic (in physics) having equal force or strength.

isoelectric 1 having the same electrical potential; containing or indicating no potential difference. 2 (of particles or molecular entities) having no net electric charge.

isoelectric focusing or electrofocusing abbr.: IEF; a technique in which solutes of different isoelectric points are caused to form stationary bands in an electric field, which is superimposed on a (stable) pH gradient, the pH increasing from the anode to the cathode. In practice the pH gradient is most conveniently formed by electrolysing a solution containing a mixture of carrier ampholytes of low molecular mass and slightly differing isoelectric points, each of which will move to its isoelectric region in the electric field and remain there.

isoelectric-focusing electrophoresis a separation technique in which electrophoresis is effected in a gel slab at right angles to a preformed, stationary pH gradient generated by isoelectrically focused carrier ampholytes (see isoelectric focusing).

isoelectric fractionation any technique for fractionating proteins or other ampholytes using isoelectric focusing.

isoelectric pH an alternative term for isoelectric point.

pI; the pH of the solution in which a protein or other ampholyte has zero mobility in an electric field; hence the pH at which the protein or other ampholyte has zero net charge, i.e. no charges or an equal number of positive and negative charges including those due to any extraneous ions bound to the ampholyte molecule. The pH value of the isoelectric point may depend on other ions, except hydrogen and hydroxide ions, present in the solution. Compare isoionic point.

isoelectric precipitation the precipitation of a protein at its isoelectric point, at which proteins are generally least soluble. It is useful in the fractionation of mixtures of proteins.

isoelectronic describing two or more chemical entities having the same number of electrons, especially valence electrons. Compare isosteric.

isoenergetic taking place at constant energy.

isoenzyme or isozyme any one of the multiple forms of an enzyme arising from a genetically determined difference in primary structure. Isoenzyme is an operational term to denote any one of a group of enzyme proteins with similar catalytic properties but separable by suitable methods, e.g. by electrophoresis, where knowledge of the nature of the multiplicity may be lacking. If the different enzyme proteins are derived from a common gene, then the term 'multiple forms' rather than 'isoenzymes' should be used. The term embraces allelozyme and multilocus enzyme. Compare interconvertible enzyme.

isoflavone 7-O-glucosyltransferase EC 2.4.1.170; an enzyme that catalyses the reaction between UDPglucose and isoflavone to form isoflavone 7-O- β -D-glucoside and UDP.

2-chloro-2-(difluoromethoxy)-1,1,1-trifluoroethane; a widely used nonflammable volatile anesthetic agent.

isoform any of several multiple forms of the same protein that differ in their primary structure, but retain the same function. They can be produced by different genes or by alternative splicing of RNA transcripts from the same gene.

isogeneic or isogenic describing two or more individuals that possess exactly the same genotype. See also syngeneic.

isoglucose see high-fructose corn syrup.

isoglutamine a trivial name for the α -amide of glutamic acid: glutamic 1-amide; y-aminoglutaramic acid; 4-amino-4-carbamoylbutanoic acid; H₂N-CO-CH(NH₂)-[CH₂]₂-COOH; a chiral α-amino acylamide. L-Isoglutamine (symbol: Glu-NH₂) can occur as an N-terminal amidated residue of proteins. Residues of D-isoglutamine (symbol: D-Glu-NH₂) are found in Staphylococcus aureus peptidoglycan. Compare glutamine.

isoglutaminyl the acyl group, H₂N-CO-CH(NH₂)-[CH₂]₂-CO-, derived from isoglutamine. Compare glutaminyl. isoglutamyl a former name for y-glutamyl.

isograft an alternative term for syngenic graft.

isohormone any of two or more structural variants of a polypeptide hormone that have the same hormonal action and are produced within the same organism, or at least within the same species of organism. —isohormonal adj.

isohydric describing solutions that have the same hydrogenion concentration, hydrogen-ion activity, or pH.

isohydric shift the opposing and counterbalancing changes in hydrogen-ion concentration occurring in peripheral tissues when dioxygen leaves the blood and carbon dioxide enters it. The hydration of CO₂ to H₂CO₃, catalysed by erythrocyte carbonic anhydrase, has a tendency to lower the blood pH. This tendency is counteracted in some degree by the simultaneous deoxygenation of hemoglobin; deoxyhemoglobin binds hydrogen ions more strongly than oxyhemoglobin, thus tending to raise the blood pH.

isoionic pH an alternative name for isoionic point.

isoionic point or isoionic pH the pH of a solution of a protein or other ampholyte from which all other ions have been removed, except hydrogen and hydroxide ions formed by dissociation of water or of the protein or ampholyte itself. Compare isoelectric point.

isoelectric point or isoelectric pH abbr.: IEP or i.e.p.; symbol: isolonic solution any solution of a protein or other ampholyte Ban dang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

isokinetic gradient isomeric trans

that contains no other ions except those arising from dissociation of the solute and the solvent.

isokinetic gradient any concentration and viscosity gradient used in centrifugation that allows particles (molecules) of the same density to sediment at a constant velocity at all distances from the centre of rotation.

isolate 1 to separate (a pure substance, a cell type, or a sample of a subcellular component) from a mixture or from naturally occurring material and then (usually) to characterize it; to separate and put into pure culture (a particular species or strain of a microorganism) from a mixture, sample, or biological specimen. 2 to remove a viable tissue or organ for the purpose of study or experiment. 3 (in physics) to disconnect (part of a circuit), or to prevent interaction between (circuits or components). 4 a group of similar microorganisms, especially a pure culture, obtained by isolation for study, experiment, or as an aid to diagnosis; something isolated. —isolable or isolatable adj; isolability, isolator n.

isolectin any of two or more molecular forms of lectins, of the same origin, apparently with the same biological properties, and of very similar molecular masses, but of differing electrophoretic mobilities. They may be the products of closely related genes or formed prior to or during isolation. In glycoprotein lectins, their differences may lie in the carbohydrate side chains.

1 isoleucine anion; the anion, CH₃-CH₂isoleucinate CH(CH₃)-CH(NH₂)-COO-, derived from isoleucine. 2 any salt containing isoleucine anion. 3 any ester of isoleucine.

isoleucine the trivial name for α -amino- β -methylvaleric acid; $(2R^*,3R^*)$ -2-amino-3-methylpentanoic acid; CH(CH₃)-CH(NH₂)-COOH; an α -amino acid with two chiral centres. Because molecules of isoleucine possess a second chiral centre, at C-3, in addition to the chiral centre at C-2 common to all α -amino acids other than glycine, the enantiomers Lisoleucine, (2S,3S)-2-amino-3-methylpentanoic acid (symbol: I or IIe), and D-isoleucine, (2R,3R)-2-amino-3-methylpentanoic acid (symbol: D-Ile or DIle), are diastereoisomeric with those of alloisoleucine, $(2R^*,3S^*)$ -2-amino-3-methylpentanoic acid. Lisoleucine is a coded amino acid found in peptide linkage in proteins; codon: AUA (not in mitochondria of fruit fly, mammals, or yeast), AUC, or AUU. In mammals it is an essential dietary amino acid, and is both glucogenic and ketogenic. D-Isoleucine is not known to occur naturally.

L-isoleucine

isoleucine biosynthesis a pathway that commences with formation of α -aceto- α -hydroxybutyrate (I) from pyruvate and α -ketobutyrate (2-oxobutanoate, formed by removal of ammonia from threonine by serine dehydratase). I is converted via α,β -dihydroxy- β -methylvalerate to α -keto- β -methylvalerate (II). Isoleucine is then formed from II as a result of transamination with glutamate.

isoleucinium isoleucine cation; the cation, CH₃-CH₂-CH(CH₃)-CH(NH₃⁺)-COOH, derived from isoleucine.

isoleucino the alkylamino group, CH₃-CH₂-CH(CH₃)-CH(COOH)-NH-, derived from isoleucine.

isoleucyl the acyl group, CH₃-CH₂-CH(CH₃)-CH(NH₂)-CO-, derived from isoleucine.

isoliquivitigenin see chalcone.

isolog the US spelling of isologue.

isologous 1 of, relating to, or being two or more closely related chemical compounds in a series whose successive members differ in composition in a regular manner, other than by a difference of one methylene group. The term is now applied especially to compounds that have different atoms of the same valency at one or more positions in the molecule but are otherwise structurally identical, e.g. methionine and selenomethionine. 2 an alternative term for isogeneic.

isologous association or isologous binding any association between two identical protein subunits (i.e. protomers) in which the domain of bonding is made up of two identical binding sets.

isologue or (US) isolog any of two or more isologous (def. 1) compounds.

isology the state or condition of being isologous (def. 1); chemical kinship among molecules or compounds.

isomaltase EC 3.2.1.10; recommended name: oligo-1,6-glucosidase; systematic name: dextrin 6-α-D-glucanohydrolase. An enzyme that hydrolyses 1,6-α-D-glucosidic bonds in dextrins and isomaltose produced after α-amylase degradation of starch and glycogen. The enzyme from intestinal mucosa also catalyses the reaction of EC 3.2.1.48 (see sucrase). Example from Bacillus sp.: database code O16G_BACSP, 508 amino acids (59.78 kDa).

isomaltose the disaccharide 6-O- α -D-glucopyranosyl-D-glucose; it exists as the branching unit in amylopectin, glycogen, and some bacterial dextrans. Compare maltose.

isomaltulose the disaccharide 6-O-α-D-glucopyranosyl-Dfructofuranose.

isomer 1 (in chemistry) molecular isomer any of two or more compounds that have identical molecular formulas but differ in the nature of bonding of their atoms (constitutional isomers) or in the arrangement of their atoms in space (stereoisomers). 2 (in physics) nuclear isomer any of two or more nuclides that have the same proton number and the same mass (nucleon) number but different energy states.

isomerase any enzyme of EC class 5 that catalyses geometric or structural changes within one molecule. According to the type of isomeric change they catalyse, they may be called racemases or epimerases (EC subclass 5.1); cis-trans-isomerases (EC subclass 5.2); intramolecular oxidoreductases (EC subclass 5.3); intramolecular transferases (mutases) (EC subclass 5.4); or intramolecular lyases (EC subclass 5.5); other isomerases are placed in EC subclass 5.99.

isomeric of or pertaining to an isomer; pertaining to the phenomenon of, or displaying, isomerism.

isomeric state any of the states of an atomic nucleus having a different energy and observable half-life from those of other states of the same nucleus; the condition of being an isomer

isomeric transition abbr.: IT; the change of one nuclear isomer (see isomer (def. 2)) into another without change in either proton number (atomic number) or nucleon number (mass number), energy being lost in the form of gamma radiation; e.g. the decay of the metastable nuclide technetium-99m (halflife 6 h) to the unstable nuclide technetium-99 (half-life 2.1 x 10⁵ years), which in turn decays to ruthenium-99 with emission of an electron.

isomerism

isomerism the phenomenon of the existence of **isomers** in general, or the occurrence of molecular or nuclear isomers in a particular instance.

isomerization or **isomerisation** the act of changing or the process of change of one molecular isomer into another one.

—isomerize or isomerise vb.

isometric 1 having identical dimensions. 2 (in physiology) of or pertaining to a contraction of a muscle that does not cause shortening of the muscle. 3 (in crystallography) having three mutually perpendicular axes of equal length; cubic.

isomorph a substance or organism that is **isomorphic** (def. 1) to another substance or organism.

isomorphic 1 or isomorphous of identical or similar form, shape, or structure. 2 describing a type of alternation of generations in which morphologically identical generations occur in both diploid and haploid phases. It occurs mainly in algae. Compare heteromorphic.

isomorphism 1 (in biology) similarity of form in organisms of different ancestry. 2 (in chemistry) similarity of crystalline form and structure between substances of similar composition or substances that can form a more or less continuous series of solid solutions.

isomorphous 1 an alternative term for isomorphic (def. 1).
2 displaying isomorphism (esp. def. 2).

isomorphous replacement method a method used to solve the phase problem in X-ray diffraction analysis of macromolecular structures. It involves combining one or more heavy atoms (def. 2) (which are strong scatterers) in a specific manner with the macromolecule in question and investigating their effects on the diffraction pattern. The heavy atom must not modify either the conformation or the crystal form of the macromolecule, i.e. the replacement must be isomorphous.

isoniazid 4-pyridinecarboxylic acid hydrazide; an antitubercular drug that may act by inhibiting the synthesis of the mycolic acids that are vital for the construction of the cell wall of the pathogen, *Mycobacterium tuberculosis*. Like related hydrazides it is highly hepatotoxic and no longer used. Its euphoric side effects led to the discovery of monoamine oxidase inhibitors.

isoosmotic a variant spelling of isosmotic.

isopartitive (in chromatography) describing two or more solvents that bring about similar partitions of a given substance between the solvent and the stationary phase and hence result in R_f values that are the same or nearly so.

isopentenyl the trivial name for 3-methylbut-3-enyl, CH₂=C(CH₃)-CH₂-CH₂-, the alkenyl group formally derived from isopentenyl alcohol (i.e. 3-methylbut-3-en-1-ol) by loss of its hydroxyl group. Compare prenyl.

isopentenyl diphosphate abbr.: IDP; formerly called Δ³isopentenyl pyrophosphate (abbr.: IPP); an isomer of dimethylallyl diphosphate and the key precursor of all isoprenoids
(def. 2). See also dimethylallyltranstransferase, isopentenyldiphosphate Δ-isomerase, isoprene rule.

isopropylm

isopentenyl-diphosphate Δ -isomerase EC 5.3.3.2; systematic name: isopentenyl diphosphate $\Delta^3 - \Delta^2$ -isomerase; other name: IPP isomerase. An enzyme in the pathway for the synthesis of cholesterol, terpenes, and prenyl groups; it catalyses the reversible reaction:

isopentenyl diphosphate = dimethylallyl diphosphate.

Example from Saccharomyces cerevisiae: database code IPPI_YEAST, 287 amino acids (33.18 kDa).

isopeptidase any peptidase catalysing the cleavage of an isopentide bond.

isopeptide bond any peptide bond other than one that is a eupeptide bond, i.e. any amide bond formed between a carboxyl group of one amino-acid molecule or residue and an amino group of another where either group occupies a position other than α (or both do so). Examples include peptide bonds formed from the β -carboxyl group of aspartic acid, the γ -carboxyl group of glutamate from the ε -amino group of lysine, and from either the carboxyl group or the amino group of β -alanine.

isopiestic of, pertaining to, or characterized by equal pressures.

isopiestic vapour pressure method a method for the determination of the activity of water in a solution of a nonvolatile solute. The solution in question is equilibrated with a reference solution containing a nonvolatile solute for which the activity of water at different solute concentrations has been determined with high precision. The two solutions are placed in an enclosure at constant temperature until their vapour pressures are equal, i.e. the activity of water in both solutions is equal. They are then analysed for their solute contents, from which the activity of water in both of them can be calculated.

isoprenaline an alternative name for isoproterenol.

isoprene 2-methylbuta-1,3-diene; CH₂=C(CH₃)-CH=CH₂; a liquid hydrocarbon hemiterpene isolated from products of the pyrolysis of natural rubber, turpentine, etc., and widespread in plants although generally found only in extremely small amounts.

isoprene residue the branched-chain bivalent group, 3-methyl-2-butenylene; 3-methylbut-2-en-1,4-diyl; -CH₂-C(CH₃)=CH-CH₂-. It is formally derived by bond rearrangement from **isoprene** and constitutes the repeating unit of the molecular structures of prenols and many other isoprenoids.

isoprene rule a rule, formulated by Wallach in 1887, that stated that many natural products are built up from isoprene carbon skeletons. It was modified to the biogenetic isoprene rule by Ružička, who proposed that all terpenoids, steroids, etc. are synthesized from a precursor called 'active isoprene'. This precursor is now known to be isopentenyl diphosphate.

branched five-carbon-atom moiety formally derived from an isoprene residue by chemical modification, e.g. by hydrogenation, hydroxylation, etc. It represents isopentenyl alcohol (i.e. 3-methylbut-3-en-1-ol), the diphosphate of which is the universal biogenetic precursor of isoprenoids.

isoprenoid 1 of, pertaining to, or being isoprene and its chemical relatives; having a molecular structure composed of, containing, or derived from linked isoprene residues. 2 any isoprenoid compound. Isoprenoids comprise a large and varied family of natural products, including carotenoids, phytol prenols, rubber, steroids, terpenoids, and tocopherols. Many substances contain both isoprenoid and nonisoprenoid components, e.g. the vitamins K.

isoprenyltransferase any of the enzymes within subclass EC 2.5.1, existing as $\alpha-\beta$ heterodimers, that add C_{15} or C_{20} carbon chains by **prenylation** near the carboxyl terminus of proteins. Examples include the nuclear lamins and Ras.

isopropyl symbol: iPr or Pri; the alkyl group (CH₃)₂CH-, derived from propane. Compare propyl.

isopropylmalate either of the isomeric substances 2-isopropylmalate (i.e. 3-carboxy-3-hydroxy-4-methylpentanoate) or 3-Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

3-isopropylmalate dehydratase

isopropylmalate (i.e. 3-carboxy-2-hydroxy-4-methylpentanoate); they are enzymatically interconvertible intermediates in the biosynthesis of leucine in plants. See also 3-isopropylmalate dehydratase.

(2R,3S)-3-isopropylmalic acid

3-isopropylmalate dehydratase EC 4.2.1.33; systematic name: 3-isopropylmalate hydro-lyase; an enzyme that catalyses the isomerization of 3-isopropylmalate to 2-isopropylmalate, by dehydration to 2-isopropylmaleate and rehydration to generate the isomer, in the pathway of L-leucine biosynthesis in plants. See leucine and valine biosynthesis.

3-isopropylmalate dehydrogenase EC 1.1.1.85; systematic name: 3-carboxy-2-hydroxy-4-methylpentanoate:NAD+ oxidoreductase; an enzyme that catalyses the oxidation of 3-isopropylmalate by NAD+ (followed by loss of CO₂) to 4-methyl-2-oxopentanoate, in the pathway of L-leucine biosynthesis in plants. See leucine and valine biosynthesis.

2-isopropylmalate synthase EC 4.1.3.12; systematic name: 3-carboxy-3-hydroxy-4-methylpentanoate 3-methyl-2-oxobutanoate-lyase (CoA-acetylating); an enzyme that condenses acetyl-CoA with 3-methyl-2-oxobutanoate to form 2-isopropylmalate, in the pathway of L-leucine biosynthesis in plants. See leucine and valine biosynthesis.

isopropyl β -thiogalactoside abbr.: IPTG; isopropyl β -D-1-thiogalactopyranoside; an inducer of β -galactosidase in bacteria; it also induces the *lac* operon by binding and inactivating the *lac* repressor. It is used in cloning techniques to enhance expression of DNA cloned into vectors containing the *lac* operon.

isoproterenol or isoprenaline 3,4-dihydroxy- α -[(isopropylamino)methyl]benzyl alcohol; the synthetic isopropyl analogue of epinephrine. It is a selective agonist of β adrenoceptors, but does not discriminate between β_1 and β_2 subtypes.

isoproterenol

isopycnic of, pertaining to, or characterized by equal densi-

isopycnic banding the formation during isopycnic centrifugation of one or more bands composed of molecules that have the same density as that of the solvent at that position in the gradient; the process of separating or purifying substances by forming such bands.

isopycnic centrifugation or band centrifugation or densitygradient centrifugation or density-gradient sedimentation equilibrium a separation technique in which macromolecules are subjected to a centrifugal field in a solvent containing a density gradient. The macromolecules will sediment or float and arrange themselves in bands (isopycnic bands) in the column of solvent where the density of the solvent is the same as that of the particular macromolecule. Compare isokinetic gradient.

isoquinoline 2-benzazine; benzo[c]pyridine; a bicyclic, aromatic, nitrogen-containing compound. Many alkaloids contain an isoquinoline ring system.

isoquinolinesulfonylmethylpiperazine see H7.

isosbestic point any wavelength at which the molar **absorption coefficients** of two or more particular chemical species are equal, i.e. their absorption spectra intersect. All mixtures (or solutions) of two or more such species, having the same total concentration, will then exhibit absorption spectra that pass through the isosbestic point, provided the species do not interact

isoschizomer any of two or more restriction endonucleases from different sources that recognize the same sequence in a DNA molecule and display identical specificity of cleavage within that sequence. The term is sometimes extended to include those enzymes that cleave at different sites within the sequence recognized, or that respond to methyl groups on different bases in the sequence. Examples are *MspI* and *HpaII*, both of which cleave the unmethylated sequence CCGG.

—isoschizomeric adi.

isosemantic substitution the incorporation of an amino-acid residue into its normal position in a polypeptide chain in response to a mutated but synonymous codon.

isosmotic or **isoosmotic** (of two or more solutions) having equal osmotic pressure; having the same osmotic pressure as another solution. See also **isotonic** (def. 2).

isostere or **isoster** any of two or more **isosteric** chemical species.

isosteric (of two or more chemical species) having the same, or similar, shape and size, e.g. L-threonine and L-valine; having the same number of valence electrons arranged in a similar manner. Compare isoelectronic. —isosterism n.

isotachophoresis or **isotachoelectrophoresis** or **displacement electrophoresis** a method for separating ion species in which all ions under observation are given the same migration velocity; moreover, they all have the same sign and a common counterion. The sample ions are introduced as a zone between a leading electrolyte, whose ions have a higher mobility than any of the sample ions, and a terminating electrolyte, whose ions have a lower mobility than any of the sample ions.

isotactic of, relating to, or having stereochemical regularity in the repeating units of a polymer. *Compare* syndyotactic.

isotherm or isothermal any line on a graph, or diagram, that connects points of equal temperature.

isothermal 1 (of a process or reaction) occurring at constant temperature. 2 of or pertaining to an isotherm. 3 an alternative name for isotherm.

isothiocyanate any organic compound containing the monovalent group -N=C=S. Compare thiocyanate.

isotocin or (formerly) isotocine [Ser⁴, fle⁸]oxytocin; the somewhat less potent structural variant of oxytocin. It is present in many bony fish in place of oxytocin, hence it is sometimes known as ichthyotocin. See also mesotocin.

the same density as that of the solvent at that position in the Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

isotonic

nur search

of neutrons but, usually, different numbers of protons and therefore differing in atomic number.

isotonic 1 of, or having the same tension; used especially of muscular contraction occurring in the absence of significant resistance and accompanied by marked shortening of the muscle fibres. Compare isometric (def. 2). 2 having the same osmotic pressure as some particular solution, especially one in a cell or body fluid; isosmotic. Compare hypertonic, hypotonic. 3 of, relating to, or being an isotone or isotones.

isotonically under isotonic (def. 1) conditions.

isotonicity the state or quality of being **isotonic** (def. 2); the degree of osmotic pressure.

isotope any of two or more nuclides that have the same proton number, i.e. that are nuclides of the same chemical element and thus display qualitatively the same chemical properties (for quantitative differences, see isotope effect). Isotopes with a given proton number usually have different nucleon numbers and thus characteristically usually have different relative atomic masses. In some instances, however, two isotopes of an element are isomeric, i.e. they have the same nucleon number (and hence the same relative atomic mass) but differ instead in their nuclear energy levels, the isotope with the higher level being metastable (def. 3). For the majority of elements, isotopes occur naturally and at more or less constant relative abundances; additional isotopes can be produced artificially. In general, any given element possesses both stable and unstable isotopes, although there are no stable ones for elements of high proton number; conversely, the naturally occurring isotopes of elements of lower proton number are, with a few exceptions, all stable. Metastable and unstable isotopes undergo radiative decay and are collectively termed radioactive isotopes, or radioisotopes. (*Note*: In common parlance the term isotope is often used loosely as a synonym of nuclide irrespective of its proton number.) Compare heterotope, isobar, isotone. —isotopic, adj.

isotope abundance the number of atoms of a particular isotope in a mixture of the isotopes of an element in a sample, expressed as a percentage of all the atoms of that element in the sample. Compare isotope ratio.

isotope dilution analysis an accurate method for measuring the concentration of an element, or a compound of that element, in a system by adding a known amount of a different isotope, or a labelled compound, and then measuring its concentration in a sample withdrawn from the system after mixing.

isotope effect any variation in some chemical, physicochemical, or biochemical property of a molecular entity that is detectable on isotopic substitution of an atom or atoms of the entity, e.g. variation in reaction rate, in chromatographic mobility, or in binding to macromolecules. For a given pair of isotopes, 'light' and 'heavy', the effect may be expressed quantitatively either (in the **kinetic isotope effect**) as the ratio of the rate constants, $k_{\text{light}}/k_{\text{heavy}}$, or (in the **equilibrium isotope effect**) as the ratio of the equilibrium constants, $K_{\text{light}}/K_{\text{heavy}}$, for two chemical reactions that differ only in the isotopic composition of one or more of their otherwise chemically identical components. The magnitude of the effect depends on the relative difference in atomic mass of the isotopes in question; thus it is the greatest by far for isotopes of hydrogen.

isotope exchange any chemical reaction in which the reactants and products are chemically identical but of different isotopic composition. In such a reaction the isotope distribution tends towards equilibrium.

biological techniques for the large-scale preparation, usually for sale, of radioisotope-labelled biochemicals, especially when a number of such compounds are obtainable in the same operation, e.g. the simultaneous preparation of a number of ¹⁴C-labelled compounds from ¹⁴CO₂ by photosynthesis in whole leaves or whole plants.

atoms of any two isotopes of a given element in a particular preparation, sample, or substance. Compare isotope abundance.

isotope-ratio mass spectrometer a mass spectrometer designed specifically for the determination of isotope ratios.

isotopic 1 of, relating to, or being an **isotope** or isotopes. 2 being or containing a less common or artificial isotope, especially as a label or tracer. 3 (especially of techniques) using or depending on isotopes.—**isotopically** adv.

isotopy the phenomenon of the existence of isotopes in general; or the fact or condition of being isotopic in a particular instance.

isotropic or **isotropous** 1 (in physics): exhibiting uniform properties when measured along axes in all directions. Compare anisotropic. 2 (in biology) not having predetermined axes of growth. —isotropically adv.; isotropy or isotropism n.

isotropic band or I-band see sarcomere.

isotropic motion the random tumbling of a chemical species about its three axes.

isotropous an alternative word for isotropic.

isotypic specificity any antigenic specificity that is the same in a given protein in all normal individuals of the same animal species. For example anti-rabbit gamma globulins prepared in another animal species do not distinguish between gamma globulins from different rabbits.

isotypic variation structural variability of any one antigen that is common to all members of the same species.

isovaleric acidemia a hereditary metabolic disease of humans, due to defects in isovaleryl-CoA dehydrogenase i.e. Leu→Pro at position 13 and Gly→Val at position 170 (of the mature enzyme). It is of variable severity.

isovaleryl-CoA dehydrogenase abbr.: IVD; EC 1.3.99.10; a flavoprotein enzyme of the pathway for degradation of valine. It catalyses the oxidation of 3-methylbutanoyl-CoA to 3-methylbut-2-enoyl-CoA. The flavin is FAD. Example (precursor) from human: database code IVD_HUMAN, 423 amino acids (46.27 kDa).

isozyme an alternative word for isoenzyme.

isozymogen any precursor of an isozyme.

IT abbr. for isometric transition.

itaconate methylenesuccinate; methylenebutanedioate; the dianion OOC-CH₂-C(=CH₂)-COO; a constitutional isomer of **citraconate**. It is a metabolite of strains of Aspergillus terreus, which can yield it in large amounts by decarboxylation of cisaconitate. It is a comparatively reactive compound, with properties useful in the manufacture of synthetic resins and plastics.

iteron any sequence of nucleotides in the duplex DNA of certain lambdoid phages that is reiterated several times with only minor changes. These repeated sequences, of 13-19 base pairs, are usually separated by short spacer sequences, each having internal dyad symmetry.

+itis suffix forming nouns denoting inflammation of the (specified) organ, tissue, etc.

ITP abbr. for 1 inosine (5'-)triphosphate. 2 isotachophoresis.

itraconazole a complex derivative of triazole, useful as an antimycotic. It inhibits cytochrome P450-dependent enzymes, thereby impairing the synthesis of ergosterol.

+ity suffix forming nouns meaning a property of a substance; e.g. absorptivity, density, solubility.

IU abbr. for International Unit (preferred alternative to i.u. or

IUB abbr. for International Union of Biochemistry; renamed (1992) International Union of Biochemistry and Molecular Biology (IUBMB).

IUBMB abbr. for International Union of Biochemistry and Molecular Biology. See Appendix C.

IUdR or IUDR abbr. for 5-iododeoxyuridine (IdUrd preferred). IUPAB abbr. for International Union of Pure and Applied Bio-

isotope rațio or isotopic rațio the rațio between the numbers of physics. Bạn dang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

IUPAC

Burnsant /

IUPAC abbr. for International Union of Pure and Applied Chemistry.

iupaciubin alanyl-lysyl-glutamyl-tyrosyl-leucine; a pentapeptide containing one residue each of the five main types of amino acid found in peptides and proteins, i.e. small neutral, basic, acidic, aromatic, and lipophilic. It exists only on paper and was designed as a model to illustrate nomenclature recommendations relating to the modification of named peptides. Its name symbolizes the cooperation between IUPAC and IUB.

IUPAP abbr. for International Union of Pure and Applied Physics.

IV or i.v. abbr. for intravenous or intravenously.

IVD abbr. for isovaleryl-CoA dehydrogenase.

ivermectin 22,23-dihydroabamectin; 22,23-dihydroavermectin B₁; a semisynthetic material derived from **abamectin** and used as an anthelmintic in both clinical and veterinary practice, especially against onchocerciasis. It is used extensively as a once-a-month pill against heartworm in dogs.

iVI symbol for the isovaleryl group, (CH₃)₂CH-CH₂-CO-(alternative to VIⁱ).

component B_{1a} , $R = C_2H_5$ component B_{1b} , $R = CH_3$ ivermectin

i symbol for electric current density (alternative to J).

J symbol for 1 joule. 2 J chain (of an immunoglobulin).

J symbol for 1 coupling constant. 2 flux (def. 2). 3 electric current density (preferred alternative to j).

jack bean 1 an annual tropical American leguminous plant, Canavalia ensiformis, grown in the USA for forage. 2 the seed of this plant. It is the source of the globulin canavalin, the toxic amino acid L-canavanine, the lectin concanavalin A, and the enzyme urease.

Jacob, François (1920-), French molecular biologist notable, inter alia, for coining the term allosteric, for postulating the existence of messenger RNA, and for studies of genetic regulatory mechanisms in protein synthesis (all with J. L. Monod); Nobel Laureate in Physiology or Medicine (1965) jointly with J. L. Monod and A. M. Lwoff 'for their discoveries concerning genetic control of enzyme and virus synthesis'.

Jacob-Monod model a model of genetic regulation of protein synthesis in prokaryotes whereby the structural genes that determine the organization of the proteins are controlled by other regions of DNA upstream from the structural genes. The latter consist of a regulator gene and a control site, which comprises the promotor (p) and operator (o). The regulator gene produces a repressor (r), which interacts with the operator. The operator and its associated genes are called an operon. The structural genes are transcribed into a single mRNA coding for the several proteins. An mRNA coding for more than one protein is known as a polygenic or polycistronic transcript. The first example was the lac operon but the model has been used to elucidate many other such phenomena, e.g. the tryptophan and arabinose operons. The repressor can be either inactivated (induction) or activated (repression) by specific metabolites. While the model has been helpful in explaining the mode of expression of genes in eukaryotes, operons have not been described in them. [After F. Jacob and J. Monod.]

Jamaican vomiting sickness a syndrome of sickness, vomiting, and poisoning of the nervous system, associated with profound hypoglycemia, induced by consumption of the unripe fruit of the ackee, the toxic principle of which is hypoglycin.

jaundice or icterus a yellowing of the skin and/or of the whites of the eyes indicating an excess of bilirubin in the blood. Jaundice may be classified into three types depending on cause: obstructive jaundice, in which the passage of bile from the liver to the intestine is obstructed; hepatocellular jaundice, in which there is disease and/or inflammation of liver cells thus diminishing their ability to secrete bile pigments into the bile passages; and hemolytic jaundice, in which there is an excessive breakdown of erythrocytes in the body and hence an excess of bile pigments.

JCBN abbr. for (IUPAC-IUB or IUPAC-IUBMB) Joint Commission on Biochemical Nomenclature. See also CBN.

J chain or **J piece** abbr. for joining chain or joining piece; a 15 kDa, cysteine-rich polypeptide chain occurring in immunoglobulin A (IgA) and immunoglobulin M (IgM) molecules. It is concerned in cross-linking the monomeric immunoglobulin moieties to form a dimer or pentamer in IgA and IgM, respectively. It is not to be confused with the J segment of an immunoglobulin gene (see joining gene). Example from human: database code IGJ_HUMAN, 137 amino acids (15.58

iejunum the part of the small intestine of mammals between the duodenum and the ileum. —jejunal adj.

jelly roll a motif in protein structure consisting of two antiparallel B sheets placed one above the other to form a sandwich structure. The polypeptide chain follows a route in which successive β strands alternate between the two sheets. If the β strands are numbered β₁, β₂, etc. and the β sheets numbered in Ban dang dọc một quyền sách được tặng bởi HUY NGUYÊN. Nếu bạn có như cấu về sách sinh học, xin liên hệ:

parentheses, as (1), (2), etc. the structure of the motif can be represented as $loop-\beta_1(1)-loop-\beta_2(2)-loop-\beta_3(1)-loop-\beta_4(2)$ loop- $\beta_5(1)$, etc. The jelly-roll motif was first observed in viral coat proteins but has since been found in other proteins, the first of these to be determined being tumour necrosis factor.

Jerne, Niels Kaj (1911–94), Danish microbiologist and immunologist distinguished for his pioneering theories of antibody generation; Nobel Laureate in Physiology or Medicine (1984) jointly with G. J. F. Köhler and C. Milstein 'for theories concerning the specificity in development and control of the immune system and the discovery of the principle for production of monoclonal antibodies'.

Jerne's theory of immunity an alternative name for naturalselection theory of immunity.

J gene abbr. for joining gene.

Job's method an alternative name for continuous variation.

Johnston-Ogston effect a phenomenon occurring in sedimentation velocity experiments when two or more solutes are present in a mixture and their sedimentation coefficients are mutually concentration-dependent. It follows that the sedimentation coefficient of the more slowly sedimenting component is less in the plateau region containing both species than it is in the plateau region between the boundaries, resulting in a higher concentration of the more slowly moving component in the plateau region between the boundaries. As a consequence, the apparent concentration of the faster moving species, based on the concentration difference between the two plateaus, is too low, while the apparent concentration of the more slowly moving species is too high. [After Alexander George Ogston (1911-96) and Joseph Percy Johnston (1923-76), British biochemists.]

joinase or joining enzyme a former name for DNA ligase (ATP) and DNA ligase (NAD+). See DNA ligase.

joining gene or J segment abbr.: J gene; any member of a group of approximately five germ-line genes concerned in coding for immunoglobulin synthesis. The J genes code for the fourth framework region of both light and heavy immunoglobulin chains and for part of the third hypervariable region of the light chain. Compare J chain.

joining peptide an acidic 18-residue peptide situated between y₃-MSH and ACTH in proopiomelanocortin.

Joliot, Jean Frédéric (1900-58), latterly adopting the surname Joliot-Curie, French nuclear physicist noted particularly for the production, in collaboration with his wife, I. Joliot-Curie, of the first artificial radioactive nuclides by bombarding stable elements, e.g. boron or aluminium, with fast alpha-particles; Nobel Laureate in Chemistry (1935) jointly with I. Joliot-Curie 'in recognition of their synthesis of new radioactive elements'.

Joliot-Curie 1 Irène Joliot-Curie (1897-1956), daughter of M. and P. Curie (see Curie), French nuclear physicist noted particularly for the production, in collaboration with her husband, J. F. Joliot, of the first artificial radioactive nuclides; Nobel Laureate in Chemistry (1935) jointly with J. F. Joliot. 2 surname latterly adopted by J. F. Joliot.

Jones-Mote sensitivity a weak, delayed-type hypersensitivity of the skin seen on challenge a few days after priming with soluble protein in aqueous solution or in incomplete Freund's adjuvant. The cells infiltrating the lesion characteristically include a high proportion of basophils.

joule symbol: J; the SI derived unit of energy, work, or heat, equal to a force of one newton acting over a distance of one metre; i.e. 1 J = 1 N m = 1 W s. The joule is equivalent to 10^7 ergs and is the energy dissipated by one watt in one second. [After James Prescott Joule (1818-89), British physicist.]

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

J segment

juxtacrine stimul

J segment an alternative name for joining gene. jumping gene an informal term for transposon.

is the oncogene from avian sarcoma virus ASV17 (named from junana, Japanese for seventeen). JUN encodes transcription factor AP1; it belongs to the FOS/JUN family, and is rapidly and transiently expressed on stimulation of cells by mitogens. The product, Jun, forms heterodimers with Fos, and these, together with Jun homodimers, bind to the AP1 consensus site. Jun is a leucine zipper protein, which also contains basic sequences essential for DNA binding. In resting cells Jun is phosphorylated on four serines and one threonine; removal of one or more of these phosphates leads to increased binding to the AP1 promoter site. Jun has five motifs. Database code TAP1_HUMAN, 331 amino acids (35.63 kDa).

junction potential see liquid-junction potential.
'junk' amino acid any noncontributing amino acid.
'junk' DNA see selfish DNA hypothesis.

juvenile hormone any insect hormone, produced in the corpora allata glands, that functions to keep the insect in the larval (juvenile) stage. At least three are known; all are derivatives of farnesoic acid. They have potential as insect control agents.

juvenile-hormone esterase see methylesterase.

juxtacrine stimulation a mode of intercellular communication established by the binding of a membrane-anchored growth factor on one cell to its receptor on an adjacent cell, e.g. in the case of pro-transforming growth factor-α (see transforming growth factor). Unlike endocrine, paracrine, or autocrine modes there is no diffusible factor.

Kk

k symbol for kilo+ (SI prefix denoting 10³).

k symbol for 1 rate constant; the various associated terms are distinguished by subscripts and/or superscripts (see individual entries below). 2 Boltzmann constant. See also k(7).

 \tilde{k} symbol for pH-independent value of the rate constant k.

k₀ symbol for catalytic constant (of an enzyme); alternative to $k_{\rm cat}$.

k_A, **k**_B symbols for the specificity constants of substances A and

 k_{app} symbol for the apparent value of the rate constant k.

k_{cat} symbol for catalytic constant (of an enzyme); alternative to

ki, k-i symbols for the forward and reverse rate constants, respectively, for the ith step in an enzyme reaction.

 k_{ii} symbol for the rate constant for the step from E_i to E_i in an enzyme reaction.

K symbol for 1 potassium. 2 kelvin. 3 a residue of the α -amino acid L-lysine (alternative to Lys). 4 a residue of an incompletely specified base in a nucleic-acid sequence that may be guanine, or either thymine (in DNA) or uracil (in RNA). 5 phylloquinone. 6 (in computing) indicating multiplied by 1024

K symbol for 1 (thermodynamic) equilibrium constant (of a chemical reaction); the various associated terms are distinguished by subscripts and/or superscripts (see individual entries below). 2 kinetic energy. 3 kerma (kinetic energy released in matter). 4 luminous efficacy.

K' symbol for apparent (concentration) equilibrium constant.

 K° or K^{\ominus} symbol for standard equilibrium constant.

K₁, K₂, ... K_n symbols for the first, second, ... nth equilibrium (dissociation or association) constants, respectively, of the same substance.

Ka, K'a symbols for the thermodynamic and apparent acid dissociation constants, respectively.

K_A symbol for activator constant.

K_b, K'_b symbols for the thermodynamic and apparent basic dissociation constants, respectively.

K_e symbol for equilibrium constant with respect to concentration (concentration equilibrium constant).

K_i symbol for inhibition constant (inhibition type unspecified); the reactant to which it relates may be indicated by an appropriate subscript, e.g. K_{iA} .

K_{ic} symbol for competitive inhibition constant.

K_{iu} symbol for uncompetitive inhibition constant.

Km symbol for Michaelis constant (also called Michaelis concentration or, more appropriately Michaelis-Menten constant); the reactant to which it relates may be indicated by an appropriate subscript, e.g. K_{mA}.

K_a symbol for substrate dissociation constant; the reactant to which it relates may be indicated by an appropriate subscript,

K_s' symbol for salting out constant.

 $K_{\mathbf{w}}$ symbol for the ion product of water.

kainate receptor a type of excitatory amino-acid receptor characterized by its specific agonist ligand, kainate (see glutamate receptor), and for which glutamate may be the endogenous ligand. The receptor is coupled to Na⁺/K⁺ channels in the cell membrane, which are opened when activated by agonist.

kainic acid (2S,3S,4S)-2-carboxy-4-(1-methylethenyl)-3-pyrrolidineacetic acid; digenic acid; a cyclic analogue of L-glutamic acid obtained from Digenea simplex (a red alga). It is an amino-acid agonist for the kainate receptor, is a neurotoxin,

kainic acid

kairomone any of a heterogeneous group of chemical messengers that are emitted by organisms of one species but benefit members of another species; they are commonly nonadaptive or maladaptive to the emitter. They include attractants, phagostimulants, and other substances that mediate the positive responses of, e.g., predators to their prey, herbivores to their food plants, and parasites to their hosts. Compare allomone, pheromone.

kalinin 1 another name for laminin 5 (see laminin), 2 a filamentassociated protein of the laminin family. Example (precursor) human kalinin B1, also known as nicein B1 or (most commonly) laminin B1k: database code A53612, 1170 amino acids (129.27 kDa).

kallidin an alternative name for lysylbradykinin; see bradykinin. kallikrein any of two groups of serine endopeptidases, EC 3.4.21.34 and EC 3.4.21.35; the active site provides a chargerelay system. They are widely distributed in mammalian tissues and body fluids, including blood. Plasma kallikrein (EC 3.4.21.34; also called kiningenin or Fletcher factor or serum kallikrein) cleaves Arg-|-Xaa and Lys-|-Xaa bonds, including Lys-|-Arg and Arg-|-Ser bonds in kiningen to produce bradykinin, and activates blood coagulation factors XII and VII; it is formed from prekallikrein by factor XIIa. Example (precursor): database code KAL_HUMAN, 638 amino acids (71.37 kDa). Tissue kallikrein EC 3.4.21.35; other names: glandular kallikrein; kininogenin; a serine endopeptidase that catalyses the preferential cleavage of Arg-|-Xaa bonds in small molecule substrates. Its highly selective action to release kallidin (lysyl-bradykinin) from kiningen involves hydrolysis of Met-[-Xaa or Leu-[-Xaa. The rat enzyme is unusual in liberating bradykinin directly from autologous kininogens by cleavage at two Arg-|-Xaa bonds. Examples: human glandular kallikrein 1 precursor (kidney/pancreas/salivary gland kallikrein): database code KLK1_HUMAN, 262 amino acids (28.86 kDa); human glandular kallikrein 2 precursor (prostate): database code KLK2_HUMAN, 261 amino acids (28.64 kDa). 3-D structures of the protein with basic proteinase inhibitor from pig have been obtained: chain a, database code NRL_2KAIA, 80 amino acids (9.10 kDa); chain b, database code NRL_2KAIB, 152 amino acids (16.48 kDa). They were formerly classed as EC 3.4.4.21 and EC 3.4.21.8, respectively.

kallistatin or protease inhibitor 4 an acidic protein (in plasma) of the serpin family, expressed widely in human tissues. It inhibits tissue kallikrein, forming a 1:1 complex with it. Example (precursor) from human: database code A55560, 427 amino acids (48.50 kDa).

kanamycin an aminoglycoside antibiotic complex produced by Streptomyces kanamyceticus. It is made up of three components: kanamycin A (in which $R_1 = NH_2$, $R_2 = OH$; see structure), the major component, often designated as kanamycin; and two minor congeners, kanamycin B (R_1 and $R_2 = NH_2$) and kanamycin C ($R_1 = OH$, $R_2 = NH_2$). Kanamycin causes and has anthelmintic properties.

misreading during protein synthesis in bacteria, but its target Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Kautsky (kanosamine

site on the ribosome is apparently different from that of streptomycin. See also kanosamine.

kanosamine 3-amino-3-deoxy-D-glucose; an amino sugar present in kanamycin and other antibiotics, and as free carbohydrate in fermentation broths of Bacillus aminoglucosidicus.

K antigen see capsular antigen.

kaolin or china clay a finely powdered hydrated aluminium silicate; it is useful as an adsorbent.

Kaposi's sarcoma a skin cancer endemic to equatorial Africa and often occurring in AIDS patients. [After Moritz Kaposi (1837–1902), Austrian dermatologist.]

kappa symbol: κ (lower case) or K (upper case); the tenth letter of the Greek alphabet. For uses see Appendix A.

kappa B or kB an element common in eukaryotic promoters. GGRNNYYCC, consensus sequence is GGGGACTTTCC in mouse and human.

kappa chain or κ chain symbol: κ ; one of the two types of light chain found in human immunoglobulins, the other type being a lambda chain. See also Bence-Jones protein.

kappa factor a protein factor that causes termination of transcription of various bacteriophage DNAs, including those of T4, T5, and T7, by Escherichia coli DNA-dependent RNA polymerase in a DNA site-specific manner. It is a dimer of two apparently identical 17 kDa peptide chains.

kappa particle a cell of any of several species of Caedibacter present in the cytoplasm of killer strains of Paramecium aurelia. (Caedibacter is a genus of Gram-negative bacterial obligate endosymbionts of this protozoan.) When kappa particles (and/or toxic constituents or products of them) are released by killer paramecia they may be lethal to sensitive paramecia (which lack both the endosymbiont and a protective genetic

Karplus curve a curve describing the relation of the nuclear magnetic resonance spin-spin coupling constant and the dihedral angle. [After Martin Karplus (1930-).]

Karplus relation an equation describing the relation between the magnitude of the nuclear magnetic resonance spin-spin coupling constant, J, across three bonds and the dihedral angle, Θ , about the central bond. It is:

$$J = A + B\cos\Theta + C\cos^2\Theta,$$

where A, B, and C are coefficients that depend on the electronegativity of the substituents.

Karrer, Paul (1889-1971), Swiss organic chemist distinguished, inter alia, for his structural characterization of vitamin A, for the synthesis (at the same times as R. J. Kuhn) of vitamins A and B₂, and for the synthesis of vitamin E; Nobel Laureate in Chemistry (1937) 'for his investigations on carotenoids, flavins, and vitamins A and B2' [prize shared with W. N. Haworthl.

karyo+ or caryo+ comb. form denoting the nucleus of a cell.

karyogram an alternative name for idiogram.

karyoid an alternative name for nucleoid (def. 1).

karyokinesis 1 an alternative name for mitosis. 2 division of

the cell nucleus during mitosis. Compare cytokinesis.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

karyophilic proteins soluble proteins that accumulate in the nucleus on microinjection into the cytoplasm of amphibian oocytes. They are not bound to chromatin or other nuclear structures. They include nucleoplasmin and the acidic nuclear proteins N1 to N4 of the Xenopus oocyte nucleus.

karyosome a compartment, located on the nucleolus of some plant species, that may support the rRNA genes as they extend from the nucleolar organizer region.

karyotype the visual appearance of the set of chromosomes of a typical somatic eukaryotic cell of a given species, individual, or cell strain. It is expressed in terms of chromosomal sizes, shapes, and number. - karyotypic adj.

kasugamine 2,4-diamino-2,3,4,6-tetradeoxy-D-arabino-hexose; a component of kasugamycin and other antibiotics.

kasugamycin an aminoglycoside antibiotic produced by a strain of Streptomyces kasugaensis and containing kasugamine. It interacts stoichiometrically with the 30S ribosomal subunit, preventing initiation of protein biosynthesis in prokaryotes; it also blocks translation in fungal systems.

kat symbol for katal.

katabolism a variant spelling of catabolism. —katabolic adj.

katacalcin a 21-residue peptide derived from the protein precursor of calcitonin, in which it flanks calcitonin on the C-terminal side. It is potent in lowering plasma calcium levels. It is present in normal plasma in concentrations equimolar with calcitonin, and is released rapidly by calcium infusion.

katal symbol: kat; a derived coherent unit for expression of enzyme activities, defined as that catalytic activity of an enzyme that will raise the rate of conversion of a specified chemical reaction by one mole per second in a specified assay system. There are several important points regarding usage. (1) This definition supersedes a version expressed in terms of the intensive quantity 'rate of reaction' rather than the extensive quantity 'rate of conversion', as well as earlier versions in which catalytic activity was identified with the overall rate of reaction (including the spontaneous rate) rather than with the increase in rate. (2) The katal is not an SI unit; the SI unit mol s⁻¹ may be used if preferred. (3) The katal is not used to express rates of conversion themselves (for which the unit is mol s⁻¹). (4) The katal is independent of assay conditions (although the measured catalytic activity of a given system depends on assay conditions). (5) The use of enzyme unit (symbol: U) is discouraged; 1 kat $\approx 6 \times 10^7$ U; 1 U ≈ 16.7 nkat).

katanin a microtubule-stimulated ATPase that severs and disassembles microtubules to tubulin dimers.

Kat.f. an obsolete unit for expressing the specific activity of catalase preparations, originally defined as the rate constant for the catalysed reaction under certain conditions divided by the number of grams of enzyme in the total test volume. The rate constant is calculated from the standard equation for a unimolecular reaction using decadic logarithms and is expressed per minute. Later (apparently unintended) variations of this definition sometimes were used. [From the German Katalasefähigkeit, catalase capability.]

katharometer an apparatus used to determine the composition of a gas mixture by measuring its thermal conductivity.

kathode a variant spelling of cathode. -kathodic adj.

kation a variant spelling of cation.

Katz, (Sir) Bernard (1911-), German-born British biophysicist and neurophysiologist distinguished for his studies of the physiology of muscle and nerve, especially regarding the mechanism of release of acetylcholine by neural impulses; Nobel Laureate in Physiology or Medicine (1970) jointly with J. Axelrod and U. S. von Euler 'for their discoveries concerning the humoral transmittors in the nerve terminals and the mechanism for their storage, release, and inactivation'.

Kauffmann-White scheme a classification scheme for the

many serotypes of the bacterial genus Salmonella, defined in

terms of their somatic (surface) antigens and, where appropri-

karyon or caryon the nucleus of a cell.

Kautsky effect the characteristic changes with time in the fluBạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

ate, their capsular and flagellar antigens.

kayser keratiniz

Z Jugada

orescence emission of chlorophyll a that occur when darkadapted cells or isolated chloroplasts are illuminated. The changes may be distinguished into a fast change lasting only a few seconds, and a slower change lasting a few minutes. [After Hans Kautsky (1891–1966).]

kayser a unit of wave number expressed as the number of wavelengths of electromagnetic radiation in 1 cm.

Kazal inhibitor an electrophoretically heterogeneous proteinaceous trypsin inhibitor and anticoagulant found in the pancreas and in pancreatic juice of a number of mammalian species. Compare pancreatic trypsin inhibitor. [After Louis Anthony Kazal (b. 1912), US physiologist.]

kb symbol for kilobase.

K capture see electron capture.

K cell 1 an immunocytochemically distinguishable, granule-containing cell, found in the duodenum and jejunum, that produces glucose-dependent insulinotropic peptide. 2 or killer cell a type of large granular mononuclear lymphocyte that can kill target cells sensitized with antibody. The K cells engage the antibody via their Fc receptors. They are probably identical with natural killer (NK) cells.

K chromophore any chromophore that gives rise to high-intensity absorption bands due to π - π conjugation. Compare R chromophore.

kDa symbol for kilodalton.

KDEL a tetrapeptide sequence (in the single-letter amino-acid code) at the C terminus of proteins that are to be retained in the endoplasmic reticulum (ER). An equivalent sequence is HDEL, especially in plants. The sequence is recognized by the KDEL receptor, and retention is thought to be mediated by continual retrieval from a post-ER compartment, as soluble ER proteins carry carbohydrate modifications assumed to have been acquired in the Golgi complex. See also luminal proteins.

KDEL receptor a transmembrane protein of the endoplasmic reticulum that recognizes and binds the tetrapeptide **KDEL**, which constitutes the C terminus of proteins destined to be retained in the endoplasmic reticulum. Such receptors are seventransmembrane-helix proteins. An equivalent receptor in yeast for the HDEL sequence is a product of the gene *ERD2*. Example: database code ER21_HUMAN, 212 amino acids (24.54 kDa).

KDO abbr. for ketodeoxyoctanoate.

ke- abbr. for keto-.

Keilin-Hartree heart-muscle preparation a preparation of submitochondrial particles from bovine heart muscle that is capable of catalysing the reoxidation by dioxygen of NADH and succinate. [After D. Keilin (1887–1963) and E. F. Hartree (1910–94).]

Kell system a blood-group system whose antigenic determinant depends on the structure of an erythrocyte membrane glycoprotein with molecular mass 93 kDa. This glycoprotein has a long extracellular C-terminal domain with 15 cysteine residues, a short N-terminal cytoplasmic domain, and a zinc binding site of the type found in neutral endopeptidases. Example from human: database code KELL_HUMAN, 732 amino acids (82.82 kDa).

kelvin symbol: K; the SI base unit of thermodynamic temperature, defined as the fraction 1/273.16 of the thermodynamic temperature of the triple point of water. The symbol K is used both for thermodynamic temperature and for thermodynamic temperature interval, and supersedes °K (degree Kelvin). [After William Thomson, Lord Kelvin (1824–1907), British mathematician, physicist, and inventor, who first defined the absolute scale of temperature.]

KEM1 the symbol of a gene of yeast that encodes a nuclease specific for **G-quartets**.

Kendall, Edward Calvin (1886–1972), US physiological chemist noted for his isolation of the thyroid hormone thyroxine (1915) and especially for the isolation of a number of adrenal cortical hormones and the study (with P. S. Hench) of their actions; Nobel Laureate in Physiology or Medicine, (1950).

jointly with P. S. Hench and T. Reichstein 'for their discoveries relating to the hormones of the adrenal cortex, their structure and biological effects'.

Kendall's compounds a series of naturally occurring steroids of the adrenal cortex and their metabolites; they were provisionally designated by Kendall, using letters of the alphabet, before elucidation of their structures. They are: Kendall's compound A, 11-dehydrocorticosterone; Kendall's compound B (Reichstein's substance H), corticosterone; Kendall's compound C (Reichstein's substance C), 5α -pregnane- 3α , 11β , 17α , 21tetrol-20-one; Kendall's compound D (Reichstein's substance A), 5α -pregnane- 3β , 11β , 17α , 20β , 21-pentol; Kendall's compound E (Reichstein's substance Fa), cortisone; Kendall's compound F (Reichstein's substance M), cortisol; Kendall's compound G (Reichstein's substance D), 5α-pregnane- 3β ,17 α ,21-triol-11,20-dione; Kendall's compound \hat{H} (Reichstein's substance N), 5α -pregnane- 3β ,21-diol-11,20-dione; Kendall's desoxy compound B (Reichstein's substance Q), cortexone, 11-deoxycorticosterone.

Kendrew, (Sir) John Cowdery (1917-97), British biophysicist and molecular biologist renowned especially for his determination by X-ray analysis of the three-dimensional structure of the myoglobin molecule; Nobel Laureate in Chemistry (1962) the prize being shared with M. F. Perutz 'for their studies of the structures of globular proteins', especially myoglobin and hemoglobin.

kephalin a variant spelling of cephalin.

kerasin or cerasin a cerebroside in which the fatty acyl moiety is lignoceroyl.

keratan sulfate or (formerly) keratosulfate any member of a group of glycosaminoglycans with repeat units consisting of $(\beta 1 \rightarrow 3)$ -linked D-galactopyranosyl- $(\beta 1 \rightarrow 4)$ -N-acetyl-D-glucosamine 6-sulfate and containing variable amounts of fucose, sialic acid, and mannose units. In keratan sulfate I, isolated from cornea, the carbohydrate is attached to the polypeptide backbone through N-acetylglucosaminyl-asparaginyl linkages, while in keratan sulfate II, isolated from cartilage and bone, the carbohydrate appears to be attached to the polypeptide backbone through N-acetylgalactosamine in O-glycosidic linkage to either serine or threonine residues. The keratan sulfates are often attached to the same polypeptide backbone as the chondroitin sulfates.

keratein the soluble product formed by reductive scission of disulfide cross-links in wool keratin on treatment with sulfhydryl compounds such as thioglycolate.

keratin any member of a class of structural fibrous scleroproteins that occur in vertebrate skin and in various specialized epidermal structures, e.g. feathers, nails, hair, hooves, horns, and quills, as well as in the cytoskeleton. They are classified into hard keratins, specific to hair, nails and feathers, and cytokeratins, which form part of the cell cytoskeleton. The hard keratins are typically sulfur-rich proteins cross-linked by disulfide bonds, having M_r in the region of 6000-20 000; the cytokeratins are larger (40 000-56 000) low-sulfur proteins. The hard keratins of mammals are largely a helical ('a keratins'), whereas those of birds and reptiles are largely \beta sheet ('β keratins'). However a keratin can be converted to a β-sheet conformation by reduction and heating (as in hairdressing). Example, keratin of merino wool: database code KRB2_ SHEEP, 97 amino acids (10.29 kDa). Cytokeratins are intermediate-filament proteins and are of two types: I (acidic) and II (neutral to basic) (40-55 and 56-70 kDa respectively); these form microfibrillar filaments in epithelial cells. Cytokeratin is composed of complexes formed by the aggregation of at least one of each type: e.g. keratin 1 is generally associated with keratin 10. There is similarity to all other intermediate-filament proteins. Example, keratin 1 (human): database code K2C1_HUMAN, 643 amino acids (65.42 kDa); keratin 10: database code K1CJ_HUMAN, 593 amino acids (59.46 kDa).

cortical hormones and the study (with P. S. Hench) of their actions; Nobel Laureate in Physiology or Medicine (1950) malacells synthesize keratin. 2 the elaboration of structures Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

Nur Heart

containing keratin, especially in skin. —keratinize or keratinise vb.

keratinocyte or **keratocyte** any epidermal cell that produces keratin.

keratohyalin a material seen in microscopic sections in granular cells of the skin. It is thought to consist mainly of **filaggrin**. **keratosulfate** a former name for **keratan sulfate**.

kernicterus an encephalopathy associated with degeneration and yellow pigmentation of basal ganglia and other nerve cells in the spinal cord and brain, caused by the severe unconjugated bilirubinemia occurring in newborn infants and occasionally in older children with hereditary unconjugated hyperbilirubinemia.

kerosene or kerosine an alternative name (esp. US) for paraffin (def. 2).

Kerr effect an alternative name for electric birefringence. [After John Kerr (1824–1907), Scottish physician.]

kestose 1 or (sometimes) 6-kestose O- β -D-fructofuranosyl- $(2\rightarrow 6)$ -O- β -D-fructofuranosyl- $(2\rightarrow 1)$ - α -D-glucopyranose; a trisaccharide widely distributed in plants, especially in the bulbs and tubers of monocotyledons, and formed artificially when yeast invertase is incubated with a 50% solution of sucrose. The name is derived from the fact that it was discovered at the Tate and Lyle research laboratories, then at Keston, Kent, UK. 2 1-kestose isokestose; inulobiosyl glucose; O- β -D-fructofuranosyl- $(2\rightarrow 1)$ -O- β -D-fructofuranosyl- $(2\rightarrow 1)$ - α -D-glucopyranose; an isomer and congener of 6-kestose. See also neokestose.

ket+ a variant form of **keto+** (sometimes before a vowel). **ketal** see acetal.

ketamine (±)-2-(2-chlorophenyl)-2-(methylamino)cyclohexanone; a dissociative anesthetic with cataleptic and analgesic effects, possibly through acting as an N-methyl-D-aspartate (excitatory amino acid) receptor antagonist.

ketanserin 3-[2-[4-(4-fluorobenzoyl)-1-piperidinyl]ethyl]-2,4[1H,3H]-quinazolinedione; an antagonist to α_1 adrenoceptors, H_1 histamine receptors, and 5- HT_2 5-hydroxytryptamine receptors. A clinically effective hypotensive agent, it differentiates between 5- HT_1 and 5- HT_2 receptors with high specificity; within adrenoceptors and histamine receptors it is less specific.

ketene 1 ethenone; $CH_2=C=0$. 2 any substituted **ketene** (def. 1). **ketimine** any **imine** that is an analogue of a ketone; the general structure is $R_2C=NR'$ where R is any organyl group and R' may be any organyl group or H. Compare aldimine.

keto 1 carbonyl group, =CO, in any ketone. 2 describing a class of chemical compounds of the general formula R-CO-R'

(where R, R' are not H). The term is often used to distinguish such compounds from isomeric compounds of another class, e.g. keto sugar. 3 a nonpreferred term, often still used, to denote the presence of a substituent in an organic compound of a double-bonded oxygen atom that is part of a ketonic structure. The recommended term is **oxo**.

keto+ 1 or (sometimes before a vowel) ket+ comb. form indicating ketonic or derived from a ketone; e.g. ketal, ketoaldose, ketol. 2 or (sometimes before a vowel) keton+ comb. form denoting of or pertaining to a ketone body or bodies; e.g. ketoacidosis, ketogenesis, ketonuria. 3 prefix (in chemical nomenclature) denoting a ketonic derivative of an indicated organic compound; oxo now recommended.

keto- abbr.: ke-; an optional prefix to the (semi)systematic name of a monosaccharide or monosaccharide derivative containing an uncyclized ketonic carbonyl group, used to stress its acyclic nature. Compare aldehydo-, keto, keto+.

keto acid any organic (carboxylic) acid containing a **keto** (def. 3) group; the recommended term is an oxo acid.

ketoacidosis a type of acidosis caused by enhanced production of ketone bodies by the ketogenic pathway. Excessive production of ketone bodies has harmful effects not only in lowering the blood pH but in promoting the excretion of K⁺ and Na⁺ by the kidney, leading to cation depletion. It occurs in conditions where ketogenesis occurs faster than the ketone bodies produced can be metabolized; this results most often from hormonal imbalance, especially insulin deficiency, when fatty acids are mobilized at an excessive rate from adipose tissue and transported to the liver, where they are converted to ketone bodies. In humans, a plasma level of up to 8 mmol L⁻¹ is considered safe and may be beneficial, but in disease states levels may reach up to 20 mmol L⁻¹, contributing to life-threatening situations. —ketoacidotic adj.

ketoaldonic acid any monosaccharide formally derived from an aldonic acid by oxidation of a secondary alcoholic hydroxyl group to an oxo group.

ketoaldose any monosaccharide containing both an aldehydic and a ketonic carbonyl group.

ketoconazole a complex derivative of imidazole, clinically useful as an antimycotic. It impairs ergosterol synthesis in fungal cell membranes, thereby increasing their permeability.

ketodeoxyoctanoate abbr.: KDO; 2-keto-3-deoxy-D-octanoate; 3-deoxy-D-manno-2-octulosonate; an acid present in lipopolysaccharides of the outer membranes of certain Gramnegative bacteria.

keto-enol tautomerism a type of **tautomerism** in which the keto and enol forms of a compound are in equilibrium, the change corresponding to the migration of a hydron and a shift of bonding electrons. *Compare* **amino-imino tautomerism**.

ketofuranose any ketose in the furanose form.

ketogenesis the metabolic production of ketone bodies. The pathway starts with the formation of acetoacetyl-CoA (I) from two molecules of acetyl-CoA by acetyl-CoA C-acetyltransferase (EC 2.3.1.9); I then reacts with a further molecule of acetyl-CoA, in a reaction catalysed by mitochondrial hydroxymethylglutaryl-CoA synthase, to form (S)-3-hydroxy-3-methylglutaryl-CoA (II); II is then cleaved to acetoacetate and acetyl-CoA by hydroxymethylglutaryl-CoA lyase. The reactions of ketogenesis occur in higher animals, localized entirely in mitochondria; the liver is the main site of synthesis, but kidney, and possibly also small intestine, and adipose tissue may play a part in some situations.

ketogenic forming, or having the quality of being convertible into ketone bodies by metabolic processes.

a-ketoglutarate a nonpreferred (though often used) name for 2-oxoglutarate; 2-oxo-1,5-pentanedioate; a compound that has important roles in carbohydrate and amino-acid metabolism, especially in transamination reactions and as a component of the tricarboxylic-acid cycle.

a-ketoglutaric dehydrogenase see oxoglutarate dehydrogenase (lipoamide).

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

2-keto-L-gulonate or (preferably) 2-oxo-L-gulonate L-xylo-2hexulosonate; a compound obtained from sorbitol and an important intermediate in the manufacture of ascorbic acid.

ketoheptose any ketose having a chain of seven carbon atoms in the molecule. Eight enantiomeric pairs of such compounds

ketohexokinase EC 2.7.1.3; systematic name: ATP:D-fructose 1-phosphotransferase; other name: hepatic fructokinase. An enzyme that catalyses the phosphorylation by ATP of D-fructose to D-fructose-1-phosphate with release of ADP. The enzyme occurs in liver (in the soluble fraction), in muscle, intestine, and renal cortex, and in bacteria. It also phosphorylates some other ketoses (e.g. 5-dehydro-D-fructose, D-sorbose, D-tagatose). This enzyme is often referred to as fructokinase, although this is the recommended name for the enzyme EC 2.7.1.4, which forms D-fructose 6-phosphate (see fructokinase). In mammals, some fructose can be phosphorylated to fructose 6-phosphate by hexokinase. Example from rat: database code KHK_RAT, 298 amino acids (32.71 kDa).

ketohexose any ketose having a chain of six atoms in the molecule. Four enantiomeric pairs of such compounds are possible, these being the D and L isomers of fructose, psicose, sorbose, and tagatose.

α-ketoisocaproate or (preferably) α-oxoisocaproate 4methyl-2-oxopentanoate; an intermediate in the biosynthesis of L-leucine. See leucine and valine biosynthesis.

 α -ketoisovalerate or (preferably) α -oxoisovalerate 3-methyl-2-oxobutanoate; an intermediate in the biosynthesis of Lleucine, L-valine, and pantothenic acid. See leucine and valine biosynthesis.

ketol 1 any organic compound that is both a ketone and an alcohol, especially an α -ketol (i.e. acyloin), one in which the two functions are adjacent. 2 the strongly reducing group, HO-CH₂-CO-, that is characteristic of an α -ketol. It is present, e.g., in ketoses and certain corticosteroids.

ketol-acid reductoisomerase EC 1.1.1.86; systematic name: (R)-2,3-dihydroxy-3-methylbutanoate:NADP+ oxidoreductase (isomerizing); other names: dihydroxyisovalerate dehydrogenase (isomerizing); acetohydroxy-acid isomeroreductase. An enzyme, found in chloroplasts, that catalyses the reversible reaction:

(R)-2,3-dihydroxy-3-methylbutanoate + NADP⁺ = (S)-2-hydroxy-2-methyl-3-oxobutanoate + NADPH.

It is a component of the pathways for isoleucine and valine biosynthesis. Example from Spinacia oleracea (spinach); tetramer of similar but nonidentical chains: database code ILV5_SPIOL, 595 amino acids (63.68 kDa).

ketol condensation the enzyme-catalysed formation of certain **ketols** (def. 1) by addition of an acyl moiety of one α -oxo acid to another α -oxo acid to form an α -hydroxy- β -oxo acid. It occurs, e.g., in the condensations catalysed by acetolactate synthase (EC 4.1.3.18); these involve either two molecules of pyruvate condensing to form α -acetolactate and CO₂, or one molecule of pyruvate and one of α -oxobutyrate condensing to form α -aceto- α -hydroxybutyrate and CO₂. The main products are biosynthetic precursors of valine and leucine, and of isoleucine, respectively.

ketolysis a term sometimes used to describe the oxidation, for energy production, of ketone bodies by extrahepatic tissues.

 α -keto- β -methylvalerate or (preferably) α -oxo- β -methylvalerate 3-methyl-2-oxopentanoate; the biosynthetic precursor of, and catabolic product of, L-isoleucine.

keton+ a variant form of keto+ (def. 2) (sometimes before a

ketone 1 any compound containing a carbonyl group, >C=O, joined to two carbon atoms. 2 the functional class name for any ketone (def. 1) that does not have a trivial name, e.g. ethyl methyl ketone.

ketone body any of the three substances: (1) acetoacetate, enzymically from acetyl-CoA; (2) D-3-hydroxybu- **β-ketothiolase** see acetyl-CoA C-acyltransferase. Ban dang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

tyrate (β -hydroxybutyrate), formed by liver mitochondrial 3hydroxybutyrate dehydrogenase (EC 1.1.1.30) from acetoacetate; or (3) acetone, formed by spontaneous decarboxylation of acetoacetate. Ketone bodies may accumulate in excessive amounts in the body in starvation, diabetes mellitus, or in other defects of carbohydrate metabolism. They are formed in the post-absorptive state and during more prolonged fasting, and can be used as an energy source as an alternative to glucose, sparing glucose and thus indirectly muscle protein, since the carbon source for glucose synthesis under such conditions derives from muscle amino acids. Biosynthesis involves the formation of hydroxymethylglutaryl-CoA, which is cleaved to acetoacetate and acetyl-CoA by hydroxymethylglutaryl-CoA lyase; it occurs largely in the liver, but to a small extent also in kidney. Utilization of ketone bodies in peripheral tissues involves conversion by 3-oxo-acid CoA-transferase of acetoacetate to acetoacetyl-CoA, which is then converted to two molecules of acetyl-CoA by acetyl-CoA C-acetyltransferase. Although not a ketone, 3-hydroxybutyrate is classed as a ketone body because it exists in an equilibrium with acetoacetate that depends on the redox state in the liver mitochondria. To determine the extent of ketone body formation, it is therefore necessary to include 3-hydroxybutyrate in the analysis.

ketonemia or (esp. Brit.) ketonaemia an abnormally high concentration of ketone bodies in the blood.

ketonic of, relating to, or having the properties of a ketone or a keto (def. 1) group.

ketonize or ketonise to convert into or become converted into a ketone. - ketonization or ketonisation n.

ketonuria a condition in which there is an abnormally large excretion of ketone bodies in the urine.

ketopentose any ketose having a chain of five carbon atoms in the molecule. Two enantiomeric pairs of such compounds are possible, these being the D and L isomers of ribulose and xylul-

ketoprofen 2-(3-benzoylphenyl)propionic acid; a nonsteroidal anti-inflammatory agent; it is one of the substituted propionic acids that inhibit prostaglandin-endoperoxide synthase (EC 1.14.99.1). See also ibuprofen.

(S)-ketoprofen

ketopyranose any ketose in the pyranose form.

ketose any monosaccharide in the acyclic form of which the actual or potential carbonyl group is nonterminal, i.e. ketonic. The systematic names and many of the trivial names of ketoses have the ending '+ulose'. The position of the (potential) carbonyl group is indicated by a prefixed locant (e.g. 3-ketose, 5nonulose), which may be omitted from the name of a 2-ketose when no ambiguity can arise. The term is frequently modified by an infix indicating the number of carbon atoms in a chain in the molecule; thus ketopentose, ketotetrose, etc. Compare aldose.

ketosis any clinical condition in which there are abnormally high concentrations of ketone bodies in the tissues. The condition is usually accompanied by acidosis. See also ketogenesis. –ketotic *adj.*

ketosteroid a former name for oxosteroid.

keto sugar a common name for any ketose.

ketotetrose either of two ketoses having a chain of four carbon atoms in the molecule, these being the enantiomeric pair Dand L-glycero-tetrulose.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

ketotriose the single achiral ketose having a chain of three carbon atoms in the molecule and known as dihydroxyacetone, or glycerone.

kex2 a structural gene for pre-pro-alpha mating type polypeptide in Saccharomyces cerevisiae. It gives rise to the designation Kex2 site, a cleavage site (Arg-|-Arg or Lys-|-Arg) for kexin in the processing of the mating polypeptide and several extracellular fungal proteins.

kexin EC 3.4.21.61; other names: yeast Kex2 protease; proteinase YSCF; prohormone-processing endoprotease; pairedbasic endopeptidase. An enzyme that catalyses the cleavage of Lys-Arg-|-Xaa and Arg-Arg-|-Xaa bonds to process yeast αfactor pheromone and killer toxin precursors. Example, kexin precursor from yeast: database code KEX2_YEAST, 814 amino acids (89.90kDa); the human enzyme with the same specificity (and EC number) is neuroendocrine convertase 1 precursor, database code NEC1_HUMAN, 753 amino acids (84.03 kDa). See also furin, kex2, proopiomelanocortin.

kg symbol for kilogram.

KHF abbr. for killer cell helper factor (i.e. interleukin 2).

Khorana, Har Gobind (1922-), Indian organic chemist and biochemist renowned, inter alia, for his chemical synthesis of coenzyme A, various codon-containing polyribonucleotides, and a double-stranded DNA segment containing the gene for the tyrosine tRNA of Escherichia coli and its (larger) precursor RNA; Nobel Laureate in Physiology or Medicine (1968) jointly with R. W. Holley and M. W. Nirenberg 'for their interpretation of the genetic code and its function in protein

kicksorter a multichannel pulse-height analyser, especially one used to distinguish between radioisotopes by sorting them according to the energies (i.e. 'kicks') of their emitted radiations.

kidney either of a pair of organs of vertebrates concerned with osmoregulation and the elimination of nitrogenous waste products. Kidneys of different species vary in structure according to the animal's mode of life, but their basic design and function is the same. Each kidney is enclosed in a capsule and is made up of an outer cortex and an inner medulla, and contains numerous nephrons and their associated blood supply. The nephrons filter constituents from the blood to form urine, which is discharged from the kidney via the ureter.

kieselguhr an alternative name for diatomaceous earth.

killed vaccine any suspension of killed (or otherwise inactivated) microorganisms or virus used as an antigen to produce immunity.

killer cell any cell that is cytotoxic to in vitro cell cultures, e.g. killer T-lymphocytes and macrophages. Antibody-dependent cell-mediated cytotoxicity may be displayed by a number of cell types, e.g. by human monocytes or interferon-activated neutrophils, which can kill antibody-coated tumour cells, and by NK cells, which kill hybridoma cells through the NK cell FcyRII receptor. See also K cell.

killer-cell helper factor abbr.: KHF; an alternative name for interleukin 2.

killer factor an RNA molecule responsible for the lethal property of killer strains of yeast.

killer strain any strain of cells that is able to kill sensitive cells of the same species, e.g. some strains of yeast and Paramecium. See also kappa particle, killer factor.

killer T-lymphocyte any T lymphocyte that is able to kill target cells. Killer T-lymphocytes are produced in response to viral infection or an allogeneic tissue graft, and are specifically cytotoxic to host cells infected with virus or to grafted cells carrying the major histocompatibility antigens of the donor, respectively.

kilo+ symbol: k; an SI prefix denoting 10³ times.

kilobase symbol: kb; a unit of length of a polynucleotide equal either to 1000 base residues in a single-stranded polynucleotide or to 1000 base pairs in a double-stranded polykilocalorie or kilogram calorie or (esp. in nutrition) Calorie a non-SI unit of heat or energy equal to 10³ cal_{IT}. See caloris. kilodalton symbol: kDa; a unit of molecular mass equal to 103

kilogram symbol: kg; the SI base unit of mass, and also the fundamental unit of mass in the metric system; it is equal to the mass of the international prototype of the kilogram.

kilogram calorie an alternative name for kilocalorie.

kinase any phosphotransferase enzyme that transfers a phosphate group, usually from ATP. Kinases are divided into EC sub-subclasses according to the nature of the phosphate-accepting group: EC 2.7.1 - phosphotransferases with an alcohol group as acceptor; EC 2.7.2 - phosphotransferases with a carboxyl group as acceptor; EC 2.7.3 - phosphotransferases with a nitrogenous group as acceptor; EC 2.7.4 - phosphotransferases with a phosphate group as acceptor. The name is also used for enzymes that transfer a phosphate group from other nucleoside triphosphates. Compare dikinase, pyrophosphokinase, thiokinase.

+kinase suffix (in the trivial name of an enzyme) 1 designating a kinase or, by extension in certain instances, one that transfers some other inorganic oxo-acid group, e.g. sulfokinase. 2 designating an enzyme that activates a zymogen by proteolysis, e.g. enterokinase, streptokinase, thrombokinase.

kinasing a jargon term for the act or process of labelling the 5' end of a nucleic-acid molecule or fragment with phosphorus-32 by reaction with adenosine 5'-[α - 32 P]triphosphate and the enzyme T4 polynucleotide kinase. This is a step in the chemical cleavage method for sequencing DNA and RNA.

kinematic viscosity symbol: ν , the dynamic viscosity, η , of a

fluid divided by its density, ρ , i.e. $\nu = \eta/\rho$. kinesin microtubular motor protein, composed of two heavy chains and several light chains, that uses the energy of ATP hydrolysis (ATPase activity in the head of the heavy chain) to move along microtubules, mostly to the plus end but in some cases to the minus end (e.g. in Drosophila). Kinesins are involved in organelle transport, and in mitosis and meiosis. Example, kinesin heavy chain from human: database code KINH_HUMAN, 963 amino acids (109.56 kDa). See also dynein.

kinetensin or neurotensin-related peptide (abbr.: NRP) the nonapeptide Ile-Ala-Arg-Arg-His-Pro-Tyr-Phe-Leu; it has neurotensin-like immunoreactivity and is isolated from human, bovine, and canine plasma.

kinetic 1 of or relating to the motions of material bodies and the forces and energies associated therewith; of or relating to motion. 2 of or relating to the rate(s) of change of physical or chemical systems. 3 of or relating to kinetics.

kinetic energy symbol: E_k or T or K; the energy possessed by a material body by virtue of its motion, determined by the work necessary to bring it to rest.

kinetic proofreading a suggested mechanism of twice using the same Michaelis kinetic ability of an enzyme system to distinguish between two substrates C and D. The essential features of the mechanism are contained in the following reaction scheme, shown for substrate C, but identical in form if substrate C is replaced by D.

$$C + E \stackrel{k_1}{\rightleftharpoons} EC \xrightarrow{----} EC^* \xrightarrow{k_3} E + \text{product}$$

$$k_4 \parallel k_4$$

$$E + C^* \xrightarrow{k_5} C$$

The second step is enzymically coupled to an energy source, typically the hydrolysis of a nucleoside triphosphate, and is strongly enough driven to be essentially irreversible. EC*, a high-energy intermediate, may either react to give free enzyme nucleotide.

plus product or diffuse into the solution where it decomposes

kinetics

Kjeldahl me

to free enzyme plus the nonproduct C*, which can further decompose to C. According to kinetic proofreading, the incorrect intermediate, ED*, diffuses into the solution and decomposes faster than it reacts to give the wrong product, i.e. for ED* $k_3 \ll k_{-4}$, while for EC* $k_3 > k_{-4}$. In this way, the better binding of C is used twice, once in the formation of EC and again in the binding of the intermediate EC*. If the discrimination in the formation of the initial complex is f, a second factor of f may theoretically be attained, giving a total discrimination of f^2 .

kinetics 1 the branch of chemistry concerned with studying rates of chemical reactions. 2 the branch of mechanics concerned with the effects of forces on the motions of material bodies.

kinetin 6-furfurylaminopurine; N⁶-furfuryladenine; an artefactual compound formed by autoclaving DNA. It exhibits cytokinin activity in plants and was originally thought to be a naturally occurring substance. Compare Kinetin.

Kinetin a proprietary name for hyaluronidase. Compare kinetin. kinetochore a specialized assembly of proteins that bind to the centromere and also attach to microtubules growing out from centrosomes during mitosis. They are involved in the separation of chromosomes into the daughter cells. They are composed of centromere-binding proteins.

kinetochore microtubule see mitotic spindle, prometaphase.

kinetoplast a DNA-rich organelle located within an expanded region of a mitochondrion lying close to the basal body in members of the order Kinetoplastida. The kinetoplast is self-replicating and divides before the nucleus in cell division.

Kinetoplastida an order of protozoans whose members are characterized by the presence of a kinetoplast in the mitochondrion. It includes the genera Trypanosoma, Leishmania, and Crithidia.

kinetosome an alternative name for basal body.

King-Altman method a general method for obtaining steadystate expressions for enzymic mechanisms with n enzyme-containing intermediates $EX_1 ... EX_n$. First, a simple geometrical pattern describing the mechanism is drawn. Second, all possible patterns, consisting of (n-1) lines, that interconnect the possible enzyme forms are drawn; closed loops are forbidden. In general there will be m!/(n-1)!(m-n+1)! patterns, where m is the number of interconversion steps. Third, n expressions for $(d[EX_i]/dt[E_{tot}]) = 0$ in terms of the rate constants are set out and solved by determinant methods, using the fact that $\sum_{i=1}^{n} ([EX_i]/[E_{tot}]) = 1$

$$\sum_{i=1}^{n} ([\mathbf{E}\mathbf{X}_{i}]/[\mathbf{E}_{tot}]) = 1$$

where [E_{tot}] is the total enzyme concentration. [After E. L. King and C. Altman, who described it in 1956.]

kinin 1 or kinin-hormone any member of a varied group of linear polypeptides that constitute a class of so-called tissue or local hormones. Each is locally released from diffuse stores in the body, not having specialized glands of secretion, and is rapidly inactivated at the site of release. Among the most important are angiotensins, bradykinin, substance P, colostrokinin, urinary kinins, and secretin. 2 kinin-9 an alternative name (sometimes) for bradykinin, 3 kinin-10 an alternative name (sometimes) for kallidin (lysylbradykinin). See bradykinin. 4 an alternative name for cytokinin.

kininase any enzyme concerned in the natural breakdown of a kinin (def. 1). Included are kininase I (or lysine carboxypeptidase, EC 3.4.17.3), a carboxypeptidase circulating in plasma that inactivates bradykinin and possibly also kallidin, and kininase II (peptidyl-dipeptidase A, EC 3.4.15.1), also known as angiotensin-converting enzyme.

kininogen any inactive precursor of a kinin (def. 1).

kininogenin an alternative name for kallikrein.

kinked-helix model of duplex DNA a speculative model of the structure of double-stranded DNA in chromatin, proposed in 1975 by F. Crick and A. Klug to account for the high degree this model, based on the B form of duplex DNA, all the base pairs of the double helix remain intact but a sharp turn, or kink, of 95-100° occurs every 20 base pairs along the duplex. At this point one base pair has become unstacked from an adjacent pair through change of the conformation of the deoxyfuranose ring of a nucleotide residue from one of its possible staggered conformations to another. It was suggested that a kink might render several base pairs more easily available for specific interaction with a protein, and that a similar type of folding might occur in double-stranded DNA in other situations, especially when closely associated with protein.

kinomere an alternative term for centromere.

Kirkwood-Riseman theory of hydrodynamic properties of complex structures a theory providing an approximate method for computing the friction of a structure made up of identical subunits. A linear or coiled polymer is approximated as a string of beads, each with identical hydrodynamic properties, while an oligomeric protein is modelled as a cluster of identical subunits each with identical hydrodynamic proper-

Kirkwood theory of dielectric polarization of polar liquids an extension of the Onsager theory in which the dielectric constant of the central molecule and its first shell of neighbours is considered to differ from its macroscopic value. [After John Gamble Kirkwood (1907-59).]

Kirkwood theory of ion-dipole interactions a model in which the electrical contribution to the chemical potential of an ion having an arbitrary charge distribution is calculated with the aid of the Debye-Hückel theory and in which the Born relation between the free energy of solvation of a spherical ion and the dielectric constant of the solvent is generalized to include ions of arbitrary charge distribution.

Kirkwood–Westheimer theory of electrostatic effects on acid dissociation constants an extension and amplification of the Bjerrum theory of the influence of substituents on acid dissociation constants, the molecules and ions entering into ionization equilibria being treated as cavities of low dielectric constant. [After John Gamble Kirkwood (1907-59) and Frank Henry Westheimer (1912-), US biochemist.]

kirromycin or mocimycin an antibacterial antibiotic isolated from Streptomyces collinus and others. It specifically interacts with elongation factor EF-Tu (see EF-T) and prevents the release of EF-Tu from the bacterial ribosome after GTP hydrolysis. In the absence of ribosomes, the antibiotic induces an EF-Tudependent hydrolysis of GTP.

kistrin a protein isolated from the venom of the Malayan pit viper, Agkistrodon rhodostoma. It contains the RGD sequence and binds to a platelet adhesion site. It is a potent platelet aggregation inhibitor and antagonist of a family of glycoproteins that mediate aggregation. For example, see disintegrin.

KIT a family of genes encoding plasma membrane class III receptor tyrosine kinases. The viral gene, v-kit, is the oncogene of the Hardy-Zuckerman 4 strain of acutely transforming feline sarcoma virus. The product of the protooncogene c-kit has five immunoglobulin-like loops in the extracellular domain; the cytoplasmic region contains a tyrosine kinase domain with an insert region, and is myristoylated. Interaction with its ligand, steel factor (see stem cell factor), brings about dimerization, leading to enhanced autophosphorylation and binding of phosphatidylinositol 3-kinase and phospholipase Cy. Kit and its ligand are highly expressed in small-cell lung cancer and a significant proportion of testicular germ cell tumours. Example from human (precursor): database code KKIT_HUMAN, 976 amino acids (109.74 kDa).

Kieldahl, Johan Gustav Christoffer Thorsager (1849–1900). Danish brewing chemist; first director of the Carlsberg Laboratory, Copenhagen.

Kieldahl flask a small pear-shaped glass flask with a long neck, as used in the **Kjeldahl method**.

Kjeldahl method a method for the determination of the total of folding of the DNA (to about one seventh of its length). In nitragen in an organic compound or mixture of compounds. Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Kleinschmidt technique

K Just Barrell

The sample, in a **Kjeldahl flask**, is digested in hot, concentrated sulfuric acid in the presence of a catalyst, usually one containing mercury, copper, or selenium; the nitrogen in the sample is thereby converted to ammonium hydrogen sulfate. The ammonium formed may be estimated by neutralization and steam distillation of the resultant ammonia into a known amount of acid, the residual acid being determined by titration, or it may be estimated by **nesslerization** or with an ammonium electrode.

Kleinschmidt technique a technique for preparing monolayers of DNA for electron microscopy in which the DNA molecules are bound to a film of denatured basic protein, e.g. cytochrome c, on the surface of an aqueous solution. The DNA molecules are consequently brought from a three-dimensional conformation to a two-dimensional one by adsorption to the protein layer. The DNA-protein complex is then transferred to a solid surface, e.g. an electron microscope grid or collodion film, dried, and contrasted with heavy metals by shadowing or staining. The tendency of ssDNA to fold back on itself with the formation of intramolecular base pairs can be overcome by using formamide (which denatures short basepaired regions) or by replacing cytochrome c with DNA-unwinding proteins, which have high affinity for ssDNA. The method may also be applied to RNA. [After Albrecht K. Kleinschmidt (1916-), German microbiologist.]

Klenow enzyme or Klenow fragment a name sometimes used for the larger (75 kDa) of the two fragments formed by the treatment of Escherichia coli DNA polymerase I with subtilisin in the presence of DNA. The Klenow enzyme retains the polymerase activity and the single-strand-specific 3'→5' exonuclease activities but lacks the 5'→3' exonuclease activity of DNA polymerase I. It is useful in sequencing single-stranded DNA. [After Hans Klenow (1923—), Danish biochemist.]

Klotz plot a name sometimes given to a plot of the reciprocal form of an equation describing ligand binding at multiple independent sites on, e.g., a macromolecule. It has the form:

$$1/v = (1/nk)(1/[A]) + 1/n$$

where v is the average number of ligand molecules bound per molecule of the macromolecule, n is the number of binding sites per macromolecule, [A] is the molar concentration of free ligand molecules, and k is the intrinsic association constant. If the equation correctly describes the equilibria involved, a plot of 1/v versus 1/[A] gives a straight line of slope (1/nk) and with an intercept on the 1/v axis of 1/n and on the 1/[A] axis of -1/k. [After Irving Myron Klotz (b. 1916), US biochemist.]

Klug, (Sir) Aaron (1926—), Lithuanian-born South African and subsequently British molecular biologist distinguished for his determination of the structure of transfer RNA and for his contributions to the understanding of the three-dimesional structure of complexes of proteins and nucleic acids, especially tobacco mosaic virus and the nucleosome, through his invention of the technique of image reconstruction; Nobel Laureate in Chemistry (1982) 'for his development of crystallographic electron microscopy and his structural elucidation of biologically important nucleic acid-protein complexes'.

KMEF group abbr. for keratin-myosin-epidermin-fibrinogen group; a group of proteins that have in common an α -type X-ray diffraction pattern. Some of these may show a β -type pattern in some conditions. Silk fibroin, which normally occurs with a β structure, is often included in the KMEF group.

knallgas bacteria or hydrogen bacteria any of a number of bacterial species that can obtain energy from the knallgas reaction i.e. the oxidation of dihydrogen to water by dioxygen. They include some Alcaligenes and Pseudomonas spp. and Paracoccus denitrificans. [From the German, Knallgas, an explosive mixture of hydrogen and oxygen.]

knallgas reaction the energy-yielding direct oxidation of dihydrogen by dioxygen occurring in certain bacteria (see knallgas bacteria). The reaction is: **knockout** indicating an animal in which function of a gene has been deleted by genetic engineering techniques.

Knoop's hypothesis the hypothesis that fatty acids are metabolically oxidized by the successive removal of two-carbon fragments as acetic acid. See also beta oxidation. [After Franz Knoop (1875–1946), German physiologist and biochemist.]

Knop solution an aqueous solution containing the major inorganic constituents required for the growth of cells of higher plants, namely calcium nitrate, potassium nitrate, magnesium sulfate, potassium dihydrogen phosphate, and potassium chloride. [After J. A. L. W. Knop (1817–1901), German chemist.]

Knox plot (in high-performance liquid chromatography) a plot of relative separation efficiency versus flow rate, useful in determining the optimal conditions for a desired separation. [After John H. Knox.]

Koch phenomenon a cell-mediated hypersensitivity reaction in which inflammation of guinea-pig skin, when injected with living or dead *Mycobacterium tuberculosis*, is very much greater in animals actively infected with the organism than in uninfected animals injected with dead organisms. [After (Heinrich Hermann) Robert Koch (1843–1910), German bacteriologist, who isolated the bacillus in 1882.]

Köhler, Georges Jean Franz (1946-95), German immunologist famous for his discovery (with C. Milstein) of the technique of using cell fusion to generate a clonal cell population capable of producing unlimited quantities of a pure antibody; Nobel Laureate in Physiology or Medicine (1984) jointly with N. K. Jerne and C. Milstein 'for theories concerning the specificity in development and control of the immune system and the discovery of the principle for production of monoclonal antibodies'.

kojibiose the disaccharide 2-O- α -D-glucopyranosyl-D-glucopyranose.

kojic acid 5-hydroxy-2-(hydroxymethyl)-4*H*-pyran-4-one; a metabolite from *Aspergillus oryzae* and *A. terreus*. It can be obtained in large amounts and has some industrial application

Kok effect the sharp difference in yield of photosynthesis above and below the compensation point. Below compensation, where respiration can supply intermediates at a greater rate than the rate of photosynthesis, the yield is about twice as great as above compensation, where CO₂ has presumably to be drawn into the process. [After Bessel Kok (1918–81) Dutchborn US plant physiologist.]

Kornberg 1 Arthur Kornberg (1918-), US biochemist distinguished especially for his discovery and purification of the enzyme DNA polymerase and its use to synthesize segments of DNA molecules and viral DNA; Nobel Laureate (1959) in Physiology or Medicine jointly with S. Ochoa 'for their discovery of the mechanisms in the biological synthesis of ribonucleic acid and deoxiribonucleic [sic] acid'. 2 Hans Leo Kornberg (1928-) German-born British biochemist notable for his studies of intermediary metabolism in bacteria.

Kornberg enzyme an alternative name for DNA polymerase I. See DNA polymerase. [After A. Kornberg.]

Korsakoff's psychosis see Wernicke-Korsakoff syndrome.

Koshland model see induced-fit theory.

Kossel, Karl Martin Leonhard Albrecht (1853–1927), German physiological chemist distinguished for his researches on nucleins (i.e. nucleoproteins), for his discovery of adenine, cytosine thymine, and uracil as breakdown products of nucleic (GUYEN). Neu han co nhu câu vê sách sinh học xin liện hệ:

 $2 H_2 + O_2 \rightarrow 2 H_2O + energy$. sine thymine, and uracil as breakdown products of nucleic Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

250K protein

acids, for his discoveries of histone and histidine, and for his studies of the composition of proteins and its relation to their biological functions; Nobel Laureate in Physiology or Medicine (1910) 'in recognition of the contributions to our knowledge of cell chemistry made through his work on proteins, including the nucleic substances'.

Kr symbol for krypton.

Krabbe's disease an alternative name for galactosylceramide lipidosis. [After Knudd Haraldsen Krabbe (1885-1961), Danish physician.]

KRB abbr. for Krebs Ringer bicarbonate; see Krebs mammalian Ringer.

Krebs 1 (Sir) Hans Adolf Krebs (1900-81), German-born British biochemist renowned for his work on intermediary metabolism and in particular for the discovery of the two cyclic metabolic pathways named after him (see Krebs cycle def. 1,2) Nobel Laureate in Physiology or Medicine (1953) 'for his discovery of the citric acid cycle' [prize shared with F. A. Lipmann]. 2 Edwin Gerhard Krebs (1918-), US biochemist; Nobel Laureate in Physiology or Medicine (1992) jointly with Edmond H. Fischer 'for their discoveries concerning reversible protein phosphorylation as a biological regulatory mechanism'. Krebs-Cohen dismutation The anaerobic reaction summa-

2-oxoglutarate + NH₄⁺ → succinate +

glutamate + CO_2 + H^+ .

It has been shown to occur in pigeon heart and breast muscle, rat and guinea-pig renal cortex, and rat-liver mitochondria. It is the sum of two reactions:

2-oxoglutarate + H_2O + $NAD^+ \rightarrow$ succinate + CO_2 + NADH + H^+ ,

and

2-oxoglutarate + NADH + NH₄⁺ →

glutamate + $NAD^+ + H_2O$.

[After H. A. Krebs and Philip Pacy Cohen (1908-93), US biochemist.]

Krebs cycle an alternative name (sometimes) for 1 tricarboxylicacid cycle. 2 ornithine-urea cycle.

Krebs-Henseleit cycle an alternative name (sometimes) for the ornithine-urea cycle. [After H. A. Krebs and Kurt Henseleit

Krebs-Henseleit Ringer bicarbonate see Krebs mammalian Ringer.

Krebs-Kornberg cycle an alternative name (sometimes) for glyoxylate cycle. [After H. A. Krebs and H. L. Kornberg.]

Krebs mammalian Ringer any of several media devised for the suspension of mammalian tissues. Their composition was essentially based on the available analytical data for the inorganic constituents of blood plasma of a number of mammalian species. In the first version (1932), Krebs-Henseleit Ringer bicarbonate, the buffer was bicarbonate-CO₂, while in the second (1933), Krebs original Ringer phosphate, it was phosphate. In improved versions (1950), often referred to respectively as Krebs Ringer bicarbonate (abbr.: KRB) and (calcium-free) Krebs Ringer phosphate (abbr.: KRP), a mixture of organic acids and glucose was substituted for part of the NaCl in the first two versions, to resemble as closely as possible the state of the tissues in the intact animal. Also, an additional medium, low in phosphate, bicarbonate, and CO₂, was devised. See also Ringer's solution.

Krebs' manometer fluid a solution containing 44 g NaBr, 0.3 g Triton X-100, and 0.3 g Evans' Blue in 1000 mL of water; D = 1.033. The standard pressure (760 mmHg) in mm of manometer fluid is 10 000. Other detergents may be substituted for the Triton X-100 in equivalent proportions.

K region a region in a carcinogenic polycyclic aromatic hydrocarbon molecule in which there is a carbon-carbon bond having ordinary double-bond rather than aromatic character and atoms C-9 and C-10 in phenanthrene. It has been suggested that carcinogenicity in such molecules is determined by the existence in them of an active K region. Compare L region.

kringle a conserved protein domain of about 85 amino acids that is held in a characteristic three-dimensional conformation by three internal disulfide bridges. It is so-named because its two-dimensional representation resembles that of the kringle, a Scandinavian pastry of characteristic shape. It was first described in prothrombin, but homologous domains, with the characteristic shape and similarly positioned disulfides, are found in plasminogen and (both tissue-type and urokinasetype) plasminogen activators. See also Appendix E.

Kronig-Kramers transform any of a set of mathematical relations describing the response of a system to a perturbation such as light. These relations allow the calculation of optical rotary dispersion from circular dichroism (ellipticity) and vice versa, and describe the relationship between dispersion and absorption. [After R. de L. Kronig and Hendrik Anthony Kramers (1894-1952), Dutch physicist, who independently devised them in 1926 and 1927, respectively.]

KRP abbr. for Krebs Ringer phosphate; see Krebs mammalian Ringer.

Krüppel a protein involved in the segmentation of the embryo and in the differentiation of the malpighian tubules in insects (e.g. Drosophila). It is a nuclear, chromatin-associated protein, encoded by a gap gene, and is a member of a subfamily of C₂H₂-type zinc-finger proteins. Mutant krüppel larvae lack eight body segments. Example from Drosophila melanogaster: database code KRUP_DROME, 466 amino acids (50.74 kDa). [From German Krüppel, cripple.]

KS/hst a human oncogene, with no known viral counterpart, whose product is related to fibroblast growth factor and is expressed in Kaposi's sarcoma. Database code: HBG4_HUMAN, 206 amino acids (22.02 kDa).

k(T) symbol for rate constant (alternative to k, used when distinction of a rate constant from the Boltzmann constant is necessary).

Kuhn, Richard Johann (1900-67), Austrian-born German chemist and biochemist notable, inter alia, for his reintroduction (with H. Lederer) of the technique of adsorption chromatography by demonstrating the resolution of carotene into three isomers, for his synthesis (at the same times as P. Karrer) of vitamins A and B2, for his isolation of nicotinamide from heart muscle and of riboflavin from milk, and for the synthesis of the coenzyme flavin mononucleotide, riboflavin 5'-phosphate; Nobel Laureate in Chemistry (1938) 'for his work on carotenoids and vitamins'.

Kunitz and Northrop inhibitor see pancreatic trypsin inhibitor. Kunitz inhibitor the best known of the three distinguishable soybean trypsin inhibitors. The term has been extended to refer to

any type of protease inhibitor that contains consensus sequences known as Kunitz domains (see Appendix E). These include some serine protease inhibitors. Such domains have also been identified in some α-amyloid precursor protein isoforms.

Kunitz (tryptic) unit a measure of tryptic activity based on the extent to which trypsin-containing samples can digest casein under standard conditions often used to determine the relative amounts of Kunitz and Bowman-Birk type trypsin inhibitors present in samples, comparison being made between tryptic activity and chymotryptic activity. Crystalline trypsin has an activity of 6 Kunitz units per mg.

Kupffer cell a type of nonmotile, mononuclear phagocytic cell. Such cells line the sinusoids of the liver. [After Karl Wilhelm von Kupffer (1829-1903), German anatomist.]

kuru a transmissible spongiform encephalopathy of humans, characterized by degeneration of the nervous system and found among the Fore people of Papua New Guinea. It is a prion disease, transmitted through funerary practices thought to have involved endocannnibalism. The brains of victims of this and Gerstmann-Sträussler syndrome contain so-called kuru plaques that takes part in addition reactions; e.g. the bond between which have been shown to stain positively with antibodies Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

kwashiorkor

kyotol Justine

against prion protein in patients with Gerstmann-Sträussler syndrome. It has become extremely rare since cannibalism ceased in the late 1950s.

kwashiorkor a form of severe malnutrition of children occurring in tropical or near-tropical regions. It is generally believed to be caused by a dietary deficiency of protein, but not of other energy-producing foodstuffs. The condition commonly develops when, after prolonged breast feeding, the child is weaned onto a diet inadequate in protein. Compare marasmus.

kynurenate 4-hydroxyquinaldate; 4-hydroxy-2-quinoline carboxylate; the anion of kynurenic acid and an intermediate in the conversion of **kynurenine** to quinaldate.

kynureninase EC 3.7.1.3; *systematic name*: L-kynurenine hydrolase; a pyridoxal-phosphate-containing enzyme that hydrolyses L-kynurenine to anthranilate and L-alanine. It also acts on 3'-hydroxykynurenine and some other (3-arylcarbonyl)-alanines.

kynurenine 3-anthraniloylalanine; L-kynurenine is a metabolite on the degradative pathway of tryptophan, is found in the urine especially in pyridoxal (vitamin B₆) deficiency, and is an intermediate in the synthesis of nicotinic acid from tryptophan.

kyotorphin the analgesic dipeptide, L-Tyr-L-Arg, isolated from bovine brain; D-kyotorphin is L-Tyr-D-Arg.

I symbol for 1 litre (alternative to L). 2 liquid.

I symbol for length (alternative to L).

I- prefix (in chemical nomenclature) denoting levorotatory; now obsolete, use (-)-; see optical isomerism.

L symbol for 1 litre (alternative to 1). 2 a residue of the α -amino acid L-leucine (alternative to Leu). 3 an atom of hydrogen that may be one of either protium or deuterium. 4 linking number. 5 light chain (def. 1) (of an immunoglobulin).

L symbol for 1 Avogadro constant (alternative to N_A). 2 latent heat. 3 radiance.

L- a configurational prefix used in designating the absolute configuration of chiral compounds of certain classes; see D/L convention.

La symbol for lanthanum.

label 1 or (sometimes informally) tag any (radioactive or stable) isotope substituted in a proportion of the molecules of a particular compound so that the translocation and/or the chemical or biochemical transformation of the compound may be followed. See also tracer. 2 or (sometimes) marker an easily recognizable chemical group (which can be radioactive) attached to a molecule or incorporated within a structure. 3 to attach or apply such a label. The following particular uses of the terms label or labelled have individual entries (see also the list at labelling): affinity label, electron-dense label, immunoassay, mixed labelled, multiply labelled, nonselectively labelled, photoaffinity label, radioactive label, selectively labelled, singly labelled, specifically labelled, spin label, uniformly labelled.

labelled compound or (US, usually) labeled compound a compound bearing a label (def. 1, 2). An isotopically labelled compound is a compound in which one or more atoms of a proportion of the molecules have been replaced by a (radioactive or stable) isotope; i.e. it is a mixture of an isotopically unmodified compound with one or more analogous isotopically substituted compound(s). In some cases, the amount of isotopically unmodified compound may be small. This is particularly the case for ²H compounds, when near 100% replacement is possible. See also carrier-free.

labelling or (US, usually) labeling 1 the attribute of being labelled. 2 the act or process of chemically introducing a label (def. 1, 2) into a compound either by substitution or by synthesis, or of incorporating such a label into a material or structure. The following particular uses of the term labelling have individual entries (see also the list at label): conjugation labelling, double labelling, enzyme labelling, ferritin labelling, fluorescein labelling, generally labelled, hapten-sandwich labelling, iodine labelling.

labile 1 describing a chemical compound that is prone to spontaneous change or decomposition; relatively unstable. 2 describing an atomic or molecular grouping in a chemical compound that unusually readily dissociates from the compound; loosely attached. 3 describing a chemical bond that very easily ruptures or is ruptured. —lability n.

labile factor an alternative name for factor V; see blood coagula-

labile phosphate the amount or proportion of any phosphate that is readily liberated from a phosphate-containing compound by hydrolysis in 1 M HCl at 100 °C within 7-10 min (hence also sometimes known as seven-minute phosphate or tenminute phosphate). These conditions were selected originally for estimating the two terminal phosphate groups of ATP. The following compounds are included in the group (percentage hydrolysis in parentheses): phosphocreatine (100), ATP (67), ADP (50), aldose 1-phosphate (100), pyrophosphate (100).

labilize or labilise to render labile (esp. def. 3). —labilization or labilisation, labilizer or labiliser n.

lac any of various resinous substances secreted by certain

lac symbol for the genetic system of Escherichia coli that controls the organism's ability (lac⁺) or inability (lac⁻) to metabolize lactose. See also lac operon, lac repressor.

laccase any of a group of copper-protein enzymes (EC 1.10.3.2) of low specificity, that catalyse the oxidation of both o- and p-quinols by dioxygen to form the corresponding semiquinones and two molecules of water. They are so-called because such an enzyme was first found in the lac (or lacquer) tree (Rhus verniciflua); however, they are now known to be widely distributed in plants and fungi.

lac! the structural gene for lac repressor, the repressor of the lac

lac operon or lactose operon a genetic system, or operon, of Escherichia coli that controls the synthesis of the inducible enzyme β -D-galactosidase (see galactosidase). It is probably the most intensively studied group of E. coli genes. It consists of a linear sequence (5' end to 3' end of the coding strand) of two control sites, designated p and o, followed by three structural genes, designated z, y, and a; p is the promoter (concerned with RNA-polymerase binding), o is the operator (binding site for repressor), z is the gene for β -galactosidase, y is the gene for the permease, and a is the gene for thiogalactoside transacetylase (an enzyme of uncertain physiological function). Immediately preceding the p site is a regulatory gene designated i (concerned with synthesis of lac repressor).

lac repressor a protein encoded by the lacI gene, that controls the expression of structural genes coding for enzymes involved in lactose metabolism in the Escherichia coli genome; in the absence of inducer it binds with high affinity to the operator site of the lac operon. It is a homotetramer and specifically recognizes a 23 base-pair DNA sequence in the lac operator by means of its four N-terminal domains (headpieces), each of 51 amino-acid residues; each subunit also has one allosteric binding site for an inducer. The repressor is a typical helix-turnhelix protein and gives its name to a subfamily. Database code: LACI_ECOLI, 360 amino acids (38.55 kDa).

lact+ a variant form of lacto+ (before a vowel).

lactalbumin or α-lactalbumin a Ca²⁺-binding protein of the lactalbumin/lysozyme family, present in the milk of virtually all mammals. In the case of non-ruminants it is the predominant protein in whey. It contains 123 amino-acid residues, 40 of which are identical with and occupy corresponding positions to those of lysozyme. It is a noncatalytic regulatory protein whose presence is required for lactose synthase to transfer a galactose residue from UDPgalactose to D-glucose; hence it is also known as B protein of lactose synthase. It causes the substrate for N-acetyllactosamine synthase to change from Nacetylglucosamine to glucose to give lactose and UDP. Protein B had, therefore, been called a 'specifier' protein The genes for lysozyme and α-lactalbumin arose evolutionarily from a common ancestral gene. Example (precursor) from human: database code LCA_HUMAN, 142 amino acids (16.21 kDa); five

lactalbumin/lysozyme family a protein family whose members are characterized by six conserved motifs. Common members are α -lactalbumin (see lactalbumin (def. 2)) and lysozyme; 3-D structures are known.

lactam any intramolecular cyclic amide produced by the formal removal of a molecule of water between the amino and the carboxyl groups of an amino acid other than an α -amino acid. A prefix (as in β -lactam) may be used to designate the position of the amino group in the parent compound. A lactam commonly exists in tautomeric equilibrium with its corresponding lactim.

B-lactam antibiotic any member of a class of natural or semiplants or insects, used in the manufacture of lacquers, synthetic antibiotics whose characteristic feature is a strained, Ban dang doc một quyển sách dược tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ: β-lactamase

Mur regree

lactobionic

four-membered β -lactam ring (see lactam). They include the penicillins and many of the cephalosporins.

β-lactamase any member of a group of constitutive or inducible enzymes (EC 3.5.2.6); systematic name: β-lactamhydrolase. They are produced by certain strains of various bacterial species and can catalyse the hydrolysis of the lactam linkage in one or more β -lactam antibiotics, leaving a substituted β -amino acid; they thereby inactivate the antibiotic. The enzymes are of varying specificity, some acting more rapidly on penicillins (penicillinases), some more rapidly on cephalosporins (cephalosporinases); the latter were formerly classified separately as EC 3.5.2.8. The β -lactamases can be inhibited by various substances, such as clavulanic acid. There are several classes: class A (or type I) enzymes have seven motifs; class B (or type II) enzymes have a zinc cofactor. Class A example, Men-1 broad spectrum (hydrolyses penicillins and many cephalosporins) from Escherichia coli: database code BLM1_ ECOLI, 263 amino acids (28.18 kDa). Class B example (hydrolyses carbapenems and penicillins) from Bacteroides fragilis: database code BLAB_BACFR, 249 amino acids (27.23) kDa).

lactam-lactim tautomerism a form of tautomerism occurring in lactam-lactim interconversion as a result of migration of a hydron between the nitrogen atom and the oxygen atom. It represents a special case of amide-imidol tautomerism.

lactase a trivial name for any β -D-galactosidase. Some hydrolyse certain other glycosides, including α -L-arabinosides, β -D-fucosides, and β -D-glucosides.

lactase deficiency a condition of humans in which there is a congenital or acquired deficiency of lactase (i.e. β -galactosidase) in the mucosa of the small intestine leading to failure to digest lactose and to lactose intolerance. The condition is rare in infants and young children but is more common in healthy adolescents and adults; its frequency varies considerably in different population groups: it is more prevalent in native populations of Australia and Oceania, east and south-east Asia, tropical Africa, and the Americas (45–95%) than in those of central and northern European ancestry (<25%).

lactate 1 α -hydroxypropionate; 2-hydroxypropanoate; the anion, CH₃-CH(OH)-COO⁻, derived from **lactic acid**. It occurs naturally as D(-)-lactate (i.e. (R)-2-hydroxypropanoate) and L(+)-lactate (i.e. (S)-2-hydroxypropanoate). L(+)-lactate is formed by anaerobic glycolysis in animal tissues, and DL-lactate is found in sour milk, molasses, and certain fruit juices. Bacterial **lactic-acid fermentations** produce either the D(-) or L(+) enantiomer or the racemate (DL) depending on the individual organism. 2 any salt or carboxylic ester of lactic acid. 3 to secrete milk; see **lactation**.

lactate dehydrogenase any of several enzymes that interconvert lactate and pyruvate. L-Lactate dehydrogenase (EC 1.1.1.27; abbr.: LD or LDH) acts on L-lactate and NAD⁺. Example from human (heart muscle form): database code LDHH_HUMAN, 333 amino acids (36.47 kDa); this is a homotetramer, but some are heterotetramers of the heart muscle (H) and skeletal muscle (M) forms (the five isoenzymes are: LD₁, H₄; LD₂, H₃M; LD₃, H₂M₂; LD₄, HM₃; and LD₅, M₄). In clinical chemistry the assay of LD₁ (known also as α-hydroxybutyrate dehydrogenase or HBD) can be of use in diagnosing myocardial infarction, in which it reaches a peak at 2-3 days after the infarct, and in hemolytic crisis of sickle-cell anemia, since this isoenzyme is the predominant form in cardiac muscle and red cells. D-Lactate dehydrogenase (EC 1.1.1.28)

acts on D-lactate and NAD⁺. L-Lactate dehydrogenase (cytochrome) (EC 1.1.2.3) acts on L-lactate and ferricytochrome c and is a flavohemoprotein (FMN is coenzyme). D-Lactate dehydrogenase (cytochrome) (EC 1.1.2.4) acts on D-lactate and ferricytochrome c and is a flavoprotein (FAD is coenzyme). D-Lactate dehydrogenase (cytochrome c-553) (EC 1.1.2.5) acts on D-lactate and ferricytochrome c-553 and is present in Desulfovibrio vulgaris. These enzymes are very widely distributed, catalysing the interconversion of pyruvate and lactate.

lactation 1 the secretion of milk by the mammary gland. 2 a complete period of milk secretion from about the time of parturition to that of weaning. See also lactate (def. 3).

lacteal 1 of, relating to, or resembling milk, milky. 2 (of lymph vessels) containing or conveying chyle. 3 any blind-ended lymph vessel that carries chyle from a villus of the small intestine to the thoracic duct.

lactic pertaining to, or derived from, milk.

lactic acid α -hydroxypropionic acid; 2-hydroxypropanoic acid; a reasonably strong acid (p $K_a = 3.86$ at 25 °C). In biological systems it normally exists largely as its anion, **lactate** (def. 1). It is also useful as a preservative of foodstuffs.

lactic-acid bacterium any bacterium in which lactate is the main metabolic product. Lactic-acid bacteria belong chiefly to the genera *Lactobacillus* and *Streptococcus*, and some are of commercial importance, e.g. in the manufacture of fermented foods.

lactic-acid cycle an alternative name for Cori cycle.

lactic-acid fermentation a general name for heterolactic fermentation and/or homolactic fermentation.

lactic acidosis a clinical condition characterized by a persistent raised blood lactate concentration, usually above 5 mmol L⁻¹, with a lowered blood pH. The condition may be caused by severe exercise, cardiovascular insufficiency, hypoxia, shock, drug intoxication, and some inborn errors of metabolism. Compare hyperlactatemia.

lactide any intermolecular cyclic ester formed by self-esterification from two (or more) molecules of a hydroxy carboxylic acid. Compare lactone.

lactifer a special cell, found in the bark of the rubber tree (*Hevea*), in which rubber latex accumulates.

lactim any intramolecular cyclic carboximidic acid produced by the formal removal of a molecule of water between the amino and the carboxyl groups of an amino carboxylic acid other than an α -amino acid. A prefix (as in β -lactim) may be used to designate the position of the amino group in the parent compound. A lactim commonly exists in tautomeric equilibrium with its corresponding **lactam**.

lactitol 4-O-β-D-galactopyranosyl-D-glucitol; a disaccharide used as a sweetener.

lacto+ or (before a vowel) lact+ comb. form indicating milk.

lactobacillic acid (1*R-cis*)-2-hexylcyclopropanedecanoic acid; 11,12-methyleneoctadecanoic acid; a lipid constituent of various microorganisms, including *Lactobacillus arabinosus*.

Lactobacillus a genus of Gram-positive, anaerobic or facultatively aerobic, straight or curved bacilli or coccobacilli. Their metabolism is fermentative and all species form lactate as the major end product of glucose fermentation. Various species of lactobacilli are important in the preparation of certain fermented foods, e.g. cheese, yoghurt, sauerkraut.

Lactobacillus bulgaricus factor an alternative name for pantetheine.

Lactobacillus casei factor an alternative name for folic acid.

lactobionic acid the aldonic acid obtained by the oxidation of

muscle and red cells. D-Lactate dehydrogenase (EC 1.1.1.28) lactose.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

lactochrome

lactochrome a former name for riboflavin.

lactoferrin or lactotransferrin an iron(III)-binding protein present in milk. Its level in human plasma may be elevated in pan-

lactoflavin or lactoflavine a former name for riboflavin.

lactogen 1 any agent that stimulates the secretion of milk. 2 placental lactogen an alternative name for choriomammotropin.

lactogenic hormone an alternative name for prolactin. **β-lactoglobulin** see beta lactoglobulin.

lactonase 1 EC 3.1.1.17; recommended name: gluconolactonase; systematic name: D-glucono-1,5-lactone lactonohydrolase; other name: aldonolactonase. An enzyme that catalyses the reaction:

D-glucono-1,5-lactone + $H_2O = D$ -gluconate;

it also acts on a wide range of hexono-1,4-lactones. Example from Zymomonas mobilis: database code GNL_ZYMMO, 320 amino acids (34.73 kDa); homodimer. 2 1,4-lactonase or y-lactonase EC 3.1.1.25; an enzyme that specifically hydrolyses 1,4lactones having 4-8 carbon atoms to the corresponding 4-hydroxyacids.

lactone any intramolecular cyclic ester produced by the formal removal of a molecule of water between the hydroxyl and the carboxyl groups of a molecule of a hydroxy carboxylic acid other than an α -hydroxy acid. A prefix (as in β -lactone) may be used to designate the position of the hydroxyl group in the parent compound. Compare lactide.

lactoperoxidase a special name for peroxidase (def. 2) from milk. It also catalyses the oxidation of iodide to iodine, hence it is useful in radioiodine labelling of proteins and other biological materials under mild conditions.

lactose or (formerly) milk sugar the trivial name for the disac**charide** 4-O-β-D-galactopyranosyl-D-glucose. It constitutes roughly 5% of the milk of almost all mammals (human milk 6.7%; cow's milk 4.5%). It occurs rarely in plants, e.g. in the anthers of Forsythia spp. See also allolactose.

lactose fermenter jargon term for any genus, species, or strain of microorganism that ferments lactose.

lactose intolerance a syndrome occurring in humans in response to the ingestion of lactose (in milk) due to a congenital or acquired lactase deficiency in the mucosa of the small intestine. The failure to hydrolyse lactose leads to accumulation of the disaccharide within the intestine and consequent osmotically induced net fluid secretion into the gut, rapid intestinal transit, and acid stools due to bacterial fermentation of lactose. The condition is particularly prevalent in the Orient.

lactose operon see lac.

lactose permease an H+-lactose symporter in Escherichia coli. It has 12 transmembrane helices but is not very closely related to most other members of the superfamily. Database code LACY_ECOLI, 417 amino acids (46.45 kDa).

lactose synthase EC 2.4.1.22; systematic name UDPgalactose:D-glucose 4-β-D-galactotransferase; other name: UDPgalactose-glucose galactosyltransferase. An enzyme that catalyses the reaction:

UDPgalactose + D-glucose = UDP + lactose.

In mammary gland the protein comprises N-acetyllactosamine hypotonic medium.

Bạn dang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

synthase, the A protein, and α-lactalbumin (see lactalbumin), the B protein, both of which are required for lactose synthesis.

lactose-tolerance test a procedure used in the investigation of suspected lactase deficiency. Blood-glucose concentrations are estimated before an oral dose of lactose (1 g per kg body mass) and thereafter at 30-min intervals for 2 h. In normal individuals an increase of at least 30 mg per 100 ml (0.167 mM) in the blood-glucose concentration above the fasting value is observed.

lactosuria the presence of lactose in the urine. It is not uncommon during late pregnancy and lactation, or if the flow of milk is prevented.

lactosyl either of the glycosyl groups formed from lactose by detaching the anomeric (α or β) hydroxyl group on C-1.

lactotransferrin an alternative name for lactoferrin.

lactotroph any of a class of irregular, granulated, acidophilic cells of the anterior pituitary gland that secrete prolactin. Their number increases greatly during pregnancy.

lactotrophic describing any agent that induces normal growth and development of the mammary gland and sustains it.

lactotropic describing any agent that acts on the mammary gland to induce changes in its metabolism.

lactotropic hormone an alternative name for prolactin.

lactotropin an alternative name for prolactin.

lactoy! the acyl group, CH₃-CH(OH)-CO-, derived from lactic acid.

lactulose the trivial name for 4-O-β-D-galactopyranosyl-Dfructofuranose; a semisynthetic disaccharide, prepared from lactose, that is sweeter than lactose but less sweet than sucrose. Concentrated solutions of lactulose are useful clinically as an osmotic laxative by virtue of the inability of enzymes of the small intestine to hydrolyse lactulose to absorbable monosaccharides. On ingestion it therefore passes unchanged into the colon, where it acts partly directly to increase the water content of the bowel by osmosis and partly indirectly through breakdown by commensal saccharolytic bacteria to simple organic acids, with resultant lowering of colonic pH and further osmotic uptake of water.

lactyl a former term for lactoyl.

lacY a gene in Escherichia coli for lactose permease.

L1 adhesion molecule a type I membrane glycoprotein involved in neuron-neuron adhesion, neurite fasciculation, outgrowth of neurites, etc. It is a member of the immunoglobulin superfamily, and has fibronectin domains. Example (precursor) from human: database code CAML_HUMAN, 1257 amino acids (139.77 kDa).

Laetrile see amygdalin.

laevo- a variant spelling (esp. Brit.) of levo-.

laevo+ a variant spelling (esp. Brit.) of levo+.

laevodopa a variant spelling (esp. Brit.) of levodopa.

laevorotation a variant spelling (esp. Brit.) of levorotation.

laevulose a variant spelling (esp. Brit.) of levulose.

LAF abbr. for lymphocyte-activating factor (i.e. interleukin 1).

lagging strand the DNA strand that is synthesized by the joining together of short Okazaki fragments, giving the effect of continuous 3' to 5' synthesis in the direction of fork movement during the discontinuous replication of duplex DNA. Compare leading strand.

lag phase 1 the initial phase of the growth of a bacterial culture during which the rate of increase of cell numbers remains static, before rising to a value determined by environmental conditions. The extent of the lag phase is determined by the cultural history of the cells of the inoculum and the chemical and physical conditions of the medium into which they are placed. 2 a period of comparatively low activity after the start of an enzymic reaction that involves enzymes that act at a surface, e.g. phospholipases. It is due to the slow formation of the complex between the enzyme and the substrate interface. Once this has been formed the reaction accelerates.

lake to lyse erythrocytes, especially by suspending them in a

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Laki-Lorand factor abbr.: LLF or L-L factor; an alternative name for factor XIII; see blood coagulation.

lambda symbol: λ (lower case) or Λ (upper case); the eleventh letter of the Greek alphabet. For uses see Appendix A.

lambda chain or λ chain symbol: λ ; one of the two types of light chain of human immunoglobulins, the other type being a kappa chain. Example, V region (4A) from human: database code LV0A_HUMAN, 117 amino acids (12.37 kDa).

lambda phage or λ phage a temperate phage that infects Escherichia coli and contains linear duplex DNA, which circularizes during infection; the genome is 48 514 bp. Important gene clusters include those for the head and tail genes, recombination (att, int, xis, α , β , γ), lysis, and regulatory genes. Of the regulatory genes (cIII, N, cI, cro, cII, O, P, Q), two are immediate-early genes, cro and N; cro prevents synthesis of the repressor (see prophage) and turns off expression of immediate-early genes, including itself, after its product, cro, binds to O. Lambda phage is an example of the antitermination mechanism of phage control (see antiterminator); N codes for an antitermination factor that allows transcription to proceed through the terminator to the delayed-early genes, cII and cIII, and Q, codes for an antitermination factor that allows host RNA polymerase to proceed to the late (lytic) genes. The lytic cycle is repressed by expression of cI, the product of which acts at the operator O to prevent use of the promoter P. Lambda phage has been widely used as a vector in cDNA technology; foreign DNA can be inserted into the chromosome, and some foreign genes can be expressed using the lambda promoters. The linear DNA has cohesive ends that, when the DNA circularizes, associate to form the cos site (cohesive end site), which is important in packaging. The cos site has been exploited in the formation of cosmids.

lambda pipette colloquial term for a pipette used for the transfer of volumes in the microlitre range.

lambda repressor or λ repressor the product of gene cI; it is responsible for maintenance of phage λ prophage. Its product binds to the operator associated with the RNA polymerase promoter, thus preventing RNA polymerase from initiating transcription. The phage genome then cannot enter the lytic cycle. Mutants in this gene cannot maintain lysogeny. Example from bacteriophage λ: database code RPC1 LAMBD, 236 amino acids (26.05 kDa); and from related phage 434: database code S32822, 210 amino acids (22.96 kDa). 3-D structures, including complexes with operators, are known.

Lambert-Beer law another name for Beer-Lambert law.

Lambert's law (of absorption) a physical law in which Bouger's law was re-expressed; put into modern terms, it states that the fraction of monochromatic light (or other electromagnetic radiation) absorbed by a system is independent of the incident radiant power, Φ_0 . The law holds only if Φ_0 is small and other factors such as reflection, scattering, and photochemical reactions are negligible. See also Beer-Lambert law. [After Johann Heinrich Lambert (1728-77), German mathematician and physicist who stated it in 1760.]

lamella (pl. lamellae) any thin layer, membrane, or platelike structure, e.g. one of the series of double membranes that carry the photosynthetic pigments in chloroplasts, one of the thin layers of calcified bone matrix, or one of the spore-bearing gills of the fruiting bodies of mushrooms or related fungi. -lamellar or lamellate adj.

lamellar phase one type of liquid-crystalline phase.

lamin any of a group of intermediate-filament proteins that form the fibrous matrix (nuclear lamina) on the inner surface of the nuclear envelope. They are classified as lamins A, B, and C. Examples, all from Mus musculus; lamin A: database code LAMA_MOUSE, 665 amino acids (74.21 kDa); lamin B₁: database code LAM1_MOUSE, 584 amino acids (66.75 kDa); lamin C: database code LAMC_MOUSE, 574 amino acids (65.45 kDa). See also gliadin.

lamina (pl. laminae) 1 any thin plate or layer, e.g. of bone or

tened part of the thallus of certain algae. See also basal lamina, nuclear lamina. —laminar adj.

laminar flow a form of nonturbulent flow of a fluid in which parallel layers (laminae) of the fluid are moving in the same direction but with different velocities.

laminar-flow cabinet another name for safety cabinet.

laminaribiose the disaccharide, 3-O-β-D-glucopyranosyl-Dglucose; a unit of the seaweed polysaccharide laminarin.

pyranose form

laminarin a β -1,3-glucan that functions as a reserve polysaccharide in some brown algae (Laminaria spp.). It contains laminaribiose.

laminin a glycoprotein that is the major constituent of basement membranes. It consists of three chains, bound to each other by disulfide bonds into a cross-shaped molecule having the appearance of one long and three short arms with globules at each end (the three chains are wound together in a helical conformation for two thirds of their length, but diverge at the N-terminal end into the three arms that form the apex and side arms of a cross). The molecule interacts with procollagen type IV. Laminin mediates the attachment, migration, and organization of cells into tissues during embryonic development by interacting with other extracellular-matrix components. The precursor sequences of the three chains (all human) are: A, database code LMA_HUMAN, 3075 amino acids (336.78 kDa); B1, database code LMB1_HUMAN, 1786 amino acids (197.84 kDa); B2, database code LMB2_HUMAN, 1609 amino acids (177.41 kDa). Laminins of varying composition and sequence have been categorized as laminins 1 to 5. Laminin 5 is also known as kalinin.

laminin receptor any of a number of proteins, especially integrins (see also VLA) that bind laminin, interacting with it to promote cell adhesion and migration.

Lamm equation a general hydrodynamic equation describing the mass transport of a two-component system during ultracentrifugation. It is:

$$dc_2/dt = (1/x) d\{x[D(dc_2/dx) - c_2s\omega^2x]\}/dx,$$

where c_2 is the concentration of solute molecules at distance xfrom the axis of rotation, D is the translational diffusion constant, ω is the angular velocity, and s is the sedimentation coefficient.

lampbrush chromosome any of the large diplotene chromosomes found in the oocytes of many animals. They are up to 1 mm long and are covered with loops projecting in pairs from most chromomeres; each loop has a core of DNA and is the site of active gene expression.

lamprin a self-aggregating extracellular cartilage protein of lampreys, aggregates of which form fibres rich in beta structure. It is a major structural protein isolated from the annular cartilage of the lamprey, similar in amino-acid composition to elastin, but it does not contain desmosine or isodesmosine. Examples (precursors) from Petromyzon marinus: lamprin 1.9-12/10: database code LAMP_PETMA, 139 amino acids (13.24 kDa); lamprin 1.8-10; database code LAMA_PETMA, 119 amino acids (11.32 kDa); these two are seemingly formed by mineral. 2 (in botany) a the blade of a leaf or petal. b the flat-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Lan symbol for lanthionine.

lan+ comb. form indicating wool. [From Latin lana, wool.] Landsteiner, Karl (1868-1943), Austrian-born US pathologist and immunologist distinguished for his discoveries of the human blood groups. He designated A, B, and O (in 1901), factors M and N (in 1927), and factor Rh (in 1940); Nobel Laureate in Physiology or Medicine (1930) 'for his discovery of human blood groups'.

Landsteiner-Weiner antigen abbr.: LW antigen; see Rhesus

lane any of a set of parallel tracks resulting from the simultaneous separation of similar samples by one-dimensional zone electrophoresis or chromatography in thin-layer media.

Langendorff perfused heart a nonworking rodent heart preparation maintained in vitro by perfusion into the aorta with an oxygenated fluid so that the fluid circulates primarily into the coronary arteries. It is useful for studying the metabolism of heart muscle. A number of improvements of the original preparation have been made since its introduction. [After O. Langendorff (1853–1909), German physiologist.]

Langerhans, Paul (1847-88), German physician and anatomist who first described the islets of Langerhans.

Lang-Levy pipette a type of constriction micropipette (5-500 μL) that is self-adjusting and very reproducible.

Langmuir, Irving (1881-1957), US physical chemist and inventor; Nobel Laureate in Chemistry (1932), for his discoveries and investigations in surface chemistry.

Langmuir adsorption isotherm an equation describing the fraction of the surface of an adsorbent covered with a monomolecular layer of an adsorbed gas, arrived at from a consideration of the number of gas molecules striking and leaving the surface in a given time. It is:

$$V/V_{\rm m} = k_1 p/(1 + k_2 p),$$

where V is the volume of gas adsorbed, $V_{\rm m}$ is the volume of gas required to cover the whole surface, p is the gas pressure, and k_1 and k_2 are constants for the system. Compare Hill-Langmuir equation.

Langmuir-Blodgett multilayer a thin film of oriented amphiphilic molecules, consisting of superposed monolayers built up by successive dipping and withdrawing of a solid substrate, e.g. a glass slide, through an insoluble monolayer of an appropriate amphiphilic substance (or mixture of such substances) spread on the surface of an aqueous solution and kept at constant pressure. [After I. Langmuir and Katharine B. Blodgett (1898-1979).]

Langmuir trough an apparatus for measuring the dependence of the surface force exerted by a film of a substance (of low vapour pressure), floating on a liquid with which it is immiscible, on the area of the film. The apparatus consists of a rectangular tank containing the subnatant liquid, e.g. water, on which a known amount of the immiscible substance, e.g. an oil or a higher fatty acid, is spread between two parallel barriers to form a film. One of the barriers is fixed and the other may be moved so as to compress the film to a predetermined area. The force exerted on the film to achieve any given area is measured by a system of levers and either a torsion wire or balancing masses.

lanolin or wool fat the fatlike secretion of the sebaceous glands of sheep that is deposited onto the wool fibres. It is a wax consisting of a complex mixture of esters and polyesters of over 30 high-molecular-mass aliphatic, steroid, and triterpenoid alcohols and a similar number of fatty acids. Lanolin normally contains 25-30% water and is widely used as an ointment base.

lanosterol kryptosterol; lanosta-8,24-dien-3 β -ol; a steroid alcohol (triterpene) originally obtained from **lanolin**. It occurs in the biosynthetic pathway from squalene 2,3-epoxide to cholesterol in animals and fungi, but not in photosynthetic tissues, where it is replaced by **cycloartenol**. See also **lanosterol synthase**.

lanosterol

lanosterol synthase EC 5.4.99.7; other names: 2,3-epoxysqualene-lanosterol cyclase; oxidosqualene-lanosterol cyclase (abbr.: OSC); an enzyme of the pathway for the synthesis of sterols. It catalyses the cyclization of (S)-2,3-epoxysqualene to lanosterol. Example from Saccharomyces cerevisiae: database code ERG7_YEAST, 730 amino acids (83.33 kDa).

lantern see firefly lantern.

lanthanoid or lanthanide or (formerly) lanthanon any member of the series of 15 metallic elements with atomic numbers 57 (lanthanum) to 71 (lutecium) inclusive that occur together in group 3 and period 6 of the IUPAC periodic table; sometimes the term is restricted to the 14 elements following lanthanum. Lanthanoid is now the preferred name. Together with the elements scandium and yttrium, the lanthanoids are known also as rare-earth elements or (more loosely) rare earths (the latter term referring strictly to their oxides). Despite such names, however, they do mostly occur widely in nature, albeit in small amounts. Apart from the element of atomic number 61 (promethium), all lanthanoids have at least one stable nuclide and occur naturally, the principal source being the mixed phosphate ore monazite. All nuclides of promethium, however, are radioactive, and (except for traces possibly occurring as a fission product of natural uranium) all are artificial. The lanthanoids are strongly electropositive, and their chemical properties are similar, due usually to the filling of an inner electron subshell (4f) progressively across the series. Like the actinoids, they thus represent a series of inner transition elements within the series of transition elements embraced by groups 3 to 11 inclusive. Some paramagnetic lanthanoid ions induce strong shifts in the positions of many NMR spectral peaks and have been used as relaxation and shift probes in structural studies employing NMR spectroscopy.

lanthionine (2S,6R)-lanthionine, meso-lanthionine, S-(alanin-3-yl)-L-cysteine, 2,2'-diamino-3,3'-thiobis(propionic acid); symbol (recommended):

or Lan; a di(α -amino acid) found in **lantibiotic** polypeptides. It is formed as a post-translational modification, the first step involving dehydration of a Ser to the α, β -unsaturated aminoacid residue, 2,3-didehydroalanine. A bond is then formed between the =CH₂ group thus formed and the sulfur atom of a cysteine, inversion of configuration of the α carbon of the Serderived moiety occurring in the process. Chick embryo protein contains the (2R,6R) diastereoisomer. Lanthionine is also formed artefactually by the mild alkaline treatment of wool, hence its name (see lan+).

lantibiotic

lathvr

lantibiotic any of a number of polypeptides, of 1.89–4.63 kDa, that contain **lanthionine** or methyllanthionine (threo-β-methyllanthionine, (2S,3S,6R)-3-methyllanthionine) and have antibiotic action. They are produced by and primarily act on Gram-positive bacteria. In addition to lanthionines, they contain the amino acids 2,3-didehydroalanine (abbr.: Dha) and 2,3-didehydrobutyrine (2-aminocrotonic acid, (Z)-2-aminobut-2-enoic acid, abbr.: Dhb) resulting from dehydration of serine and threonine residues respectively. These amino acids are formed post-translationally from normally coded amino acids. Lantibiotics are broadly divided into type A, elongated amphiphilic peptides, and type B, compact globular peptides. Type-A peptides kill bacterial cells by forming pores in the cytoplasmic membrane, type-B peptides possibly acting by enzvme inhibition.

LAP (in clinical chemistry) abbr. for leucine aminopeptidase (LAS preferred).

LA-PF4 abbr. for low-affinity platelet factor 4; a peptide derived from platelet basic protein precursor. It stimulates DNA synthesis, mitosis, glycolysis, intracellular cyclic AMP accumulation, prostaglandin E2 secretion, and synthesis of hyaluronic acid and sulfated glycosaminoglycan. Other name: connective-tissue activating peptide III (abbr.: CTAP-III).

Laplace transform method a method that enables solutions of linear differential equations with constant coefficients to be found by reference to tables of Laplace transform pairs, with a minimum of mathematical work. The Laplace transform of a function y = F(t) is defined by:

$$F(s) = \int_{0}^{\infty} e^{-st} F(t) dt$$

in which s is usually a complex quantity and must have a positive real term, so that e^{-st} will be zero when $t = \infty$. [After Pierre Simon, Marquis de Laplace (1749-1827), French astronomer and mathematician.]

Largactil see chlorpromazine.

large calorie an alternative name for kilocalorie or (in nutrition)

large-patch repair (of DNA) a name sometimes given to the process of excision repair of duplex DNA in some mutant organisms, e.g. polA- Escherichia coli, in which the newly synthesized polynucleotide 'patch' is considerably larger than in the wild type.

large T-antigen see T antigen (def. 1).

lariat a lasso-shaped structure formed from the fragment of RNA to be excised during the process of splicing out the introns in the primary transcript of eukaryotic genes.

lariat debranching enzyme an enzyme that cleaves the 2',5'phosphodiester bond formed during pre-mRNA splicing between the 5'-terminal guanylyl residue of the intron and an adenylyl residue near the 3' splice site, at the branch point of excised intron lariats. It is involved in the turnover of excised introns. Example from yeast: database code DBR1_YEAST, 405 amino acids (47.69 kDa).

Larmor frequency the angular frequency of Larmor precession of an atomic electron.

Larmor precession the precession of a charged particle moving under the influence of a central force, e.g. of an orbiting electron in an atom, when acted on by an external magnetic field. [After Joseph Larmor (1847–1942), Irish-born physicist.]

LAS (in clinical chemistry) abbr. for leucine aminopeptidase (preferred alternative to LAP).

lasalocid or X-537A any of five closely related lipophilic antibiotics, lasalocid A-E, isolated from cultures of Streptomyces lasaliensis. Lasalocid A $(M_r = 591)$ is a carboxylic ionophore for virtually every known cation, but transports monovalent cations about ten times more effectively than divalent cations.

lased light an imprecise term for laser light; see laser (def. 2).

laser 1 any device for producing an intense, coherent, monochromatic, parallel beam of light (or other electromagnetic radiation) by stimulated emission. A laser consists of an optically transparent cylinder containing an active medium gestion induce the disease lathyrism.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

bounded by a full mirror at one end and by a partial mirror at the other end. Some chemical species of the medium are excited above their ground state by application of electromagnetic radiation from an external source; the excited species revert to their ground state with the emission of a photon, which in turn can collide with other excited species to produce stimulated emission of other photons. The radiation is reflected backwards and forwards up and down the cylinder and the beam emerges through the partial mirror. The frequency of the radiation is determined by the nature of the active medium; many different types of laser are available with a wide range of power outputs. 2 having the characteristic quality of, being, or using, light emitted by a laser (def. 1), as in laser densitometry, laser ionization (micro) mass spectrometry, laser light, laser microprobe mass analysis, laser nephelometry, laser photolysis, laser (light) scattering, laser spectrophotometry, and laser velocimetry. [Acronym from light amplification by stimulated emission of radiation.]

Latapie mincer a device for mincing tissues for metabolic studies in which both the rate of rotation of the cutting disks and the rate at which the tissue is forced against these disks may be controlled by varying the rates at which two cranks are turned, thus enabling minces of different degrees of fineness to be obtained. Sterile conditions may be maintained during the mincing if desired.

late enzyme see late gene.

late gene any gene of a bacteriophage or other viral genome that is expressed significantly, as a late enzyme or other late protein, only after replication of the genome has started. Compare early gene.

latency 1 or crypticity the state or quality of being latent. 2 an alternative term for latent period.

latent 1 existing in a potential, dormant, or suppressed form but usually capable of being expressed or evoked. 2 (in pathology) (of an infection or disease) not yet manifest or apparent.

latent enzyme any enzyme whose activity only becomes manifest when the conditions are changed. The term is used especially of a particulate enzyme that becomes active when the particles are disrupted.

latent heat symbol: L; the change in the heat content of a (given amount of) substance when it changes phase without change in its temperature.

latent image (in photography) the invisible image produced by the action of light, etc. on the photosensitive emulsion that is made visible by development.

latent period or latency 1 the time between the arrival of a stimulus at an irritable tissue and the beginning of the appropriate response. 2 the time between the adsorption of virulent bacteriophage onto a bacterium and lysis with liberation of newly formed virions.

late protein see late gene.

lateral phase separation the phenomenon of coexistence of solid and liquid regions in a lipid bilayer at temperatures between the pretransition temperature and the transition temperature.

lathyrism any of several pathological states that result from ingesting any of several toxins, characteristically found in plants of the genus Lathyrus. In humans one kind of lathyrism is characterized by a spastic paraplegia of the lower extremities associated with degenerative changes in the lateral pyramidal tracts of the spinal cord. It is caused by ingestion of neurotoxins, e.g. β -cyano-L-alanine and L- α , γ -diaminobutyric acid. These are present in several species of plants of the genus Lathyrus and in the common vetch (Vicia sativa). In experimental animals a defect of cross-linking of collagen is caused by feeding sweet pea (Lathyrus odoratus) seeds; the toxic substance was first identified as β -(γ -L-glutamyl)aminopropionitrile but it was later shown that β -aminopropionitrile alone is fully active. Turkeys fed L. odoratus died of hemorrhage from rupture of the aorta.

lathyrogen any member of a group of substances that on in-

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Latin square

Hur thought

Latin square (in statistics) a square array of n columns and n rows containing n different elements and in which no element occurs more than once in any row or column. It is used as a basis of experimental procedures when it is desired to allow for two sources of variability while investigating a third.

LATS abbr. for long-acting thyroid stimulator.

lattice 1 any regular array of objects or points in two or three dimensions. 2 (in crystallography) any regular, three-dimensional array of fixed points about which atoms, ions, or molecules vibrate in a crystal. 3 (in immunology) the three-dimensional aggregate suggested to be built up in an antigenantibody reaction (see lattice hypothesis).

lattice energy (of a crystal) the energy that would be required to separate the ions of a crystal to an infinite distance from each other.

lattice hypothesis a hypothesis describing antigen-antibody reactions in terms of the building up of large antigen-antibody aggregates or three-dimensional lattices. The hypothesis requires both antigen and antibody to have valencies greater than one.

Lau symbol for the dodecanoyl (i.e. lauroyl) group.

Laue, Max Theodor Felix von (1879–1960), German physicist,

Nobel Laureate in Physics (1914) 'for his discovery of the diffraction of X-rays by crystals'.

Laue equation any of a set of three equations describing the occurrence, positions, and intensities of X-ray beams after diffraction by a crystal. For three crystal axes, x, y, and z, with separations of chemical entities along them of a, b, and c, respectively, the equations are:

$$a(\cos\alpha-\cos\alpha_0)=h\lambda,$$

$$b(\cos\beta-\cos\beta_0)=k\lambda,$$

and

$$c(\cos\gamma - \cos\gamma_0) = l\lambda$$
,

where α_0 , β_0 , and γ_0 are the angles that the incident beam makes with the x, y, and z, axes, respectively, and α , β , and γ are the corresponding angles for the diffracted beam; λ is the wavelength of the radiation and h, k, and l are integers corresponding to the **Miller indices** of the planes considered to be diffracting the radiation. See also **Bragg's law**. [After M. F. T. von **Laue**.]

Laue photograph or Laue pattern the spot diagram produced when a heterogeneous beam of X-rays is diffracted by passage through a crystal.

laurate 1 the trivial name for dodecanoate, CH₃-[CH₂]₁₀-COO-, the anion derived from lauric acid (i.e. dodecanoic acid), a saturated straight-chain higher fatty acid. 2 any mixture of free lauric acid and its anion. 3 any salt or ester of lauric acid. Dodecyl laurate is one of the main components of laurel oil, the oil obtained from berries of the laurel plant, Laurus nobilis. Laurate is present in appreciable amounts in hydrolysates of phosphoglycerides of plants and animals.

Laurell technique an alternative name for rocket immunoelectrophoresis. [After C.-B. Laurell, Swedish biochemist.]

lauroyl or (formerly) **lauryl** symbol: Lau; the trivial name for dodecanoyl, CH₃-[CH₂]₁₀-CO-, the acyl group derived from lauric acid (i.e. dodecanoic acid). It occurs in natural lipids, mainly as acylglycerols.

lauryl 1 symbol: Dod; a common name for dodecyl, CH₃-[CH₂]₁₀-CH₂-, the alkyl group derived from dodecane; use deprecated. 2 a former trivial name for dodecanoyl (lauroyl now used).

lauryldimethylamine oxide abbr.: LDAO; N,N-dimethyl-N-dodecylamine oxide; a water-soluble, zwitterionic (at pH 7 or above) detergent, aggregation number 76, CMC 1-2 mM.

lauryl sulfate, sodium salt an alternative name for sodium dodecyl sulfate.

lavendustin any of several substituted amino salicylic acids that are used as protein tyrosine kinase inhibitors. Lavendustin A is {5-amino-[(N-2,5-dihydroxybenzyl]-N'-2-hydroxybenzyl]}aminosalicylic acid and lavendustin C is 5-(N-2,5-dihydroxybenzyl)aminosalicylic acid. Lavendustin A inhibits protein tyrosine linase activity with little effect on cyclic AMP-dependent kinase or protein kinase C. Lavendustin C is similar but also inhibits Ca²⁺/calmodulin kinase II.

lavendustin A

lawn a layer of microorganisms uniformly distributed in or over the surface of a solid culture medium.

law of conservation of energy see thermodynamics, laws of. law of independent assortment see Mendel's laws of heredity. law of mass action see mass action.

Lawrence, Ernest Orlando (1901-58), US physicist; Nobel Laureate in Physics (1939) 'for the invention and development of the cyclotron and for results obtained with it, especially with regard to artificial radioactive elements'.

laws of thermodynamics see thermodynamics.

lawsone 2-hydroxy-1,4-naphthoquinone; the active dyeing compound of henna.

layer line one of the parallel lines of spots obtained on the photographic plate in the rotating crystal method of X-ray diffraction analysis.

lb symbol for pound.

LBF abbr. for Lactobacillus bulgaricus factor (see pantetheine).

LC abbr. for liquid chromatography.

LCAD abbr. for long-chain acyl-CoA dehydrogenase; see betaoxidation system.

LCAT abbr. for lecithin-cholesterol acyl transferase.

LCD abbr. for liquid-crystal display.

L cell an alternative name for EG cell.

L chain see light chain (def. 1).

LCK a gene family encoding nonreceptor tyrosine kinases (e.g. p56^{lck}) of the Src family (see src), originally detected in the LSTRA murine lymphoma cell line. The product is lymphocyte-specific and associates with the cytoplasmic domains of CD4 and CD8. The mitogen-activated protein (MAP) kinase is a substrate for p56^{lck}; it is a myristoylated protein with SH2 and SH3 domains. Example from human: database code KLSK_HUMAN, 508 amino acids (57.80 kDa).

LCR abbr. for locus control region.

LD abbr. for 1 lethal dose. 2 (in clinical chemistry) L-lactate de-

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

LD₅₀

LDB abbr. for median lethal dose. **LDH** abbr. for L-lactate dehydrogenase (alternative to LD).

LDL abbr. for low-density lipoprotein.

LDL receptor a cell-surface receptor that binds apolipoprotein B and so internalizes **low-density lipoprotein** (LDL) from the plasma, leading to processing that regulates cholesterol and LDL synthesis, and thence plasma cholesterol concentration. It is a type I membrane protein. The number of LDL receptors on liver cells is regulated by cholesterol synthesis: when cholesterol levels rise, the number of receptors falls. Defects in this receptor are associated with certain forms of type II **hyperlipidemia**. The amino end of the extracellular domain contains seven or eight 40-residue repeats; each repeat has about six Cys residues, all of which are involved in disulfide bonds; following these repeats is a region of about 350 residues that is homologous with part of the epidermal growth factor precursor. Example (precursor) from human: database code LDLR_HUMAN, 860 amino acids (95.27 kDa).

Le abbr. for Lewis antigen.

leaching (microbial) a process for the solubilization of metals, mostly from poor ores, by lithotrophic bacteria. See also lithotroph.

lead symbol: Pb; a very soft, bluish-white metallic element of group 14 of the IUPAC **periodic table**. It has a low melting point and high relative density; proton number 82; relative atomic mass 207.2. It is commonly used for shielding from ionizing radiation.

leader peptidase EC 3.4.99.36; other name: signal peptidase I, phage-procoat-leader peptidase; an enzyme that catalyses the cleavage of N-terminal leader sequences from secreted proteins.

leader peptide an alternative name for signal peptide.

leader sequence or lead sequence an alternative name for signal sequence (see signal peptide).

leading strand the DNA strand that is synthesized continuously, in the 5' to 3' direction, towards the replication fork during the discontinuous replication of duplex DNA. Compare lagging strand.

lead screw a threaded rod the rotation of which is used to drive the tool carriage of a lathe, the plunger of a syringe, etc.

leaf (pl. leaves) 1 the principal organ of photosynthesis and transpiration in higher plants. It typically consists of a flattened bladelike lamina, often relatively broad, attached to the plant stem directly or by a stalk. 2 any thin, flattened object that resembles a leaf. See also leaflet.

leaflet 1 a any small or young **leaf** (def. 1). b an individual segment of a compound leaf. 2 any small, thin, flattened object or structure that resembles the leaf of a plant, especially a lipid bilayer or a portion of a biological membrane.

leaky (in genetics) describing any mutation that fails to shut off completely the activity of a gene so that some residual expression of the gene remains.

Le antigen symbol for Lewis antigen.

least squares a statistical method for determining the 'best' value of an unknown quantity relating one or more sets of measurements or observations. It is based on minimizing the sum of the squares of the deviations of the experimentally determined values from the calculated values, and is used especially to find a curve that best fits a given set of data.

leaving group any atom or group, charged or uncharged, that departs during a substitution or displacement reaction from what is regarded as the residual or main part of the substrate of the reaction.

Lebedev-Saft or **Lebedev** juice an aqueous extract of air-dried yeast. It will ferment glycerone (dihydroxyacetone) and, in the presence of phosphate, produces a hexose phosphate. [After Alexander Nikolaevich Lebedev (1881–1938), Russian botanist who described the preparation in 1911.]

Le Chatelier principle or Le Chatelier-Braun principle a principle stating that when a system in equilibrium is subject to stress, i.e. to a change in its conditions, the system will adjust

itself to annul, as far as possible, the effect of the stress. [First formulated (in 1885) by Henry (Louis) Le Chatelier (1850–1936), French chemist, and independently in 1886 by Karl Ferdinand Braun (1850–1918), German physicist.]

lecithin an old trivial name, still in frequent use, for any 3-sn-phosphatidylcholine.

lecithinase any of a number of distinct enzymes acting on lecithins that are now usually considered among the **phospholipases**.

lecithin-cholesterol acyl transferase abbr.: LCAT; EC 2.3.1.43; recommended name: phosphatidylcholine-sterol O-acyltransferase; other name: phospholipid-cholesterol acyltransferase. An enzyme that catalyses a reaction between phosphatidylcholine and cholestereol to form a cholesteryl ester and 1-acylglycerophosphocholine. This enzyme is central to the extracellular metabolism of plasma lipoproteins; it acts on free cholesterol in the high-density lipoprotein (HDL) precursor, transferring a fatty acyl group to cholesterol, thus contributing to the altered class composition of the mature HDL; some of the resulting cholesterol esters are partly taken up by low-density lipoprotein. The enzyme is a glycoprotein, and is activated by apolipoprotein A1. It is deficient in Norum and fish eye diseases. Example (precursor) from human: database code LCAT_HUMAN, 440 amino acids (49.52 kDa).

lectin any of a group of specific agglutinins and other antibody-like (glyco)proteins of nonimmune origin, defined (by IUB) as 'sugar-binding protein or glycoprotein of non-immune origin which agglutinates cells and/or precipitates glycoconjugates'. Lectins are widely distributed in nature, being found mainly in seeds but also in other parts of certain plants, and in many other organisms from bacteria to mammals. Lectins bear at least two sugar-binding sites; they bind specific sugars and thereby precipitate certain polysaccharides, glycoproteins, and glycolipids, and/or agglutinate animal and plant cells. Some can distinguish between normal and malignant cells, and many, e.g. phytohemagglutinin, are mitogenic. They are widely used experimentally, especially concanavalin A, as tools in carbohydrate biochemistry, for studying cell surfaces and for inducing transformation (def. 3) of lymphocytes. Plant lectins are also known as phytoagglutinins.

LED abbr. for light-emitting diode.

Lederberg, Joshua (1925-), US geneticist notable for his work on sex factors in bacteria and for discovering bacterial transduction; Nobel Laureate in Physiology or Medicine (1958) 'for his discoveries concerning genetic recombination and the organization of the genetic material of bacteria' [prize shared with G. W. Beadle and E. L. Tatum].

leghemoglobin or (esp. Brit.) leghaemoglobin a hemoglobinlike red pigment found in the root nodules of leguminous plants. An autoxidizable hemoprotein, it sequesters dioxygen to prevent inhibition of nitrogenase in the bacteroids. It is thus essential for symbiotic nitrogen fixation. Example, leghemoglobin I (monomer) from pea: database code LGB1_PEA, 147 amino acids (15.82 kDa).

legumain EC 3.4.22.34; other names: bean endopeptidase; vicilin peptidohydrolase; phaseolin; an endopeptidase from legumes that hydrolyses Asn-|-Xaa bonds in small molecule substrates such as Boc-Asn-|-OPhNO₂. Example (precursor) from *Phaseolus vulgaris*: database code CYSP_PHAVU, 362 amino acids (40.17 kDa).

legumin a major storage protein of the seeds of both leguminous and nonleguminous plants. It consists of two chains, an acidic α chain and a basic β chain which are linked by a single disulfide bond. These are derived from a common precursor; example (precursor) from *Pisum sativum*: database code LEG2_PEA, 520 amino acids (59.27 kDa). Residues 23-335 form the α chain, and 336-520 the β chain.

Leigh theory a theory that enables the use of electron spin resonance data to estimate distances between two interacting spins embedded in a rigid lattice. [After J. S. Leigh.]

stress, i.e. to a change in its conditions, the system will adjust Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

for his isolation of uridine diphosphate glucose and his discovery of the role of sugar nucleotides in interconversion of sugars and in polysaccharide formation; Nobel Laureate in Chemistry (1970) for his discovery of sugar nucleotides and their role in the biosynthesis of carbohydrates'.

LEM abbr. for light-effect mediator.

length symbol: I or L; a scalar physical quantity indicating linear extent; one of the seven SI base physical quantities. The SI base unit of length is the metre.

lens 1 a piece of glass or other transparent and refracting material, or two or more such pieces joined together, for converging or diverging a beam of light in order to form optical images. 2 any electrostatic or electromagnetic device for focusing or otherwise altering the direction of movement of a beam of electrons or other elementary charged particles; any similar device acting on sound waves. 3 (in zoology) any of various transparent structures responsible for focusing light onto photoreceptors. The crystalline lens of vertebrates is a near-spherical structure in the eye, lying in the aqueous humour behind the pupil. It focuses or assists in focusing light rays onto the retina. Enclosed within a collagenous capsule, it consists largely of cells containing proteins called crystallins.

lenticular 1 having the shape of a biconvex lens (def. 1). 2 of or pertaining to a lens.

lentinan a polysaccharide isolated from the edible mushroom Lentinus edodes. It is a β -1,3-glucan, having for every five β -1,3 linear linkages, two glucopyranoside units in β -1,6 linkage. lentinarin see callose.

lentropin a protein, present in the vitreous humour of the eye, that stimulates lens-fibre differentiation. It is related to insulin-like growth factors.

Lepidoptera a large order of insects that includes butterflies, skippers, and moths. The adults are characterized by a prominent coiled proboscis and two pairs of large, scaly, membranous wings. The larvae are caterpillars. —lepidopteran adj.

leporine of, pertaining to, or resembling a rabbit or hare.

leprachaunism an autosomal recessive inherited disease characterized by small stature and elfin-like appearance, with motor and mental retardation and severe failure to thrive. Most patients die in early childhood, though a few, who are compound heterozygotes for two different alleles, survive childhood. The condition can be caused by any of a number of mutations in the gene encoding the insulin receptor. These involve changes in single amino acids, those so far found being between residues 55 and 487.

leptin a protein encoded by a gene, ob, first identified as the obese mutation (see ob/ob) in mice. Leptin may act as a signal in the regulation of adipose mass, possibly by regulating appetite and also possibly by regulating energy expenditure. It appears to be expressed exclusively in white adipose tissue. The predicted sequence is largely hydrophilic and has structural features indicative of a secreted protein. Example from human (precursor): database code OB_HUMAN, 167 amino acids (18.64 kDa). See also leptin receptor.

leptin receptor a receptor family that binds leptin and is presumed to mediate its intracellular effect. It is probably encoded by the gene db (for diabetes), and has at least six alternatively spliced forms. It is expressed at high levels in the hypothalamus relative to other tissues. A mutant form of the receptor which lacks the cytoplasmic region is likely to be defective in signal transduction and may be responsible for obesity in db mice. Example from human (precursor): database code OBR_HUMAN, 1165 amino acids (132.45 kDa). See also diabetes mutation, ob/ob.

leptocene the first phase of prophase I in meiosis.

leptotene see meiosis.

Lesch-Nyhan syndrome an X-chromosome-linked, inherited disorder of male humans in which there is an almost complete deficiency of hypoxanthine phosphoribosyltransferase (EC 2.4.2.8), one of the two key enzymes of the salvage pathway of purine metabolism. Clinically the condition is characterized leucine and valine biosynthesis the biosynthesis of leucine Ban dang doc môt quyển sách dược tăng bởi HUY NGUYEN. Nếu ban có như câu về sách sinh nọc, xin liên hệ:

by hyperuricemia, excessive uric-acid biosynthesis, and certain neurological features including self-mutilation, spasticity, and mental retardation. Death usually occurs in the second or third decade of life. [After M. Lesch (1939-) and William Leo Nyhan (1926-), US physician and biochemist.]

lesion 1 (in pathology) a zone of tissue with impaired function resulting from damage by disease or wounding. 2 (in biochemistry) any deleterious disturbance of a metabolic pathway resulting from chemical interference or genetic abnormality.

+less suffix forming adjectives and adverbs without, lacking; unable to do or to be done. In biochemistry it is used especially of auxotrophic mutants to indicate the substance they cannot synthesize, e.g. thymineless mutant.

let23 a gene in Caenorhabditis elegans for a receptor tyrosine kinase of the epidermal growth factor family. It is probably activated by the lin3 product. The product of let23 is a type I membrane glycoprotein. Precursor: database code LT23_ CAEEL, 1323 amino acids (150.34 kDa).

lethal dose abbr.: LD; the amount of a drug or other agent that when administered to an organism causes the organism's death. See also median lethal dose.

lethal factor any lethal mutation.

lethal gene any gene carrying a lethal mutation. Such mutations may only be fatal in the homozygous state.

lethal mutant any organism carying a lethal mutation.

lethal mutation any mutation that may bring about the death of the organism before its maturity. The consequences of such a mutation may depend on whether the organism is homozygous or heterozygous for the gene in question, and possibly also on the conditions (see conditional lethal mutation).

lethal synthesis any process by which a highly toxic compound is synthesized in an organism from a nontoxic precursor. The classic example is the formation of **fluorocitrate** when e.g. kidney homogenates are incubated with fluoroacetate. The fluorocitrate thus formed inhibits aconitase.

LETS protein abbr. for large external transformation sensitive (glyco)protein (i.e. cellular fibronectin).

Leu symbol for a residue of the α -amino acid L-leucine (alternative to L).

leuc+ a variant spelling of leuk+. See leuko+.

leucinate 1 leucine anion; the anion, (CH₃)₂CH-CH₂-CH(NH₂)-COO-, derived from leucine. 2 any salt containing leucine anion. 3 any ester of leucine.

leucine the trivial name for α -aminoisocaproic acid; α -aminoy-methylvaleric acid; 2-amino-4-methylpentanoic acid; (CH₃)₂CH-CH₂-CH(NH₂)-COOH; a chiral α-amino acid. Lleucine (symbol: L or Leu), (S)-2-amino-4-methylpentanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: CUA, CUC, CUG, or CUU; UUA or UUG. In mammals it is an essential amino acid and is ketogenic. Residues of D-leucine (symbol: D-Leu or DLeu), (R)-2-amino-4-methylpentanoic acid, occur in a number of peptide antibiotics, e.g. gramicidins A, B, C, and D and polymixins D_1 , D_2 , E₁, and E₂.

leucine aminopeptidase abbr. (in clinical chemistry): LAP (preferred) or LAS; the common name for aminopeptidase (cytosol) (EC 3.4.11.1), an enzyme that, despite its name, in fact acts on most amino-acid residues. It is widely distributed in animal tissues, its level in the serum being useful clinically in monitoring hepatobiliary disease processes and placental wellbeing. The recommended name is leucyl aminopeptidase.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

and valine initially follows a common pathway that commences with the formation of acetolactate from two molecules of pyruvate, a reaction catalysed by acetolactate synthase. Acetolactate is converted via α,β -dihydroxyisovalerate (2,3dihydroxy-3-methylbutanoate) to α -ketoisovalerate (2-oxo-3methylbutanoate). At this point the pathway branches. α-Ketoisovalerate can be converted by transamination with glutamate to valine. Alternatively, it can be converted successively to α -isopropylmalate (2-isopropylmalate), β -isopropylmalate (3-isopropylmalate), and α -ketoisocaproate (4-methyl-2-oxopentanoate), and thence by transamination with glutamate to leucine. See also 3-isopropylmalate dehydratase, 3-isopropylmalate dehydrogenase.

[5-leucine]enkephalin abbr.: [Leu5]enkephalin or [Leu]enkephalin; the recommended trivial name for the pentapeptide Tyr-Gly-Gly-Phe-Leu. See enkephalin.

leucine-rich repeat abbr.: LRR; short sequence motifs in proteins, of average length 24 residues, containing a high proportion of leucines, typically five to seven at positions 2, 5, 7, 12, 16, 21, and 24 within the repeat. Such arrays form an amphipathic sequence, with leucine as the predominant hydrophobic residue. It is thought they participate in protein-protein or protein-lipid interaction. The first was discovered in α₂-glycoprotein, but they have since been found in other proteins. The number of such repeats can vary from one, in platelet glycoprotein Ib\beta to 30, in e.g. chaoptin. Structure analysis has shown that in ribonuclease inhibitor protein these repeats comprise 90% of the protein, and that they correspond to β - α structural units, arranged to form a parallel \beta sheet with a parallel α helix, such that the β sheet has one surface exposed to solvent so that the protein acquires a non-globular shape.

leucine zipper a set of leucines (normally four or five) repeating every seventh amino-acid residue in a protein structure. Such an arrangement was originally found in DNA-binding proteins, but it is now known to occur also in other proteins, especially adjacent to proposed transmembrane regions, mediating dimerization. The abbreviation ZIP is used e.g. in designating the bZIP family of proteins. See also potassium channels.

leucinium leucine cation; the cation, (CH₃)₂CH-CH₂-CH(NH₃⁺)-COOH, derived from leucine.

alkylamino (CH₃)₂CH-CH₂leucino the group. CH(COOH)-NH-, derived from leucine.

leuco+ a variant spelling of leuko+.

leucocyte a variant spelling of leukocyte.

leucyl the acyl group, (CH₃)₂CH-CH₂-CH(NH₂)-CO-, derived from leucine.

leucyl aminopeptidase EC 3.4.11.1; other names: leucine aminopeptidase; peptidase S; cytosol aminopeptidase; an enzyme that catalyses the hydrolysis of an aminoacyl-peptide to an amino acid and the residual peptide. It thus releases the Nterminal amino acid of a protein, provided the amino group is free; it has been so used in protein sequence determination. Its action is most rapid when the N-terminal amino acid is leucine; it liberates other residues at varying rates, and acts poorly at an Xaa-Pro bond. It requires zinc. Example from Rickettsia prowazekii: AMPL_RICPR, 500 amino acids (53.94 kDa).

[Leu⁵]enkephalin or [Leu]enkephalin abbr. for [5-leucine]enkephalin.

leuk+ a variant form of leuko+ (before a vowel).

leukemia or (esp. Brit.) leukaemia or (sometimes) leukosis any of a group of neoplastic diseases of the leukocytes, usually involving increase in the number of leukocytes in the blood. Leukemias are classified according to the type of leukocyte affected and whether the disease is acute or chronic.

leukemia inhibitory factor abbr.: LIF; also called differentiating-stimulating factor or differentiation-inducing factor; a cytokine produced by fibroblasts, T cells, and macrophages. It is a monomer of 179 amino acids that maintains the pluripotent phenotype of embryonic stem cells, and potentiates interleukin-3-dependent proliferation of hemopoietic progenitors.

versibly from a coloured substance, often by reduction; e.g. leuko compound, leuko dye.

leuko+ or leuco+ or (before a vowel) leuk+ or leuc+ 1 white or colourless. 2 denoting of, pertaining to, or acting upon a leukocyte or leukocytes.

leukocidal or leucocidal describing an agent that kills leukocytes.

leukocidin or leucocidin any extracellular bacterial product that can kill leukocytes of certain animal species and that may also be toxic or lytic towards other cell types. Leukocidins are produced by pathogenic strains of Staphylococcus and Strepto-

leukocyte any white blood cell, i.e. one not containing an oxygen-transporting pigment such as hemoglobin. Vertebrate leukocytes include the polymorphonuclear leukocytes, lymphocytes, and monocytes; they are distinguished by size, shape, and staining characteristics. —leukocytic or leucocytic adj.

leukocytosis or leucocytosis a gross increase in the number of leukocytes in the blood. It often occurs as a response to an infection. See also leukemia.

leukokinin or leucokinin a specific cytophilic immunoglobulin G (IgG) obtained by fractionating human plasma IgG and constituting about 2% of the total IgG. It binds specifically and reversibly to autologous polymorphonuclear leukocytes, causing 2- to 2.5-fold stimulation of their phagocytic activity. A proteinase, leukokininase, cleaves from leukokinin a tetrapeptide, tuftsin, which is thought to bear all the activity.

leukopenia or leucopenia an abnormal decrease or deficiency of leukocytes circulating in the blood. Also (esp. Brit.) leukopaenia or leucopaenia.

leukoplast or leucoplast or leukoplastid or leucoplastid any of the colourless plastids found in plant cells. They include aleuroplasts, amyloplasts, and elaioplasts. Leukoplasts may develop into chloroplasts.

leukopoiesis or leucopoiesis the processes by which leukocytes are formed in the body. —leukopoietic or leucopoietic adj.

leukopterin or **leucopterin** 2-amino-4,6,7-trihydroxypteridine; a white pigment found in the wings of butterflies, especially white-winged butterflies.

leukosis or leucosis 1 a condition in which there is an abnormal proliferation of one or other of the leukocyte-forming tissues. 2 an alternative name for leukemia.

leukosulfakinin a sulfated myotropic 11-residue peptide isolated from head extracts of the cockroach. It exhibits sequence homology with human gastrin II and cholecystokinin.

leukotaxin or leucotaxin a nitrogen-containing material, found in injured tissue, that when injected into an animal causes increased capillary permeability and migration of leukocytes to the site of injection.

leukotoxin or **leucotoxin** 1 any compound toxic to leukocytes. 2 cytochrome P450-derived linoleic acid peroxide; any of a group of substances observed in high concentrations in burned skin samples that may have a bacteriocidal function. Leukotoxin A is (12Z)-9,10-epoxyoctadec-12-enoic acid, and leukotoxin B is (9Z)-12,13-epoxyoctadec-9-enoic acid (abbr.: EpODE) or, its methyl ester (abbr.: EpOME).

leukotriene abbr.: LT; any member of a family of pharmacologically active substances derived from polyunsaturated fatty acids, notably arachidonic acid, some of which contain a peptide moiety based on cysteine. They may be regarded as local hormones that are not stored, but synthesized in response to specific stimuli. They are formally derived from eicosanoic acid and contain a set of three conjugated double bonds (hence 'triene'); one or two additional double bonds, not conjugated to the others, may also be present - a subscript numeral after the abbreviation indicates the total number of double bonds, depending on the polyunsaturated fatty acid from which each is derived, e.g. LTA4 from arachidonic acid, LTB₅ from eicosapentaenoic acid. They are products of the 5leuko or leuco describing the colourless derivative formed re-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

leukotriene A

an eicosanoid; loss of glutamic acid from this leads to LTD₄, and loss of glycine then leads to LTE₄. These three, sometimes collectively known as peptidoleukotrienes, are potent spasmogenic agents that make up the active components of slow-reacting substance of anaphylaxis (SRS-A). See also individual entries

leukotriene A abbr.: LTA; any of a group of leukotrienes characterized as unstable 5,6-epoxides. Leukotriene A4 (abbr.: LTA₄) is (7E,9E,11Z,14Z)-(5S,6S)-5,6-epoxyeicosa-7,9,11,14tetraen-1-oate. Leukotriene A₃ (abbr.: LTA₃) is similar, but lacks the double bond at the C-14, while leukotriene A₅ (abbr.: LTA₅) has an additional, 17Z, double bond. LTA₄ is derived biosynthetically from arachidonate via 5-hydroperoxyeicosatetraenoate, and is the precursor either of leukotriene B4 (see loukotriene B) by the action of highly specific loukotriene-A4 hydrolase (EC 3.3.2.6), or of leukotriene C₄ by the action of leukotriene-C₄ synthase (EC 2.5.1.37).

leukotriene A4

leukotriene-A₄ hydrolase abbr.: LTA₄ hydrolase; EC 3.3.2.6; an enzyme that converts (7E,9E,11Z,14Z)-(5S,6S)-5,6-epoxyeicosa-7,9,11,14-tetraenoate (LTA₄) to (6Z,8E,10E,14Z)-(5S,12R)-5,12-dihydroxyeicosa-6,8,10,14-tetraenoate (LTB_d). Example from human: database code LKHA_HUMAN, 610 amino acids (69.07 kDa).

leukotriene B abbr.: LTB; any of a group of leukotrienes characterized as (5S,12R)-5,12dihydroxy polyunsaturated acids. Leukotriene B_4 (LTB₄) is (6Z, 8E, 10E, 14Z)-(5S, 12R)-5, 12-di-Leukotriene hydroxyeicosa-6,8,10,14-tetraen-1-oate. (LTB₅) has an additional, 17Z, double bond. LTB₄ is a product of leukotriene-A₄ hydrolase (see leukotriene A); it is a major product of the 5-lipoxygenase pathway, and is a potent aggregatory, chemokinetic, and chemotactic agent for polymorphonuclear leukocytes (PMNLs) in vitro and induces increased vascular permeability and PMNL infiltration in vivo.

leukotriene B₄

leukotriene C₄ abbr.: LTC₄; a leukotriene comprising a glutathione moiety linked through its thio group to C-6 of an eicosanoid. LTC4 is formed from LTA4 and glutathione by leukotriene-C₄ synthase (EC 2.5.1.37). Among other actions, it is a potent mediator of smooth muscle contractility, and of vascular tone and permeability, being a potent vasoconstrictor

in a variety of vascular beds including the coronary and cerebral circulations. It is the predominant leukotriene in the central nervous system.

levorp

leukotriene D₄ abbr.: LTD₄; a leukotriene comprising a cysteinylglycine moiety linked through its thio group to an eicosanoid moiety. It is a rapidly formed metabolite of leukotriene C4 (LTC4), resulting from the action of membranebound y-glutamyl transferase, which removes glutamic acid. Its actions are similar to those of LTC₄.

leukotriene E₄ abbr.: LTE₄; a leukotriene comprising a cysteine moiety linked to an eicosanoid moiety. It is derived metabolically from leukotriene D4 (LTD4) by the action of specific membrane-bound dipeptidases, which remove glycine. It has a somewhat longer metabolic half-life than LD4, but is further metabolized to a number of more polar products, notably those in which the terminal methyl group of the eicosanoid moiety is oxidized to a carboxyl group. It activates receptors in human airways and has been implicated in airway hyper-responsiveness in humans.

leukovirus or leucovirus any tumorigenic retrovirus.

leukovorin or leucovorin see folinic acid.

leumorphin an endogenous 29-amino-acid opioid peptide that corresponds to residues 228-256 of preproenkephalin B; the N-terminal 13 residues correspond to rimorphin (dynorphin B) and the N-terminal five to Leu-enkephalin (see enkephalin).

leupeptin any of several modified tripeptide protease inhibitors produced by various actinomycetes. Commonly Nacetyl-Leu-Leu-argininal is supplied for use in the laboratory; other variants have propionyl in place of acetyl, and valine or isoleucine in place of one or both leucines.

Leu-prolide an analogue of gonadotropin-releasing hormone in which residues 5 and 10 (glycine and glycinamide) are replaced by D-Leu and ethylamine respectively.

levan a common name for any $(2\rightarrow 6)$ - β -D-fructofuranan; such compounds are produced mostly by bacteria. As in inulin each chain terminates in a $(1\rightarrow 2)-\alpha$ -D-glucopyranosyl residue, but it may also contain $(2\rightarrow 1)-\beta$ branch points.

levansucrase the recommended name for sucrose 1-fructosyl transferase, EC 2.4.1.10; an enzyme that catalyses the reaction:

sucrose +
$$(2,6-\beta-D-\text{fructosyl})_n = \text{glucose} + (2,6-\beta-D-\text{fructosyl})_{n+1}$$
.

See also sucrase (def. 3).

levarterenol see norepinephrine.

levigate (in chemistry) 1 to grind (something) into a smooth powder or paste. 2 to separate fine from coarse particles by grinding and suspending them in a fluid. —levigation n.

Levi-Montalcini, Rita (1909-), Italian cell biologist; Nobel Laureate in Physiology or Medicine (1986) jointly with S. Cohen 'for their discoveries of growth factors'.

levo- or (esp. Brit.) laevo- symbol: l-; a prefix, no longer used, to denote a compound that is levorotatory; the levorotatory enantiomer of compound A is now designated as (-)-A.

levo+ or (before a vowel) lev+ comb. form denoting on or towards the left. Also (esp. Brit.) laevo+, laev+. Compare dextro+.

levodopa or (Brit.) laevodopa (-)-3-hydroxy-L-tyrosine; a naturally occurring amino acid that has been used in the treatment of Parkinson's disease easing symptoms such as rigidity, postural problems, and slowness of movement. See 3,4-dihydroxyphenylalanine.

levorotatory or (esp. Brit.) laevorotatory 1 symbol: (-)- or (formerly) 1-; describing a chemical compound that rotates the plane of polarization of a transmitted beam of plane-polarized light or other electromagnetic radiation to the left, i.e. in an anticlockwise direction as viewed by the observer looking towards the light source. 2 describing any leftwards or anticlockwise rotation. Compare dextrorotatory. —levorotation or laevorotation n.

levorphanol 17-methylmorphinan-3-ol; a synthetic analogue Ban đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu ban có nhu cấu về sách sinh học, xin liên hế:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

374 levulose

specifically with high affinity to opioid receptors $(K_d 10^{-9} \text{ M})$. Five to six times more active than morphine, it is a controlled substance under the US Code of Federal Regulations. Dextrorphan, the dextrorotatory form, does not bind to opioid receptors, is not analgesic, but is a very effective antitussive.

levulose or (esp. Brit.) laevulose an old name, still sometimes used in pharmacy, for D-(-)-fructose, the levorotatory component of invert sugar. Compare dextrose.

Lewis acid any chemical species that is able to accept an electron pair and is thus able to react with a Lewis base to form an adduct (i.e. Lewis adduct). For example:

$$(CH_3)_3B + :NH_3 \rightarrow (CH_3)_3B^-N^+H_3$$

or

$$(CH_3)_3C^+ + Cl^- \rightarrow (CH_3)_3C-Cl;$$

i.e.

Lewis acid + Lewis base → Lewis adduct.

[After Gilbert Newton Lewis (1875–1946), US chemist.] Lewis adduct the adduct formed between a Lewis acid and a Lewis base

Lewis antigen abbr.: Le antigen; symbol: Le; one of the serologically distinguishable human blood-group substances. Lewis specificities are carried on glycosphingolipids and glycoproteins. Primarily a system of soluble antigens in secretions (e.g. saliva) and plasma, the Lewis antigens on red cells are adsorbed passively from plasma, which must be constantly present for them to be maintained. Three Lewis phenotypes are common amongst Caucasians, namely Le(a+b-), Le(a-b+), and Le(a-b-); the very rare Le(a+b+) is detected in Polynesians and Orientals. The carbohydrate structures providing Le^a and Le^b specificity are shown below; these partial structures are linked through other carbohydrate moieties to a ceramide, thus forming a glycosphingolipid, or to a protein, thus forming a glycoprotein.

Le^a
$$Gal(\beta 1-3)[Fuc(\alpha 1-4)]GlcNAc(\beta 1-3)Gal...$$

 $Fuc(\alpha 1-2)Gal(\beta 1-3)[Fuc(\alpha 1-4)]GlcNAc(\beta 1-3)Gal...$

The structures of the Lec, Led, Lex, and Ley determinants are also known. The Lewis antigens are named after a Mrs H. D. G. Lewis, in whom they were first identified. See also galactoside 3(4)-L-fucosyltransferase.

Lewis base any chemical species that is able to supply an electron pair and is thus able to react with a Lewis acid to form an adduct (i.e. Lewis adduct).

Lewis formula or Lewis structure a depiction of molecular structure in which the valency electrons are shown as dots so placed that each pair of dots represents two electrons. When placed between two atoms each pair of dots also represents a single covalent bond, whereas dots placed adjacent to only one atom represent the non-bonded outer-shell electrons considered to be associated with that atom alone. (e.g. H: Cl:). A double bond is represented by two pairs of dots (e.g. Ö:: Ö), and so on. Formal charges are attached to atoms as appropriate.

Lewis transferase see galactoside 3(4)-L-fucosyltransferase.

lexA a gene in Escherichia coli encoding a repressor that regulates the genes induced by SOS repair. In the latter, following DNA damage, the *lexA* product, LexA, is hydrolysed by RecA

vated. lexA is itself regulated autogenously. LexA binds to operators as a dimer. Database code LEXA_ECOLI, 202 amino acids (22.33 kDa).

lexicographer one who compiles a dictionary, defined by Samuel Johnson (the first English lexicographer) as 'a harmless drudge'. An alternative definition is from The Enlarged Devil's Dictionary by Ambrose Bierce, compiled and edited by Ernest J. Hopkins: 'A pestilent fellow who, under the pretense of recording some particular stage in the development of a language, does what he can to arrest its growth, stiffen its flexibility and mechanize its methods.' See also the Preface to this present work.

Leydig cell a type of steroid-secreting, interstitial cell that occurs in large numbers between the seminiferous tubules of the testis. The cells secrete androgens, especially testosterone, and this activity is stimulated by luteinizing hormone, for which the cells have specific receptors. [After Franz von Leydig (1821–1908), German anatomist and zoologist.]

LFA 1 a leukocyte cell-surface glycoprotein involved in the adhesion of leukocytes to target cells and thus in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic T-cell-mediated killing, and antibodydependent killing by granulocytes and monocytes. It binds to ICAM. LFA 1 is a type I membrane glycoprotein belonging to the LEUCAM family of integrins; it is a dimer of the α_L and β_2 subunits. Example from human (alpha precursor): database code ITAL_HUMAN, 1170 amino acids (128.70 kDa).

L form (of a bacterium) a defective bacterial cell, of indefinite or spherical shape, in which the cell wall is defective or absent. L forms may develop spontaneously or in response to a variety of stimuli, e.g. thermal or osmotic shock, or the presence of antibiotics that inhibit cell-wall synthesis. They may revert to their original condition on removal of the stimulus or they may reproduce as L forms. On solid media, L forms have a characteristic colonial appearance resembling that of mycoplasmas (with which they were originally confused).

Ig symbol for decadic, or common or Briggsian, **logarithms** (alternative to log₁₀).

LH abbr. for luteinizing hormone.

LHC abbr. for light-harvesting complex.

LHCP abbr. for light-harvesting chlorophyll protein.

LH/FSH-RF abbr. for luteinizing hormone/follicle-stimulating hormone releasing factor (i.e. gonadotropin releasing hormone).

LHRF or LH-RF abbr. for luteinizing hormone releasing factor (see gonadotropin-releasing hormone).

LHRH or LH-RH abbr. for luteinizing hormone releasing hormone (see gonadotropin releasing hormone).

Li symbol for lithium.

Libby, Willard Frank (1908-80), US chemist; Nobel Laureate in Chemistry (1960) for 'his method to use carbon 14 for age determination in archaeology, geology, geophysics, and other branches of science'.

+liberin word ending denoting a hypothalamic factor (or hormone) that promotes the release (and perhaps also the biosynthesis) of the particular pituitary hormone indicated; e.g. luliberin, thyroliberin. Compare +statin.

library of genes see gene library.

librate to oscillate about an equilibrium position. —**libration** n. Librium see chlordiazepoxide.

licorice see glycyrrhiza.

Liebermann-Burchard reaction the reaction of acetic anhydride in chloroform with unsaturated steroids (e.g. cholesterol) or triterpenes in the presence of concentrated sulfuric acid to produce a blue-green colour. It is used especially in the estimation of cholesterol.

LIF abbr. for leukemia inhibitory factor.

life cycle the totality of functional and morphological stages through which any organism passes between any one developmental stage and the identical stage in the next generation. Less commonly it refers to the totality of the various stages through protein (see recA), thereby allowing the SOS genes to be acti- which an individual organism passes between birth and death. Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Lig 1375

Lig symbol for the lignoceroyl group, CH₃-[CH₂]₂₂-CO-.

ligancy a less common alternative name for coordination number. ligand 1 (in a simple inorganic compound) any individual atom, group, or molecule that is attached covalently to the characteristic or central atom or moiety. 2 (in an organic compound) any individual atom or chemical group that is attached covalently to a specified carbon atom; see also point ligand. 3 (in a coordination entity) a any individual atom, ion, or molecule that is attached coordinately to one central metal atom (unidentate ligand). b an ion, molecule, or molecular grouping that has more than one coordinating group (bi-, tri-, or multidentate ligand). In both cases the ligand is an electron donor in the formation of one or more coordinate bonds. 4 an ion of either sign that can associate reversibly with one or more (charged or uncharged) atoms or characteristic molecular groupings in another (usually larger) molecule (as in the hydronation of a conjugate base, the coordination of a metal cation by a protein, etc.). 5 a molecule (or a class of molecules) that has become linked covalently to another molecule to form a conjugate, whether in a single-step reaction or by stepwise addition of its components (e.g. an oligosaccharide moiety in a glycoprotein). 6 a molecule (or part of one) that is bound or is able to bind selectively and stoichiometrically, whether covalently or not, to one or more specific sites on another molecule (as in the combination of antigen with antibody, of hormone with receptor, of substrate with enzyme, etc.). [German: bound element or group, from Latin ligandus, gerundive

liganded bound by or as a ligand or ligands; ligated; see ligate (def. 2).

of *ligare* to bind.1

ligand exchange (chromatography) a column-chromatographic technique in which a cation-exchange resin is loaded with a complexable metal ion and the resulting loaded resin, which retains the capability of the metal ion to coordinate to an appropriate complexing agent or ligand, is used for the sorption of that ligand from a solution or a gas phase. Elution is then effected by displacement with, i.e. exchange for, another ligand. The resin is commonly a chelating resin (e.g. asyrene—divinylbenzene copolymer to which iminodiacetate groups are attached) and the ion is usually of a transition metal (e.g. copper or nickel), such ions tending to be bound strongly to these resins. Separation of components of mixtures occurs by virtue of the differences in the stabilities of the various metal—ligand complexes formed.

ligand-field theory (in inorganic chemistry) a theory, closely related to the valence-bond theory, that deals with the effects of ligands on the energy levels of the central atom or ion in complexes and crystals. It is especially useful in interpretation of the spectra of inorganic complexes.

ligand-gated describing an ion channel in a cell membrane that is caused to open by the action of an agonist binding to the receptor that governs the channel. Channel opening can be direct, when the receptor acts as an ionophore, or indirect, involving a second messenger regulated by a G-protein.

ligandin a name formerly given to a basic dimeric protein of ≈25 kDa per dimeric subunit (see gluthathione transferase). It is abundant in rat and human liver, kidney, and small intestine. It binds with high affinity to heme, bilirubin, and other organic anions, polycyclic aromatic carcinogens, and various metabolites. In addition it catalyses the conjugation of glutathione with a variety of electrophilic substrates, shows selenium-independent glutathione-peroxidase activity and steroid isomerase activity, and covalently binds activated metabolites of several carcinogens. Ligandin corresponds to the α class of glutathione transferase. Ligandin is present in the pars recta of the proximal renal tubules but does not normally pass into the urine: its presence in the urine, ligandinuria, has been used to follow the evolution of various forms of kidney injury, while its presence in serum provides a sensitive indicator in liver injury. Also variously called Y protein, organic anion

metabolite binding protein (binder protein I), glutathione-transferase B.

liganding binding by or as a ligand or ligands; ligating; see **ligate** (def. 2).

ligandinuria see ligandin.

ligand-mediated chromatography a variant of affinity chromatography that employs an additional component, the affinity ligand, which is a ligand both for the reactive component attached to the insoluble matrix and for the substance to be purified. Because the ligand may readily be renewed after completion of each separation, the method is particularly useful when the substance used as the ligand easily becomes degraded or inactivated during the course of a purification.

ligand-receptor assay a form of saturation analysis for a hormone or other agonist wherein the specific binding agent used is an isolated preparation of the naturally occurring cellular receptor substance for the agonist. An advantage of the assay is that the values obtained are considered to be a direct reflection of the biological properties of the substance assayed.

ligase 1 or (formerly) synthetase the systematic class name for enzymes of class EC 6, all of which catalyse the ligation of molecules of two substances with concomitant breaking of a diphosphate linkage in a nucleoside triphosphate. The recommended names of particular ligases are formed in some instances, especially those of enzymes of subclass EC 6.4, by using the generic name carboxylase, e.g. pyruvate carboxylase, EC 6.4.1.1. In the remaining instances the generic names ligase (def. 2) or synthase are used, according to whether the name of an individual enzyme is to be based on the names of the reactants or on the name of the product, respectively. 2 a generic name for many enzymes of class EC 6 (see ligase (def. 1)); when added to the names of the two reactants whose ligation is catalysed by a particular enzyme it forms the recommended name of that enzyme; e.g. tyrosine-tRNA ligase (EC 6.1.1.1), acetate-CoA ligase (EC 6.2.1.1). See also synthetase (def. 2). 3 see DNA ligase.

ligate 1 to join together, especially with a ligature. 2 (in chemistry) to join (molecules or molecular fragments) together with a bond; to coordinate. 3 to bind as or to a **ligand** or ligands. 4 (in surgery) to tie off (a blood vessel or duct) with a ligature so as to occlude. —**ligation** n.; **ligatable** adj.; **ligative** adj.

ligatin a filamentous plasma membrane protein for the attachment of peripheral glycoproteins to the external cell surface. It acts as a trafficking receptor for phosphoglycoproteins, localizing them, after internalization, within endosomes. Example (fragment) from human: database code LIGA_HUMAN, 75 amino acids (8.47 kDa).

light 1 electromagnetic radiation capable of producing a visual sensation in the eye. It comprises wavelengths in the range 380-780 nm (frequencies 385-789 THz), although the term is sometimes loosely extended to include some ultraviolet and infrared radiation in adjacent parts of the spectrum. 2 (in chemistry) describing any (especially metallic) element whose density is relatively small (usually <5000 kg m⁻³). 3 (in physics) of less than the usual mass. Compare heavy.

light band a region of a muscle sarcomere that stains less densely in light microscopy and low-magnification electron microscopy relative to the dark bands; together, these differentially staining bands give the striated appearance of skeletal muscle. The light bands are relatively isotropic in polarized light; they represent the regions occupied by thin filaments. See also thick filament, 2 line.

of several carcinogens. Ligandin corresponds to the α class of glutathione transferase. Ligandin is present in the pars recta of the proximal renal tubules but does not normally pass into the urine: its presence in the urine, **ligandinuria**, has been used to follow the evolution of various forms of kidney injury, while its presence in serum provides a sensitive indicator in liver injury. Also variously called Y protein, organic anion binding protein, basic azo-dve, binding protein, cortisol Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có như câu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

species (about 65% κ in the human), and which have different but homologous sequences. The C-terminal half of each type of light chain consists of a constant region and the N-terminal half is a variable region possibly related to the antibody-combining site. See also Bence-Jones protein. 2 any of the four 15-27 kDa polypeptide chains that, with two heavy chains of ~200 kDa, constitute a molecule of myosin.

light-effect mediator abbr.: LEM; any of a number of substances that, following their light-induced reduction, activate some of the enzymes of the Calvin cycle (see reductive pentose phosphate cycle) in photosynthesis. Not all of these mediators have been identified, but it is thought that they are cyst(e)ine-containing proteins that become oxidized in the dark and reduced again in the light. An important member of the group is thioredoxin.

light-emitting diode abbr.: LED; a device consisting of a semiconductor diode (made, e.g., of gallium arsenide) in which light is emitted at a p-n junction when electrons and holes recombine in a manner proportional to the bias current. It is used to give a visual display of numbers, etc. in calculators, counters, and other pieces of apparatus.

light guide a device consisting of one or more cylinders or strips of transparent material along which light can be made to travel, by means of total internal reflection, in a desired direction and with little loss.

light-harvesting chlorophyll protein or **light-harvesting chlorophyll-binding protein** abbr.: LHCP; a chlorophyll-binding protein that is abundant in green plants, particularly in those grown at low light intensities. It consists of a 25 kDa polypeptide, encoded by a nuclear gene and synthesized in the cytoplasm, to which is bound most of the chlorophyll b and xanthophylls together with some of the chlorophyll a. It appears to be capable of transferring the energy of absorbed light photons to both photosystem I and photosystem II. Example, Lycopersicon esculentum (tomato) chlorophyll a-b binding protein of light-harvesting complex I (type I precursor): database code CB11_LYCES, 246 amino acids (26.57 kDa); residues 1-44 are a transit peptide, 45-246 LHCP. See also **light-harvesting complex**.

light-harvesting complex abbr.: LHC; a **thylakoid** membrane complex of chorophylls a and b together with chlorophyll a-b binding proteins. In addition, LHCs contain a number of other proteins, the function of which is speculative, together with accessory pigments. The LHCs capture and transfer energy to photosystems I and II. Example, chlorophyll a-b binding protein of pea: database code CB21_PEA, 228 amino acids (24.30 kDa). It is regulated by phosphorylation on threonine residues. See also light-harvesting chlorophyll protein.

light meromyosin abbr.: L meromyosin or LMM; the smaller, 120 kDa, fragment, also called F3 fragment, produced when **myosin** is subjected to a brief treatment with trypsin or certain other peptidases. It contains much of the helical, rod-shaped tail (>90% α helical) and forms large ordered aggregates at low ionic strength. Light meromyosin has no ATPase activity and cannot bind actin.

light path 1 the path followed by a beam of light when passing through an optical device or a particular part of one. 2 or path length the length of such a path.

light pen an input/output device for use with a computer that, when pointed at a spot on a visual display unit, can sense whether or not the spot is illuminated; the output current from the light pen can then be used to control the operations of the computer.

light reactions of photosynthesis or light phase of photosynthesis those reactions of photosynthesis in higher plants and algae in which light energy is used to generate NADPH and ATP.

light repair an alternative name for photoreactivation.

light-scattering a technique used for the determination of the relative molecular mass, $M_{\rm r}$, in solution of a macromolecule whose size is large relative to the wavelength of the light used.

The value of $M_{\rm r}$ of the macromolecule can be calculated from the wavelength of the incident light, the angle and intensity of the scattered light, the refractive indices of the solvent and solute, and the concentration of the solute. See also Rayleigh scattering.

light strand or L strand 1 a polynucleotide strand not labelled with heavy isotope. 2 the strand in a naturally occurring polynucleotide duplex that is of a lower density than its complementary strand. Compare heavy strand.

light trapping 1 the process of capturing the energy of incident light in a photosynthetic pigment system. 2 the act or process of using focused light in a liquid medium so arranged as to trap phototactic organisms in a restricted part of that medium.

lignan any member of a class of phenylpropanoid dimers in which the phenylpropane units are linked tail-to-tail and thus having a 2,3-dibenzylbutane skeleton (compare neolignan). Until recently such compounds had been found only in higher plants, but certain types have now been identified in humans and other mammals as products of the action of gut flora on dietary lignans of plant origin. Guaiaretic acid is structurally one of the simplest; podophyllotoxin and more particularly its semisynthetic derivatives Etoposide and Teniposide have defined actions in clinical medicine, with antitumour and possibly antiviral actions. See also lignin.

lignify to make or become woody; to accumulate or deposit lignin in the cell walls (of plant tissues). —**lignification** n.

lignin any random phenylpropanoid polymer formed in higher plants by the dehydrogenative radical polymerization of various 4-hydroxycinnamyl alcohols, in which the residues are joined in differing proportions and by several different linkages, some of which are nonhydrolysable. Lignin is of high molecular mass, is insoluble in water, and is found in the cell walls of vascular plants (especially of the supporting and conducting tissues), on which it confers strength, rigidity, and resistance to degradation. It is one of the most abundant biopolymers. See also lignan.

ligninase an enzyme that catalyses breakdown of lignin; strictly most lignin-degrading systems rely on peroxide formed from **oxygenases** to cleave carbon-carbon bonds. An example is diarylpropane peroxidase, EC 1.11.1.14; systematic name: diarylpropane:oxygen,hydrogen peroxide oxidoreductase (C-Cbond-cleaving); other name: ligninase I. It is a hemoprotein enzyme that catalyses a reaction between 1,2-bis(3,4-dimethoxyphenyl)propane-1,3-diol and H₂O₂ to form 3,4-dimethoxybenzaldehyde, 1-(3,4-dimethylphenyl)ethane-1,2-diol, and 4H₂O. Example from Phanerochaete chrysosporium: database code LIG2_PHACH, 371 amino acids (39.33 kDa).

lignocellulose a covalent adduct of **lignin** and **cellulose**, found in the walls of xylem cells in woody tissues of plants. —**lignocellulosic** adj., n.

lignocerate 1 the trivial name for tetracosanoate, CH₃-[CH₂]₂₂-COO⁻, the anion derived from lignoceric acid (i.e. tetracosanoic acid), a saturated straight-chain higher fatty acid. 2 any mixture of lignoceric acid and its anion. 3 any salt or ester of lignoceric acid.

lignoceroyl symbol: Lig; the trivial name for tetracosanoyl, CH₃-[CH₂]₂₂-CO-, the acyl group derived from lignoceric acid (i.e. tetracosanoic acid). It occurs naturally as acylglycerols in peanut and rapeseed oils, and in certain sphingomyelins.

lignoceroyl-CoA synthase see long-chain-fatty-acid-CoA ligase. limit (in mathematics) a value to which a function or the sum of a series approaches as an independent variable approaches a specified value or infinity.

limit dextrin the highly branched core that remains after exhaustive treatment of amylopectin or glycogen with α - and/or β -amylases. It is formed because these enzymes cannot hydrolyse the $(1\rightarrow 6)$ glycosidic linkages present.

limit dextrinase see α -dextrin endo-1,6- α -glucosidase, oligo-1,6-glucosidase.

limit dextrinosis an alternative name for type III glycogen dis-

whose size is large relative to the wavelength of the light used.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Surrage !

limit digest a digest in which no further degradation can occur under the particular conditions adopted.

limiting current (in polarography) the maximal value of the current reached in circumstances when the steady-state current/potential characteristic has a positive slope.

limiting rate symbol: V; the recommended name for the extrapolated rate of an enzyme-catalysed reaction when the enzyme is saturated with substrate(s). It is equal to the product of the stoichiometric concentration of active centres, [E]₀, and the catalytic constant, k_0 . It can be determined by a number of methods, including graphical methods such as the **Lineweaver-Burk plot**. Other names: maximum rate; maximal rate; maximum velocity; maximal velocity.

limiting viscosity number the recommended name for intrinsic viscosity.

limonene p-mentha-1,8-diene; a compound that occurs in many essential oils (e.g. oils of lemon, orange, and dill); both enantiomers and the racemic mixture (i.e. dipentene) occur naturally.

(R)-(+) form

LIMS abbr. for laboratory information management systems; normally, systems involving automatic electronic data capture and computerized manipulation of data.

Lin symbol for the linoleoyl group, CH₃-[CH₂]₃-[CH₂CH=CH]₂-[CH₂]₇-CO- (all-Z isomer).

lin3 a gene in *Caenorhabditis elegans* that encodes an **epidermal** growth factor-like type I membrane protein. The protein has two versions (produced by alternative splicing), and is essential for vulval development. Database code LIN3_CAEEL, 438 amino acids (48.87 kDa). See also **let23**.

lin14 a gene involved in embryonic development in Caenorhabditis elegans that codes for a nuclear protein. Regulatory sequences in the 3' untranslated region generate a temporal switch during development. There are three forms of the product: A, database code B40581, 537 amino acids (59.09 kDa); B1, database code A40581, 539 amino acids (59.28 kDa); B2, database code C40581, 515 amino acids (56.65 kDa).

linalool 3,7-dimethyl-1,6-octadien-3-ol; a compound that occurs in linaloe oil and other essential oils; both enantiomers occur naturally. It is used in perfumery.

lincomycin an antibiotic produced by Streptomyces lincolnensis. It consists of an amide formed between a substituted pyrrolidine-2-carboxylic acid and methyl 1-thio-α-lincosamine. Lincomycin is active mainly against Gram-positive bacteria; it inhibits protein synthesis by interacting with the 50S ribosomal subunit, inhibiting the early steps of peptide bond formation prior to the formation of polysomes.

lincosamides generic name for a group of antibiotics structurally related to **lincomycin**.

lincosamine 6-amino-6,8-dideoxy-D-erythro-D-galacto-octose; the carbohydrate component of **lincomycin**.

line 1 (in spectroscopy) a very narrow band of frequencies of electromagnetic radiation that is noticeably more intense or less intense than adjacent parts of the spectrum; the image of such a line in a spectrogram. **2** (in biology) several generations of a family. See also **cell line**, **lineage**.—**lineal** or **linear** adj.

LINE abbr. for long interspersed nucleotide element (or sequence or repeat); part of the moderately repetitive DNA of mammalian genomes. Any highly repeated DNA sequence interspersed in a mammalian genome and characteristically several kilobases in length. LINEs are retroposons resulting from the action of RNA polymerase II (see RNA polymerase). Mammalian genomes may contain up to 50 000 copies of particular LINEs. They are regarded as processed pseudogenes. The function of LINEs is unknown. Compare SINE. See also Alu sequence.

lineage lineal descent, especially from a common ancestor.

linear accelerator a device for producing high-energy particles, in which charged particles are accelerated in a straight line along a long evacuated tube by potential differences applied to a series of circular electrodes along the tube.

linear chain a chain of atoms in a molecule, or a chain of residues in a macromolecule, that is neither branched nor covalently closed.

linear correlation any relationship between two variables such that a graphical plot of one variable against the other is a straight line.

linear density gradient a gradient of linearly and continuously increasing density.

linear dichroism the **dichroism** (def. 1) occurring when linearly polarized light is absorbed by a sample containing partially or completely oriented anisotropic molecules.

linear equation any equation containing any number of variables that is of the first degree, i.e. one in which the variables are all raised to the power of one.

linear growth the growth of a culture such that the number of cells (or the cell mass) increases in direct proportion to the duration of growth.

linearity the condition of being in a straight line.

linearize or linearise 1 to make linear, i.e. into a straight line.
2 to convert a branched or cyclic form of a (macro)molecule to a linear form, i.e. one with only two ends. —linearization or linearisation n.

linearly polarized or plane-polarized describing light (or other electromagnetic radiation) in which the electric vectors of the vibrations all lie in a given plane containing the light beam. See polarized light.

linear velocity the distance moved in a straight line in unit time.

line formula a two-dimensional representation of a molecular entity in which atomic symbols are joined by lines representing single bonds, without any indication or implication of stereochemistry.

OH line immunoelectrophoresis a one-dimensional single electrophoresis a one-dimensional single electrophoresis and the state of the qualitative and Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

line spectrum

quantitative comparison of the antibody spectra of different polyvalent antisera. Samples of antigens to be compared are moulded into adjoining rectangular sample gels along one edge of a gel containing a mixture of the corresponding antibodies, into which the antigens are forced at right angles by electrophoresis. Precipitation lines form parallel to the origin at a distance of antigen migration proportional to the antigen/antibody ratio. Precipitation lines from the samples against the same antibody are continuous and can be directly compared.

line spectrum any spectrum consisting of discrete spectral lines.

Lineweaver-Burk plot a method of plotting enzyme kinetic data. The Michaelis equation is rearranged to give:

$$1/v = K_{\rm m}/V[S] + 1/V,$$

where $K_{\rm m}$ is the Michaelis constant, [S] the concentration of the substrate S, v the (initial) rate of reaction at a given value of [S], and V the limiting rate of reaction at infinite [S]. If the Michaelis equation holds for the system, a plot of 1/v against 1/[S] gives a straight line of slope K_m/V , with intercepts on the $1/\nu$ axis at 1/V and on the 1/[S] axis at $-1/K_m$. See Michaelis kinetics. [After Hans Lineweaver and Dean Burk.]

linewidth the width of a spectral line, usually taken as the distance, in terms of wavelength, frequency, or magnetic flux difference, between the two points of half-peak intensity (half-maximum height).

link (in chemistry) an informal term for bond (def. 1). See also linkage (def. 2).

linkage 1 (in genetics) an association of two or more nonallelic genes so that they do not show independent assortment; i.e. they tend to be transmitted together usually due to physical association on the same chromosome. 2 (in chemistry) an informal term for bond (def. 1). See also link.

linkage disequilibrium the preferential association of linked genes/DNA markers in a population; i.e. the tendency for some alleles at a locus to be associated with certain alleles at another locus on the same chromosome with frequencies greater than would be expected by chance alone.

linkage group any group of genes whose members show a marked tendency to segregate as a unit. See also genophore.

linkage map a map of a chromosome showing in linear order the relative positions of the known genes on that chromosome. **linked genes** genes that exhibit linkage (def. 1).

linker 1 any small synthetic single-chain oligodeoxynucleotide that is six or more residues long and has a self-complementary base sequence. When self-annealed it forms a stable duplex with blunt ends and containing a restriction site. Such linkers are useful for gene splicing. 2 see cross-link.

linker DNA see chromatin, nucleosome

linking number symbol: L; a topological property of closed circular duplex DNA, defined as the number of turns one strand makes about the other. It must be an integer, and is positive if the turns are right-handed and negative if they are left-handed. It can change only when one or both strands are nicked. It comprises the sum of the writhing number (W) and the twist number (T), so that a change (ΔL) in the linking number (L) is equal to $\Delta W + \Delta T$.

linoleate 1 the trivial name for (all-Z)-octadeca-9,12-dienoate, $CH_3-[CH_2]_3-[CH_2-CH=CH]_2-[CH_2]_7-COO^-$, (all-Z isomer) the anion derived from linoleic acid, (all-Z)-octadeca-9,12dienoic acid, a diunsaturated straight-chain higher fatty acid essential in the diet of mammals. It occurs naturally as acylglycerols in many vegetable oils and in the lipids of many animal tissues. 2 any mixture of free linoleic acid and its anion. 3 any salt or ester of linoleic acid. See also linoleic family.

linoleate synthase see phosphatidylcholine desaturase.

linoleic family (of polyunsaturated fatty acids) a series of polyenoic acids occurring in mammals, in which the hydrocarbon chain terminates with the alkenyl grouping,

that are synthesized from linoleic acid by chain elongation and/or further desaturation (but which in mammals cannot be synthesized from the corresponding saturated acids or from (9,12,15)-linolenic, oleic, or palmitoleic acids – the latter represent three other series of polyenoic acids). The linoleic family is also known as the $\omega 6$, or n-6, family because of the position of the double bond nearest the terminal methyl group. The series includes (6,9,12)-linolenic acid, eicosa-11,14-dienoic acid, eicosa-5,11,14-trienoic acid, eicosa-8,11,14-trienoic acid, and arachidonic acid.

linolenate 1 or (9,12,15)-linolenate or (formerly) α -linolenate the alternative trivial names for (all-Z)-octadeca-9,12,15trienoate; CH₃-[CH₂-CH=CH]₃-[CH₂]₇-COO (all-Z isomer); the anion derived from (9,12,15)-linolenic acid, (all-Z)octadeca-9,12,15-trienoic acid, a triunsaturated straight-chain higher fatty acid synthesized by plants (notably found in linseed oil) but essential in the diet of mammals (see linolenic family). The name equally refers to any mixture of (all-Z)octadeca-9,12,15-trienoic acid and its anion, or any salt or ester of this acid. 2 (6,9,12)-linolenate or (formerly) y-linolenate the trivial name for (all-Z)-octadeca-6,9,12-trienoate; $CH_3-[CH_2]_3-[CH_2-CH=CH]_3-[CH_2]_4-COO^-$ (all-Z isomer), the anion derived from (6,9,12)-linolenic acid (all-Z)-octadeca-6,9,12-trienoic acid, a triunsaturated straight-chain higher fatty acid belonging to the linoleic family. It occurs naturally as acylglycerols in certain plant-seed oils, especially that of the evening primrose (Oenothera spp.), and also in small amounts in the lipids of many animal tissues, especially human breast milk. It is the biosynthetic precursor of arachidonate and the prostaglandins. The name refers equally to any mixture of (all-Z)-octadeca-6,9,12-trienoic acid and its anion or any salt or ester of the acid.

linolenic family (of polyunsaturated fatty acids) a series of polyenoic acids occurring in mammals, in which the hydrocarbon chain terminates with the alkenyl grouping CH₃-CH₂-CH=CH- (as in (9,12,15)-linolenic acid; see linolenate). The linolenic family is also known as the $\omega 3$ or n-3 family because of the position of the terminal double bond three carbon atoms from the methyl end. The longer-chain members of the family can be synthesized in mammals only from dietary (9,12,15)-linolenic acid by chain elongation and/or further desaturation (but not from the corresponding saturated acids or from linoleic, oleic, or palmitoleic acids - the latter represent the other three series of polyenoic acids). If animals are deprived of a source of these fatty acids in the diet, certain tissues, such as the eye, retain existing stores of these fatty acids tenaciously, even in offspring of such animals when the restricted diet is continued for more than one generation. Under these conditions, long-chain acids of the linoleic family, e.g. (4,7,10,13,16,)-docosapentaenoic (C22:5 n-6) acid, are synthesized in appreciable amounts and presumably partially support the function supplied by long-chain $\omega 3$ acids, though the nature of this is unknown. The series includes eicosapentaenoic (C20:5 ω3) and docosahexaenoic (C22:6 ω3) acids, which are found in high concentration in fish oils; these ω 3 acids may have value in protecting against heart disease, a role that, if real, would be unrelated to their function as essential fatty acids, since the amount considered necessary for this purpose greatly exceed those needed to fulfil their role as essential fatty acids.

linolencyl 1 or (9,12,15)-linolencyl or (formerly) α -linolencyl symbol: aLnn or (sometimes) Lnn; the alternative trivial names for (all-Z)-octadeca-9,12,15-trienoyl; CH₃-[CH₂-CH=CH]₃-[CH₂]₇-CO- (all-Z isomer); the acyl group derived from (all-Z)-octadeca-9,12,15-trienoic acid. 2 (6,9,12)-linolenoyl or (formerly) y-linolencyl symbol: yLnn; the trivial names for (all-Z)-octadeca-6,9,12-trienoyl; $CH_3-[CH_2]_3-[CH_2-CH=CH]_3-$ [CH₂]₄-CO- (all-Z isomer); the acyl group derived from (all-Z)-octadeca-6,9,12-trienoic acid. See linolenate.

linoleoyl symbol: Lin; the trivial name for (all-Z)-octadeca-9,12-dienoyl; $CH_3-[CH_2]_3-[CH_2-CH=CH]_2-[CH_2]_7-CO-(all-Z)$ CH₃-[CH₂]₄-CH=CH- (as in linoleic acid; see linoleate) and isomer); the acyl group derived from linoleic acid. See linoleate

liothyronine L-3,5,3'pharmaceutical name triiodothyronine.

lip+ a variant form of lipo+ (before a vowel).

lipaemia a variant spelling (esp. Brit.) of lipemia.

lipase 1 (in enzyme nomenclature) a general term for any acylglycerol carboxylic ester hydrolase, of EC sub-subclass 3.1.1. The term may be incorporated in the enzyme name as the suffix '+lipase'. 2 abbr. (in clinical chemistry): LPS; an alternative name for triacylglycerol lipase. See also hormone-sensitive lipase, lipoprotein lipase, pancreatic lipase.

lipemia or lipidemia the condition when there is a greater than normal content of lipid in the blood, e.g. after a fatty meal or in certain pathological states. Also (esp. Brit.) lipaemia, lipidaemia.

lipid or (formerly) lipide or lipid or lipin(e) 1 any member of a large and diverse group of oils, fats, and fatlike substances that occur in living organisms and that characteristically are soluble in lipid solvents but only sparingly soluble in aqueous solvents. Lipids constitute one of the four major classes of compounds found in living tissues (the others being carbohydrates, proteins, and nucleic acids) and they include: (1) fatty acids; (2) neutral fats (i.e. triacylglycerols), other fattyacid esters, and soaps; (3) long-chain (or fatty) alcohols and waxes; (4) sphingoids and other long-chain bases; (5) glycolipids, phospholipids, and sphingolipids; and (6) carotenes, polyprenols, sterols (and related compounds), terpenes, and other isoprenoids. See individual entries for details. 2 any oily, fatty, or fatlike material that occurs in living organisms. 3 of, concerned with, for, or relating to lipid (def. 2); consisting of or containing lipid (def. 1, 2); lipoid (def. 1) or lipoidal. —lipidic

lipid A the glycolipid moiety of bacterial lipopolysaccharide.

lipidaemia a variant spelling (esp. Brit.) of lipidemia; see lipemia.

lipid bilayer any layer, two molecules thick, of amphipathic lipid molecules. If it is surrounded by a polar environment, the polar parts of the lipid molecules are oriented outwards towards the environment and the nonpolar parts inwards into the interior of the bilayer. The two layers of lipid are referred to as leaflets, e.g. the inner and outer leaflets of the bilayer. See also black lipid membrane.

lipide a variant spelling of lipid.

lipidemia an alternative term for lipemia.

lipidosis or lipoidosis (pl. lipidoses or lipoidoses) any clinical disorder, also called lipid storage disease, that results in the excessive deposition within specific tissues of particular types of lipids. Many lipidoses are inherited disorders of galactosphingolipid metabolism.

lipid-soluble a vague term applied to various classes of nonpolar substances, e.g. sterols, certain vitamins, carotenoids, and polyprenoids, that are commonly present in small amounts in association with the major lipid.

lipid solvent any relatively nonpolar solvent that can be used to extract lipids from tissues or other materials.

lipid storage disease an alternative term for lipidosis.

lipin or lipine a former term for lipid (def. 1), especially one containing nitrogen and/or phosphorus.

Lipmann, Fritz Albert (1899-1986), German-born US biochemist; Nobel Laureate in Physiology or Medicine (1953) 'for his discovery of co-enzyme A and its importance for intermediary metabolism' [prize shared with H. A. Krebs].

lipo+ or (before a vowel) lip+ comb. form denoting lipid, lipidcontaining, or lipid-like.

lipoamide or (sometimes) lipoyllysine a lipoyl group when in amide linkage to the e-amino group of a specific lysine residue in dihydrolipoamide acetyltransferase (EC 2.3.1.12) and dihydrolipoamide succinyl transferase (EC 2.3.1.61), which form, respectively, parts of the pyruvate dehydrogenase complex and the 2-oxoglutarate dehydrogenase complex.

lipoamide reductase (NADH) EC 1.8.1.4; recommended

ponent of α-ketoacid dehydrogenase complexes; lipoyl dehydrogenase; dihydrolipoyl dehydrogenase; diaphorase. An enzyme that catalyses the oxidation by NAD^{+} dihydrolipoamide to form lipoamide and NADH. FAD is a coenzyme. It is typically a homodimer, occurring in the mitochondrial matrix (in eukaryotes), with a redox-active S-S bond similar to glutathione reductase. Example (precursor) from yeast (the first 21 amino acids form the mitochondrial transit peptide): database code DLDH_YEAST, 499 amino acids (53.95 kDa).

lipoate 1 1,2-dithiolane-3-pentanoate, the anion derived from lipoic acid (i.e. thioctic acid). 2 any salt or ester of lipoic acid.

lipocaic a substance extractable from the pancreas that was said to be lipotropic in pancreatectomized animals.

lipocalin any of a large group of ligand-binding proteins, particularly one that binds hydrophobic ligands, e.g. biliverdin pheromone. The family includes retinol-binding protein, αmicroglobulin, insect bilin-binding proteins, and beta lactoglobulin. The name derives from the fact that the ligand is enclosed by the protein as a flower is enclosed by the calyx (i.e. the sepals). All members of the family have a similar β barrel structure of eight barrels crossing in the centre; different ligand-binding properties are determined by loops on the periphery. See also Appendix E.

lipochrome a former name for any of various lipid-soluble biological pigments.

lipocortin see annexin.

lipofection a lipid-mediated DNA-transfection technique that makes use of unilamellar liposomes that contain a cationic lipid and spontaneously react with DNA.

lipofuscin any of various brownish lipid-soluble pigments that are deposited in animal cells, especially in senility.

lipogenesis the formation of fat. The term is applied especially to the processes by which higher fatty acids are synthesized from nonlipid sources. —lipogenic adj.

lipogenic amino acid any amino acid that can provide carbon atoms for the biosynthesis of higher fatty acids.

lipoic acid or α -lipoic acid symbol: Lip(S₂); 1,2-dithiolane-3pentanoic acid; thioctic acid; the naturally occurring form is the (R)-(+)-enantiomer. Lipoic acid provides the reversibly reducible moiety, lipoyl, of lipoamide and is a growth factor for certain microorganisms. The reduced form is dihydrolipoic $HS-CH_2-CH_2-CH(SH)-[CH_2]_4-COOH$ Lip(SH)₂); the redox potential of the system is -0.29 V at pH7. Lipoic acid is an essential component of the α-ketoacid dehydrogenase complexes. See pyruvate dehydrogenase complex and 2-oxoglutarate dehydrogenase complex.

lipoid 1 or lipoidal being or resembling an oil or a fat; oily, fatty. 2 a former term for lipid (def. 1, 2).

lipolysis the breakdown of lipids, especially the (enzymic) hydrolysis of acylglycerols. —lipolytic adj.

lipolytic hormone an alternative name for lipotropin.

lipomodulin or annexin I a 40 kDa regulatory protein isolated from rabbit neutrophils that, in its nonphosphorylated form, is an inhibitor of phospholipase A₂ and that on phosphorylation by a cyclic-AMP-dependent protein kinase loses this inhibitory property. It has been suggested that lipomodulin thereby regulates the release of arachidonate from leukoytes, or other cells, that may occur in response to chemoattractants and other external stimuli.

lipophilic tending to dissolve in, having a strong affinity for, or readily mixing with lipids or substances of low polarity. See name: dihydrolipoamide dehydrogenase; other names: E3 com-Ban dang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

lipophilin

lipoxyqe

lipophilin another name for myelinproteolipid. See myelin protein. lipophorin any member of the major class of lipid-transporting proteins found in the hemolymph of insects. In locusts the apoprotein is synthesized in the fat body as an 85 kDa polypeptide. See also apolipophorin.

lipophosphoglycans see GPI anchor.

lipopolysaccharide abbr.: LPS; any of a group of related, 10 kDa, structurally complex components of the outer leaflet of the outer membrane of Gram-negative bacteria. Lipopolysaccharide molecules consist of three covalently linked regions: lipid A, core oligosaccharide, and an O side chain. The innermost layer, lipid A, which is responsible for the toxicity of the lipopolysaccharide, consists of six fatty acyl chains (sometimes hydroxylated) linked in various ways to two glucosamine residues. The branched core oligosaccharide contains ten saccharide residues, several of them unusual, and has a structure that appears to be similar in closely related bacterial strains. The outermost O side chain, which is highly variable and determines the antigenic specificity of the organism, is made up of many (~50) repeating units of a branched tetrasaccharide containing further unusual sugar residues.

lipopolysaccharide N-acetylglucosaminyltransferase EC 2.4.1.56; an enzyme of the lipopolysaccharide core biosynthetic pathway in enteric bacteria; it catalyses a reaction between UDP-N-acetyl-D-glucosamine and lipopolysaccharide to form UDP and N-acetyl-D-glucosaminyllipopolysaccharide. Example from Salmonella typhimurium: database code RFAK_ SALTY, 381 amino acids (43.10 kDa). There is little similarity between the given example and the corresponding enzyme in Escherichia coli. See also glycolipid.

lipoprotein any conjugated, water-soluble protein in which the nonprotein moiety consists of a lipid or lipids. The lipid may be triacylglycerol, cholesterol, or phospholipid, or a combination of these. Compare proteolipid.

lipoprotein(a) one or two molecules of apolipoprotein(a) linked by a disulfide bridge to apolipoprotein B-100; it may be a physiological inhibitor of plasminogen activation. Levels in human plasma (which range from undetectable to 100 mg dL⁻³) show correlation with the incidence of atherosclerosis.

lipoprotein lipase EC 3.1.1.34; abbr.: LPL; other names: clearing factor lipase; diglyceride lipase; diacylglycerol lipase. An enzyme that catalyses the hydrolysis of triacylglycerol to diacylglycerol and fatty-acid anion. Its function, after uptake of dietary lipid, is to hydrolyse triacylglycerols in chylomicrons and very-low-density lipoproteins, to diacylglycerols and fatty-acid anions; the fatty acids are then taken into peripheral tissues for futher metabolism; it will also hydrolyse diacylglycerols. It acts in the presence of apolipoprotein C-II on the luminal surface of vascular endothelium. It is a GPI-anchor dimer, and is released by heparin, etc. Example (precursor) human: database code LIPL_HUMAN, 475 amino acids (53.10 kDa).

lipoprotein signal peptidase see premurein-leader peptidase.

liposome 1 a natural lipid globule suspended in the cytoplasm of some cells. 2 any small, roughly spherical, artificial vesicle consisting of a continuous bilayer or multibilayer of complex lipids enclosing some of the suspending medium. Liposomes are formed by allowing complex lipids to 'swell' in aqueous solution sometimes with the aid of sonication. They are used experimentally as models of biological membranes and therapeutically for entrapment of drugs, enzymes, or other agents with a view to their more effective delivery to target cells. Originally, such a structure was termed a cellule (when bilayered), smectic mesophase, spherule, or spherulite. See also liquid crystal.

lipotaurine the 7,13-dihydroxy-2-trans-octadecenoyl amide of taurine. It is found in the lipid fraction of Tetrahymena thermophila.

lipoteichoic acid any of a group of teichoic acids that contain lipid, are present in the membranes of all species of Gram-positive bacteria so far examined, and, unlike wall teichoic acids, are extractable with hot water or phenol.

lipotropic or lipotrophic tending to prevent the accumulation of, or to remove, abnormal amounts of lipid (in a tissue or organ, e.g. adipose tissue, liver).

lipotropic agent or lipotropic substance any substance capable of preventing or correcting fatty infiltration of the liver caused by choline deficiency.

lipotropic hormone or lipotrophic hormone a former name for . lipotropin.

lipotropin or lipotropic hormone (abbr.: LPH) either of two polypeptides, β - and γ -lipotropin, that can be isolated from the anterior and intermediary lobes of mammalian pituitary glands and are characterized by their ability to elicit lipolysis in adipose tissue. β -Lipotropin corresponds in sequence to the 91 C-terminal amino-acid residues of proopiomelanocortin, and γ -lipotropin corresponds to the 58 N-terminal residues of β lipotropin. In fact, they are of no greater lipotropic potency than corticotropin and a-melanotropin, and whether they have any intrinsic physiological function is still uncertain. Both β - and γ -lipotropins are found in normal human blood. Other names: lipolytic hormone; adipokinetic hormone; former names: lipotrophin; lipotrophic hormone.

lipotropism the state or quality of being lipotropic.

lipovitellin a ≈135 kDa phospholipoprotein that, together with phosvitin, constitutes the bulk of the yolk proteins of the eggs of oviparous vertebrates. These two proteins are synthesized and secreted by the liver as a single large molecule, vitellogenin, which is taken up by the ovary and split into the two compo-

lipoxin abbr.: LX; any of a group of eicosanoids containing a conjugated tetraene structure and having three hydroxyl groups. They are generated by the action of lipoxygenase enzymes on polyunsaturated fatty acids (arachidonate and eicosapentaenoate). The major lipoxins, A₄ and B₄, are derived from arachidonate; lipoxin A_4 (LXA₄) is (7E,9E,11Z,13E)-(5S, 6R, 15S)-5,6,15-trihydroxy-eicosa-7,9,11,13-tetraen-1-oate; lipoxin B_4 (LXB₄) is (6E, 8Z, 10E, 12E)-(5S, 14R, 15S)-5, 14, 15trihydroxy-eicosa-6,8,10,12-tetraen-1-oate. LXA₄ has been found to cause contraction of guinea-pig lung strips, but not ileum; LXA₄ and LXB₄ cause dilatation of arterioles.

lipoxygenase 1 EC 1.13.11.12; systematic name: linoleate:oxygen 13-oxidoreductase; other names: lipoxidase; carotene oxidase. An enzyme that catalyses the oxidation by dioxygen of linoleate to (9Z,11E)-(13S)-13-hydroperoxyoctadeca-9,11-dienoate (abbr.: 13(S)-HpODE); iron is a cofactor. 2 any member of a group of dioxygenase enzymes that catalyse the oxidation of polyunsaturated fatty acids to a parctable with hot water or phenol. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

widely distributed in plants and in animals from invertebrates to humans. They are found variously in leukocytes, mast cells, platelets, and lung, their positional specificities varying from tissue to tissue; notably a 12-lipoxygenase predominates in platelets, and a 5-lipoxygenase in neutrophils. They are important in the conversion of arachidonate to 5- and 12-hydroperoxyeicosatetraenoates (the 5-hydroperoxy compound being the biosynthetic precursor of the leukotrienes). Lipoxygenase activity has also been observed upon a variety of polyunsaturated fatty acids, indicating that such enzymes exist in a wide variety of forms. The configuration at the oxidized carbon is most often S, but R products are known, e.g. of sea urchin egg lipoxygenase. Of the three main lipoxygenase activities, the function of 12-lipoxygenase (EC1.13.11.31) remains to be clarified; 5-lipoxygenase (EC 1.13.11.34) is important in yielding precursors for leukotriene biosynthesis; 15-lipoxygenase (EC 1.13.11.33) yields precursors for the lipoxins. All three, however, are involved in the synthesis of hydroperoxy- and dihydroxy-eicosatetraenoates. Compounds that inhibit both lipoxygenase and prostaglandin-endoperoxide synthase include curcumin, eicosatetraynoic acid, and phenidone (1-phenyl-3-pyrazolidinone). Compounds that selectively inhibit lipoxygenases without inhibiting prostaglandin-endoperoxide synthase include eicosatriynoic acid and esculetin. See also dihydroxyeicosatetraenoate, hydroperoxyeicosatetraenoate, hydroperoxyoctadecadienoate, hydroxyeicosatetraenoate.

lipoy! the acyl group, 1,2-dithiolane-3-pentanoyl, derived from **lipoic acid**. It provides the reversibly reducible moiety of **lipoamide**.

lipoyllysine an alternative name for lipoamide.

Lip(S₂) symbol for a residue of (the oxidized form of) lipoic acid.

Lip(SH)₂ symbol for a residue of dihydrolipoic acid, the reduced form of lipoic acid.

lipstatin an irreversible inhibitor of several lipases, e.g. pancreatic, gastric, carboxyl ester, or bile-stimulated lipase of milk, isolated from *Streptomyces toxytricini*. It blocks fat absorption selectively.

lipuria the presence of lipid or oily droplets in the urine.

liquefy or liquify to become, or cause to become, liquid. —liquefaction or liquifaction n.

liquid 1 a state of matter, intermediate between a solid and a gas, in which the molecules are relatively free to move with respect to each other but are restricted by intermolecular forces strong enough to prevent spontaneous expansion or significant compression. 2 any substance that is liquid at normal room temperature and pressure. 3 of, pertaining to, being, or behaving as a liquid. Compare fluid.

liquid air a pale-blue liquid containing principally liquid nitrogen and liquid oxygen, b.p. -194.35 °C (78.80 K), obtained by compressing and cooling gaseous air. It is used as a refrigerant and in the preparation of nitrogen and oxygen.

liquid chromatography abbr.: LC; any form of **chromatography** in which a liquid is used as the mobile phase.

liquid crystal or mesomorphic state or mesophase any new phase, resembling both liquid and solid phases, that appears when certain pure liquids are cooled, or pure solids are heated. These new phases have a translucent or cloudy appearance. In liquids of asymmetric molecules the molecular axes are arranged at random. In liquid crystals, however, there is some alignment, which occurs in three main distinguishable modes (certain such mesomorphic substances displaying more than one). In nematic liquid crystals the long axes of the molecules are aligned parallel to each other but the molecules are not arranged in layers. These scatter light strongly and appear translucent. In cholesteric liquid crystals the molecular axes are aligned and the molecules are arranged in layers but the orientation of the axes changes in a regular way on going from one layer to the next. Because the distance between any two layers with the same molecular orientation is of the order of the wavelength of visible light such crystals display vivid iriecules that have chemically dissimilar parts, e.g. polar and nonpolar; the chemically similar parts attract one another and the molecules form layers and align themselves in one direction. See also liquid-crystalline phase.

liquid-crystal display abbr.: LCD; any display of characters or numbers in a calculator, clock, or other device, based on liquid crystal cells whose reflectivity is changed by application of an electric field

liquid-crystalline phase any of several types of phase adopted by polar lipids at moderately elevated temperatures. Two major types exist, the lamellar and hexagonal phases. In the lamellar phase, also known as the L_{α} phase, the lipids form sheets of bilayers with the polar groups oriented outwards and the fatty-acyl moieties oriented into the hydrophobic core between the two bilayers. Such a phase is likely to include many such bilayers stacked on top of each other, with their polar groups apposed. In the hexagonal phase, the lipids form a spherical aggregate, in which the polar headgroups may be oriented either into the centre of the sphere, when this is known as the H_1 phase, or towards the surface of the sphere, the H_2 phase. In liquid-crystalline phase, the lipid adopts a looser packing, with greater mobility of the fatty-acyl chains than in the crystalline state. At low temperatures, in the absence of water, lipids exist in a crystalline state. If the lipid is heated to a point that attains the transition temperature, a temperature characteristic of each pure compound, the lipid undergoes a transition to one of the liquid-crystalline phases. On further heating, it melts completely. Addition of water at low temperature to the crystalline state causes formation of a gel phase, with water layers between the apposed polar headgroups. This gel phase will, on heating to the transition temperature, undergo transition to a liquid-crystalline phase similar to those described above.

liquid-gel chromatography a type of liquid chromatography in which the stationary phase is a gel. It includes **gel-permeation chromatography** and **ion-exchange chromatography**.

liquid glucose an alternative name for corn syrup.

liquid-junction potential the electric potential, not experimentally measurable, that arises across the boundary of two solutions of different compositions, e.g. between two halfcells. It is a complex function of the activities and transference numbers of the several ions in the transition layer.

liquid-liquid chromatography abbr.: LLC; a type of liquid chromatography in which the stationary phase is a liquid supported on a solid.

liquid medium any liquid culture medium.

liquid nitrogen nitrogen in the liquid state. It has a b.p. of -195.79 °C (77.36 K), and is useful as a cooling and freezing agent.

liquid oxygen oxygen in the liquid state. It has a b.p. of -182.96 °C (90.19 K).

liquid paraffin a colourless, odourless fraction of higher liquid hydrocarbons obtained from petroleum. Light liquid paraffin has a density of 0.83–0.86 g ML⁻¹ and heavy liquid paraffin has a density of 0.86–0.89 g ML⁻¹. It is used for (hot) oil baths, and the purified material is used as a suspending medium in infrared spectroscopy.

liquid-scintillation counting abbr.: LSC; a technique for counting particulate radiation. The (radioactive) sample is dissolved or suspended in, or placed in close approximation to, a solvent containing one or more substances that are fluorescent and emit a pulse of light (scintillation) when excited by an incident ionizing particle or photon. The light is detected by photomultipliers, in a liquid-scintillation counter.

liquid-scintillation spectrometry liquid-scintillation counting of particulate radiation of one or more selected ranges of energies.

liquid-solid chromatography *abbr*.: LSC; a type of liquid chromatography in which the mobile phase is a liquid and the stationary phase a solid.

descence Smeetic liquid crystals are formed by certain mol- liquor 1 (in pharmacy) a (usually aqueous) solution of a pure Ban dang doc một quyền sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

liquorice

I Just to start

substance. 2 a solution in a chemical manufacturing process. 3 the water used in brewing.

liquorice or (esp. US) licorice or glycyrrhiza the dried roots and rhizome of Glycyrrhiza glabra. This preparation contains glycyrrhizin, the glucoside of glycyrrhetic acid; it resembles aldosterone and has effects similar to the mineralocorticoids.

LISP a high-level computer language used for artificial intelligence. [Acronym from 'list processing'.]

liter the US spelling of litre.

lithiasis (in pathology) the presence of calculi (stones), e.g. in the biliary or urinary tracts.

lithium symbol: Li; an element of group 1 of the IUPAC periodic table; atomic number 3; relative atomic mass 6.939. It is a soft, silvery white, alkali metal of such high reactivity that it must be stored in an inert atmosphere or under oil. It is not found free in nature, occurring in the minerals spodumene and lepidolite. Lithium carbonate, Li₂CO₃ (commonly referred to as 'lithium') is used to control the symptoms of manic-depressive illness. Li⁺ inhibits inositol phosphate phosphatase, thereby inhibiting the recycling of inositol, and reducing its availability for phosphatidylinositol synthesis.

lithogenesis (in pathology) the processes leading to formation of calculi (stones). —**lithogenic** adj.

lithotroph any member of either of two groups of organisms, chemoautotrophs (see chemotroph) and photolithotrophs, that use CO₂ as a carbon source.

litre or (US) liter symbol: L or l; a non-SI unit of volume, now identical to the cubic decimetre; i.e. $1 L = 1 dm^3 = 10^{-3} m^3$.

little gastrin see gastrin.

liver one of the largest organs of the vertebrate body, situated in the abdominal cavity and formed as a diverticulum of the gut. It is highly vascular; venous blood carrying the products of digestion enters via the hepatic portal vein, while arterial blood enters via the hepatic artery. Blood leaves via the hepatic vein. The liver functions as a gland by secreting bile and is an important site of metabolism of carbohydrates, proteins, and fats; it stores carbohydrate as glycogen, is active in gluconeogenesis, and is important in the regulation of the blood glucose level. It is also an important site for the synthesis of urea and ketone bodies. The liver synthesizes fibrinogen, prothrombin, serum albumin, and other blood proteins and plays an important part in detoxication. The major cells in the liver are the hepatocytes. The liver also contains Kupffer cells of the reticuloendothelial system, cells derived from the bile duct cannuliculae, and fibroblasts, which are particularly important in the pathogenesis of liver cirrhosis. See also regeneration (def. 2).

LLC abbr. for liquid-liquid chromatography.

LLD factor abbr. for Lactobacillus lactis Dorner factor; a growth factor for this organism, identical to vitamin B₁₂.

LLF or L-L factor abbr. for Laki-Lorand factor, i.e. factor XIII (see blood coagulation).

Im symbol for lumen (def. 1).

L meromyosin abbr. for light meromyosin.

LMM abbr. for light meromyosin.

In symbol for natural, or Napierian, **logarithm** (alternative to log_e).

αLnn or (sometimes) Lnn symbol for the linolenoyl or (9,12,15)-linolenoyl or (formerly) α-linolenoyl group; see linolenoyl (def.

yLnn symbol for the (6,9,12)-linolenoyl or (formerly) γ -linolenoyl group; see **linolenoyl** (def. 2).

InRNA abbr. for low-molecular-weight nuclear RNA (see small nuclear RNAs).

load (in metabolic studies) the amount (of a specified substance) given in a metabolic test.

loading test or load test a metabolic test in which the subject is given a dose of a specific substance and the concentration in blood and/or urine of the substance, or of some related metabolite, is determined as a function of time. Such a test is useful for determining the capacity of a particular metabolic pathway in the subject.

lobelia 1 any plant of the genus *Lobelia*. 2 or Indian tobacco the dried leaves, shoot tips, and seeds of *Lobelia inflata*, which contain the alkaloid **lobeline**.

lobeline 2- $[6-(\beta-hydroxyphenethyl)-1-methyl-2-piperidyl]acetophenone; an alkaloid derived from$ **lobelia**(def. 2) with actions on the central and peripheral nervous systems that resemble those of**nicotine**. It is responsible for some of the properties of herbal cigarettes.

(-)-lobeline

Lobry de Bruyn-van Ekenstein transformation a nonenzymic transformation occurring in carbohydrates, usually in alkaline conditions, that includes epimerization of both aldoses and ketoses and aldose-ketose isomerization. [After Cornelius Adrian Lobry de Bruyn and W. Alberda van Ekenstein (1857-1937), who first described it in 1895.]

localized melting the (reversible) destabilization of tertiary structure in a limited region of an ordered biopolymer through interaction with a specific agent, e.g. an enzyme.

locant a prefix or infix used in organic chemical nomenclature to identify the position of a substituent in a parent structure or of an isotopic modification to a compound. Locants are commonly Arabic numerals, but Greek letters and italicized symbols of heteroatoms are also used. In isotopically modified compounds the italicized name of the function containing the modification may be used if it has no number, e.g. in [methyl-14C]methionine.

loci the plural of locus.

lock-and-key model a model for the mechanism of an enzyme-substrate combination, of a hormone-receptor interaction, or of an antibody-antigen reaction. In this model, which is based on the analogy of the complementarity of a lock and its key, one reactant is envisaged binding to the other on a site to which it is structurally complementary.

Locke's solution or Locke solution or Ringer-Locke solution any one of several balanced salt solutions modified from Ringer's solution, initially for the perfusion of mammalian heart and other tissues in physiological experiments. Such solutions have usually contained (in grams per litre, approx.) NaCl (9.0-9.5), KCl (0.20-0.42), CaCl₂ (anhydrous, 0.20-0.24), NaHCO₃ (0.1-0.3), and glucose (1.0-2.5). [After Frank Spiller Locke (1871-1949), British physiologist, who devised them in 1894 and 1900.]

lock-washer structure a putative intermediate structure formed during the assembly of subunits of the coat protein of tobacco mosaic virus into the helically organized structure of the fully formed virion. It is believed to arise after the primary subassembly, which is a two-layered disk with 17 subunits per layer, has self-aggregated into a cylinder; a dislocation in each disk then occurs so that it becomes a two-turn flattened protohelix, of similar shape to a lock washer of the sprung type.

loco disease see locoweed.

locoweed any of various plants belonging to the genera Astragalus or Oxytropis, found mainly in western USA. They contain L-2-amino-3-(methylseleno)propionic acid (methylseleno-cysteine), a nonprotein amino acid, and may cause poisoning (loco disease) when ingested by livestock. [From Spanish loco, mad.]

locus (pl. loci) 1 (in genetics) the specific position, in all homologous chromosomes, of a particular gene or one of its alleles.
2 (in mathematics) the curve or line traced by a point moving so as to satisfy a particular set of conditions.

pathway in the subject.

So assto satisfy a particular set of conditions.

locus control region abbr.: LCR; a group of five regions upstream of the structural genes for the \beta chain of hemoglobin in human and mouse. These regions are essential for the expression of all the genes of the β-like gene cluster.

lod score abbr. for log of the odds score; a statistical test to determine whether a set of linkage data indicates linkage or not, the log₁₀ of the odds favouring linkage. For genetic disorders that are not X-linked, a lod score of +3 (1000:1 odds of linkage) indicates linkage, whilst a score of -2 is odds of 100:1 against linkage.

Loewi, Otto (1873-1961), German-born US physiologist; Nobel Laureate in Physiology or Medicine (1936) jointly with H. H. Dale 'for their discoveries relating to chemical transmission of nerve impulses'.

log 1 symbol for logarithm. 2 abbr. for logarithmic.

logarithm abbr. and symbol: log; the power to which a fixed number (the base) must be raised in order to produce a specified number; i.e. in the expression $a = b^n$, a is the specified number, b is the base, and n is the logarithm. In **decadic** (common) or Briggsian, logarithms the base is 10; the common logarithm of a is written as $\log_{10}a$, or $\lg a$. In natural, or Napierian, logarithms the base is e (= 2.718 28...); the natural logarithm of a is written as $\log_e a$ or $\ln a$. In binary logarithms the base is 2, and the binary logarithm of a is written as log_2a or 1b a. In converting between them, $\log_e a = 2.303 \times \log_{10} a$, and $\log_2 a = 3.322 \times \log_{10} a$.

logarithmic or logarithmical abbr.: log; 1 of, pertaining to, using, or containing logarithms of numbers or variables. 2 describing a relationship in which one variable is proportional to the logarithm of another.

logarithmic growth a type of growth pattern shown by bacteria or other cells in which the number of cells, or the cell mass, increases logarithmically (exponentially) with time. The rate of increase at any time is proportional to the number of cells, or the cell mass, present.

logarithmic phase abbr.: log phase; the phase of growth of bacterial or other cells during which they undergo logarithmic growth.

logarithmic plot abbr.: log plot; a graph in which one axis has a logarithmic (def. 1) scale and the other a linear scale.

logical operation an operation on binary numbers or statements used in computing and also in applications such as databases and library searches. There are three common binary operators (AND, OR, XOR) and one unary operator (NOT).

log-log plot double logarithmic plot; a graph on which both variables are plotted logarithmically.

Lohmann reaction a name sometimes given to the reversible reaction, catalysed by creatine kinase, in which ATP and creatine are formed from ADP and phosphocreatine. [After Karl Lohmann (1898-1978), German biochemist.]

Lohmann's enzyme an alternative name for creatine kinase.

lombricine the 2-guanidoethanol phosphoester of phosphoserine. In earthworms, the guanidine group can undergo phosphorylation to phospholombricine, which acts as a phosphagen.

1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea; a chloroethylnitrosourea derivative with actions resembling carmustine.

London forces see dispersion forces.

lone pair or nonbonding electrons a pair of electrons of opposite spins occupying the same orbital in the valence shell of an atom.

long-acting thyroid stimulator abbr.: LATS; an IgG immunoglobulin found in the serum of a large proportion of thyrotoxic patients. It binds competitively with thyrotropin to thyrotropin receptors in thyroid plasma membrane, stimulates membrane adenylate cyclase, and causes longer-lasting stimulation of thyroid-hormone secretion than thyrotropin

long-chain describing an aliphatic compound of any type with a chain length greater than ten carbon atoms (i.e. C_{10}).

long-chain alcohol or fatty alcohol any aliphatic compound with a chain length greater than C₁₀ that possesses a terminal hydroxymethyl group. They are components of ether lipids, and esterified with long-chain fatty acids they form wax esters, often major components of plant cuticular waxes.

long-chain-alcohol O-fatty-acyltransferase EC 2.3.1.75; other name: wax synthase; an enzyme that catalyses the formation of a long-chain fatty acyl ester, i.e. a wax, from acyl-CoA and a long-chain alcohol with release of CoA.

long-chain base any aliphatic compound with a chain length greater than C₁₀ that possesses a terminal basic group.

long-chain fatty acid any aliphatic compound with a chain length greater than C₁₀ that possesses a terminal carboxyl group.

long-chain-fatty-acid-CoA ligase EC 6.2.1.3; other names: acyl-activating enzyme; acyl-CoA synthetase; fatty acid thiokinase (long-chain); lignoceroyl-CoA synthase; an enzyme that catalyses the reaction between ATP and a long-chain carboxylic acid and CoA to form an acyl-CoA with release of AMP and pyrophosphate. It activates free fatty acids formed, e.g., by phospholipase action for further metabolism. Examples from yeast: long-chain-fatty-acid-CoA ligase 1 (longchain acyl-CoA synthetase 1; fatty acid activator 1): database code LCF1_YEAST, 700 amino acids (77.78 kDa); long-chain-fatty-acid-CoA ligase 2 (long-chain acyl-CoA synthetase 2; fatty acid activator 2): database code LCF2_ YEAST, 744 amino acids (83.34 kDa); long-chain-fattyacid-CoA ligase 3 (long-chain acyl-CoA synthetase 3; fatty acid activator 3): database code LCF3_YEAST, 694 amino acids (77.86 kDa).

long-chain-3-hydroxyacyl-CoA dehydrogenase 1.1.1.211; other name: β-hydroxyacyl-CoA dehydrogenase; an enzyme of the beta-oxidation system that catalyses the oxidation by NAD+ of (S)-3-hydroxyacyl-CoA to 3-oxoacyl-CoA with the formation of NADH. See 3-hydroxyacyl-CoA dehydrogenase.

longitudinal relaxation time an alternative name for spin-lattice relaxation time.

long-patch repair see short-patch repair.

long-range interaction describing an interaction between residues that are situated relatively far apart in a polypeptide or polynucleotide sequence.

iong terminal repeat abbr.: LTR; a double-stranded DNA sequence, generally several hundred base pairs long, that is repeated at the two ends of the DNA of retroviruses and retrotransposons.

loop 1 the round or oval figure produced by a line, wire, thread, etc. that curves round to cross (or nearly cross) itself. 2 (in electronics) any closed electric or magnetic circuit through which a signal can circulate. 3 (in computing) any set of instructions in a program that is carried out repeatedly until some specified condition is satisfied.

loopback DNA an alternative name for hairpin DNA; see hair-

loop injector a device for introducing samples into a highpressure liquid chromatographic column without interruption of the solvent flow to the column. It consists of a loop of metal tubing of small volume, which is filled with the sample; this can then, by an appropriate valve, be flushed by eluent directly onto the column.

loop of Henle or Henle's loop the U-shaped part of a nephron lying in the renal medulla. It comprises a thin descending tubule and an ascending tubule formed of both a thin and a Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Iophotoxin

lucifo

thick segment. It plays a role in the selective reabsorption of fluid and solutes. [After Friedrich Gustav Jakob Henle (1809-85), German anatomist and pathologist.]

lophotoxin a cyclic diterpenoid, isolated from Pacific gorgonians (sea fans and whips) of the genus Lophogorgia, that irreversibly inactivates the nicotinic acetylcholine receptor on intact BC3H-1 cells.

Lorentz correction factor a correction factor for the effect of solvent polarizability on optical rotation by solutions of proteins or other macromolecules. It is given by: $3/(n^2 + 2)$, where n is the refractive index of the solvent. [After Hendrik Antoon Lorentz (1853-1928).]

Lorentzian lineshape function an equation for the lineshape of a nuclear magnetic resonance absorption signal:

$$g(\omega) = T_2/[1 + (\omega - \omega_0)^2 T_2^2],$$

where $g(\omega)$ is a measure of the intensity of the resonance at a frequency ω , ω_0 is the actual Larmor frequency of the resonating nucleus, and T_2 is the spin-spin relaxation time.

loricrin the major protein of the cornified cell envelope of terminally differentiated epidermal keratinocytes. It is a substrate for transglutaminase, and exists as monomers cross-linked by disulfide and N-(γ -glutamyl)lysine isodipeptide bonds. Example from human: database code LORI_ HUMAN, 316 amino acids (26.01 kDa).

losartan 2-butyl-4-chloro-1-(p-(O-1H-tetrazol-5-ylphenyl)benzyl)imidazol-5-methanol; an antihyperactive drug that blocks the binding of angiotensin II (see angiotensin) to the AT₁ receptor. Affinity for this receptor is much greater than for the AT₂ receptor. It is oxidized by a cytochrome P450 to a carboxylicacid metabolite that is largely responsible for most of its angiotensin II antagonistic effects.

Loschmidt constant symbol: N_L; the number of molecular entities in unit volume of an ideal gas at 1 atm and 273.15 K. It is equal to the Avogadro constant divided by the molar volume, and has the value 2.686763×10^{25} m⁻³. [After Josef Loschmidt (1821–95), Austrian physicist.]

Loschmidt number or Loschmidt's number the numerical value of the Loschmidt constant.

lovastatin or mevinolin 6α -methylcompactin; a metabolite from some fungi (e.g. Monascus ruber, Aspergillus terreus) that is a potent inhibitor of hydroxymethylglutaryl-CoA reductase. It is useful clinically as an antihypercholesterolemic; it reduces plasma levels of total low-density-lipoprotein (LDL), and very-low-density-lipoprotein cholesterol, but it can increase high-density-lipoprotein cholesterol. Its effects result in the induction of up-regulation of LDL receptors on hepatocytes. Two proprietary names are: Mevacor; Mevinacor.

low-complexity region a region in the amino-acid sequence of a protein in which a particular amino acid or a small number of different amino acids are enriched. See, for example, leucine zipper.

low-density lipoprotein abbr.: LDL; one of the classes of lipoproteins found in blood plasma in many animals (data normally relate to humans). LDLs are also known as B lipoproteins due to their electrophoretic mobility intermediate particles have diameter 19.6-22.7 nm, solvent density for isolation (g mL⁻¹) 1.019-1.063, hydrated density (g mL⁻¹) 1.034. Their approximate composition (% by weight) is 13% unesterified cholesterol, 39% esterified cholesterol, 17% phospholipid, 11% triacylglycerol, 20% protein. Their apolipoprotein composition (% by weight total apolipoprotein) is 98% B-100 with traces of different C and E apolipoproteins. They are synthesized in plasma from very-low-density lipoproteins and intermediate density lipoproteins through the action of lipoprotein lipase; they transport cholesterol to peripheral tissues. They have the highest content of cholesterol of any plasma lipoprotein, and have been linked to the incidence of coronary heart disease in epidemiological studies. See also apolipoprotein (for individual apolipoproteins), and LDL receptor.

low-density-lipoprotein receptor see LDL receptor.

low-energy compound a name sometimes applied improperly to certain compounds that undergo reaction leading to release or transfer of, e.g., phosphate, where the standard free energy change for the hydrolysis of the bond is <20 kJ mol⁻¹. It is used especially in making a distinction from a high-energy com**pound**. The use of the term does not meet the highest standards of thermodynamic correctness.

low-lipid lipoprotein (sometimes) an alternative name for high-density lipoprotein.

Lowry method a colorimetric method for the estimation of small amounts (down to 10 µg) of protein. It is a combination of the biuret reaction for peptide bonds and the colour formed by reaction of Folin-Ciocalteau reagent with tyrosine and tryptophan residues in the protein. [After Oliver Howe Lowry (1910-1996), US pharmacologist and biochemist.]

low-spin complex any of the ligand complexes of transitionmetal ions having a maximal number of paired d- or f-shell electrons in the lower energy levels. This state occurs when the pairing energy is less than the crystal-field splitting energy. Compare high-spin complex.

LPG abbr. for lipophosphoglycan (see GPI anchor).

LPH abbr. for lipotropic hormone (i.e. lipotropin).

LPL abbr. for lipoprotein lipase.

LPS abbr. for 1 lipopolysaccharide. 2 lipase (def. 2).

Lr symbol for lawrencium.

L region any region in a (carcinogenic) polycyclic aromatic hydrocarbon that consists of two para-carbon atoms, e.g. the meso-9,10-carbon atoms of anthracene, which display the highest free-valence indices. The lack of such a region has been suggested to correlate with a lack of carcinogenicity of some hydrocarbons. Compare K region.

LRF abbr. for luteinizing hormone releasing factor (see gonadotropin-releasing hormone).

LRH abbr. for luteinizing hormone releasing hormone (see gonadotropin-releasing hormone).

LRR abbr. for leucine-rich repeat.

LSC abbr. for 1 liquid-scintillation counting. 2 liquid-solid chromatography.

LSD abbr. for lysergic acid diethylamide; see lysergic acid.

L7/L12 site a component of EF-Tu translocase (see EF-T) activity involving in bacteria the ribosomal proteins L7 and L12.

L strand abbr. for light strand.

LT abbr. for 1 leukotriene; the subtype may be indicated by a third letter, as in LTA (leukotriene A). 2 lymphotoxin.

LTR abbr. for long terminal repeat.

L-type pentose pathway see pentose phosphate pathway.

Lu symbol for lutetium.

Lubrol a proprietary name for a polyoxyethylene nonionic detergent; the structure of Lubrol PX is the same as C₁₂E₉ (see $C_x E_y$). It is useful for solubilizing membrane-bound enzymes such as adenylate cyclase.

luciferase any member of a group of monooxygenase enzymes that catalyse bioluminescent reactions. Firefly luciferase (EC 1.13.12.7; recommended name: Photinus luciferin 4-monooxygenase (ATP hydrolysing)) occurs in the lantern of the Ameribetween high-density or α lipoprotein, and the origin. LDL can firefly, *Photinus pyralis*, and may be used with firefly Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

luciferin

luciferin for estimation of low concentrations $(10^{-6}-10^{-10} \text{ mol L}^{-1})$ of ATP. It catalyses a reaction between *Photinus* luciferin, O_2 , and ATP to form oxidized *Photinus* luciferin, O_2 , O_2 , and ATP to form oxidized *Photinus* luciferin, O_2 , O_2 , O_3 , O_4 ,

luciferin any bioluminescent substance that is a substrate for a **luciferase** enzyme. Luciferins from different sources often bear no structural resemblance to one another. Firefly luciferin, obtained from the lantern of the American firefly, *Photinus pyralis*, is D-(-)-4,5-dihydro-2-(6-hydroxy-2-benzothiazoloyl)-4-thiazolecarboxylic acid.

Lucifer Yellow one of several dyes based on the structure 6-amino-2,3-dihydro-1,3-dioxo-benz[d,e]isoquinoline-5,8-disulfonic acid. Lucifer Yellow CH has been used as a marker for movement between cells, and for ultrastructure tracing; Lucifer Yellow VS covalently labels proteins rapidly under mild conditions.

Lucifer Yellow CH

Lucifer Yellow VS

Lucite a proprietary name for poly(methyl methacrylate).

lufenuron N-[2,5-dichloro-4-(1,1,2,3,3,3-hexafluoropropoxy)- and phosphorescence. —luminescent adj.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

phenylaminocarbonyl]-2,6-difluorobenzamide; an inhibitor of

insect development, used as a once-per-month pill to control

flea populations on domestic dogs, by inhibiting egg develop-

luffin a type I ribosome-inactivating protein.

luliberin the recommended name for a hypothalamic decapeptide amide now known to be identical with **gonadotropin-releasing hormone**.

flux, equal to the quantity of visible electromagnetic radiation emitted per second in a cone of unit solid angle (one steradian, sr) by a uniform point source of unit luminous intensity (one candela, cd); i.e. 1 lm = 1 cd sr. 2 (pl. lumina) the cavity or passageway of a tubular organ, such as a blood vessel, duct, or length of gut. 3 the volume enclosed within the membranes of a mitochondrion or of the endoplasmic reticulum, or of microsomes prepared from cells. 4 the space enclosed by the walls of a plant cell that no longer contains a protoplast. 5 the bore of a catheter, hollow needle, or other tubular device. —luminal adi.

lumichrome 7,8-dimethylalloxazine; a compound showing a blue fluorescence, formed by the photolysis of riboflavin in acid or neutral solution.

lumiflavin 7,8,10-trimethylisoalloxazine; a compound showing a yellow-green fluorescence, formed by the photolysis of riboflavin in alkaline solution.

lumina the plural of lumen (def. 2).

luminal proteins or (sometimes) ER-resident proteins proteins that are retained within the cisternae of the rough endoplasmic reticulum, e.g protein disulfide isomerase. Such proteins possess at their C terminus four characteristic amino acids, Lys-Asp-Glu-Leu (KDEL) in animal cells and His-Asp-Glu-Leu (HDEL) in yeast. The proteins move to the Golgi and are returned to the endoplasmic reticulum.

luminescence the production of visible light by any mechanism that does not depend upon the system having a temperature appreciably above the ambient. It comprises fluorescence and phosphorescence luminescent adi

luminogenic

Lux pro

luminogenic 1 producing luminescence. 2 of or pertaining to a nonluminescent material that can be acted on by an enzyme to produce a luminescent substance.

luminol 5-amino-2,3-dihydro-1,4-phthalazinedione; a substance useful in the detection or determination of trace amounts of oxidizing agents by virtue of the intense bluish luminescence it emits on oxidation in alkaline solution.

luminometer an instrument for measuring luminescence. Given appropriate conditions, it may be used also to measure the concentrations of enzymes, substrates, etc. that participate in, or can be coupled to, light-producing reactions.

luminometry the measurement of **luminescence** with a luminometer. —**luminometric** adj.

luminophore 1 any luminescent substance, whether a fluor or a phosphor. 2 a molecular grouping responsible, or thought to be responsible, for the luminescence of a larger molecule; a luminescent chromophore.

luminous 1 emitting visible light; bright, shining. 2 (in photometry) (of a physical quantity relating to light) evaluated by the visual sensation of brightness to the eye of an observer rather than by an absolute measurement of radiant energy.

luminous flux symbol: Φ_v or Φ or P_v or P; a measure of the rate of flow of radiant energy within the visible region of the electromagnetic spectrum. The SI derived physical quantity is the arithmetic product of the **luminous intensity** of a source of visible light and the solid angle, expressed in steradians, into which the light is emitted. The SI derived unit of luminous flux is the **lumen** (def. 1).

luminous flux density the **luminous flux** per unit cross-sectional area of a beam of light.

luminous intensity symbol: I_v or I; one of the seven SI base physical quantities, defined as the amount of visible light emitted per second per steradian by a point source in a given direction. The SI base unit of luminous intensity is the **candela**. **lumirhodopsin** an intermediate in the light-induced modification of **rhodopsin** prior to its breakdown into opsin and all-

trans-retinal. It has an absorption maximum at 497 nm. **lumisome** a membrane-bound particle, ≈200 nm in diameter and isolable from homogenates of various species of luminescent marine coelenterates, that contains all the proteins necessary for the production of the typical green bioluminescence observable *in vivo*. It is probably the cytoplasmic organelle responsible for emission of light by such organisms.

lumisterol 9β , 10α -ergosta-5, 7, 22-trien- 3β -ol; a compound produced by the UV irradiation of **ergosterol**, from which it differs in the spatial arrangement of the methyl group at C-10.

Lundh test a test for pancreatic function in which the pancreas is stimulated by a test meal (corn oil, milk powder, and glucose), after which trypsin activity is measured in duodenal juice.

Luria, Salvador Edward (1912-91), Italian-born US physician and biologist, Nobel Laureate in Physiology or Medicine (1969) jointly with M. Delbrück and A. D. Hershey 'for their discoveries concerning the replication mechanism and the genetic structure of viruses'.

luteal of, relating to, or characterized by the development of a corpus luteum or corpora lutea.

luteal phase see estrous cycle.

lutein 3,3'-dihydroxy- α -carotene, one of the most widespread naturally occurring xanthophylls (i.e. carotene alcohols; see carotenoid), found in many higher plants, some algae, egg yolk, and corpora lutea.

$$H_3C$$
 CH_3 H_3C CH_3 H_3C CH_3 H_3C CH_3 H_3C CH_3 H_3

luteinize or luteinise to cause the formation of corpora lutea in; to undergo transformation into a corpus luteum. — luteinization or luteinisation n.

luteinizing hormone or luteinising hormone abbr.: LH; one of the two gonadotropic glycoprotein hormones secreted by the anterior pituitary. Of molecular mass 28.5 kDa (human), it consists of α and β subunits, the α subunit being almost identical within a given species to that of other glycoprotein hormones and the β subunit conferring hormonal specificity; the carbohydrate content is 15.5% (human). In the female it promotes ovulation and luteinization of the ovarian follicle, where it stimulates the conversion of progesterone to pregnenolone, thereby increasing the formation of further progesterone. In the male it stimulates testicular interstitial (Leydig) cell function by promoting the production of androgens, especially testosterone. Example, β chain (precursor) from Bos taurus: database code LSHB_BOVIN, 141 amino acids (15.20 kDa). Recommended name: lutropin; former name: interstitial cellstimulating hormone (abbr.: ICSH).

luteinizing hormone/follicle-stimulating hormone releasing factor abbr.: LH/FSH-RF see gonadotropin-releasing hormone.

luteinizing hormone releasing factor abbr.: LHRF see gonadotropin-releasing hormone.

luteinizing hormone releasing hormone abbr.: LHRH or LH-RH or LRH; see gonadotropin-releasing hormone.

luteo+ comb. form indicating 1 yellow. 2 of the corpus luteum.

luteolysin an alternative name for prostaglandin $F_{2\alpha}.$

luteolysis degeneration or regression of the corpus luteum. —luteolytic adj.

luteotropic hormone or luteotrophic hormone abbr.: LTH; a former name for prolactin.

luteotropin or luteotrophin a former name for prolactin.

lutropin the recommended name for luteinizing hormone.

lux symbol: lx; the SI derived unit of illuminance, equal to 1 lumen per square metre; i.e. 1 lx = 1 lm m⁻².

Lux proteins the counterpart in marine bacteria of the luciferase system. They mediate bioluminesence and are products of genes regulated by the lux operon. Examples are from Vibrio spp. LuxA (catalytic subunit) and LuxB constitute bacterial luciferase (EC 1.14.14.3). It catalyses a reaction between reduced FMN, RCHO, and O₂ to form FMN, RCOOH, H₂O, and hv. Examples from V. fischeri: LUXA, database code LUXA VIBFI, 354 amino acids (40.30 kDa); LUXB, database

LUXA_VIBFI, 354 amino açids (40.30 kDa); LUXB, database Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

lvoen

code LUXB_VIBFI, 326 amino acids (37.31 kDa). LuxC is an acyl-CoA reductase required to form the 'RCHO' above. Example from V. harveyi: database code LUXC_VIBHA, 477 amino acids (54.78 kDa). LuxD is an acyl transferase component of the fatty acid reductase system required for aldehyde biosynthesis (EC 2.3.1.-). Example from V. harveyi: database code LUXD_VIBHA, 305 amino acids (34.17 kDa). LuxE is an acyl-protein synthetase (EC 6.2.1.19) that activates tetradecanoic acid. LuxG is the flavin reductase (EC 1.-.-.), Example from V. fischeri: database code LUXG_VIBFI, 236 amino acids (26.47 kDa). LuxI and LuxJ are part of the regulatory system; they are required for the synthesis of OHHL (N-(3-oxohexanoyl)-L-homoserine lactone), an autoinducer molecule that binds to LuxR. Example from V. fischeri: database code LUXJ_VIBFI, 193 amino acids (21.99 kDa). LuxR is the transcriptional activator. Example from V. fischeri: database code LUXR_VIBFI, 250 amino acids (28.52 kDa).

LVP abbr. for lysine vasopressin.

LW antigen abbr. for Landsteiner-Weiner antigen. See Rhesus factor.

Lwoff, André Michel (1902-94), French microbiologist; Nobel Laureate in Physiology or Medicine (1965) jointly with F. Jacob and J. L. Monod 'for their discoveries concerning genetic control of enzyme and virus synthesis'.

Ix symbol for lux.

LX abbr. for lipoxin.

lyase 1 the systematic name for any enzyme of EC class 4 that catalyses the cleavage of C-C, C-O, C-N, and other bonds, leaving double bonds, or conversely adding a group to a double bond. 2 17,20-lyase the common name for 17α -hydroxy-progesterone aldolase (EC 4.1.2.30).

lyate ion the anion produced by the autoprotolysis of a protogenic solvent; e.g. the hydroxide ion is the lyate ion of water.

lycopene the characteristic red pigment of tomatoes and some other ripe fruit. It is an acyclic carotenoid, and the biosynthetic precursor of the cyclic carotenes in plants.

lycopodium 1 any clubmoss of the genus *Lycopodium*. 2 the spores of various clubmosses, e.g. *L. clavatum*. They are used as a covering for pills and suppositories, in pyrotechnics, and in foundry work.

lymph 1 the pale-yellow, clear, or cloudy fluid that is contained within the vessels of the lymphatic system. It contains a little protein, and derives from the interstitial fluid, which is drained by the lymphatic vessels and ultimately discharged into the bloodstream, e.g. via the thoracic duct. The composition of lymph varies in different parts of the body, that from the liver and intestine containing more protein, and the latter more fat in the form of chylomicrons. Lymph also contains varying numbers of cells, mostly small lymphocytes, and coagulation factors. 2 the exudation from a sore.

lymphatic 1 of, pertaining to, or containing lymph; of or pertaining to the lymphatic system. 2 a lymphatic vessel.

lymphatic system the extensive network of capillary-like lymphatic vessels in vertebrates that convey the lymph from the peripheral tissues to the venous system. Lymph nodes occur at various points along the vessels.

lymph node or lymph gland any of numerous small swellings distributed throughout the lymphatic system of vertebrates. Each node consists largely of lymphocytes, together with macrophages and dendritic cells held together in a loose reticulum. Lymph nodes receive lymph from the peripheral tissues via afferent lymphatic vessels and pass it on via efferent vessels to more centrally placed lymph nodes, and ultimately to

the thoracic duct. The lymph nodes act as filters through which the lymph must pass and where foreign material comes into intimate contact with macrophages and lymphocytes. They are active centres for phagocytosis and the site of initiation of humoral and cell-mediated immune reactions.

lympho+ or (before a vowel) **lymph+** comb. form indicating lymph or the lymphatic system.

lymphoblast any blast cell of the lymphoid cell series. —lymphoblastic adi.

lymphocyte a type of leukocyte found in vertebrates and having various functions in specific immunity. A lymphocyte is a spherical cell, 7-12 μm in diameter, with a large, round nucleus, often indented when seen by electron microscopy, and scanty cytoplasm containing scattered ribosomes but little endoplasmic reticulum and few other organelles. Lymphocytes occur in lymph nodes, other tissues, lymph, and blood, and they circulate between these tissues. Mature, differentiated lymphocytes comprise two main classes, B lymphocytes and T lymphocytes. Lymphocytes without the characteristics of either of these classes are termed null lymphocytes.

lymphocyte-activating factor abbr.: LAF; an alternative name for interleukin 1.

lymphocyte transformation see transformation (def. 3).

lymphocytosis an abnormal increase in the number of lymphocytes, especially in blood.

lymphoid of or resembling lymph, or lymphatic tissue.

lymphoid cell series a cell series comprising all cells that morphologically resemble lymphocytes, their precursors (e.g. lymphoblasts), and cells that may be derived from them (e.g. plasma cells).

lymphoid tissue any vertebrate tissue that is made up predominantly of lymphocytes, e.g. lymph, lymph nodes, spleen, thymus, Peyer's patches, adenoids, pharyngeal tonsils, and, in birds, bursa of Fabricius and cecal tonsils.

lymphokine any member of a varied group of nonimmunoglobulin, soluble factors released by primed lymphocytes on a second interaction with the specific activator (which may be a soluble antigen, a cell-associated antigen, or a mitogen). They play a role in cell-mediated immunity by modulating the behaviour of other types of cell within the same organism (e.g. macrophages, polymorphonuclear leukocytes), and are now considered to be a subgroup of the cytokines. Specific lymphokines include: chemotactic factor for macrophages, lymphotactin, lymphotoxin (i.e. tumour necrosis factor β), macrophageactivating factor (MAF), macrophage migration enhancement factor, macrophage migration inhibitory factor (MIF), (antigenindependent) mitogenic factor, skin-reactive factor, and transfer factor. Lymphokines that can act between different populations of leukocytes are known also as interleukins. See also colony-stimulating factor.

lymphoma any malignant tumour, or condition allied to a tumour, arising from some or all of the cells of lymphoid tissue. The term includes lymphatic leukemias, Hodgkin's disease, and reticuloses.

lymphoreticular tissue an old general term for tissues consisting largely of lymphocytes and macrophages.

lymphotoxin abbr.: LT; an alternative name for tumour necrosis factor β ; see also lymphokine.

LYN a protooncogene encoding a tyrosine kinase belonging to the src family: Database code KLYN_HUMAN, 512 amino acids (58.51 kDa).

Lynen, Feodor (1911-79), German biochemist, Nobel Laureate in Physiology or Medicine (1964) jointly with K. E. Bloch 'for their discoveries concerning the mechanism and regulation of the cholesterol and fatty acid metabolism'.

lyo+ comb. form indicating looseness, dispersion, or dissolution. lyochrome a former name for flavin.

lyocytosis cell lysis by extracellular digestion, e.g. during insect metamorphosis.

via afferent lymphatic vessels and pass it on via efferent vessels to more centrally placed lymph nodes, and ultimately to Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

lyoglycogen an old name for the fraction of a sample of glycogen that is extractable by water on a steam bath.

lyolysis an alternative term for solvolysis.

Lyon hypothesis (in genetics) the hypothesis that gene dosage compensation in mammals is accomplished by random inactivation of one of the two X chromosomes in all somatic cells of females. [After Mary Francis Lyon (1925—), British geneticist.] lyonium ion any cation produced by the protonation of a sol-

vent molecule, e.g. H₃O⁺, CH₃OH₂⁺

lyophile 1 (in chemistry) a lyophilic compound. 2 having lyophilic properties.

lyophilic or **lyophile** (of a substance or surface) solvent preferring; easily wetted or solvated by the solvent present; the term comprehends **hydrophilic** when the solvent is water. *Compare* **lyophobic**.

lyophilic sol any sol in which the disperse phase has an attraction for the continuous phase.

lyophilization or **lyophilisation** strictly, the process of rendering lyophile or lyophilic. The term is now usually specifically applied to freeze-drying in which, by use of a vacuum, water is removed from ice by sublimation. This use bears little relationship to the true meaning of lyophile, except in so far as it maintains proteins subjected to it in a lyophilic state. — **lyophilize** or **lyophilise** vb.

lyophilizer lyophiliser an apparatus for effecting lyophilization; a freeze-drier.

lyophobic or **lyophobe** (of a substance or surface) solvent rejecting; resistant to being wetted or solvated by the solvent present; the term comprehends **hydrophobic** when the solvent is water. Compare **lyophilic**.

lyophobic sol any sol in which the disperse phase has no attraction for the continuous phase. Lyophobic sols cannot be formed by spontaneous dispersion in the medium.

lyotropic or **lyotrope** of or associated with the difference between the internal pressure of a solution compared with that of the solvent caused by the solute.

lyotropic mesophase any mesophase (i.e. liquid crystal) whose phase transitions are readily effected by changes in concentration.

lyotropic series or **Hofmeister series** a series of ions arranged in order of their **lyotropic** effects, especially their ability to cause precipitation of a lyophilic sol (to salt-out).

lypressin see [8-lysine]vasopressin.

Lys symbol for a residue of the α -amino acid L-lysine (alternative to K).

lys+ a variant form of lyso+ (before a vowel).

lysate any solution or other preparation containing the products of **lysis** of cells. The term is applied especially to lysed bacterial or blood cells.

+lysate comb. form denoting a mixture resulting from decomposition, breakdown, or lysis (of or by something indicated); e.g. autolysate, cytolysate, hemolysate, hydrolysate.

Lys-bradykinin abbr. for lysylbradykinin (i.e. kallidin); see

lyse to effect lysis (of a cell, etc.); to undergo lysis.

+lyse comb. form denoting decompose, breakdown, or lyse (of or by something indicated); e.g. autolyse, cytolyse, electrolyse, hemolyse, hydrolyse.

lysergamide lysergic acid amide. All known ergot alkaloids are derivatives of D-lysergamide, the simplest being ergonovine.

lysergic acid 9,10-didehydro-6-methylargoline-8β-carboxylic acid an alkaloid obtained from **ergot**; it is a tetracyclic indole derivative. Lysergic acid diethylamide (abbr.: LSD) is a powerful hallucinogenic substance. (Illustrated top right.)

lysin any agent, such as an antibody, enzyme, toxin, etc., that is able to lyse cells.

+lysin comb. form denoting an (indicated) agent that effects, or can effect, lysis, specifically the lysis of cells (cytolysis).

lysinate 1 lysine anion; the anion, H₂N-[CH₂]₄-CH(NH₂)-COO⁻, derived from lysine. 2 any salt containing lysine anion, 3 any ester of lysine.

H COOH

lysergic acid

lysine the trivial name for α,ε-diaminocaproic acid; 2,6-diaminohexanoic acid; H₂N-[CH₂]₄-CH(NH₂)-COOH; a chiral α-amino acid. L-Lysine (symbol: K or Lys), (S)-2,6-diaminohexanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: AAA or AAG. In mammals it is an essential dietary amino acid and is ketogenic. D-Lysine (symbol: D-Lys or DLys), (R)-2,6-diaminohexanoic acid, is a substrate for **lysine racemase** and D-lysine 5,6-aminomutase. The conversion of D-lysine to L-pipecolic acid, and of the latter to L-lysine, occurs in Nicotiana glauca and in Neurospora crassa.

D-lysine 5.6-aminomutase EC 5.4.3.4; other name: $D-\alpha$ -lysine mutase; an enzyme that catalyses the reaction:

D-lysine = 2,5-diaminohexanoate;

cobalamin is a cofactor.

lysine(arginine) carboxypeptidase EC 3.4.17.3; other names: carboxypeptidase N; arginine carboxypeptidase; kininase I; anaphylotoxin inactivator; an enzyme that hydrolyses peptidyl-L-lysine (or L-arginine) to peptide and L-lysine (or L-arginine). It inactivates bradykinin complement components. C3a and C5a by removal of the C-terminal Arg. Example (precursor) from human: database code CBPN_HUMAN, 458 amino acids (52.23 kDa).

lysine (base) a lysine residue when the ϵ -amino group is unprotonated.

lysine hydroxylase see procollagen-lysine 5-dioxygenase.

lysine intolerance a genetically determined metabolic defect of humans in which the ingestion of relatively large amounts of lysine (in protein) causes hyperlysinemia, hyperammonemia, and coma. It is possibly attributable to deficient activity of lysine dehydrogenase (L-lysine:NAD+ oxidoreductase, EC 1.4.1.15).

lysine 6-monooxygenase see monoxygenase.

lysine racemase EC 5.1.1.5; an enzyme catalysing the reaction: L-lysine = D-lysine.

lysine vasopressin see [8-lysine]vasopressin.

[8-lysine]vasopressin abbr.: [Lys⁸]vasopressin; nonproprietary name: lypressin; the molecular form of vasopressin in which the variable eighth position in its amino-acid sequence is occupied by a lysine residue. This is the form of the hormone present in pigs and a few other related mammals. It is sometimes incorrectly designated as lysine vasopressin.

lysinium 1 the usual term for lysinium(1+); the monocation of **lysine**. In theory, the term denotes any ion or mixture of ions formed from lysine and having a net charge of +1, although the species H₃N⁺-[CH₂]₄-CH(NH₃⁺)-COO generally predominates in practice. 2 the systematic name for lysinium(2+); the dication of lysine.

n. 3 any ester of lysine.

389 lysino

1 N²-lysino the alkylamino group, $H_2N-[CH_2]_{a-1}$ ivsino CH(COOH)-NH-, derived from lysine by loss of a hydrogen atom from its α -amino group. 2 N⁶-lysino the alkylamino group, HOOC-CH(NH₂)-[CH₂]₄-NH-, derived from lysine by

loss of a hydrogen atom from its ε -amino group.

lysis 1 (in chemistry) the breaking down of a substance by the splitting of its molecules into two parts; the rupture of a covalent bond. 2 (in biology) the disintegration of cells or cell organelles by rupture of their outer membranes. 3 (in medicine) the gradual diminution in the severity of the symptoms of a disease; remission.

+lysis comb. form denoting breaking down, decomposition, disintegration, or dissolution. The first element of the word may indicate: (1) the agent, e.g. electrolysis, hydrogenolysis, biolysis; (2) the substance or object affected, e.g. glycolysis, lipolysis; or (3) some other characteristic, e.g. autolysis, catalysis, heterolysis, homolysis. —+lytic adj.

lyso+ or (before a vowel) lys+ 1 comb. form indicating a dissolving or loosening; denoting lysis or the products of lysis. 2 prefix (to the name of a phospholipid) denoting removal of one of its two acyl groups; a locant may be used to designate the site of (hydro)lysis, e.g. 2-lyso designates deacylation at position 2. The term originated from the fact that such compounds are hemolytic, but it is now used to indicate a limited deacylation.

lysochrome any substance that will dissolve in lipids and col-

lysogen 1 any lysogenic bacterium. 2 any antigen that stimulates lysin production.

lysogenesis 1 an alternative term for lysogeny. 2 the production of a lysin or lysis.

lysogenic 1 pertaining to, or capable of producing or undergoing lysis (def. 1). 2 of, or relating to lysogeny. —lysogenicity n.

lysogenic bacterium any bacterium carrying a temperate bacteriophage as a prophage integrated into the bacterial genome. It has the potential to produce and release infective bacteriophages as a stable, heritable trait, which may become activated spontaneously or in response to certain stimuli. Moreover, it is immune to lytic infection by the same or closely related phages.

lysogenic conversion see bacteriophage conversion.

lysogenic virus any virus capable of becoming a prophage.

lysogenize or lysogenise to convert a nonlysogenic bacterial strain into a lysogenic strain by infection with a temperate bacteriophage, with resultant incorporation of the phage into the bacterial genome. —lysogenization or lysogenisation n.

lysogeny or lysogenesis the state created in a bacterial cell when the prophage of a temperate bacteriophage is incorporated into the bacterial genome as a stable, heritable character. Such a cell can be activated to produce and release mature phage, with accompanying cell lysis. See also lysogenic bacterium.

Lys(5-OH) symbol for a residue of the α -amino acid 5-hydroxy-L-lysine (less-preferred alternative to Hyl or 5Hyl).

Lysol the proprietary name for a disinfectant consisting of a mixture of o-, m-, and p-cresols solubilized with an excess of a potassium soap.

lysolecithin a former name for lysophosphatidylcholine.

lysolecithin acyltransferase see 1-acylglycerophosphocholine O-acvitransferase

lysophosphatidic acid any phosphatidic acid deacylated at positions 1 or 2.

lysophosphatidyl any phosphatidyl group deacylated at posi-

lysophosphatidylcholine or (formerly) lysolecithin any phosphatidylcholine (i.e. lecithin) deacylated at positions 1 or 2.

lysophospholipid any phospholipid deacylated at positions 1 or

lysoplasmenic acid any derivative of sn-glycero-3-phosphate that has an O-(1-alkenyl) residue on carbon-1, the hydroxyl lysoplasmenyl any plasmenyl group in which the hydroxyl group in position 2 is unsubstituted.

lysosomal carboxypeptidase B see cysteine-type carboxypeptidase.

lysosomal carboxypeptidase C see lysine pro-X carboxypepti-

lysosomal Pro-X carboxypeptidase EC 3.4.16.2; other names: proline carboxypeptidase; angiotensinase C; lysosomal carboxypeptidase C; an enzyme that catalyses the cleavage of a Pro-|-Xaa bond to release a C-terminal amino acid. Example from human: database code A47352, 496 amino acids (55.74 kDa).

lysosomal storage disease any of a group of hereditary diseases, with widely varying manifestations, in which there is deficiency of a single lysosomal enzyme associated with abnormal deposits (of substrate) within membrane-bound vesicles. The group is subdivided into the following classes: type II glycogen disease, mucopolysaccharidoses, sphingolipidoses, mucolipidoses, and a few others.

lysosome any of a group of related cytoplasmic, membranebound organelles that are found in most animal cells and that contain a variety of hydrolases, most of which have their maximal activities in the pH range 5-6. The contained enzymes display latency if properly isolated. About 40 different lysosomal hydrolases are known and lysosomes have a great variety of morphologies and functions. —lysosomal adj.

lysostaphin EC 3.5.1.—; an enzyme that hydrolyses polyglycine links in peptidoglycans. Zinc is a cofactor. Its physiological role is likely to be in the remodelling of the bacterial sacculus during growth. Example (prepro precursor) from Staphylococcus simulans: database code LSTP_STASI, 389 amino acids (42.19 kDa). The C terminus has some similarity to autolysin.

lysozyme EC 3.2.1.17; systematic name: peptidoglycan Nacetylmuramoylhydrolase; other name: muramidase. An enzyme that hydrolyses β -1,4-linkages between N-acetylmuramic acid and 2-acetamido-2-deoxy-D-glucose residues in peptidoglycan heteropolymers (mucopolysaccharide or muropeptide) of prokaryote cell walls. It occurs in tears, other exocrine secretions, and in very large amounts in the white of eggs of birds. The antibacterial action of lysozyme depends on the cleavage of the $\beta(1\rightarrow 4)$ glycosidic linkage between alternating units of N-acetylmuramic acid and N-acetylglucosamine that form long-chain mucopolysaccharides in the cell walls of bacteria such as Micrococcus luteus. There are a number of types of lysozyme, designated A-G. They belong to the lactalbumin/lysozyme family. Example of egg-white lysozyme from Gallus gallus (domestic fowl): database code NRL_4LYM, 129 amino acids (14.30 kDa); 3-D structure known (first enzyme of which this was true).

[Lys⁸]vasopressin abbr. for [8-lysine]vasopressin.

lysyl the acyl group, H₂N-[CH₂]₄-CH(NH₂)-CO-, derived from lysine.

lysylbradykinin or Lys-bradykinin an alternative name for kallidin; see bradykinin.

lysyl endopeptidase EC 3.4.21.50; other names: Achromobacter proteinase I; lysyl bond specific proteinase. An extracellular bacterial serine proteinase that preferentially cleaves at Lys-|-Xaa, including Lys-|-Pro.

lysyl oxidase EC 1.4.3.13; recommended name: protein-lysine 6-oxidase; systematic name: protein-L-lysine:oxygen 6-oxidoreductase (deaminating). An enzyme that catalyses a reaction between peptidyl-L-lysyl-peptide, H₂O and dioxygen to form peptidyl-allysyl-peptide, NH3, and H2O2. Example (precursor) from human: database code LYOX_HUMAN, 417 amino acids (46.89 kDa). See also allysine.

+lyte comb. form indicating a substance that can be decomposed, broken down, or lysed.

lytic 1 of, pertaining to, or resulting from lysis. 2 of, or pertaining to a lysin.

+lytic see +lysis.

group in position 2 being unsubstituted.

lyticase a jargon term for a combination of enzymes, with min-Ban dang dọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

lytic cycle

ly hornest

imal amounts of nucleases, that displays two major activities: β -1,3-glucanase and a highly specific alkaline protease. It is prepared from *Oerskovia xanthineolytica* and is useful in removing cell walls from yeasts and fungi, causing extremely rapid cell lysis.

lytic cycle the sequence of events occurring when a sensitive bacterium is infected by a virulent bacteriophage. The phage diverts the metabolism of the cell to the exclusive production of progeny phage, resulting in the lysis of the host cell with liberation of phage.

α-lytic endopeptidase EC 3.4.21.12; a bacterial serine proteinase, a homologue of chymotrypsin, that hydrolyses proteins, especially at bonds adjacent to L-Ala and L-Val residues in bacterial cell walls, elastin, and other proteins. Example from Lysobacter enzymogenes: database code NRL_2ALP, 198 amino acids (19.84 kDa); 3-D structure known.

lytic virus any virus including bacteriophages whose multiplication in a host cell leads to lysis of that cell.

Lyx symbol for a residue (or sometimes a molecule) of the aldopentose lyxose.

Iyxo+ prefix (in chemical nomenclature) indicating a particular configuration of a set of three (usually) contiguous >CHOH groups, as in the acyclic forms of D- or L-lyxose. See monosaccharide.

lyxose symbol: Lyx; a trivial name for the aldopentose, lyxopentose; the C-2 epimer of xylose, rare in nature.

α-p-lyxose (pyranose form)

Mm

m symbol for 1 metre. 2 milli+ (SI prefix denoting 10^{-3} times).

m+ prefix (in peptide hormone nomenclature) denoting mouse, murine; derived, or as if derived, from a mouse.

m, symbol for relative electrophoretic mobility.

m symbol for 1 mass; the various associated terms are distinguished by subscripts: m_e , symbol for electron rest mass; m_n , symbol for neutron rest mass; m_p , symbol for proton rest mass; m_u , symbol for atomic mass constant. 2 molality (alternative to b). 3 (bold italic) magnetic moment.

m- prefix (in chemical nomenclature) denoting meta-. Compare o-.p-.

M symbol for 1 mega+ (SI prefix denoting 10^6 times). 2 a residue of the α -amino acid L-methionine (alternative to Met). 3 a residue of an incompletely specified base in a nucleic-acid sequence that may be either adenine or cytosine. 4 mesomeric effect. 5 a metal (in chemical formulae). 6 molar (concentration), i.e. moles per litre (alternative to M or M; mol dm⁻³ is recommended). 6 6-mercaptopurine ribonucleoside, 6-thioinosine.

M symbol for molar (concentration), i.e. moles per litre (alternative to M or M; mol dm⁻³ is the recommended form).

α₂-M abbr. for α₂-macroglobulin.

M symbol for 1 mass, especially molar mass; related terms are designated by subscripts: $M_{\rm m}$, symbol for mass-average molar mass (see average molar mass); $M_{\rm n}$, symbol for number-average molar mass (see average molar mass); $M_{\rm o}$, symbol for mean relative residue mass; $M_{\rm r}$, symbol for relative molecular mass; $M_{\rm w}$, symbol for weight-average molar mass; $M_{\rm z}$ symbol for Z-average molar mass (see average molar mass). 2 molar (concentration), i.e. moles per litre (alternative to M or M; no longer recommended; use mol dm⁻³). 3 (or $M_{\rm v}$) luminous exitance. 4 (or $M_{\rm e}$) radiant exitance. 5 (bold italic) magnetization. 6 (bold italic) moment of a force.

MAA abbr. for macroaggregated (human serum) albumin.

MAC abbr. for 1 membrane attack complex. MAC 1 is a cell-surface glycoprotein of monocytes, macrophages, and granulocytes that is implicated in adhesive interactions of these cells as well as in mediating the uptake of complement-coated particles. It probably recognizes the RGD peptide in **complement** component C3b. It is a heterodimer of $\alpha_{\rm M}$ and $\beta_{\rm 2}$ chains (see integrin). Examples: (human) MAC 1 $\alpha_{\rm M}$ (precursor): database code ITAM_HUMAN, 1153 amino acids (127.16 kDa); MAC 1 $\beta_{\rm 2}$ (precursor): database code ITB2_HUMAN, 769 amino acids (84.69 kDa). 2 mammalian artificial chromosome.

MACIF abbr. for membrane attack complex inhibition factor. **MAC-IP** abbr. for MAC-inhibitory protein (i.e. **CD59**).

mackerel any marine fish of the subfamily Scombroidei. These fish are of importance as food fish, and their flesh is rich in oils with a relatively high content of n-3 fatty acids; typical composition (major fatty acids, expressed as percentage of total fatty acids): 14:0, 8%; 16:0, 16%; 18:0, 2%; 16:1 (n-7) 8%; 18:1 (n-9), 8%; 18:1 (n-7), 4%; 18:4 (n-3), 2%; 20:1 (n-9), 11%; 20:5 (n-3), 8%; 22:1 (n-11), 13%; 22:6 (n-3), 8%

Macleod, John James Richard (1876–1935), British physiologist and biochemist; Nobel Laureate in Physiology or Medicine (1923) jointly with F. G. Banting 'for the discovery of insulin'. maconha see cannabis.

macro+ or (before a vowel) macr+ comb. form 1 denoting large, long, or great in size or duration; large-scale. 2 denoting larger than normal, overdeveloped. Compare micro+.

macroaggregate any macromolecular aggregate large enough to be visible to the unassisted eve.

macrocycle any macrocyclic compound.

macrocyclic 1 (in chemistry) describing any compound containing a ring structure consisting of a large number (usually 15 or more) atoms. 2 (in biology) having a long life cycle.

macrocytic anemia anemia in which the circulating erythro-Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

cytes are larger than normal. It is often due to deficiency of vitamin B_{12} (cobalamin) or folic acid.

macroglobulin any plasma globulin of >400 kDa. Macroglobulins include immunoglobulin M, α₂-macroglobulin, and many lipoproteins.

 α_2 -macroglobulin abbr.: α_2 -M; a glycoprotein found in vertebrate plasma that strongly inhibits proteinases of all classes. In humans it constitutes about one third of the α_2 globulins; in hypoalbuminemia its synthesis is enhanced, when it constitutes a major proportion of the increased a₂-globulin band on electrophoresis strips. Human α₂-M is a 726 kDa molecule comprising two pairs of disulfide-linked, identical 185 kDa subunits, which also contain heterodetic peptide rings containing reactive thiol ester linkages, each formed between the γ -carboxyl group of a glutamic residue and the thiol group of a cysteine residue in the same peptide chain. It can inhibit all four classes of proteinase by a mechanism involving a bait region. This contains specific sites, cleavage of which induces a conformational change that results in trapping of the proteinase: following cleavage in the bait region a thiol-ester bond is hydrolysed and mediates the covalent binding of the protein to the proteinase; subsequently ε -amino groups of the proteinase react with the thiol-ester linkages in the inhibitor to form stable amide links. The entrapped proteinase is then able to act on substrates of low molar mass only. Example, subunit precursor from human: database code A2MG_ HUMAN, 1474 amino acids (163.09 kDa).

macroglobulinemia or (esp. Brit.) macroglobulinaemia a condition in humans in which there is an increase in the concentration of macroglobulins, especially immunoglobulin M, in the blood. It is often associated with lymphocyte tumours.

macro histone 2A abbr.: macro H2Aa; the counterpart of histone H2A that replaces this in certain nucleosomes, with an implied role in nucleosome positioning. Example from rat: database code H2AM_RAT, 367 amino acids (38.91 kDa).

macroion an ion of a macromolecule, especially one that does not pass through a dialysis membrane.

macrolide any of a large group of structurally related antibiotics produced by Streptomyces spp. They contain a large lactone ring (see +olide) with few or no double bonds and no nitrogen atoms, linked glycosidically to one or more sugar moieties. The macrolides include the carbomycins, the erythromycins, oleandomycin, oligomycins, and the spiramycins. They are active mainly against Gram-positive bacteria and they inhibit the early stages of protein synthesis.

macroligand (sometimes) any macromolecular ligand.

macrometabolite (sometimes) any metabolite present in a system in reasonably high concentration, especially as opposed to a trace metabolite, i.e. one present in extremely small concentrations.

macromolecule any molecule composed of a very large number of atoms, operationally defined as any molecule of mass greater than about 10 kDa (and ranging up to 10² MDa or more) that is incapable of passing through the pores of dialysis tubing as generally used. The term includes nucleic acide and most polysaccharides and proteins. Compare micromolecule. —macromolecular adj.

macronutrient any element that is required by living organisms in relatively large quantities for normal growth. Compare micronutrient.

macrophage any cell of the mononuclear phagocyte system that is characterized by its ability to phagocytose foreign particulate and colloidal material. Macrophages occur in connective tissue, liver (Kupffer cells), lung, spleen, lymph nodes, and other tissues. They contain prominent lysosomes, stain with vital dyes, and solay an important part in nonspecific immune reactions.

macrophage-activating factor abbr.: MAF; see lymphokine. macrophage-colony stimulating factor see colony stimulating factor.

macrophage inflammatory protein abbr.: MIP; any of a number of cytokines produced by B and T cells, monocytes, mast cells, and fibroblasts. MIP 1α is a chemoattractant for monocytes, T cells, and eosinophils; it also inhibits hematopoietic stem cell production; example from Mus musculus: database code MIIA_MOUSE, 92 amino acids (10.34 kDa); residues 1–23 are the signal peptide. MIP 1β is a chemoattractant for monocytes and T cells and is an adhesion molecule binding to β_1 (VLA family) integrins; example from M. musculus: database code MIIB_MOUSE, 92 amino acids (10.17 kDa); residues 1–23 are the signal peptide.

macrophage migration enhancement factor see lymphokine

macrophage migration inhibitory factor abbr.: MIF; other name: delayed early response protein 6; a lymphokine that is released by primed lymphocytes on incubation with the priming antigen. It inhibits the migration of macrophages out of macrophage-rich tissue such as spleen, and is probably a mediator of macrophage participation in inflammation. Example from human: database code MIF_HUMAN, 114 amino acids (12.30 kDa).

macrophage system see mononuclear phagocyte system.

macropipette (sometimes) a pipette of similar construction to a standard plunger-type micropipette but of capacity in the range 0.25-5 mL.

macropore any pore (in a gel or porous solid) whose width is greater than about 50 nm. Compare mesopore, micropore.
—macroporous adi.

macroreticular describing a three-dimensional polymer with a very open structure, the cross links being widely spaced.

macroscopic 1 of a size that is visible to the unaided eye.

Compare microscopic (def. 1). 2 concerned with large units.

Compare microscopic (def. 2). 3 relating to the behaviour of atoms or molecules in bulk. Compare microscopic (def. 3).

—macroscopically adv.

macroscopic equilibrium constant any constant describing the overall equilibrium between two chemical entities that may be interconverted through two or more alternative intermediates. Compare microscopic equilibrium constant.

macrosolute an operational term describing any solute of a size larger than will pass through a membrane of a specified pore size or permeability limit.

macrotetrolide or macrotetralide any of a group of antibiotics characterized structurally by the presence of a 32-membered ring built up of four hydroxy-acid residues and containing four ether and four ester bonds; the group includes nonactin and related antibiotics. Some similar compounds have an open-chain structure, e.g. monensin and nigericin.

macula adherens an alternative term for desmosome.

MadCAM abbr. for mucosal addressin cell adhesion molecule; MadCAM 1, $M_{\rm r}$ 58-66 kDa, is a member of the immunoglobulin superfamily of adhesion molecules. It is constitutively expressed on endothelial cells of post-capillary venules. It mediates lymphocyte homing to mucosal lymphoid organs and lamina propria venules, and binds L-selectin and integrin $\alpha_4\beta_7$. Example from Mus musculus: database code 533601, 405 amino acids (43.65 kDa).

mad cow disease an informal name for bovine spongiform encephalopathy.

madder the ground root of Rubia tinctoria, used as a plant dyestuff; the principal component is ruberythric acid.

MAF abbr. for macrophage-activating factor; see lymphokine.

magainin any of several antibiotic peptides from Xenopus skin, whose pore-forming activity (see PFP) results in the permeabilization of bacterial membranes. They have a wide spectrum of action against bacteria, protozoa, and fungi. Magainin I has the sequence

magainin II is (Lys¹⁰,Asn²²)-magainin I. An analogue with greater antibiotic potency is (Ala^{8,13,18})-magainin II amide. *Compare* dermaseptin.

magic spot I see magic spot (compound), ppGpp.
magic spot II see magic spot (compound), pppGpp.

magic spot (compound) abbr.: MS; either of the guanosine polyphosphates produced when stringent strains of Escherichia coli are starved of an amino acid required for protein synthesis. MS I is guanosine 5'-diphosphate 2'-(or 3')-diphosphate (symbol: ppGpp); MS II is guanosine 5'-triphosphate 2'-(or 3')-diphosphate (symbol: pppGpp).

magnesium symbol: Mg; a metallic element – an alkaline earth metal – of group 2 of the IUPAC periodic table; atomic number 12; relative atomic mass 24.305. It occurs naturally only in the combined state and is a mixture of stable nuclides of mass 24, 25, and 26. Magnesium is one of the most abundant elements of the Earth's crust and an essential component of all living material. It forms a divalent cation, Mg²⁺, which is a component of chlorophyll, occurs in bone, and is an essential cofactor for many enzymes, including the majority of enzymes utilizing ATP. It is a major biological cation, the fourth most abundant cation in the human, much of it being in the skeleton; the range in normal human plasma is 0.8–1.2 mmol L⁻¹. An excretion mechanism in the kidney is partly regulated by parathyroid hormone. See also magnesium-28.

magnesium-28 the artificial radioactive nuclide of magnesium, $^{18}_{2}$ Mg, of half-life 21.2 h. It emits a moderate-energy beta particle (i.e. electron) (0.46 MeV max.) and gamma radiation of various energies (1.35, 0.95, 0.40, and 0031 MeV).

magnesium porphyrin a general term for chlorophyll.

magnet any body that can produce an appreciable magnetic field external to itself. Magnets may be either permanent or temporary.—magnetic adj.

magnetic circular dichroism spectroscopy circular dichroism spectroscopy in the presence of a magnetic field.

magnetic constant symbol: μ_0 ; an alternative name for permeability of vacuum.

magnetic dipole moment symbol: m or μ (italic bold); a vector quantity indicating the strength of a magnet: the product of a magnet's dipole moment and the ambient **magnetic flux density** gives the torque on the magnet. The SI unit is the A m² (ampere square metre = joule per tesla (J T⁻¹)).

magnetic field 1 a field of force existing in the neighbourhood of either a permanent magnet or a circuit carrying an electric current. Another magnet will experience a couple when placed in a magnetic field. 2 an alternative name for magnetic field strength.

magnetic field strength or magnetic field or (formerly) magnetic intensity symbol: H (italic bold); a vector quantity, the magnetizing force at any point in a medium. It is measured by a couple that would act on a small magnet of unit moment placed at that point with its axis at right angles to the direction of the magnetic field. It is the magnetic flux density, B, divided by the permeability, μ ; i.e. $H = B/\mu$. The SI derived unit $H = A \text{ m}^{-1}$.

magnetic flux symbol: Φ ; a measure of the total strength of a magnetic field, defined as the scalar product of the magnetic flux density and the area. The SI derived unit is the **weber**.

magnetic flux density or magnetic induction symbol: **B** (italic bold); a pseudovector quantity, the magnetic flux passing through unit area of a magnetic field orthogonal to the magnetic force. The SI derived unit is the tesla.

magnetic force the force exerted by a magnetic field on a magnetic pole or a moving electric charge. It may be either attractive or repulsive.

magnetic immunoassay abbr.: MAIA; a variant of radioimmunoassay in which the antibody is bound to a particulate, inert, magnetic support material – e.g. cellulose containing embedded grains of iron oxide, Fe₃O₄ – and separation of antigen-antibody complexes from free antigen is effected with the aid of a powerful magnet.

GIGKFLHSAGKFGKAFVGEIMKS; the aid of a powerful magnet. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

magnetic induction an alternative term for magnetic flux

magnetic intensity a former name for magnetic field strength. magnetic lens an alternative name for a magnetic electron lens. magnetic moment 1 symbol: μ ; a property of a charged particle arising from its spin; $\mu = eL/2mc$, where c is the velocity of light, L is the angular momentum of the particle, e is its charge, and m is its mass. The SI unit is joule per tesla. The electron magnetic moment (symbol: μ_e) is equal to 9.284 7701 \times $10^{-24} \,\mathrm{J} \,\mathrm{T}^{-1}$. The proton magnetic moment (symbol: $\mu_{\rm p}$) is equal to 1.410 607 61 \times 10⁻²⁶ J T⁻¹. 2 an alternative name for magnetic dipole moment.

magnetic permeability see permeability, permeability of vacuum. magnetic pole either of the two regions of a magnet into which the lines of force of the magnetic field converge or from which they diverge. They are designated north (or north-seeking) and south (or south-seeking) according to whether they are attracted to the Earth's north or south pole.

magnetic resonance see electron-spin resonance spectroscopy, nuclear magnetic resonance.

magnetic resonance imaging abbr.: MRI; an imaging technique that uses nuclear magnetic resonance (NMR) to investigate the state of tissues in the intact body; it is so-called to avoid the use of the term 'nuclear' in the treatment of patients. It has the advantage that it is non-invasive. A magnet large enough to surround a part of the body is used in conjunction with computer analysis to provide an image resulting from the NMR signals. The technique can distinguish extracellular water from that inside cells; this distinction is used to reveal certain types of tissue damage.

magnetic resonance zeugmatography see zeugmatography. magnetic shielding 1 protection from the effects of an external magnetic field. 2 (in nuclear magnetic resonance spectroscopy) the reduction of the applied magnetic field at an atomic nucleus (as compared with that applied to the whole sample) brought about by the electron cloud of the molecule.

magnetic stirrer any apparatus for stirring a liquid in which a follower – usually a small bar magnet coated in glass or plastic - may be caused to oscillate or rotate within the liquid under the influence of a more powerful magnet outside the container. Motion of the external magnet is controlled by a variable-speed electric motor. The term is sometimes applied specifically to the follower.

magnetic susceptibility symbol: X or (sometimes) X_m or K; the ratio of the magnetization, M, produced in a substance to the magnetic field strength, H, applied to it, i.e.

$$X = M/H = \mu_{\rm r} - 1$$
,

where μ_r is the relative permeability of a vacuum. Paramagnetic materials have positive magnetic susceptibilities, diamagnetic materials have negative magnetic susceptibilities. (Note: the symbol μ_m is reserved for molar magnetic susceptibility.)

magnetism 1 the property of producing, or being affected by, magnetic flux. 2 the branch of physics concerned with magnets and magnetic phenomena.

magnetite or magnetic iron oxide or black iron oxide ferrosoferric oxide; iron(II)-diiron(III) oxide; Fe₃O₄; a strongly magnetic black mineral form of iron oxide.

magnetization or magnetisation 1 the act or process of magnetizing. 2 symbol: M (italic bold); the magnetic moment per unit volume of a magnetized body; i.e. the difference between the ratio of the magnetic flux to the permeability of vacuum and the magnetic field strength. The SI unit is the ampere per metre.

magnetization-transfer nuclear magnetic resonance spectroscopy a procedure in nuclear magnetic resonance spectroscopy in which one of the resonances is saturated by a strong radiofrequency field, and the changes in the other resonances are observed. It is useful in measuring the rates of chemical exchange processes.

magnetize or magnetise to induce a magnetic flux density in

magnetogyric ratio see gyromagnetic ratio.

magneton a unit of magnetic moment. The Bohr magneton (symbol: μ_B) refers to an electron of mass m_e ; the nuclear magneton $(symbol: \mu_N)$ refers to a proton of mass m_p . They are related by the equation: $\mu_N = (m_e/m_p)\mu_B$.

magnetophoresis the movement of magnetizable particles through a fluid under the action of a magnetic field. It is useful for separating of dispersed cells to which ferromagnetic microspheres have been conjugated. —magnetophoretic adj.

magnification (in microscopy) the apparent linear enlargement of an object when viewed through a lens, system of lenses (as in a microscope, telescope, etc.), or other instrument. It is given by the ratio of the apparent diameter of the object, as seen using the lens, to its real diameter, as seen unaided.

Magnogel a proprietary name for a bead-form support material useful in immunosorption and related procedures. It is similar to Ultrogel but contains embedded particles of iron oxide, Fe₃O₄, that enable the beads to be drawn to and held on the walls of the container by magnetism.

MAIA abbr. for magnetic immunoassay.

Maillard reaction a nonenzymic reaction in which a reducing sugar combines at its anomeric carbon atom with an amino group of an amino acid, peptide, or protein to form first a Schiff base and then, by an Amadori rearrangement, the corresponding ketoamine. The reaction is the initial step of a series that may occur during the processing and/or storage of food and that can result in a loss of nutritive value and the formation of a brown coloration; hence it is also known as the browning reaction. It may also be the reaction leading to the formation of hemoglobin A_{1c} in the erythrocyte. [After Louis Camille Maillard (1878-1936).]

major groove the larger and deeper of the two spiral grooves on the surface of a double-helical B-DNA molecule. Compare minor groove.

major histocompatibility complex abbr.: MHC; a complex of genetic loci occurring in higher vertebrates that encodes a family of cellular antigens, known in mice as histocompatibility-2 antigens (abbr.: H-2 antigens; see histocompatability antigen) and in humans as human leukocyte-associated antigens (abbr.: HLA antigens; see HLA histocompatibility system). The MHC antigens are cell-surface glycoproteins and may be divided into two classes, designated I and II. In transplantation reactions, cytotoxic T lymphocytes respond mainly against foreign MHC glycoproteins of class I together with antigen, while the response against class II and antigen is mainly by helper T lymphocytes.

Class I MHC antigens (or transplantation antigens) are glycoproteins found on the surface of most nucleated somatic cells that enable the immune system to distinguish self from foreign cells. They are encoded by three separate loci (H-2K, H2-D, and H-2L in mice; HLA-A, HLA-B, and HLA-C in humans). The antigenic activity resides in a single polypeptide chain, the a subunit, of ≈45 kDa (roughly 345 amino acids) inserted into the cell membrane with a short hydrophilic C-terminal segment inside the cell, a short hydrophobic segment traversing the membrane, and a large carbohydrate-containing N-terminal segment. This N-terminal segment is folded into three separate domains (two of which contain a single intrachain disulfide bond) and exposed to the cell exterior, where it is noncovalently linked with the β subunit, an 11.5 kDa molecule also called β₂ microglobulin, which is homologous with a single Ig-like domain (see immunoglobulin fold). In humans, these proteins are also referred to as HLA class I.

Class II MHC antigens are found on the surface of only certain cell types; these include most B lymphocytes, some T lymphocytes, and some macrophages and macrophage-like cells. They are encoded by murine I-region (abbr.: Ir) genes and human HLA-D genes, and are two-chain proteins having a ≈33 kDa α chain and a 28 kDa β chain; the C-terminal regions of both subunits (α and β) have transmembrane and intracel-(something); to cause (something) to exhibit magnetism (def. 1). lular domains. Celiac disease is due to an allelic variant in one Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

major tranquillizer

malic en:

class-II gene. Example, α from human B-lymphoblastoid cell line: database code HUMMHDRARN, 229 amino acids (25.83 kDa); β-1 from human B-lymphocyte cell line: database code HUMMHDRBWB, 94 amino acids (11.40 kDa).

major tranquillizer a term, now deprecated, for any drug used to treat major psychosis, e.g. schizophrenia or mania; the term neuroleptic is now recommended.

MAK abbr. for methylated albumin-kieselguhr; a substance used as a medium for chromatography.

Mal 1 (when linked to one other group) symbol for the univalent maleyl group. 2 (when linked to two other groups) symbol for the bivalent maleoyl group.

malate 1 a trivial name for hydroxysuccinate; hydroxybutanedioate; -OOC-CH₂-CH(OH)-COO-; the dianion of malic acid, a chiral hydroxydicarboxylic acid. The (+)-enantiomer, (S)-malate (also designated L-malate), is an important intermediate in metabolism as a component of both the tricarboxylic-acid cycle and the glyoxylate cycle. 2 any mixture of free malic acid and its mono- and dianions. 3 any salt or ester of malic acid.

malate-aspartate cycle or malate cycle an intracellular metabolic cycle, also known as the malate-aspartate shuttle or malate shuttle, that can transfer reducing equivalents from the cytoplasm to the mitochondria in liver and other tissues. Oxaloacetate formed inside the mitochondria is there converted by a transaminase into aspartate, which passes through the mitochondrial membrane on a specific carrier; a similar transaminase in the cytoplasm converts this aspartate back into oxaloacetate, which then reacts with cytoplasmic NADH, in a reaction catalysed by cytoplasmic malate dehydrogenase, to form (S)-malate and NAD⁺. The malate thereupon passes back into the mitochondria, where it is dehydrogenated again to oxaloacetate, with concomitant reduction of mitochondrial NAD⁺ to NADH and completion of the cycle.

malate dehydrogenase 1 abbr.: MDH or (in clinical chemistry) MD; EC 1.1.1.37; recommended name: malate dehydrogenase; systematic name: (S)-malate:NAD+ oxidoreductase; other name: malic dehydrogenase. An important and widespread enzyme that interconverts malate and oxaloacetate according to the reaction:

(S)-malate +
$$NAD^+$$
 = oxaloacetate + $NADH$.

In yeast, e.g., there are three isoenzymes: cytoplasmic, gly-oxysomal, and of the mitochondrial matrix. Example from yeast mitochondrial matrix, homodimer (precursor): database code MDHM_YEAST, 334 amino acids (35.53 kDa). 2 EC 1.1.1.82; recommended name: malate dehydrogenase (NADP+); systematic name: (S)-malate:NADP+ oxidoreductase. A chloroplast enzyme required for both C₃ and C₄ pathways (see reductive pentose phosphate cycle, Hatch-Slack pathway) to allow plants to circumvent the problem of photorespiration. It catalyses the reaction:

(S)-malate + $NADP^+$ = oxaloacetate + NADPH.

Example (precursor) from maize: database code MDHC_MAIZE, 432 amino acids (46.81 kDa). See also malate dehydrogenase (decarboxylating).

malate dehydrogenase (decarboxylating) any of several enzymes that bring about the oxidation of malate with simultaneous decarboxylation of the product to pyruvate. They include: (1) Malate dehydrogenase (oxaloacetate decarboxylating), EC 1.1.1.38; systematic name: (S)-malate:NAD+ oxidoreductase (oxaloacetate decarboxylating); other names: malic en-

zyme; pyruvic-malic carboxylase; malate oxidoreductase; it catalyses the reversible reaction:

(S)-malate + NAD⁺ = pyruvate +
$$CO_2$$
 + NADH.

Example, mitochondrial enzyme (a tetramer that can use NADP+) from human (precursor): database code MAOM_ HUMAN, 584 amino acids (65.37 kDa). (2) Malate dehydrogenase (decarboxylating), EC 1.1.1.39; systematic name: (S)malate: NAD+ oxidoreductase (decarboxylating); other names: malic enzyme; pyruvic-malic carboxylase; it catalyses a reaction between (S)-malate and NAD+ to form pyruvate, CO₂, and NADH. (3) Malate dehydrogenase (oxaloacetate decarboxylating) (NADP+), EC 1.1.1.40; systematic name: (S)malate: NADP+ oxidoreductase (oxaloacetate decarboxylating); other names: malic enzyme; pyruvic-malic carboxylase; it catalyses a reaction between (S)-malate and NADP⁺ to form pyruvate, CO2, and NADPH. It is an important enzyme in generating NADPH in the cytosol of mammals. Thus types 1 and 2 utilize NAD+, while only types 1 and 3 decarboxylate added oxaloacetate, which leads to three activities being distinguished. (4) D-Malate dehydrogenase (decarboxylating), EC 1.1.1.83; systematic name: (R)-malate:NAD+ oxidoreductase (decarboxylating); it catalyses a reaction between (R)malate and NAD+ to form pyruvate, CO2, and NADH.

malate synthase EC 4.1.3.2; systematic name: L-malate gly-oxylate-lyase (CoA-acetylating); other names: malate synthetase; malate condensing enzyme; glyoxylate transacetylase. An enzyme that catalyses the formation of L-malate and CoA from acetyl-CoA, H₂O, and glyoxylate. This is the second step in the glyoxylate bypass, an alternative to the complete tricarboxylic-acid cycle (in bacteria and plants). Example from Escherichia coli: database code MASY_ECOLI, 533 amino acids (60.21 kDa).

maleate 1 the trivial name for cis-1,2-ethylenedicarboxylate; (Z)-butenedioate; the dianion of maleic acid, the diastereoisomer of fumarate. 2 any mixture of maleic acid and its monoand dianions. 3 any salt or ester of maleic acid.

maleoyl symbol: Mal; the bivalent cis-acyl group, -CO-CH=CH-CO-, derived from maleic acid.

maleyl symbol: Mal; the univalent cis-acyl group, HOOC-CH=CH-CO-, derived from maleic acid.

maleylation the introduction of one or more maleyl groups into a substance by acylation, e.g. with maleic anhydride. Maleylation of a protein with maleic anhydride is used to acylate its free lysine (and other) amino groups in order to change their charge at neutral pH from positive to negative and to render the adjacent peptide bonds resistant to hydrolysis by trypsin; it can also lead to disaggregation of a multimeric protein. The reaction occurs at pH 8.5 (usually at 2 °C) and the maleyl groups can be removed at pH 3.5 (usually at 60 °C). Maleylation of thiol groups may also occur. Compare citraconylation, succinylation.—maleylate vb.

malformin A a cyclic pentapeptide from Aspergillus niger that causes curvature and malformations of various plants. The structure contains D-enantiomers of cysteine and leucine.

malic enzyme or pyruvic-malic carboxylase a trivial name commonly applied to any of three enzymes, found in most organisms, that catalyse the oxidative decarboxylation of (S)-malate with concomitant production of pyruvate. See malate dehydrogenase (decarboxylating).

ductase (oxaloacetate decarboxylating); other names: malic en-Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

malignant (in pathology) 1 (of a tumour) invasive, spreading, resistant to therapy. 2 (of a disorder) becoming progressively more serious if not treated.

malnutrition any imbalance, usually a deficiency, between the nutrients taken in by an organism and the amounts necessary to maintain that organism's normal development and health.

malonate 1 the trivial name for propanedioate; methanedicarboxylate: OOC-CH₂-COO, the dianion of malonic acid. It is a potent competitive inhibitor of succinate dehydrogenase. 2 any mixture of free malonic acid and its mono- and dianions. 3 any salt or ester of malonic acid.

malonate semialdehyde the recommended trivial name for malonate semialdehyde; formylethanoate; OHC-CH2-COO-. It is an intermediate in the oxidation of propionyl-CoA to acetyl-CoA in the terminal stages of the beta oxidation of fatty acids with an odd number of carbon atoms in plants.

malonyl 1 (in biochemistry) the univalent acyl group, HOOC-CH₂-CO-, derived from malonic acid by loss of one hydroxyl group. 2 (in chemistry) the bivalent acyl group, -CO-CH₂-CO-, derived from malonic acid by loss of both hydroxyl groups.

malonyl-CoA a key intermediate in fatty-acid biosynthesis, formed by reaction of carbon dioxide with acetyl-CoA, with hydrolysis of ATP to ADP and inorganic phosphate. This is catalysed by acetyl-CoA carboxylase; biotin is an essential cofactor. The plant enzyme also carboxylates propanoyl-CoA and butanoyl-CoA.

malonyi-CoA-acyl carrier protein transacylase EC 2.3.1.39; recommended name: [acyl-carrier-protein] S-malonyltransferase; systematic name: malonyl-CoA:[acyl-carrier-protein] S-malonyltransferase. An enzyme that catalyses a reaction between malonyl-CoA and ACP to form CoA and malonyl-ACP. It is a component of fatty-acid synthase in bacteria (see fatty-acid synthase complex). Example from Escherichia coli: database code FABD_ECOLI, 308 amino acids (32.25 kDa).

maloyl the bivalent acyl group, -OC-CH(OH)-CH₂-CO-, derived from malic acid by loss of the hydroxyl groups from both of its carboxyl groups.

Malpighian body or Malpighian corpuscle or renal corpuscle the part of a nephron comprising a cluster of blood capillaries (i.e. the renal glomerulus) together with the enclosing Bowman's capsule. [After Marcello Malpighi (1628-1694), Italian anatomist.l

malt 1 barley or other cereal grain that has been soaked in water, allowed to germinate, and then dried. In this process the starch of the cereal is largely degraded to maltose and other oligosaccharides. 2 to make into or become malt; to make or treat (something) with malt or an extract of malt.

maltase a trivial name for α -glucosidase; see glucosidase (def. 2). malto+ comb. form (in chemical nomenclature) designating an oligosaccharide or polysaccharide (e.g. maltose, maltotriose, maltoheptaose) consisting of D-glucopyranose residues in $(\alpha 1 \rightarrow 4)$ -linkage (as in maltose).

maltoporin a bacterial outer membrane transmembrane protein, with possibly 16 helices, having two roles in Escherichia coli: it transports maltodextrins (including maltose) into the cell, and acts as a receptor for lambda and some other phages. Example from E. coli: database code LAMB_ECOLI, 446 amino acids (48.86 kDa).

maltose or (formerly) malt sugar the trivial name for the disaccharide 4-O- α -D-glucopyranosyl-D-glucopyranose. It is an intermediate in the enzymic breakdown of glycogen and starch. (Illustrated top right.)

maltotriose the trisaccharide $Glc(\alpha 1-4)Glc(\alpha 1-4)Glc$; it is formed by the action of α -amylase on starch.

malt sugar a former name for maltose.

malyl either of the isomeric univalent acyl groups, HOOC-CH(OH)-CH2-CO- or HOOC-CH2-CH(OH)-CO-, derived from malic acid by loss of a hydroxyl group from one or the OH

maltose

mamma (pl. mammae) a mammary gland. —mammary adj. mammal any animal of the Mammalia, a large class of warmblooded tetrapod vertebrates characterized by the possession of sweat glands in the skin and, generally, an insulating layer of hair. Female mammals characteristically suckle their young at modified sweat glands - mammary glands - that secrete milk. Like birds, mammals possess a four-chambered heart,

mammalian artificial chromosome abbr.: MAC; a still hypothetical mammalian counterpart of a yeast artificial chromosome (YAC).

ture. —mammalian adi.

but their thoracic diaphragm is a uniquely mammalian fea-

mammary gland or mamma the milk-secreting organ of a mature female mammal. The mammary glands occur in one or more pairs on the ventral surface.

mammotropic or mammotrophic an alternative term for lactotropic.

mammotropic hormone or mammotrophic hormone an older name for prolactin.

mammotropin or mammotrophin an older name for prolactin.

Man symbol for a residue (or a molecule) of the aldohexose mannose. In the condensed system of symbolism of sugar residues it signifies specifically a mannose residue with the common configuration and ring size, i.e. D-mannopyranose. manaoic acid see cyclic fatty acid.

Mancini technique see single radial immunodiffusion.

mandelate α -hydroxybenzeneacetate; the anion, C_6H_{5-} CH(OH)-COO⁻, derived from mandelic acid, the α -carbon atom of which is chiral. 2 any salt or carboxylic ester of mandelic acid.

mandelonitrile α -hydroxybenzeneacetonitrile; benzaldehyde cyanohydrin; a compound that occurs free and as β -glucosides of (+)-, (-)-, and (±)-mandelonitrile.

manganese symbol: Mn; a ferromagnetic, metallic transition element of group 7 of the IUPAC periodic table; atomic number 25; relative atomic mass 54.938. There is one stable nuclide of other of the carboxyl groups.

mass number 55. Manganese is widely distributed and abunBan dang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

manifold

mann

dant in the Earth's crust and is an essential component of all living material. It forms manganese(II) (manganous) and less stable manganese(III) (manganic) compounds, including ionic compounds, and complexes; it can also exist in higher oxidation states. Mn2+ ions act as activators of various enzymes. A number of artificial radioactive isotopes are known.

manifold a vessel or tube with a number of inlets or outlets used to collect or distribute gases or liquids in an apparatus.

manna a sweet-tasting, white to yellow dried exudate of the manna ash tree (Fraxinus ornus) and other plants. See also manninotriose.

mannan the main hemicellulose of soft (coniferous) wood, made up of D-mannose, D-glucose, and D-galactose in the ratio of 3:1:1. Glucomannans occur in ferns and others occur in certain higher plants and algae where they may function as the main structural component of the cell wall. Highly branched mannans can be extracted from the cell walls of some yeasts.

mannanase or mannase see mannosidase (def. 2). Mannich reaction any chemical reaction in which an imminium ion of the type CR'₂=N⁺R₂ reacts with a nucleophilic carbon atom, such as that of an enolate anion derived from a ketone or that of an activated double bond as in a phenol, aryl ether, pyrrole, or indole. Mannich reactions are believed to occur widely in biosynthetic pathways of polycyclic compounds, especially alkaloids and porphyrins. [After Carl Mannich (1877-1947).]

manninotriose the trisaccharide $Gal(\alpha 1-6)Gal(\alpha 1-6)Glc$; a component of stachyose, it also occurs free in manna from ash trees.

mannite a former name for mannitol (use deprecated).

D-mannitol the alditol derived from D-mannose by reduction of the -CHO group. It is widespread in higher plants, plant exudates, and algae, and is obtained from the manna ash (Fraxinus ornus) and seaweeds. Mannitol is metabolized by a number of bacteria including many strains of Escherichia coli and Salmonella spp. Clinically it is administered intravenously as an osmotic diuretic.

manno+ comb. form of mannose.

manno- prefix (in chemical nomenclature) indicating a particular configuration of a set of (usually) four contiguous >CHOH groups, as in the acyclic forms of D- or L-mannose. See monosaccharide.

mannobiose the disaccharide Man(β 1-4)Man; a constituent of D-gluco-D-mannans isolated from hardwoods, and of polysaccharides from iris, orchid, and lily families.

mannoheptulose manno-2-heptulose; the D enantiomer (formerly known as D-manno-ketoheptose) occurs in the avocado. mannokinase EC 2.7.1.7; an enzyme that catalyses the phosphorylation by ATP of D-mannose to D-mannose 6-phosphate with release of ADP. It initiates the further metabolism of mannose, e.g. after uptake by bacteria. Hexokinase has a wide specificity for sugars and catalyses this reaction, e.g., in mammalian liver.

mannosamine symbol: ManN; a trivial name for 2-amino-2deoxymannose.

mannose symbol: Man; a trivial name for the aldohexose

widely distributed in mannans and hemicelluloses and is of major importance in the core oligosaccharide of N-linked oligosaccharides of glycoproteins, especially at branch points. A commonly occurring structure is $Man(\alpha 1-6)[Man(\alpha 1-3)]$ - $Man(\beta 1-4)GlcNAc(\beta 1-4)GlcNAc-Asn.$

mannose 6-phosphate an intermediate in mannose metabolism, formed from mannose by mannokinase or from fructose 6phosphate by mannose-6-phosphate isomerase. Apart from acting as a precursor in GDPmannose formation, it is a component of lysosomal enzymes, playing an important role in sorting the enzymes into lysosomes. See also I-cell disease, mannose 6-phosphate receptor.

mannose-1-phosphate guanylyltransferase EC 2.7.7.13; other name: GTP-mannose-1-phosphate guanylyltransferase; an enzyme that catalyses the reaction between GTP and α -Dmannose 1-phosphate to form GDPmannose with release of pyrophosphate. Example (fragment) from pig: database code A47415, 23 amino acids (2.49 kDa).

mannose-1-phosphate guanylyltransferase (GDP) EC 2.7.7.22; systematic name: GDP:D-mannose-1-phosphate guanylyltransferase. An enzyme involved in M-antigen biosynthesis in salmonellae; it catalyses a reaction between GDP and D-mannose 1-phosphate to form orthophosphate and GDPmannose. Example from Salmonella choleraesuis: database code CPSB_SALCH, 471 amino acids (52.57 kDa). This protein belongs to the mannose-6-phosphate isomerase family 2.

mannose-6-phosphate isomerase EC 5.3.1.8; systematic name: D-mannose-6-phosphate ketol-isomerase; other names: phosphomannose isomerase; phosphohexoisomerase; phosphohexomutase. An enzyme that catalyses the reaction:

D-mannose 6-phosphate = D-fructose 6-phosphate;

zinc is a cofactor. The sequences belong to two families. Example (family 1) from Escherichia coli: database code MANA_ ECOLI, 391 amino acids (42.80 kDa). Most enzymes (including human) belong to this family. Family 2 is represented by an enzyme involved in alginate metabolism; example from Pseudomonas aeruginosa: database code ALGC_PSEAE, 462 amino acids (50.23 kDa). See also mannose-1-phosphate guanylyltransferase.

mannose 6-phosphate receptor a protein on the surface of membranes in the Golgi apparatus and late endosomes that recognizes mannose 6-phosphate residues on lysosomal enzymes and is responsible for sorting them into late endosomes, which then become lysosomes. Lysosomal enzymes bearing phosphomannosyl residues bind specifically to mannose-6phosphate receptors in the Golgi apparatus, and the resulting receptor-ligand complex is transported to an acidic prelysosomal compartment where the low pH mediates dissociation. There are two types of receptor protein (examples are bovine): (1) the cation-dependent type – these are type I membrane glycoprotein dimers involved in transport of phosphorylated lysosomal enzymes from the Golgi apparatus and the cell surface to lysosomes; example (precursor): database code MPRD_BOVIN, 279 amino acids (31.17 kDa); (2) the cation-independent type – these are similar in action and with some sequence homology to the first type; example (precursor): database code MPRI_ BOVIN, 2499 amino acids (274.22 kDa). See also I-cell disease.

mannosidase 1 α -mannosidase; EC 3.2.1.24; systematic name: α -D-mannoside mannohydrolase; an enzyme that catalyses hydrolytic removal of terminal, nonreducing residues in α-D-mannosides. Example from Saccharomyces cerevisiae: database code MAN1 YEAST, 1083 amino acids (124.5 kDa). **2** β -mannosidase EC 3.2.1.25; systematic name: β -D-mannoside mannohydrolase; other names: mannanase; mannase; an enzyme that catalyses hydrolytic removal of terminal, nonreducing residues in β -D-mannosides. Example from Bos taurus: database code A5881, 879 amino acids (101.06 kDa). See also ER mannosidase, Golgi mannosidase.

mannoside any glycoside in which the sugar moiety is a man-

manno-hexose, the C-2 epimer of **glucose**. The p-(+)-form is nose residue,
Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

mannosyl any of the glycosyl ligands formed by detaching the anomeric (α - or β -) hydroxyl group, on C-1, from a cyclic form (pyranose or furanose) of mannose.

lpha-1,3-mannosyl-glycoprotein eta-1,2-N-acetylglucosaminyltransferase EC 2.4.1.101; other name: N-glycosyl $oligos accharide-glycoprotein {\it N-} acetylglucos aminyltransferase$ I (abbr.: GlcNAc-TI or GNT-I); an enzyme involved in the synthesis of oligosaccharides, particularly those that are Nlinked in glycoproteins. It catalyses the reaction between UDP-N-acetyl-D-glucosamine and α -D-mannosyl-1,3-(R)- β -Dmannosyl-R' to form N-acetyl- β -D-glucosaminyl-1,2- α -Dmannosyl-1,3-(R)- β -D-mannosyl-R' with release of UDP. Example from human: database code GNT1_HUMAN, 445 amino acids (50.80 kDa).

mannuronate 1 the anion of mannuronic acid, the compound formed by oxidation of the C-6 hydroxymethylene group of mannose to a carboxyl group. 2 any salt or ester of mannuronic acid. D-Mannuronic acid is a component of alginic

β-p-pyranose form

manoalide a naturally occurring marine sesterterpenoid. It is an irreversible inhibitor of phospholipases A2 and C, and a potent inhibitor of Ca2+ mobilization.

manometer an instrument for measuring pressure differences. The simplest type consists of a U-tube filled with a suitable liquid (often mercury), and compares a pressure delivered to one side with atmospheric pressure on the other, open, side of the tube. The difference in the level of liquid in the two arms of the tube gives a measure of the unknown pressure. In biochemistry the term is often used to mean a manometric respirometer.

manometer constant a predetermined factor, calculated for each individual constant-volume manometric respirometer, that when multipled by the manometer reading immediately gives the volume of gas evolved in cubic millimetres at standard temperature and pressure. The factor is itself dependent upon temperature, liquid volume, density of the manometer fluid, and nature of the gas phase.

manometer fluid any fluid used to fill a manometer. In biochemistry this usually refers to the fluid used to fill the manometer of a respirometer. Such fluids are generally easily visible, wet the glass walls of the manometer, have a density that will give an easily calculated manometer constant, and have a low vapour pressure. Examples include Brodie's fluid, and Krebs' manometer fluid.

manometric 1 of, pertaining to, or measured with a manometer. 2 (in biochemistry) of, or pertaining to, a manometric respirometer. - manometrically adv.

manometry 1 the measurement of gas pressure by means of a manometer. 2 (in biochemistry) the use of manometric respirometers in studies of chemical and biochemical reac-

Manp symbol for a mannopyranose residue.

mantissa the fractional part of any logarithm.

MAO abbr. for monoamine oxidase.

MAO inhibitor abbr. for monoamine oxidase inhibitor.

map 1 any representation of the surface features of an object, especially the spatial relationships of physical or chemical landmarks, as in electron-density map, genetic map, and restricmensional patterns obtained in analysis, e.g. peptide map. 2 to make a map (def. 1). 3 to occur, or be placed, at a specific position on a map (def. 1).

MAP abbr. for microtubule-associated protein.

map distance (in genetics) the distance, in terms of percentages of crossing-over (i.e. 100 × no. of recombinants/total no. of progeny), between particular linked genes. See also map unit.

MAP kinase abbr. for mitogen-activated protein kinase; a family of protein kinases that perform a crucial step in relaying signals from the plasma membrane to the nucleus. They are turned on by a wide range of proliferation- or differentiationinducing signals. Example, MAP kinase FUS3 of Saccharomyces cerevisiae, required for the transition from mitosis into conjugation: database code FUS3_YEAST, 353 amino acids (40.77 kDa). The name does not indicate that this is a kinase for MAPs - rather that it is a protein kinase that is mitogenactivated. Nevertheless, some MAPs can be substrates for this enzyme. See also ERK.

MAP kinase kinase abbr.: MAPKK; EC 2.7.1.-; a dual-specificity mitogen-activated protein kinase kinase; other names: ERK activator kinase; extracellular signal-regulated kinase; an enzyme that catalyses the concomitant phosphorylation of threonine (T) and tyrosine (Y) residues in a TEY sequence in MAP kinases. It requires activation by the serine/threonine kinase, MAP kinase kinase kinase (see RAF). Examples from human: MAPKK 1, database code MPK1_HUMAN, 392 amino acids (43.28 kDa); MAPKK 2, database code MPK2_ HUMAN, 400 amino acids (44.37 kDa).

maple-syrup urine disease or branched-chain ketonuria an autosomal recessive disease of humans characterized by neurological signs and the onset of feeding problems in the first week of life, and associated with a maple-syrup odour of the urine. The concentrations of branched-chain amino acids and branched-chain keto acids are elevated in the blood of patients, due to deficiency of the enzyme responsible for the oxidative decarboxylation of branched-chain keto acids.

MAPTAM 1,2-bis-(2-amino-5-methylphenoxy)ethane-N, N, N'tetraacetic acid tetraacetoxymethyl ester; a substance that readily penetrates cell membranes and undergoes intracellular hydrolysis with the formation intracellularly of the 5-methyl form of BAPTA. It is useful as an indicator of intracellular calcium concentrations.

map unit or Morgan's unit a unit of genetic length along a chromosome and defined in terms of recombination frequency, expressed as a percentage; a recombination frequency of 1 per cent (that is one recombinant individual in a hundred progeny) equals one map unit. I map unit = 1 centimorgan. Compare morgan.

marasmus a wasting away of the body, especially of infants, caused by chronic deficiency of intake of energy-producing foodstuffs. Compare kwashiorkor.

marcks abbr. for myristoylated alanine-rich C kinase substrate; a filamentous (F) actin cross-linking protein and the most tion map. By extension the term is applied to certain two-di-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

margarine mass spec

calmodulin, actin, and synapsin and is displaced from the membrane by phosphorylation by protein kinase C. Example from human: database code MACS_HUMAN, 331 amino acids (31.38 kDa).

margarine a processed fat used as a substitute for butter. Modern margarines are prepared from hydrogenated natural fats, the trend in recent years having been to preserve a high content of nutritionally desirable polyunsaturated fatty acids. Apart from the oil or fat content, margarine contains a water phase that is 16-20% of content and includes water, cream, whole milk, skim milk (powder), whey, and buttermilk in various ratios; flavouring, which may include diacetyl, fatty acids, and ketones; colouring agents, mainly based on carotenes; additional vitamins A and D; and antioxidants such as di-tert-butyl p-cresol. The process was invented in 1869 by H. Mège-Mouriès on the order of Napoleon III to produce a cheap stable butter substitute. Mège-Mouriès churned a beef tallow fraction, known as oleomargarine, with cream.

marijuana *see* cannabis.

Mariotte bottle or Mariotte flask a device for providing a flow of liquid maintained at a constant pressure head; it is used, e.g., in column chromatography. It consists of a sealed flask, closed to the atmosphere, with an outlet at or near the bottom and an air inlet tube open to the atmosphere. The height of the bottom of the inlet tube is adjustable. When the flask is filled with liquid to a level above the bottom of the inlet tube the pressure of the liquid flowing from the flask is determined by the height of the bottom of the inlet tube above the outlet point. [After Abbé Edmé Mariotte (1620-84), French physi-

Mariotte's law an alternative name (esp. Fr.) for Boyle's law (see gas laws).

marker 1 an appropriate reference substance or material included in a sample being subjected to a separation procedure such as chromatography, electrophoresis, or density-gradient centrifugation. 2 see biochemical marker. 3 see genetic marker. 4 an alternative term for label (def. 3).

marker enzyme any enzyme of known intracellular location that can be assayed as an aid in following the isolation and purification of subcellular fractions.

marker gene any gene of known function and known location on a chromosome. Compare genetic marker.

marker rescue a process whereby one or more genetic markers from a UV-irradiated virus are integrated into an unirradiated helper virus in infected bacteria; such genes are thereby 'rescued' by recombination.

Markham still a simple, all-glass, steam-jacketed apparatus for the rapid and efficient steam distillation of a succession of small samples of volatile substances. It was designed especially for the distillation of ammonia as part of the micro-Kjeldahl procedure for the determination of nitrogen, but has been found to be prone to carry-over from one sample to the next. [After Roy Markham (1916-79), British biochemist.]

Markovnikov('s) rule a generalization stating that when a molecule of water, or a hydrogen halide, or some other polar substance, is added heterolytically across an asymmetrically substituted carbon-carbon multiple bond, the hydrogen atom or other more electropositive part of the molecule becomes attached usually to that carbon atom carrying the larger number of hydrogen atoms while the hydroxyl, halo, or other more electronegative part of the molecule becomes attached to that carbon atom carrying the smaller number of hydrogen atoms. [After Vladimir Vasilyevich Markovnikov (1838–1904), Russian chemist, who formulated the rule on empirical grounds (1870).]

Maroteaux-Lamy syndrome an alternative name for mucopolysaccharidosis VI.

marsh gas another name for methane.

Martin, Archer John Porter (1910-), British biochemist, physical chemist, and inventor; Nobel Laureate in Chemistry (1952) jointly with R. L. M. Synge 'for their invention of par**MAS** a human transforming gene that encodes a neuronal-type angiotensin III receptor. This is a transmembrane cell surface protein, mediating a G-protein-linked phosphoinositide response. Example: database code MAS_HUMAN, 325 amino acids (37.42 kDa).

maser a device for producing intense beams of microwave radiation of defined frequency. Compare laser. [From microwave amplification by stimulated emission of radiation.]

masked residue any residue in a biopolymer that is not accessible to, and cannot react with, a reagent specific for that type of residue, either because of the position of the residue or because of the nature of its immediate environment.

maspin a serpin-like tumour suppressor of epithelial cells. Example from human: database code HSU04313, 375 amino acids (42.09 kDa).

mass 1 symbol: m or M; one of the seven SI base physical quantities; the SI base unit of mass is the kilogram. 2 a general term for the quantity of matter in a body, a characteristic that is both a measure of the resistance of the body to changes in its velocity, i.e. inertial mass, and a measure of the force experienced by the body in a gravitational field, i.e. gravitational mass. Mass is commonly confused with weight. According to the theory of relativity, inertial and gravitational masses are equal, mass increases with velocity, and mass and energy are interconvertible.

mass action, law of a law stating that, for a homogeneous system, the rate of reaction of a chemical reaction is proportional to the active masses of the reacting substances; i.e. the rate is proportional to the product of the activities of the reactants, each raised to a power equal to the number of reactant molecules of that type that participate in the reaction.

mass-average molar mass see average molar mass.

mass concentration see concentration (def. 1a).

mass density see concentration (def. 1a).

mass fraction symbol: w; the mass of a specified component of a system divided by the mass of the system; it is dimensionless. mass fragmentography a common but less rigorous name for selected-ion monitoring.

mass number an older name for nucleon number.

mass spec. abbr. (colloquial) for mass spectrometer, massspectrometric, or mass spectrometry.

mass spectrograph a mass spectrometer in which the ions fall on a photographic plate.

mass spectrometer abbr.: MS or (colloquial) mass spec.; any instrument for mass spectrometry.

mass spectrometry abbr.: MS or (colloquial) mass spec.; an analytical method for determining the relative masses and relative abundances of components of a beam of ionized molecules or molecular fragments produced from a sample in a high vacuum. It is applicable to any sample that is gaseous or volatile at low pressure, or that can be so rendered by derivatization. In the commonest version, the ions, generated usually by electron bombardment of the sample, are formed into a beam and then accelerated to a uniform velocity by means of an arrangement of electrically charged slits. The beam is then dispersed into a spectrum of particles of different mass-tocharge ratios, m/e, by application of a suitably disposed magnetic field. The ions of any particular m/e value may be focused on a collecting electrode by appropriate adjustment of the accelerating potential or magnetic field and the resulting ion currents measured electrometrically. With a suitably designed mass spectrometer the method can be used to determine the relative abundances of isotopes of an element or the relative molecular masses of two or more compounds, or used to aid the identification of a complex compound by the mass spectrum of the fragments generated from it on electron bombardment. See also gas chromatography/mass spectrometry, selected-ion monitoring. —mass-spectrometric adj.

mass spectrum a tracing, photographic record, or diagram of the relative numbers of different ions (representing moltition chromatography'.

ecules or molecular fragments) obtained (from a specimen) by

mass-to-charge ratio

matur Justin

mass spectrometry, ranked in order of their mass-to-charge ratios.

mass-to-charge ratio (in mass spectrometry) the ratio of the mass, m, of an ion to the charge, e, on the ion. See also mass spectrometry.

mass transfer the spontaneous and irreversible process of transfer of mass across nonhomogeneous fields, e.g. between liquid phases, or from one side of a membrane to another.

mass unit see atomic mass unit, dalton.

mast cell a type of leukocyte, of the subclass granulocyte; it is characterized by having numerous basophilic granules in the cytoplasm; these granules contain relatively large amounts of histamine together with 5-hydroxytryptamine and heparin. Degranulation of mast cells, with concomitant release of the vasoactive amines, occurs by reaction, through a specialized region of the Fc piece, of antigen with homocytotropic antibody (reagin) bound to the cell. This leads to an immediate hypersensitivity reaction.

mast cell degranulating peptide abbr.: MCDP; one of the major neurotoxic peptides of bee venom; the 22-residue peptide IKCNCKRHVIKPHICRKICGKN-NH₂. It stimulates degranulation of mast cells, and also selectively blocks the neuronal Ca²⁺-dependent K⁺ channel.

mast cell growth factor see stem cell factor.

mastoparan a tetradecapeptide toxin from wasp venom: Ile-Asn-Leu-Lys-Ala-Leu-Ala-Ala-Leu-Ala-Lys-Lys-Ile-Leu-NH₂. It is neurotoxic, and functions in a similar way to melittin and mast cell degranulating peptide, in generating ion channels in membranes.

MATQ2 yeast mating-type protein α -2 repressor; a regulatory DNA-binding protein whose DNA recognition sequence (CATGTAATT) resembles a homeobox, the recognition sequence of homeobox proteins in higher organisms. MAT α 2 acts as a master switch in yeast differentiation by controlling gene expression in a cell-type-specific fashion. In α haploids and a/α diploids (see mating type) it represses the transcription of α -cell-specific genes. In a/α diploids it also forms a complex with MAT α 1 protein that represses haploid-specific gene expression. Database code MAT2_YEAST, 210 amino acids (24.25 kDa).

matchmaker proteins see molecular matchmakers.

maternal-effect gene a gene that is transcribed from the maternal genome during oogenesis, and expresses products at or immediately before fertilization, so that the phenotype of the embryo is determined by the maternal alleles alone. Genes that determine egg polarity, e.g. oskar are of this type.

mathematics 1 functioning as sing. the group of related sciences concerned with number, space, shape, and quantity, and their interrelationships. 2 functioning as sing. or pl. the use of mathematical processes or operations in calculations or the solution of problems.

mating type one of the two types of Saccharomyces cerevisiae, α and a, each of which is necessary for the occurrence of mating, a process in which two haploid cells fuse. The resulting diploid cell, a/α , cannot mate, but can produce spores, giving rise to haploid cells by meiosis. The mating type of the haploid cell is determined by a single locus, the mating-type (MAT) locus. In a cells, this encodes a single gene regulatory protein a1, and in an α cell it encodes two such proteins, $\alpha1$ and $\alpha2$. In the a/α cell, the regulatory proteins a1 and a2 combine to generate a completely new pattern of gene expression. See also MAT $\alpha2$.

matrilysin EC 3.4.24.23; other names: matrin; uterine metalloendopeptidase; matrix metalloproteinase 7 (abbr.: MMP7); putative (or punctuated) metalloproteinase-1 (abbr.: PUMP-1); an enzyme that catalyses the cleavage of Ala¹⁴-|-Leu¹⁵ and Tyr¹⁶-|-Leu¹⁷ in the B chain of insulin. It has no action on collagen types I, II, IV, or V. It cleaves casein and fibronectin and shows preference for gelatin chain α-2(I) over α-1(I). It is secreted as the precursor, promatrilysin, and is activated by autocatalytic cleavage at Glu⁷⁷-|-Tyr⁷⁸. Zinc and calcium are cofactors. Example (precursor) from human uterus: database code COG7_HUMAN, 267 amino acids (29.64 kDa).

matrin or DNA-binding protein F/G a zinc-finger DNA-binding protein of the fibrogranular areas of the nucleus. Matrins comprise a family of eight major internal matrix polypeptides of nuclear matrices of rat liver and tissue culture cells, highly conserved between humans and mouse. Example from rat: database code MAFG_RAT, 544 residues (59.67 kDa). The name has sometimes been used as a synonym for matrilysin and matrin F/G is therefore used to avoid confusion.

matrix (pl. matrices or matrixes) 1 a medium or place wherein something is formed, develops, or is embedded or enclosed. 2 the medium that forms, or supports, the stationary phase in certain separative procedures, as in chromatography or zone electrophoresis; the material that forms, or is used to form, the substratum of an immobilized reagent in affinity chromatography. 3 (in animal histology) see extracellular matrix. 4 (in plant histology) the meshwork of solubilizable substances, largely polysaccharide in nature, occurring in cell walls and in which insoluble microfibrils of cellulose are embedded. 5 see mitochondrial matrix. 6 cytoplasmic matrix; see groundplasm. 7 the substratum, living or nonliving, in or on which a fungus or lichen grows. 8 (in mathematics) any rectangular array of numbers or symbols manipulable algebraically as a single entity and used according to specific rules to facilitate solving of certain kinds of problems, e.g. a set of simultaneous linear equations.

matrix Gla protein a protein that mediates association of the organic matrix of bone and cartilage. It contains γ -carboxy-glutmate (Gla) residues, formation of which is vitamin-K-dependent. Example (precursor) from human: 103 amino acids (12.31 kDa).

matrix metalloproteinase abbr.: MMP; a name given to proteolytic enzymes associated with the extracellular matrix as the basis of a new nomenclature for these enzymes. The classification includes: MMP1, interstitial collagenase; MMP2, gelatinase A; MMP3, stromelysin-1; MMP8, neutrophil collagenase; MMP10, stromelysin-2; MMP12, metalloelastase. Such metalloproteinases have been implicated in clearing a path through the extracellular matrix for cell migration, and thus have been thought to be involved in the ability of malignant cells to invade tissues and metastasize. They have also been shown to be involved in conversion of tumour necrosis factor (TNF) precursor into active TNF and may be implicated in other diseases such as rheumatoid arthritis or osteoarthritis. For these reasons, there is current interest in matrix metalloproteinase inhibitors (abbr.: MMPIs) as potentially useful drugs. See also TIMP

matrix metalloproteinase inhibitor see MMPI.

matrix processing peptidase abbr.: MPP; an alternative term for mitochondrial processing peptidase.

matrix protein 1 the major protein component of the outer membrane of Escherichia coli. It is a transmembrane protein that forms hydrophilic pores permitting the passage of microsolutes through the outer membrane; in association with lipopolysaccharide (def. 4) it forms a receptor for phages. It is a member of the porin family, and is a product of the gene DMPC: database code DMPC_ECOL1, 367 amino acids (40.39 kDa). 2 any of a class of proteins that coat the inside of the lipid bilayer in the envelope of some groups of enveloped viruses.

matrix space or (mitochondrial) lumen the innermost compartment of a mitochondrion, containing the mitochondrial matrix.

matrix vesicle any of the minute, membrane-bound, extracellular particles (≈100 nm in diameter) occurring in the interstitial matrix of calcifying cartilage. The vesicles contain a number of enzymes involved with local calcification mechanisms.

and shows preference for gelatin chain α-2(I) over α-1(I). It is secreted as the precursor, promatrilysin, and is activated by autocatalytic cleavage at Glu⁷⁷-|-Tyr⁷⁸. Zinc and calcium are Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

Mu tronge

gametocytes involving meiosis of the nucleus with reduction of chromosome number from diploid to haploid. 3 (in virology) the overall process leading to the incorporation of a viral genome into a capsid and the development of a complete virion. maturation-promoting factor an alternative name for M-

phase-promoting factor.

maturation protein or A protein one of the three proteins coded for by certain single-stranded RNA bacteriophages, one molecule of which is necessary for proper encapsulation of the RNA and for binding of the phage to a pilus on the host cell. Example from bacteriophage fr: database code VASS_BPFR, 393 amino acids (43.96 kDa).

maturity-onset diabetes a former name for type 2 diabetes mellitus.

max abbr. for maximal or maximum.

MAX the symbol for a gene family coding for DNA-binding proteins that function in cell growth control. The product, Max, forms heterodimers with Myc (see MYC) that bind specifically to CACGTG; it also forms homodimers of similar specificity. Max contains helix-turn-helix and hydrophobic heptad repeats. Database code MAX_HUMAN, 160 amino acids (18.27 kDa).

maxicell or maxi cell a bacterial cell that has been heavily irradiated with UV light and in which the chromosomal DNA is extensively degraded. Any plasmid(s) present usually escape damage and the genes they encode can be expressed.

maxicircle DNA any large, closed circular DNA molecule, as in the kinetoplast of Leishmania tarantolae.

maxima a plural of maximum (def. 1).

maximal abbr.: max; of, pertaining to, or reaching a maximum; being the greatest possible in size, duration, etc.; **maximum** (def. 2). —**maximally** adv.

maximal agonist effect or intrinsic activity symbol: a; the maximal effect that an agonist, whether conventional or inverse, can elicit in a given tissue under particular experimental conditions, expressed as a fraction of that produced by a full agonist acting through the same receptors under the same conditions.

maximal rate or maximum rate another name for limiting rate (now recommended).

maximal velocity or maximum velocity an older name for limiting rate.

maximum abbr.: max; 1 (pl. maxima or maximums) the highest or greatest possible amount, degree, etc.; the highest value of a variable quantity. Compare minimum. 2 of, being, or exhibiting a maximum or maxima; maximal.

Maxwell relation a relation between the dielectric constant, ε , and the refractive index, n, of a nonabsorbing, nonmagnetic material such that $\varepsilon = n^2$. [After James Clerk Maxwell (1831-79), British physicist.]

Mb 1 abbr. and symbol for myoglobin; hence MbO₂, oxymyoglobin; MbCO, carbonmonoxymyoglobin; etc. 2 symbol for megabase, i.e. = 10⁶ bases. 3 (in computing) abbr. for megabyte (i.e. 2²⁰ bytes; alternative to MB).

MBS abbr. for meta-maleimidobenzoyl-N-hydroxysuccinimide

ester; a heterobifunctional reagent useful, *inter alia*, for coupling an enzyme to an antibody, without appreciable loss of either activity.

MBSA abbr. for methylated bovine serum albumin.

mc (formerly) abbr. for millicurie (mCi now used).

Mc₃ symbol for mucotriaose (McOse₃ preferred if space permits).

Mc₄ symbol for mucotetraose (McOse₄ preferred if space permits).

MCAD abbr. for medium chain acyl-CoA dehydrogenase; see beta-oxidation system.

McArdle's disease an alternative name for type V glycogen disease.

McClintock, Barbara (1902-92), US geneticist noted for her studies on chromosome breakage and reunion and her proposal of the existence of transposable elements, Nobel Laureate in Physiology or Medicine (1983) 'for her discovery of mobile genetic elements'.

MCD abbr. for 1 magnetic circular dichroism. 2 mean corpuscular (erythrocyte) diameter.

MCDP abbr. for mast cell degranulating peptide.

McFarlane's method a method for the radioiodination of proteins with high efficiency in which the protein to be labelled is reacted with iodine monochloride that has been previously equilibrated with radioiodide. The extent of substitution can be precisely controlled by use of an appropriate quantity of iodine monochloride. [After Arthur Sproul McFarlane (1905–78), British biophysicist.]

mCi symbol for millicurie.

McIlwain chopper or McIlwain-Buddle chopper a hand- or motor-driven machine for rapidly cutting a piece of animal tissue into slices of uniform, preselected thickness (≥0.07 mm) and then, if desired, into prisms by making a second series of cuts. Such prisms can yield easily dispensed suspensions that retain those metabolic characteristics that tend to be lost on homogenization of tissue. [After Henry McIlwain (1912–92), British biochemist, and H. L. Buddle.]

McIntosh and Fildes jar see anaerobic jar.

McLeod gauge a mercury-in-glass vacuum pressure gauge that is capable of measuring down to 10^{-5} mmHg (1.33×10^{-3} Pa). A known large volume of gas is compressed into a small volume, in which the now much larger pressure is measured.

McOse₃ symbol for mucotriaose (preferred alternative to Mc₃).

McOse₄ symbol for mucotetraose (preferred alternative to Mc₄).

MCP abbr. for methyl-accepting chemotaxis protein.

Md symbol for mendelevium.

MD (in clinical chemistry) abbr. for malate dehydrogenase (def. 1).

MDa abbr. for megadalton.

MDCK cell abbr. for Madin-Darby canine kidney cell; a cell of a heteroploid cell line.

MDH abbr. for malate dehydrogenase (def. 1).

Mdm2 protein a nuclear phosphoprotein that binds to p53 and inhibits its action. Example MDM2_MOUSE, 489 amino acids (54.54 kDa).

MDMA abbr. for 3,4-methylenedioxymethamphetamine.

MDP abbr. for muramyl-dipeptide.

MDR abbr. for multiple drug resistance or multidrug resistance; the acquired simultaneous resistance to a wide spectrum of drugs arising from the administration, typically over long periods, of one or a limited number of drugs. Such resistance may extend to drugs with little structural or even functional similarity to the original drug(s), and results in reduced efficacy of all the drugs concerned. The phenomenon is seen, e.g., in long-term chemotherapy of cancer patients, and is due to the induced expression of plasma membrane glycoproteins known as P-glycoproteins, or MDR proteins.

MDR protein any of several integral transmembrane glycoproteins of the ABC type that are involved in (multiple) drug resistance (see MDR). MDR 1 (or P-glycoprotein 1) is an energy-

tance (see MDR). MDR 1 (or P-glycoprotein 1) is an energy-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Du toute

dependent efflux pump responsible for decreased drug accumulation in multidrug-resistant cells. Example from human: database code MDR1_HUMAN, 1280 amino acids (141.34 kDa). MDR 3 (or P-glycoprotein 3) is an energy-dependent efflux pump that causes decreased drug accumulation but is not capable of conferring drug resistance by itself. Example from human: database code MDR3_HUMAN, 1279 amino acids (140.52 kDa). MDR-associated protein participates in the active transport of drugs into subcellular organelles. Example from human: database code MRP_HUMAN, 1531 amino acids (171.47 kDa). MDR protein (or P-glycoprotein) of Leishmania tarentolae is a protein responsible for acquired methotrexate resistance, and is encoded by a gene located in the 'H-circle', a 68 kb duplex DNA circle containing a 30 kb inverted repeat. Database code MDR_LEITA, 1548 amino acids (172.04 kDa).

Me symbol for the methyl group, CH₃-.

Mead acid a name sometimes given to (all-Z)-eicosa-5,8,11-trienoic acid. It can be synthesized de novo by mammals via palmitate and oleate, and is thought to substitute partially for the long-chain polyunsaturated fatty acids lacking in essential fatty acid deficiency. [After J. F. Mead, who first identified it as an acid found in elevated concentrations in mammals during essential fatty acid deficiency].

mean or arithmetic mean or average the quotient of the arithmetic sum of any set of two or more numbers, measurements, values, etc. and the number of components of the set. See also geometric mean. Compare median (def. 1).

mean deviation the arithmetic average of the absolute values of the differences between the individual values of a set of numbers, values, etc. from their mean.

mean free path the average distance travelled by a molecular entity between collisions. In a gas, the mean free path between molecular entities is inversely proportional to the pressure of the gas.

mean ionic activity coefficient symbol: y_{\pm} ; the average rational activity coefficient of the ions of an electrolyte that dissociates in solution into cations of charge z^+ and anions of charge z^- , given, according to the limiting law of the Debye-Hückel theory, by:

$$-\log \gamma_{+} = z^{+} z^{-} A I^{0.5},$$

where A is a constant whose magnitude depends on temperature, dielectric constant, etc., having a value near 0.5, and I is the ionic strength of the solution.

mean life or average life abbr.: τ ; the mean of the lengths of time required for the disintegration of all atoms of a given radionuclide. It is related to the **half-life**, t_{V_3} , and to the **disintegration constant**, λ , of the radionuclide by the expressions:

$$\tau = t_{1/2}/\ln 2 = 1.443t_{1/2}$$

and

$$\tau = 1/\lambda$$
.

mean relative residue mass or (formerly) mean residue weight symbol: M_o ; the quotient of the relative molecular mass of a polymer and the number of residues it contains.

mean residue rotation the average molar optical rotation for a residue in a polymer. It is obtained by substituting the mean relative residue mass, M_0 , for the relative molecular mass, M_r , of the polymer in the equation defining **molar optical rotation**.

mean residue weight a former name for mean relative residue

Mec abbr. for the 4-methylcoumarin-7-yl group.

mechanical concerned with, executed or operated by, or as by, a machine: relating to mechanics. —**mechanically** adv.

mechanically gated channel see ion channel.

mechanics 1 the science concerned with the equilibrium or motion of bodies in a given frame of reference. 2 the science of machines and/or machinery.

mechanism 1 the chain of events in a particular process; the action or process by which an effect is produced or an action Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

performed. 2 (in chemistry) the detailed description of the pathway leading from reactants to products of a reaction, including where possible a characterization of the composition, structure, and other properties of any reaction intermediates and transition states. 3 any system or structure of moving parts that performs some function; a machine.

mechanistic of, pertaining to, or explained by mechanics; of, pertaining to, or resembling a mechanism. Compare stochastic. mechanochemical coupling the coupling of a chemical

process with a mechanical process in the same structure. See also motor protein.

meconium antigen see carcinoembryonic antigen.

Medawar, (Sir) Peter Brian (1915-87), British zoologist and immunologist; Nobel Laureate in Physiology or Medicine (1960) jointly with F. M. Burnet 'for discovery of acquired immunological tolerance'.

media 1 a plural of medium. 2 (in morphology) or tunica media the middle layer of the wall of a blood or lymph vessel.

medial 1 of, situated in, or towards the middle. 2 of, or pertaining to, a media (def. 2).

median 1 (in statistics) the centre value of any series of numbers, measurements, values, etc. when these are arranged in order from the lowest value to the highest value (with an even-numbered series, the mean of the two central values is taken); i.e. half the members of the series have values greater than that of the median and half have values smaller than that of the median. Compare mean. 2 of, pertaining to, situated in, or pointing towards the middle. 3 (in biology) of or pertaining to the plane that divides an organism, organ, etc. into two symmetrical parts.

median effective dose abbr.: ED₅₀ or ED50; the dose of a drug, agonist, or other agent that is effective in 50% of the test objects.

median infectious dose abbr.: ID₅₀ or ID50; the dose of bacteria, viruses, or other infective agents that produces infection in 50% of the test objects.

median lethal dose abbr.: LD_{50} or LD50; the dose of bacteria, viruses, toxic substances, or other agents that causes death of 50% of the test objects.

mediated transport the transport of a substance across a (biological) membrane that requires the participation of one or more transporting agents (or carriers (def. 3)). See also facilitated diffusion.

medical of, or pertaining to, the science or practice of medicine.

medicinal pertaining to or possessing therapeutic properties.
medicine 1 the science or practice of preventing, diagnosing, alleviating, and curing disease. 2 a common term for a pharma-

alleviating, and curing disease. 2 a common term for a pharmaceutical substance or mixture.

medium (pl. media or mediums) 1 the surrounding substance in

medium (pl. media or mediums) 1 the surrounding substance in which organisms or cells are studied or preserved. 2 the continuum in which particular chemical entities and their reactions are studied, commonly the solvent together with any nonreacting solutes. 3 any of the materials in which a chromatographic or an electrophoretic separation is effected. 4 the continuum through which electromagnetic radiation is considered to be transmitted. 5 see culture medium.

MEDLINE a US computerized science bibliography related to *Index Medicus*, that contains medical and many biochemical and biological references.

medulla (pl. medullas or medullae) the innermost part of an organ, tissue, or structure; marrow, pith. —medullary adj.

mega+ 1 symbol: M; an SI prefix denoting 10^6 times. 2 a prefix used in computing to indicate a multiple of 2^{20} (i.e. 1 048 576), as in megabyte. 3 a general prefix denoting large size.

Mega-8 or Omega the octanoyl amide of N-methylglucamine (i.e. 1-methylamino-1-deoxy-D-glucitol); a water-soluble, non-denaturing detergent (CMC = 58 mM) useful for membrane research. It is one of a series, which also comprises Mega-9, the nonanoyl derivative (CMC = 19-25 mM), and Mega-10, the decanoyl derivative (CMC = 6-7 mM)

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Mega-8 n = 6Mega-9 n = 7Mega-10 n = 8

megabase symbol: Mb; a unit of length of a polynucleotide equal to 10⁶ base residues in a single-stranded polynucleotide or 10⁶ base pairs in a double-stranded polynucleotide.

megadalton symbol: MDa; a unit of mass equal to 10⁶ daltons. megakaryocyte a large (diameter 40-150 µm), polyploid cell that gives rise to the blood platelets by budding of its cytoplasm. It contains, on average, four times the diploid number of chromosomes in a large, usually lobulated nucleus. Megakaryocytes are found in bone marrow, lung, and to a lesser extent in other tissues.

megaloblastic anemia any of a group of disorders characterized by an abnormality of red cell development in the bone marrow. There is an accumulation of primitive cells, with failure of nuclear development, while cytoplasmic development, including hemoglobinization, continues; oval macrocytes appear in the blood. Vitamin B₁₂ or folate deficiency, or abnormality of vitamin B₁₂ or folate metabolism, is a frequent cause, but drug treatment (with antifolates, e.g. methotrexate, or drugs that interfere with DNA synthesis, e.g. cytarabine (β cytosine arabinoside), hydroxyurea, AZT) or certain leukemias may also be causes.

megatomic acid see tetradecadienoic acids.

meiosis or reduction division a process by which the nucleus of a diploid cell divides twice with the formation of four daughter haploid cells, each containing half the number of chromosomes of the parent nucleus. Meiosis occurs during the formation of gametes from diploid cells and at the beginning of haplophase in those organisms that exhibit alternation of generations. Meiosis involves two rounds of cell division. Prophase in the first division proceeds as follows. Chromosomes first become visible as elongated threads during leptotene; by this time each chromosome has already replicated to form two identical sister chromatids. During zygotene each chromosome pairs with its homologue; the two become aligned and the synaptonemal complex develops between them. When synapsis is complete pachytene is said to have begun; it is during this stage that crossing over occurs between a chromatid in one partner and another chromatid in the homologous chromosome. The points of crossing over, or chiasmata, first become visible as the two chromosomes begin to separate in diplotene, when the synaptonemal complex dissolves. The final phase of prophase I, diakenesis, is the transition into metaphase I, which is analgous to mitotic metaphase and is followed by anaphase I and telophase I, producing two daughter cells each with one copy of each chromosome (each still made up of two sister chromatids). A second division quickly follows, comprising an interphase (without chromosome replication), and mitosis-like prophase II, metaphase II, anaphase II, and telophase II to separate the two chromatids in each chromosome. Compare mitosis. - meiotic adj.

MEK abbr. for methyl ethyl ketone.

mass formed by the action of oxidase enzymes on phenols. They are widely distributed in plants and animals and are usually bound to protein. The most important precursor of melanins is the phenolic amino acid tyrosine. Plant melanins are called catechol melanins because they yield catechol on alkali fusion; animal melanins, termed eumelanins, arise from the formal polymerization of indole-5,6-quinone and thus, in contrast to plant melanins, contain nitrogen. —melanic adj.

melanocortin a generic term for either of the peptide hormones melanotropin or corticotropin, deriving from the composite proopiomelanocortin, the polyprotein from which they are formed. Although the two hormones have distinct functions (melanotropin in control of melanocyte growth and pigment formation, corticotropin in stimulating the adrenal cortex to produce glucocorticoids and aldosterone), they also share functions in, e.g., immunomodulation and antipyretic activity; while corticotropin can regulate melanocyte function, it is thus possible also to regard it as a melanotropin.

melanocortin receptor similarities between the receptor structures for corticotropin (abbr.: ACTH) and melanotropin (abbr.: MSH) indicate that this is a subfamily of G-proteincoupled, adenylate cyclase-activating, seven-transmembranedomain receptors. Several types of receptor have been identified: melanocortin-1 receptor, other names: melanocyte-stimulating hormone receptor; melanotropin receptor; located on melanocytes and adrenocortical tissue; example from human: database code MSHR_HUMAN, 317 amino acids (34.66 kDa); melanocortin-2 receptor, other name: adrenocorticotropic hormone receptor; located on melanocytes and adrenocortical tissue; example from Bos taurus: database code ACTR_BOVIN, 297 amino acids (33.29 kDa); melanocortin-3 receptor, located on brain, placental, and gut tissue; example from human: database code MC3R_HUMAN, 360 amino acids (40.11 kDa); melanocortin-4 receptor, located on brain, placental, and gut tissue; example from human: database code MC4R_HUMAN, 332 amino acids (36.95 kDa); melanocortin-5 receptor, expressed in brain but not melanocytes; example from human: database code MC5R_HUMAN, 325 amino acids (36.6 kDa). Human ACTH receptor is 39% identical with the human MSH receptor. Receptors 1-3 and 5 respond to α -, β-, and γ-MSH and ACTH, melanocortin-4 receptor being specific to a common heptapeptide core sequence MGHFRWG. However, despite similarities in structure and action on melanocortin receptors, physiologically MSH has no ACTHlike activity. These are among the smallest G-protein-coupled receptors identified to date; they are more closely related to the Δ^9 -tetrahydrocannabinol receptor (see cannabinoid receptor) than to other peptide and amine G-protein-coupled receptors.

melanocyte a type of pigmented cell that can synthesize and store melanin in melanosomes. Melanocytes occur in the skin and in the pigmented layer of the eye. See also melanophore.

melanocyte regulatory factor an alternative name for melanotropin regulatory factor.

melanocyte-stimulating hormone abbr.: MSH; any of three peptide hormones, α-MSH, β-MSH, and γ-MSH, produced primarily by the intermediate lobe of the pituitary gland, that cause dispersal of melanosomes in melanophores of poikilothermic vertebrates, but whose physiological function in mammals is not understood. Their sequences are all contained within that of proopiomelanocortin (the common precursor of corticotropin and β lipotropin). α-MSH is a tridecapeptide amide (usually acetylated on the N-terminal serine residue) that corresponds to residues 1-13 of corticotropin and has the same sequence in almost all animals studied. B-MSH (formerly called intermedin), not believed to be present in humans, corresponds to residues 41-58 of \(\beta \) lipotropin and shows greater structural variability. γ-MSH, a putative hormone, is a peptide of variable length that corresponds to part of the so-called cryptic region of proopiomelanocortin. See also melanotropin.

melanocyte-stimulating hormone receptor see melano-

melanin any of the black or brown pigments of high molecular tropin receptor.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Saturday.

melanocyte-stimulating-hormone regulatory factor or melanocyte-stimulating-hormone regulatory hormone an alternative name for melanotropin-regulatory factor.

melanocyte-stimulating-hormone release-inhibiting factor (abbr.: MSHIF or MSHRIF) or melanocyte-stimulating-hormone release-inhibiting hormone (abbr.: MSHIH or MSHRIH) an older name for melanostatin.

melanocyte-stimulating-hormone releasing factor (abbr.: MSHRF) or melanocyte-stimulating-hormone releasing hormone (abbr.: MSHRH). See MSHRH.

melanoliberin the recommended name for melanocyte-stimulating-hormone releasing hormone (see MSHRH).

melanophore a type of melanocyte that occurs especially in the skin of poikilothermic vertebrates. The cell's contractile properties allow rapid internal translocation of melanosomes, thereby bringing about rapid adaptive changes in the skin coloration of such creatures.

melanosome a type of cellular organelle that occurs in melanocytes; melanosomes contain tyrosinase and can synthesize and store melanin.

melanostatin a substance identified by its ability to inhibit release of melanotropin; it is now known to be identical with neuropeptide Y. Other names: melanotropin release-inhibiting factor (abbr.: MIF or MRIH); melanotropin release-inhibiting hormone (abbr.: MIH or MRIH); melanocyte-stimulating-hormone release-inhibiting factor (abbr.: MSHIF or MSHRIF); melanocyte-stimulating-hormone release-inhibiting hormone (abbr.: MSHIH or MSHRIH).

melanotransferrin see transferrin.

melanotropic or **melanotrophic** describing any agent that causes dispersal of melanosomes within **melanophores**.

melanotropin or (formerly) **melanotrophin** a generic term for any melanotropic hormone of the anterior pituitary that is derived from **proopiomelanocortin**. The term embraces α , β , and γ **melanocyte-stimulating hormones**. See also **melanocortin**.

melanotropin receptor any of a family of receptors that bind melanotropins. See also melanocortin receptor.

melanotropin-regulatory factor or melanotropin-regulatory hormone an older generic name for either MSHRH or melanostatin. Other names: melanocyte-regulatory factor; melanocyte-stimulating-hormone regulatory factor; melanocyte-stimulating-hormone regulatory hormone.

melanotropin release-inhibiting factor (abbr.: MIF or MRIF) or melanotropin release-inhibiting hormone (abbr.: MIH or MRIH) an older name for melanostatin.

melanotropin-releasing factor (abbr.: MRF) or melanotropin-releasing hormone (abbr.: MRH) see MSHRH.

melatonin N-acetyl-5-methoxytryptamine; a neuroendocrine principle synthesized in the pineal gland from 5-hydroxytryptamine; its synthesis exhibits a circadian photoperiodism. In amphibia, it has an action opposite to that of melanocyte-stimulating hormone. It stimulates the aggregation of melanosomes in melanophores, thus lightening the skin. When used as a drug it is reputed to control jet lag.

melezitose the trisaccharide, $O-\alpha$ -D-glucopyranosyl- $(1\rightarrow 3)$ - $O-\beta$ -D-fructofuranosyl- $(2\rightarrow 1)$ - α -D-glucopyranoside; a component of the sweet exudations from many plants and of the leaves of some trees after insect attack.

melibiase see glucosidase.

melibiose the disaccharide, $6 \cdot O \cdot \alpha$ -D-galactopyranosyl-D-glucose; it occurs as a constituent of the trisaccharide, **raffinose**, and in the exudates and nectaries of a number of plants.

melissyl an alternative name for myricyl. melitriose see raffinose.

melittin a strongly basic, sulfur-free, hemolytic, 26-residue peptide amide, often formylated on its N-terminal glycine residue. It comprises 40-50% of the dry mass of the venom of the honey bee, *Apis mellifera*. The hemolytic activity of melittin appears to be related to the ordering of its amino-acid residues, which renders the polypeptide markedly surface active. Example from *A. mellifera*, chain A: database code NRL_2MLTA, 26 amino acids (2.84 kDa); chain B: database code NRL_2MLTB, 26 amino acids (2.84 kDa); both 3-D structures are known.

melting 1 the (reversible) act or process of liquefaction of a solid through the action of heat (or change in pressure). 2 the increase (reversible and usually fairly abrupt) of molecular mobility of lipids in a biological membrane or artificial lipid bilayer with increase of temperature above the transition temperature. 3 or thermal denaturation the transition (usually fairly abrupt but not necessarily reversible) of a biopolymer from a highly ordered to a less highly ordered state with increase in temperature. Examples are the heat-induced change from a helical to a random coil structure in a protein or a duplex nuleic acid. See also localized melting, melting temperature.

melting curve an alternative name for thermal denaturation profile. melting point abbr.: m.p.; the temperature at which the solid and liquid phases of a substance are in equilibrium at a given pressure. Melting points are usually given for standard atmospheric pressure, i.e. 101 325 Pa.

melting temperature symbol: $T_{\rm m}$ or $t_{\rm m}$ or $\theta_{\rm m}$; the temperature at which a conformational transition brought about by change in temperature, e.g. of a macromolecule in solution, is 50% complete. It follows therefore that $T_{\rm m} = \Delta H_{\rm ot}/\Delta S_{\rm ot}$, where $\Delta H_{\rm ot}$ and $\Delta S_{\rm ot}$ are, respectively, the standard enthalpy difference and the standard entropy difference for the transition. In the denaturation of DNA the melting temperature is taken as the midpoint of the **helix-to-coil transition**.

MEM abbr. for 1 minimum essential medium. 2 minimum Eagle's medium.

membrane any thin sheet or layer, often separating two compartments. Membranes may be natural or artificial, and are sometimes soft and pliable. See also cell membrane, semipermeable membrane, unit membrane. —membranous adj.

membrane attack complex see MAC (def. 1).

membrane attack complex inhibition factor abbr.: MACIF or CD59 glycoprotein precursor; other names: MAC-inhibitory protein, protectin, membrane inhibitor of reactive lysis (abbr.: MIRL); a surface antigen of T cells that potently inhibits the membrane attack complex (see MAC). It is complexed with a GPI anchor. Example from human: database code CD59_HUMAN, 128 amino acids (14.18 kDa).

ent of the sweet exudations from many plants and of the leaves membrane-bound describing any component that is not readof some trees after insect attack. Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

No thought

vitro and/or that appears to be an integral part of a membrane in an intact cell.

membrane channel a protein complex that specifically facilitates the passive diffusion of small molecules through a membrane; particularly applied to ion channels.

membrane electrode any electrode that incorporates a membrane in its structure, e.g. a glass electrode, an ion-exchange electrode, or an oxygen electrode.

membrane filter or filter membrane any membrane consisting of a thin polymeric structure with pores of a defined and very uniform size that is used for filtration; a disk or piece of such membrane.

membrane filtration the act or process of separating suspended particles from a liquid, or of separating macromolecules from their solvent, with a membrane filter.

membrane-organizing spike protein see moesin. membrane osmometer see osmometer.

membrane potential the electric potential existing across any membrane arising from charges in the membrane itself and from the charges present in the media on either side of the membrane. Plant and animal plasma membranes maintain a potential, the cell interior being more negative than the exterior. In plants this arises mainly from the activity of electrogenic pumps, whereas in animals passive ion movements predominate in creating this potential. The resting potential varies from -20 mV to -200 mV according to cell type; for a neuron it is about -70 mV. In plants, H+-transporting ATPases pump protons out of the cell, thus maintaining a pH gradient across the plasma membrane. This is involved in symport of carbohydrates and amino acids into the cell. In animals, the Na+,K+-ATPase exchanges intracellular Na+ for extracellular K⁺, maintaining the high intracellular Na⁺ for extracellular K⁺ concentration and low intracellular Na⁺ concentration. K⁺-leak channels in the plasma membrane allow K⁺ to escape until counteracted by the electrical potential and excess of intracellular negative charge that results. An electrochemical gradient across the mitochondrial inner membrane is created by proton-pumping cytochromes. See also chemiosmotic coupling hypothesis. Nernst equation.

membrane protein any protein that is normally closely associated with a cell membrane. Such an association results from a variety of properties of the protein and the method by which it is synthesized. Integral proteins contain hydrophobic regions that traverse the lipid bilayer; in some cases, the protein has only one such region, with hydrophilic domains on either side of the membrane; in other cases, where several such regions are present, a single polypeptide chain may traverse the membrane several times (see seven-transmembrane-domain proteins). Other proteins are bound to the membrane by a GPl anchor, and others by the hydrophobic moiety of a fatty-acyl group (see myristoylation) or a prenyl group (see prenylation). Other proteins may be more loosely attached, mainly by ionic forces (peripheral proteins).

Membrane-anchored proteins may be classified into a number of types, depending on the number of transmembrane domains, the orientation of the protein, and the presence of other kinds of attachment to the lipid bilayer. Type I membrane proteins have a single transmembrane domain, with the C terminus on the cytoplasmic side. Type II membrane proteins have a single transmembrane domain with an N terminus that is cytoplasmic. Type III membrane proteins have a single polypeptide chain that traverses the membrane several times. Type IV membrane proteins are made up of multimers of subunits that when assembled make a transmembrane channel. Proteins attached to the membrane only by covalently bound lipids are classified as type V, and those that are anchored by one or more transmembrane domains and also by a GPI anchor are designated type VI. The structures of only a few membrane proteins have been solved at high resolution (7 Å or better). Except for these it is not known whether the transmembrane receptor any of the many proteins, situated in or on a cell membrane, that bind extracellular signalling molecules (e.g. hormones, growth factors) and transduce the signal to intracellular effects.

membrane skeleton the protein network of an erythrocyte membrane, defined operationally as the insoluble residue that remains after extraction of either intact red cells or their isolated membranes with the nonionic detergent Triton X-100.

membrane teichoic acid any teichoic acid found in the protoplast of a bacterial cell as opposed to any found exclusively in the cell wall or in capsular material. Such substances commonly are glycerol teichoic acids, and they occur, covalently attached to lipid, in the cell membrane and probably also in mesosomes.

membrane transport any movement of substances across a (biological) membrane.

memory cell any of a population of long-lived T or B lymphocytes that have previously been stimulated by antigen, and make an accelerated response to that antigen if they encounter it again. Memory B cells carry surface immunoglobulin G as their antigen receptor; this is of higher affinity than on virgin lymphocytes. Memory T cells may be distinguishable by high expression of CD44.

menadione 2-methyl-1,4-naphthalenedione; 2-methyl-1,4-naphthoquinone; vitamin K_3 ; a synthetic naphthoquinone derivative possessing the physiological properties of vitamin K.

menaquinone abbr.: MK; the class name for a series of 2-methyl-3-all-trans-polyprenyl-1,4-naphthoquinones, also known as vitamins K_2 (see vitamin K for function). They are antihemorrhagic vitamins, present in bacteria, and possess 1-13 prenyl residues, the number of prenyl residues being indicated by a suffixed Arabic number, e.g. menaquinone-6 (MK-6; also known as farnoquinone). [From methyl naphthaquinone.]

Mendel, Gregor Johann (1822-84), Austrian monk and botanist. See also Mendel's laws of heredity.

Mendeleev or Mendeleyev or Mendeléeff, Dmitri Ivanovich (1834–1907) Russian chemist who proposed the periodic law and periodic table.

Mendelian 1 of or relating to Mendel, or following his laws of heredity. 2 one who adheres to or supports Mendel's laws of heredity.

Type IV membrane proteins are made up of multimers of subunits that when assembled make a transmembrane channel. Proteins attached to the membrane only by covalently bound lipids are classified as type V, and those that are anchored by one or more transmembrane domains and also by a GPI anchor are designated type VI. The structures of only a few membrane proteins have been solved at high resolution (7 Å or better). Except for these it is not known whether the transmembrane domain is helical.

meniscus

pair. Mendel's second law, the law of independent assortment, states that the separation of members of any pair of allelic genes occurs independently of every other pair provided they are not linked.

meniscus (pl. menisci) the curved upper surface of a liquid column that is concave when the containing walls are wetted by the liquid (contact angle $<90^{\circ}$) or convex when not (contact angle $>90^{\circ}$), sometimes extended to include a flat surface (contact angle $=90^{\circ}$). —meniscoid adj.

meniscus depletion (sedimentation equilibrium) method or Yphantis method a variant of the sedimentation equilibrium method for determining the relative molecular mass of a macromolecule in which centrifugation is effected at a speed high enough to render the concentration of the solute at the meniscus essentially zero; the concentrations of solute along the length of the cell are proportional to the difference in refractive index at any point from that at the meniscus. The method is especially useful for monodisperse systems.

Menke's disease or kinky-hair syndrome or steely-hair syndrome a genetically determined defect of copper metabolism found in some humans. Most of the clinical and pathological manifestations can be explained on the basis of a profound copper deficiency caused by an inability to absorb copper from the gastrointestinal tract and also, probably, to a reduced ability to absorb copper from the mother during intrauterine life.

menopausal gonadotropin or human menopausal gonadotropin (abbr.: hMG or HMG); another name for menotropin.

menotropin or menotrophin other name: human menopausal gonadotropin; abbr.: hMG or HMG; a gonadotropin with follicle-stimulating hormone and luteinizing hormone activity, isolated from the urine of postmenopausal women and used to stimulate ovulation in infertility. One proprietary name is Pergonal.

Menten, Maude Leonora (1879-1960), Canadian physician, biochemist, and experimental pathologist; best known for her collaboration with Leonor Michaelis in the formulation of Michaelis-Menten kinetics of enzyme action (see Michaelis kinetics).

MEP abbr. for major excreted protease; see cathepsin L.

meprin A EC 3.4.24.18; other names: endopeptidase-2; endopeptidase MEP-1; a metalloendopeptidase of the membranes of kidney and intestinal brush borders. It is an integral protein with the catalytic domain lying towards the exterior. Zinc is a cofactor. It catalyses the hydrolysis of proteins and peptides on the C-terminal side of hydrophobic residues, and is a homotetramer of α or β subunits. Example: precursor of mouse α -subunit (mep-1): database code MEPA_MOUSE, 760 amino acids (85.61 kDa); theoretical 3-D model of this: database code NRL_1IAF, 198 amino acids (22.88 kDa).

meq or mEq symbol for milliequivalent (use deprecated, mmol recommended).

mer or constitutional unit the repeating unit of a polymeric molecule.

+mer suffix forming nouns (in chemical nomenclature) denoting specific kinds or classes of polymer (e.g. hexamer, oligomer) or isomer (e.g. enantiomer, epimer, tautomer). —+meric adj.; +merism n.

mer the symbol for genes of the mer operon whose products confer (or regulate) mercury resistance. The following examples are of mer products from Serratia marcescens. (1) MerA: mercury II reductase (EC 1.16.1.1); systematic name: Hg:NADP+ oxidoreductase; one of the very rare enzymes with metal substrates, it catalyses the reduction by NADPH of Hg²⁺ to form Hg and NADP+. It is a flavoprotein (FAD) with redox-active disulfide bonds; homodimer: database code MERA_SERMA, 460 amino acids (48.53 kDa). This enzyme is responsible for volatilizing mercury as Hg(0). (2) MerB: alkylmercury lyase (EC 4.99.1.2); systematic name: alkylmercury mercuric-lyase; it catalyses a reaction between RHg⁺ and H²⁺. This enzyme cleaves the carbon-mercury bond of organomercurials and the Hg²⁺.

product is detoxified by MerA. Database code MERB_SERMA, 212 amino acids (23.05 kDa). (3) MerR: this is a helix-turn-helix regulatory protein: database code MERR_SERMA, 144 amino acids (16.01 kDa). In the absence of mercury, MerR represses transcription by binding tightly to the mer operator region; when mercury is present the dimeric complex binds a single ion and becomes a potent transcriptional activator, while remaining bound to the mer site. mer operons are encoded by a number of plasmids which have been cloned into Escherichia coli, e.g. Tn21 of Shigella flexneri, Tn501 from Pseudomonas aeruginosa (these two lack the organomercury lyase gene and so confer resistance only against inorganic mer-

mer+ prefix (in coordination compound nomenclature) denoting a meridional (def. 2) arrangement of ligands.

merB and thus encodes a broad spectrum mer operon).

cury salts), and pDU1358 from S. marcescens (which includes

MER abbr. for medium reiteration frequency repeat; other usage: medium reiteration frequency interspersed repetitive elements (abbr.: MER elements). They consist of repeated base sequences in eukaryotic genomes. More than fifty human repetitive families are known, of which most represent MERs. The latter have copy numbers per genome ranging from hundreds to thousands, and length ranging from tens to a few hundred base pairs. They are of unknown function, but some may play a role in regulation of gene expression and others may affect genome stability and gene rearrangements.

mercapt+ a variant form of mercapto+ (sometimes before a variant)

mercaptan an old name for thiol.

mercapto+ or (sometimes before a vowel) mercapt+ comb. form (in chemical nomenclature) indicating the presence of an unsubstituted thio group, -SH.

2-mercaptoethanol HO-CH₂-CH₂-SH; 2-hydroxyethylmercaptan; a sulfhydryl reducing agent often used in buffers to maintain protein sulfhydryl groups in the reduced state.

mercaptopurine or 6-mercaptopurine abbr.: 6-MP; symbol: Shy; thiohypoxanthine; 6-purinethiol; an immunosuppressive and antineoplastic drug useful in organ transplantation and in the treatment of some leukemias. It is a substrate for guanine-hypoxanthine phosphoribosyltransferase, which converts it to 6-mercaptopurine ribonucleoside (or 6-thioinosine; symbol: Sno or M or sI).

mercapturic acid any S-alkyl- or S-aryl-N-acetylcysteine; such compounds are formed as detoxification products in mammals. The initial reaction involves conjugation with the thiol group of glutathione catalysed by a glutathione transferase to form the S-radyl-glutathione (see radyl). Glutamic acid and glycine are then removed in the kidney, and the resulting mercapturic acid is excreted in the urine.

mercurate to treat or mix with mercury; to introduce mercury into an organic compound. —mercuration n.

mercurial 1 of, containing, like, or pertaining to mercury. 2 any compound containing mercury, especially one used in medicine and/or agriculture; see also organomercurial.

mercuric perchlorate Hg(ClO₄)₂; a substance used in solution to trap ethylene.

mercury II reductase EC 1.16.1.1; product of the Serratia marcesens merA gene (see mer).

mercury-vapour lamp or mercury-discharge lamp or (informally) mercury lamp a lamp that emits bluish-green light rich in ultraviolet radiation, produced by passing an electric discharge through mercury vapour, often at low pressure. It is useful for provoking or investigating fluorescence, as a light source for a polarimeter, and as a source of sterilizing radiation.

meridian 1 any line on the surface of a sphere or spheroid that is orthogonal to its equator, or any corresponding line in a projection of part of the surface of a sphere or spheroid onto a planar or cylindrical surface. 2 in a fibre diagram produced by X-ray diffraction, the vertical axis on the film that corresponds to the z axis in reciprocal space.

carbon-mercury bond of organomercurials and the Hg²⁺ meridional 1 of, along, pertaining to, or resembling a meri-Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

meridional

mesomeric a morpholino)ethanesulfonic acid; a Good buffer substance, pKa $(20 \, ^{\circ}\text{C}) = 6.15.$

dian. 2 describing the geometrical isomer of a coordination compound of octahedral configuration in which three ligands in the coordination sphere are in such a relationship that one is cis to the two others, which are themselves trans. Such an isomer is designated by prefixing mer- to the chemical name.

meristem a region of tissue in a plant that is composed of one or more undifferentiated cells that are capable of undergoing mitosis and differentiation, and thereby of effecting growth and development of a plant by giving rise either to more meristem or to specialized tissue. In vascular plants, meristems may be apical (located at the tips of growing roots and shoots) or lateral (arranged circumferentially and constituting the cambium). —meristematic adj.

merlin or neurofibromatosis type 2 (tumour suppressor) (abbr.: NF2) or Schwannomin a membrane-stabilizing protein from fetal brain, and other tissues such as kidney, lung, and breast. It is similar to ezrin and talin. Example from human: database code MERL_HUMAN, 595 amino acids (69.61 kDa). It is a tumour suppressor of the **TERM** family. In the human, it is encoded by a gene on chromosome 22q12. Mouse complete sequence: database code MUSNF2D, 596 amino acids (69.61 kDa).

mero+ comb. form denoting part, partly, or partial.

merocrine 1 describing a type of secretion that does not entail disintegration of the secretory cell. 2 describing a gland made up of such cells. Compare apocrine, eccrine, holocrine.

merodiploid a haploid organism that is diploid for a small region of the chromosome, i.e. a partial diploid.

meromyosin either of the two fragments, heavy meromyosin and light meromyosin, produced by brief treatment of myosin with trypsin or certain other proteinases.

mero-receptor the smallest subunit of a receptor for a (steroid) hormone that contains an intact hormone-binding site. The biological significance of mero-receptors is unclear; they may be artefacts of experimental cellular disruption or products formed by proteolysis associated with the termination of (steroid) hormone action.

merosin a tissue-specific-basement-membrane protein, and the M chain of laminin. It is covalently associated with laminin B chains and like laminin is cruciform. It has homology to the Cterminal part of the laminin A chain. Example from human: database code HSLAMMMER, 3110 amino acids (342.38 kDa).

merozygote any bacterial cell that is partly diploid and partly haploid, formed by conjugation, transduction, or transformation. It contains one complete genome, that of the recipient organism, and a fragment of a second genome, derived from the donor.

Merrifield, Robert Bruce (1921-), US peptide chemist and biochemist; Nobel Laureate in Chemistry (1984) 'for his development of methodology for chemical synthesis on a solid matrix'.

Merrifield method an alternative name for solid-phase peptide

Merrifield resin a beaded reactive synthetic resin designed for use in the Merrifield method (i.e. solid-phase peptide synthesis).

mersalyl pharmaceutical name of sodium o-{[3-(hydroxymercuri)-2-methoxypropyl]carbamoyl}phenoxyacetate; a mercury-containing derivative of salicylamide. It is a diuretic drug useful as an inhibitor of the exchange of phosphate and hydroxide ions across the inner mitochondrial membrane.

 $\textbf{mes+} \ a \ variant \ form \ of \ \textbf{meso+} \ (sometimes \ before \ a \ vowel).$

mesaconic acid (E)-2-methyl-2-butenedioic acid; methylfumaric acid; an intermediate in the fermentation of glutamate to acetyl-CoA by Clostridium tetanomorphum.

mescaline 3,4,5-trimethoxyphenylethylamine; a hallucinogenic and sympathomimetic drug isolated from the flowering heads of the mescal cactus (Lophophora williamsii), also known as peyotle or peyote.

Meselson-Stahl experiment a landmark experiment, reported by Meselson and Stahl in 1958, that provided convincing evidence for semiconservative replication of DNA in bacteria. Cultures of Escherichia coli were grown in a medium containing ¹⁵NH₄Cl (96.5% isotopic purity) as sole nitrogen source for many generations so as to label the DNA with heavy nitrogen. The cells were then transferred to a medium containing 14NH₄Cl and the culture sampled for several subsequent generations. Cell lysates were subjected to density-gradient centrifugation and the positions of the DNA bands in the gradients located by UV absorption. Initially the DNA appeared as a single band corresponding to DNA containing heavy nitrogen; subsequently a second band of DNA, containing equal amounts of heavy and light nitrogen, appeared, and one generation after transfer to natural ammonium chloride all the DNA was this hybrid form. After two generations only hybrid and natural DNA was present. Furthermore, the separated strands of this hybrid DNA proved to contain all heavy nitrogen or all normal nitrogen only. [After Matthews Meselson (b. 1930), US molecular biologist, and Franklin William Stahl (b. 1929), US geneticist.]

mesenchyme immature, unspecialized connective tissue found in the early embryo of animals. It consists of cells embedded in a tenuous extracellular matrix. —mesenchymal adj.

mesentery 1 the double-layer fold of peritoneum serving to hold the abdominal viscera in position. 2 any of the muscular partitions extending inwards from the body wall in coelenterates. —mesenteric adj.

Me₃Si symbol for the trimethylsilyl group.

meso describing a bridging atom or group between two rings in a polycyclic molecule.

meso+ or (sometimes before a vowel) mes+ comb. form denoting middle, or intermediate.

meso- abbr.: ms-; prefix (in chemical nomenclature) designating a substance whose individual molecules contain equal numbers of enantiomeric groups, identically linked, but no other chiral group; i.e. a substance whose molecules are optically inactive because of internal compensation; e.g. meso-compound, meso-cystine. Compare racemo-.

meso-carbon atom a term suggested for any prochiral carbon atom in an organic molecule whose valence bonds are linked to two identical groups, a, and to two other dissimilar groups, b and d. The resulting molecule, Caabd, has a plane of symmetry and thus the carbon atom is not chiral; however, the two a groups are not geometrically equivalent but bear a mirrorimage relationship to each other, and they may react at different rates with chiral reagents or in enzymic reactions. The term is now obsolete. See prochiral.

mesoderm the middle of the three primary germ layers of a triploblastic animal embryo, lying between the ectoderm and endoderm. It is the source of bone, muscle, connective tissue, the inner layer of the skin, and other structures. -mesodermal

meso-inositol a former name for myo-inositol.

mesomeric effect (in chemistry) an experimentally observable effect (on reaction rates, etc.) of a substituent caused by the overlap of its p- or π -orbitals with the p- or π -orbitals of the rest of the molecular entity, resonance (def. 2) (or mesomerism) being thereby introduced into, or extended within, the molecular entity in question. Compare inductive effect.

mesomerism (in chemistry) a term used to imply that the cor-MES abbr. for and trivial name of 2-(N- rect representation of the structure of a particular molecular Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

mesomerism metabolic alka

entity is intermediate between two or more formal valence-bond representations (known as contributing structures); resonance (def. 2).—mesomeric adj.

mesomorphic 1 (in chemistry) existing in, designating, or pertaining to an intermediate state between a true liquid and a true solid that exists in a liquid crystal. 2 (in biology) having a form, size, or structure that is average, normal, or intermediate between extremes.

mesophase any phase of matter intermediate between a true liquid and a true solid that exists in a **liquid crystal**.

mesophil or mesophile any organism that thrives at moderate temperatures, between 20 and 40 °C. —mesophil, mesophile, or mesophilic adi.

mesophyll the internal parenchyma of a foliage leaf between the two epidermal layers; it is usually photosynthetic.

—mesophyllic adj.

mesophyte any plant requiring moderate amounts of water for optimum growth. —mesophytic adj.

mesopore any pore (in a gel or porous solid) intermediate in size between a micropore and a macropore, i.e. of width in the range roughly 2.0-50 nm. —mesoporous adj.

mesosecrin a glycoprotein, M_r 46 000, secreted by human mesoderm-derived and endothelial cells in culture.

mesosome an intracellular, often complex, membranous structure found in many bacteria and probably formed by invagination of the plasma membrane. It is more complex and larger in Gram-positive organisms than in Gram-negative ones. Its function is unclear. —mesosomal adj.

mesothelium (pl. mesothelia) a layer of flat cells derived from mesoderm and found lining various body cavities.
—mesothelial adj.

mesotocin [Ile8] oxytocin; a neurohypophyseal hormone present in some nonmammalian vertebrates, so-named because it is intermediate in structure between isotocin and oxytocin. It may represent an ancestral molecule, which has been preserved in these groups of vertebrates but has undergone a single residue replacement in mammals.

mesotrophic describing an environment providing a moderate amount of nutrients.

message 1 a specific piece of information, or something containing information, that is transmitted from a donor to a recipient by some means or agent. 2 a jargon term used, sometimes without an article, as the name of a substance, to denote the particular messenger RNA (mRNA) of interest in a specified context, or any preparation containing that mRNA. 3 the segment of mRNA (or any particular segment of a polycistronic mRNA) that consists of a sequence of codons carrying the information determining the sequence of amino-acid residues of a specific polypeptide to be synthesized at a ribosome. 4 the part of the information contained within the amino-acid sequence of a hormonal polypeptide, or of its biosynthetic precursors, that elicits a specific physiological response to the hormone. Compare address (def. 2).

message-dependent (of a partially purified, cell-free, protein-synthesizing system) capable of a significant response to added mRNA.

message sequence or message region the segment (or segments) of the complete sequence of amino-acid residues of a molecule of a hormonal or prohormonal polypeptide in which the message (def. 4) resides. Compare address sequence.

messenger 1 something, or someone, that bears or carries a message (def. 1), or that is able to do so. 2 a molecule or substance that carries genetic information; see messenger RNA. 3 a molecule or substance that carries physiological instructions; a rheoseme. See also chemical messenger, first messenger, second messenger.

messenger ribonucleoprotein abbr.: mRNP; any complex of messenger RNA (mRNA) and protein. Included are: nuclear ribonucleoprotein that contains mRNA sequences; cytoplasmic ribonucleoprotein that is associated with polyribosomes;

and free cytoplasmic ribonucleoprotein particles, also known as informosomes.

messenger RNA or template RNA abbr.: mRNA; a class of naturally occurring RNA molecules that carry the information embodied in the genes of DNA to the ribosomes, where they direct protein synthesis. Molecules of mRNA are singlestranded, relatively short-lived, and formed by the process of transcription from the template strand of genomic DNA. They carry genetic information in the form of a succession of codons. At the ribosomes, by the process of translation, they orchestrate the synthesis of the corresponding polypeptide(s). The plus strand of certain RNA viruses can act as messenger RNA without transcription, as can a synthetic polyribonucleotide. The primary transcript of DNA is often referred to as hnRNA which contains the introns which have to be removed by excising and splicing together the exons to form the mature mRNA. mRNA may also undergo 'editing' whereby some bases are changed. See also mRNA binding site, splicing.

messenger-RNA-interfering complementary RNA abbr.: micRNA; an alternative name for antisense RNA.

Messing vector any one of certain cloning vectors derived from bacteriophage M13 by insertion of a synthetic multipurpose cloning site and which are especially suitable for the cloning and rapid sequence determination of small (≈500 base pair) fragments of DNA. These have developed into the pUC vectors. [After Joachim Messing (1946—).]

met+ a variant form of **meta+** (usually before a vowel or letter h). **Met** symbol for a residue of the α -amino acid L-methionine (alternative to M).

MET a gene, first identified in an N-methyl-N'-nitrosoguanidine-treated cell line, that encodes a receptor tyrosine kinase with α and β subunits. The receptor binds **hepatocyte growth factor** and undergoes autophosphorylation of the cytoplasmic domain. Cells co-transfected with **MET** and **HGF** are highly tumorigenic. Example, database code KMET_HUMAN. See also **hepatocyte growth factor receptor**.

meta+ or (before a vowel or letter h) met+ prefix 1 indicating alteration, alternation, or change of condition or position; after, distal to, behind, beyond; more highly specialized form of. 2 (in inorganic chemistry) denoting the least hydrated acid of a series of oxoacids formed from any one of certain anhydrides, or the anion or a salt formed from such an acid; Compare ortho+ (def. 2), pyro+ (def. 2). It is now approved only for the polymeric acids: metaboric acid, (HBO₂)_n, metaphosphoric acid, (HPO₃)_n, and metasilicic acid, (HSiO₃)_n; and for anions and salts of these acids (but see metabsulfite). 3 (in organic chemistry) distinguishing a particular polymeric form of the substance named, e.g. metaldehyde, metaformaldehyde.

meta- symbol: m-; prefix (in organic chemical nomenclature) denoting the isomer of a disubstituted monocyclic aromatic compound in which the substituents are separated by one intervening unsubstituted ring-carbon atom. Compare ortho, para-.

metabisulfite an old name, still frequently used, esp. in commerce, for inorganic salts of the general formula M₂S₂O₅, where M is a monovalent metallic element.

metabolic of, pertaining to, occurring in, produced by, or liberated during **metabolism**. —**metabolically** adv.

metabolic acidosis any clinical condition in which hydrogen ions accumulate in the blood plasma through an excessive production of acidic metabolites (as in ketoacidosis or lactic acidosis), the excessive ingestion of acids, or a defect in the excretion of hydrogen ions by the kidneys.

metabolic activation bioactivation, usually with particular reference to the conversion of procarcinogens to carcinogens in the body.

metabolic alkalosis any clinical condition in which there is a deficiency of hydrogen ions in the blood plasma caused by the excessive ingestion of alkalis, extrarenal loss of acid (as with vomiting), or therapy with diuretic agents.

mic ribonucleoprotein that is associated with polyribosomes; **metabolic balance** see **balance** (def. 1).

metallocarboxypepti

metabolic block the complete or partial interruption of a specific reaction in a metabolic pathway caused by the absence or greatly reduced activity of the enzyme catalysing that reaction (for genetic reasons or due to the action of a specific agonist). The consequences of a metabolic block include: (1) the complete or partial absence of the final product of the pathway; (2) the accumulation of a metabolic intermediate of the pathway before the block, for which no significant alternative pathway exists; (3) the accumulation of products of an alternative, normally minor, metabolic pathway. See also inborn error of metabolism.

metabolic code a model for the evolution of biological regulation and the origin of hormone-mediated intercellular communication. It is characterized by a set of symbols and their corresponding domains. A symbol is an intracellular molecule, e.g. a hormone or other messenger, that indicates to the cell the existence of a particular state of the environment, e.g. lack of glucose or of amino acids. The symbol regulates a diverse set of biochemical events and reactions in the cell, the nature and number of which are the domain of that symbol.

metabolic compartmentation or metabolic compartmentalization the concept that certain metabolic reactions occur in separate compartments of the cell (or organism) and are therefore not necessarily in equilibrium with each other.

metabolic control an alternative term for metabolic regulation. metabolic cycle any closed sequence of metabolic reactions in which an end product is a reactant in the initiation of the cycle, e.g. the tricarboxylic-acid cycle.

metabolic disease any disease caused by a recognizable abnormality of metabolism.

metabolic flux the rate of passage of material, or of a specified substance or molecular fragment, through a given metabolic pathway.

metabolic pathway any series of connected (enzymic or other) reactions occurring in a cell or organism, whether anabolic, catabolic, or amphibolic.

metabolic pool the sum total of all the different amounts of a given substance, group of similar substances, or specified molecular fragment, irrespective of their distribution in a cell, organ, tissue, or organism, that are in complete equilibrium with each other in regard to participation in a specified set of metabolic reactions.

metabolic quotient symbol: Q_x ; a measure of the rate at which a given substance (x) is taken up by, or discharged from, a cell, organ, tissue, or organism.

metabolic rate the rate of metabolism of an animal measured under given conditions. It may be determined from the dioxygen consumption and carbon dioxide (and urinary nitrogen) excretion, or from the total energy output of the animal. Compare basal metabolic rate.

metabolic regulation the coordinated action of the many systems that control the activity of metabolic pathways. The systems embrace gene regulation and control of protein biosynthesis, as well as the control of the rate of enzyme reactions by phosphorylation of the enzyme protein or by the action of allosteric effectors. The action of second messengers is important in the transduction of signals from outside a cell to the in-

metabolic state (of mitochondria) an alternative term for respiratory state.

metabolic turnover the continual exchange of cellular components by degradation and synthesis. Even for cell components for which the content and composition remain relatively constant, a continuous breakdown and resynthesis of individual molecules is occuring.

metabolism 1 the totality of the chemical reactions and physical changes that occur in living organisms, comprising anabolism and catabolism. 2 the totality of the chemical reactions and physical processes undergone by a particular substance, or class of substances, in a living organism.

that is formed or changed by metabolism. See also primary metabolite, secondary metabolite.

metabolize or metabolise 1 to affect by metabolism. 2 to effect metabolism. —metabolizable or metabolisable adj.

metabolon a supramolecular complex of sequential metabolic enzymes and cellular structural elements.

metabotropic describing a type of receptor (e.g. certain glutamate receptors) that mediates its effects by activation of enzymes, especially adenylate cyclase or the phosphatidylinositol **cycle**, in distinction from receptors that regulate ion channels. Compare ionotropic. See also excitatory amino-acid receptor.

metachromasia or metachromasy or metachromatism 1 the property exhibited by certain cationic (i.e. basic) dyes of shifting their absorption spectra towards shorter wavelengths in the presence of substances with appropriately arranged anionic groups. 2 the property exhibited by some biological structures or materials, when treated with certain cationic (basic) dyes, of staining with a different colour from that of the dye used. Biological materials showing metachromasia include heparin, chondroitin sulfate, sulfatides, gangliosides, and polyphosphates. —metachromatic adj.; metachromatically adv.

metachromatic granule any cytoplasmic granule that exhibits metachromasia (def. 2). Volutin granules are an example.

metachromatic leukodystrophy any of a group of hereditary diseases of humans characterized by disintegration of myelin and the accumulation of metachromatic lipid - galactosyl sulfatide (cerebroside sulfate) - in the white matter of the central nervous system, in peripheral nerves, and in some visceral organs. The accumulation of galactosyl sulfatide is due to deficiency in the activity of cerebroside sulfatase (EC 3.1.6.1). The disorder is characterized clinically by progressive paralysis and dementia, usually in the first few years of life, and is transmitted as an autosomal recessive trait. See also sanosin

metachromism see metachromasia.

metadrenaline an alternative name for metanephrine.

metagon a stable, virus-like RNA particle postulated to occur in certain mate-killer strains of Paramecium aurelia, in which it acts like messenger RNA.

metahalone any of a class of metaphase inhibitors having the general formula 5-halopyridine-2-one. [From meta(phase) halone.]

metakentrin an obsolete name for luteinizing hormone.

metal 1 any of a large class of chemical elements that, with certain exceptions, are ductile, malleable solids with a characteristic lustre, are good conductors of electricity and heat, and generally form simple cations. 2 any substance or material consisting entirely or predominantly of one or more metals (def. 1). 3 consisting or made of metal. —metallic adj.

metal-chelate affinity chromatography a method of purifying proteins or other substances that contain, or are dependent on, chelatable metal ions. It consists of a type of affinity chromatography in which a chelate-forming adsorbent is used. The adsorbent is prepared by covalently linking molecules of a suitable chelator, e.g. iminodiacetate, via long, stable, hydrophilic spacer arms to a gel-forming matrix, e.g. a preparation of cross-linked agarose, and then saturating it with ions of an appropriate metal, e.g. copper(II); the affinity of the metal ions for the adsorbent must be greater than that for the substance to be separated. Components of a mixture selectively retained by the adsorbent may subsequently be eluted, e.g. with EDTA, by change of pH, or with a gradient of a weak base. metal-ion buffer a buffer (def. 1, 2) for metal ions.

metallo+ comb. form denoting metal, or characterized by the presence of metal.

metalloantigen any metal-labelled antigen for use in a metalloimmunoassay.

metallocarboxypeptidase recommended generic name for any carboxypeptidase of the sub-subclass EC 3.4.17, for which a bivalent cation is an essential component of the catalytic mechanmetabolite any substance, either endogenous or exogenous, ism. Ban đang đọc một quyển sách được tặng bởi HUY NGUYỄN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

methadone (hydrochl-

metallocene the generic name for π -bonded bis(η -cyclopentadienyl) coordination compounds of certain metals, e.g. ferrocene, bis(η -cyclopentadienyl)iron, [Fe(C₅H₅)₂].

metallochromic describing a dye, indicator, or stain that exhibits a distinctive colour change when complexed with metal ions; the colour change is often specific for a particular metal. metalloendopeptidase recommended generic name for any

endopeptidase of the sub-subclass EC 3.4.24, for which a bivalent cation is an essential part of the catalytic mechanism.

metalloenzyme any enzyme that is a metalloprotein.

metallohapten any metal-labelled hapten for use in a metalloimmunoassay.

metalloimmunoassay a form of immunoassay in which ions of an appropriate transition metal, tightly complexed to the antigen or hapten in question, are used as the distinguishable label. The amount of metal present in the free and antibodybound forms is determined by a suitable analytical method such as emission, absorption, or fluorescence spectrometry.

metallopeptidase see metallocarboxypeptidase, metalloendopep-

metalloporphyrin any compound formed by chelation of a porphyrin with a metal ion, e.g. hemoglobins (with iron), cytochromes (with iron), and chlorophylls (with magnesium).

metalloprotease a former name for metalloendoproteinase (see also metallocarboxypeptidase, matrix metalloproteinase).

metalloprotein any protein containing one or more molecular proportions of a metal bound to it, either directly or as part of a prosthetic group.

metalloproteinase see metallocarboxypeptidase, metalloendopep-

metalloselenonein a synthetic analogue of the copper metallothionein peptide of Neurospora crassa that contains selenocysteine residues in place of cysteine.

metallothionein any of a group of very small proteins with extraordinarily high contents both of one or more metals (cadmium, copper, zinc) and of cysteine. They occur widely, from microorganisms to humans, and have highly conserved structures. Mammalian metallothioneins are of 6.8 kDa, consist of 61 amino-acid residues, including 20 cysteine residues, and contain about 7 g atoms of metal per molecule. The apoprotein may be termed thionein.

metal proteinase a former name for metalloproteinase (see metallocarboxypeptidase, metalloendopeptidase).

metal response element abbr.: MRE; a sequence in the promoter region regulating groups of genes that respond to the presence of metals. See also response element.

metamer (in chemistry) a former term for any one of two or more constitutional isomers that are of the same chemical class, ethylamine, CH₃-CH₂-NH₂, and dimethylamine, $CH_3-NH-CH_3$.

metamere (in morphology) any of the linearly arranged similar body segments in animals that exhibit metamerism (def. 2); a

metameric 1 (in chemistry) of or pertaining to a metamer; pertaining to the phenomenon of, or displaying metamerism (def. 1). 2 (in morphology) of, or pertaining to, a metamere; consisting of metameres; segmented; of, or pertaining to, metamerism (def. 2).

metamerism 1 (in chemistry) the occurrence as metamers of two or more chemical substances of the same molecular formula. 2 (in morphology) the condition of an animal body characterized by the presence of a series of similar segments or metameres; segmentation.

metameter a quantity derived from an observation, and independent of all parameters, that conveys the magnitude of the phenomenon observed. A metameter is frequently used to simplify the expression or analysis of dose-response relationships.

metamorphosis 1 a complete change in physical form; a structural transformation. 2 (in zoology): the rapid, postembryonic, structural transformation from a larva into an of opioid dependence. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

adult that occurs in certain animals, e.g. the change from a tadpole to a frog. —metamorphose vb.; metamorphic adj.

metanephrine or metadrenaline 3-O-methylepinephrine; an inactive metabolite of epinephrine, produced by the action of catechol O-methyltransferase. Small quantities are normally found in the urine, and larger amounts occur in the urine of patients with catecholamine-secreting tumours.

metaphase the stage in mitosis, following prometaphase, during which the chromosomes become arranged so that their centromeres all lie in one plane and their longitudinal axes are at right angles to the spindle axis; the corresponding phases in meiosis.

metaphosphatase an alternative name for 1 endopolyphosphatase (EC 3.6.1.10). 2 exopolyphosphatase (EC 3.6.1.11).

metaphosphate the traditional name for any anion or any (partial or full) salt or ester derived from the condensed acid metaphosphoric acid, polytrioxophosphoric(v) acid, (HPO₃)_n, where n is a small integer, commonly 3, 4, or 6. Metaphosphoric acid and its derivatives are thought not to exist in the monomeric state, although they are often represented as such for convenience. See also polyphosphate.

metaprotein an old term for the products formed by acid or alkaline hydrolysis of proteins that are soluble in weak acids or alkalis but insoluble in neutral solutions.

metarhodopsin either of two intermediates, metarhodopsin I (absorption maximum 480 nm) and metarhodopsin II (absorption maximum 380 nm), formed during the photolysis of

metastable 1 a describing any body or system existing in a state of apparent equilibrium when undisturbed, or subject to very small perturbation, but capable of passing to a more stable state when subjected to greater perturbation. **b** describing such a state or such an equilibrium. 2 describing an excited state of an atom, ion, nucleus, or other quantum-mechanical system that is relatively long-lived because the transitions to a lower energy state are forbidden transitions. 3 symbol: m; describing any comparatively stable excited state of a radioisotope that decays to a more stable state by isomeric transition, with the emission of gamma radiation, e.g. the metastable nuclide $^{99}_{42}$ MTC, which is formed by decay of $^{99}_{42}$ MO and which in turn decays by transition to its nuclear isomer \frac{93}{1}Tc with a halflife of 6 h and emission of one quantum of gamma radiation.

metastasis (pl. metastases) the transfer of disease, especially tumour cells, from one part of the body to another by way of the natural passages (blood vessels, lymphatics) or by direct continuity. —metastasize or metastasise vb.; metastatic adj.

metazoa the plural of metazoan (def. 1) or metazoon.

Metazoa a subkingdom of animals consisting of multicellular animals whose cells are organized into tissues and their activities coordinated by a nervous system. The group includes all animals except the Protozoa and Parazoa.

metazoal a variant form of metazoan (def. 2).

metazoan 1 or metazoon (pl. metazoa) any animal of the subkingdom Metazoa. 2 or metazoal or metazoic of, characteristic of, or belonging to the Metazoa.

metazoic a variant form of metazoan (def. 2).

metazoon (pl. metazoa) an alternative term for metazoan (def. 1). [Met⁵]enkephalin or [Met]enkephalin abbr. for [5-methionine]enkephalin.

meter 1 an instrument or device for measuring (and recording) the quantity of something (either instantaneously or cumulatively). 2 to measure (something) by means of a meter (def. 1). 3 to supply (something) in a measured or regulated amount. 4 the US spelling of metre.

+meter comb. form denoting an instrument or device for measuring (something indicated or specified). -+metric adj.

metestrus see estrous cycle.

meth+ a variant form of metho+ (before a vowel).

methadone (hydrochloride) 6-dimethylamino-4.4-diphenyl-3-heptanone hydrochloride; a narcotic analgesic used in cases

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

R-(-)-enantiomer

methaemoglobin a variant spelling (esp. Brit.) of methemoglobin.

methaemoglobinaemia a variant spelling (esp. Brit.) of methemoglobinemia.

methane or marsh gas a colourless, odourless, flammable gas, CH₄; it is the simplest alkane and is the principal constituent of natural gas found in association with mineral oil. It is formed by the anaerobic decay of vegetable matter and in large amounts by ruminants and other herbivores.

methano+ comb. form. 1 indicating methane. 2 (in chemical nomenclature) denoting the presence of a -CH₂- bridge in a polycyclic hydrocarbon.

methanoate see formate.

methanogen any microorganism that produces methane. methanogenic adj.

methanogenesis the microbial production of methane by anaerobic breakdown of carbon-containing compounds.

methanogenic the ability to form methane from CO₂, a property of some anaerobic bacteria. The pathway involves the coenzyme tetrahydromethanopterin (abbr.: H₄MPT), and involves formation of 5-formyl-H₄MPT, from which successively methenyl-H₄MPT, methylene-H₄MPT, and methyl-H₄MPT are formed in reactions analgous to those for folate coenzymes. From the last of these, methyl is transferred to coenzyme M to form methyl-coenzyme M, from which methane is formed in a reductive step involving factor F₄₃₀. See also coenzyme F₄₂₀.

methanol methyl alcohol; CH3-OH; the lowest member of the alkanols. It is a colourless, flammable, mobile, poisonous liquid, widely used as a solvent. Numerous esters and ethers of methanol occur naturally, especially in plants. Other names: wood alcohol; wood spirit; carbinol. —methanolic adj.

methanol oxidase see alcohol oxidase.

methanolysis alcoholysis using methanol.

MetHb abbr. for methemoglobin (i.e. ferrihemoglobin).

methemoglobin or (esp. Brit.) methaemoglobin abbr.: MetHb; an older name for ferrihemoglobin.

methemoglobinemia or (esp. Brit.) methaemoglobinaemia any clinical condition characterized by an excess of ferrihemoglobin (i.e. methemoglobin) in the erythrocytes. It accompanies a number of hemoglobinopathies, and also results from administration of large amounts of sulfonamides. A hereditary methemoglobinemia is associated with a lack of enzymic capacity to reduce ferrihemoglobin within the red cell. Ferrihemoglobin imparts a brown colour to urine.

methene an old name, still commonly used in biochemistry, for the trivalent diatomic group, =CH-, attached to two other groups in an organic molecule. The name now recommended is methyne.

methene bridge the methene group that links consecutive pyrrole rings in the molecular structure of tetrapyrroles and related compounds.

methenyl+ prefix (to a trivial biochemical name) denoting substitution of a methene group into the indicated parent compound (at the positions specified by appropriate locants); e.g. 5,10-methenyltetrahydrofolate. Compare methylene+.

methenyltetrahydrofolate cyclohydrolase EC 3.5.4.9; sys-

cyclizing); one of the enzymes involved in transformations between folate coenzymes. It catalyses the hydrolysis of 5,10methenyltetrahydrofolate to form 10-formyltetrahydrofolate. One of three enzymes (see also methylenetetrahydrofolate dehydrogenase (NADP+) and formate-tetrahydrofolate ligase) necessary for the biosynthesis of purines, thymidylate, methionine, histidine, pantothenate, and formyl tRNA-Met. See methylenetetrahydrofolate dehydrogenase (NADP+) for an example.

5,10-methenyltetrahydrofolate synthetase see 5-formyltetrahydrofolate cyclo-ligase.

MeTHFA abbr. for 5-methyltetrahydrofolate.

methicillin see meticillin (sodium).

methine a former name for methyne.

methioninate 1 methionine anion; the anion, CH₃-S-[CH₂]₂-CH(NH₂)-COO⁻, derived from methionine. 2 any salt containing methionine anion. 3 any ester of methionine.

methionine the trivial name for α -amino- γ -methylmercaptobutyric acid; 2-amino-4-(methylthio)butanoic acid; CH₃-S- $[CH_2]_2$ -CH(NH₂)-COOH; a chiral α -amino acid. L-Methionine (symbol: M or Met), (S)-2-amino-4-(methylthio)butanoic acid, is a coded amino acid, found in peptide linkage in proteins; codon: AUG (or AUA also in various species of mitochondria). D-Methionine (symbol: D-Met or DMet) is not known to occur naturally. In mammals methionine is glucogenic and is an essential dietary amino acid, although either enantiomer will serve (the D-form being oxidatively deaminated to the α oxo acid, which is then reaminated with inversion).

methionine adenosyltransferase EC 2.5.1.6; other names: S-adenosylmethionine synthetase; AdoMet synthetase; an enzyme that catalyses the formation of S-adenosyl-L-methionine from L-methionine, ATP, and H₂O with the release of pyrophosphate and orthophosphate. Example from Escherichia coli: database code METK_ECOLI, 384 amino acids (42.03 kDa). Example from human: database code METK_ HUMAN, 395 amino acids (43.61 kDa).

methionine dioxide symbol: MetO₂; methionine S,S-dioxide; CH₃-SO₂-[CH₂]₂-CH(NH₂)-COOH; an oxidation product of methionine, formerly known (incorrectly) as methionine sulfone.

[5-methionine]enkephalin abbr.: [Met]enkephalin [Met⁵]enkephalin; the recommended designation for the trivial name of the pentapeptide Tyr-Gly-Gly-Phe-Met. See enkephalin. methionine oxide symbol: MetO; methionine S-oxide; CH₃-SO-[CH₂]₂-CH(NH₂)-COOH; an oxidation product of methionine and an intermediate in the formation of methionine dioxide. It was formerly known (incorrectly) as methionine sulfoxide.

methionine salvage pathway a metabolic cycle in which methionine is synthesized from carbons originating in the ribose of ATP, the sulfur atom being conserved throughout the cycle. In outline, the cycle consists of reactions in which, starting with L-methionine, S-adenosylmethionine (I) is formed in a reaction with ATP. I is then converted by 1-aminocyclopropane-1-carboxylate synthase, EC 4.4.1.14, to 5'-methylthioadenosine (II) and 1-aminocyclopropane-1-carboxylate, a precursor of ethylene (see ethylene-forming enzyme). Adenine is then cleaved from methylthioadenosine to form 5-methylthioribose from which 5-methylthioribose-1-phosphate (III) is formed by reaction with ATP. III is then converted through a series of intermediates to 2-keto-4-methylthiobutyrate from which methionine is formed by a transamination reaction.

methionine sulfone an old (incorrect) name for methionine

tematic name: 5,10-methenyltetrahydrofolate 5-hydrolase (de-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Bu-thouse)

methionine sulfoxide an old (incorrect) name for methionine oxide.

methionine sulfoximine [3-amino-3-carboxypropyl]methyl sulfoximine; an inhibitor of glutamine synthetase (glutamate-ammonia ligase) in plants, and identified as the toxic agent in flour treated with the bleaching agent NCl_3 (agene, hence the term agenized flour). It interferes with the action of γ -amino-n-butyric acid in the brain. This is associated with the ability of methionine sulfoximine to cause fits in a wide variety of animals – ferrets are particularly susceptible. Although methionine sulfoximine has not been clearly proven to be toxic to humans, agene is no longer used for bleaching flour.

methionine synthase see homocysteine methyltransferase.

methioninium methionine cation; the cation, CH₃-S-[CH₂]₂-CH(NH₃⁺)-COOH, derived from methionine.

methionino the alkylamino group, CH₃-S-[CH₂]₂-CH(COOH)-NH-, derived from methionine.

methionyl the acyl group, CH₃-S-[CH₂]₂-CH(NH₂)-CO-, derived from methionine.

methionyllysylbradykinin or Met-Lys-bradykinin see brady-

methionyl-tRNA formyltransferase EC 2.1.2.9; systematic name: 10-formyltetrahydrofolate:L-methionyl-tRNA N-formyltransferase. An enzyme that catalyses a reaction between 10-formyltetrahydrofolate, L-methionyl-tRNA, and H₂O to form tetrahydrofolate and N-formylmethionyl-tRNA. N-formylmethionyl-tRNA is involved in the initiation of prokaryote translation. Example from Escherichia coli: database code FMT_ECOLI, 314 amino acids (34.00 kDa).

metho+ or (before a vowel) meth+ (comb. form) a variant of methyl+ in the names of certain chemical compounds.

methotrexate 4-amino-10-methylfolic acid; other name: amethopterin; a folic acid analogue that is a potent competitive inhibitor $(K_i < 10^{-9} \text{ M})$ of **dihydrofolate reductase**. It is useful as an antineoplastic agent in the treatment of acute leukemia and choriocarcinoma. It acts by blocking nucleotide synthesis and thus also DNA synthesis and has similar activity to **aminopterin**. The structure of a complex of methotrexate and dihydrofolate reductase from Lactobacillus casei is known: database code NRL_3DFR.

methoxatin or pyrroloquinoline quinone 4,5-dihydro-4,5-dioxo-1*H*-pyrrolo-[2,3-*f*]quinoline-2,7,9-tricarboxylic acid; a heat-stable fluorescent cofactor implicated in the action of

and possibly more generally associated with the oxidation of single-carbon compounds.

methoxy symbol: OMe or MeO; the alkoxy group, CH₃-O-, derived from methanol by loss of a hydrogen atom.

3-methoxy-4-hydroxymandelate acid See hydroxymethoxy-

5-methoxypsoralen an intercalating reagent for DNA; it forms covalent cross-links on irradiation. See also psoralen.

methoxyvinylglycine abbr.: MVG; L-2-amino-4-methoxy-trans-3-butenoic acid; an inhibitor of ethylene biosynthesis in plants.

methyl symbol: Me; the alkyl group, CH₃-, derived from methane.

methyl- prefix (in chemical nomenclature) used as a locant to indicate in or at a methyl group.

methyl-accepting chemotaxis protein abbr.: MCP; any of several similar integral plasma membrane proteins, one or more of which may be present in the cell membranes of particular strains of certain motile bacteria, e.g. Escherichia coli and Salmonella typhimurium, and each of which appears to mediate the responses of these organisms to corresponding classes of chemotactic agent by undergoing enzymic methylation/ demethylation of the γ -carboxylate group(s) of one or more glutamic residues (for the enzymes responsible see che). The type of ligand determines the nature of the methylation, which in turn determines the action of the receptor on the bacterial flagellar motor, so that the effect can be either attractant or repellent. The following examples are from E. coli. MCP1 is a receptor for attractants such as L-serine and other amino acids and is also responsible for chemotaxis away from a wide range of repellents, including leucine, indole, and weak acids; database code MCP1_ECOLI, 551 amino acids (59.38 kDa). MCP2 is a receptor for L-aspartate, dicarboxylic acids, and maltose (via interaction with a periplasmic maltose-binding protein), and is also responsible for chemotaxis away from cobalt and nickel; database code MCP2_ECOLI, 553 amino acids (59.96 kDa). MCP3 interacts with periplasmic ribose- or galactose-binding proteins and mediates taxis towards these sugars; database code MCP3_ECOLI, 535 amino acids (57.99 kDa). MCP4 interacts with periplasmic dipeptide-binding proteins and mediates taxis towards such peptides; database code MCP4_ECOLI, 535 amino acids (57.65 kDa).

M⁶-methyladenine a methylated base of DNA; this and 5-methylcytosine are the only modified bases in the DNA of cellular organisms.

methyl alcohol a common name for methanol.

methylase a common name for methyltransferase.

methylaspartase see under methylaspartate mutase.

N-methyl-D-aspartate abbr.: NMDA; an excitatory amino acid and a neurotransmitter. It acts as agonist for the N-methyl-D-aspartate receptor, a subclass of glutamate ionotropic receptors (see glutamate receptor).

methylaspartate ammonia-lyase recommended name for methylaspartase; see under methylaspartate mutase.

methylaspartate mutase EC 5.4.99.1; systematic name: L-threo-3-methylaspartate carboxy-aminomethylmutase; other name: glutamate mutase. An enzyme that catalyses the reaction:

L-threo-3-methylaspartate = L-glutamate.

This is the first step of the glutamate-fermentation pathway of primary alcohol dehydrogenases in methylotrophic bacteria of the sanaerobic bacteria Clostridium cochlegrium, C. tetanamor-Ban dang doc mot duven sach duoc tang boi HUY NGUYEN. Neu ban co nhu cau ve sach sinh noc xin lien he:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

methylate

methylest

phum, and others. The product, (2S, 3S)-3-methylaspartate, is converted to mesaconate by the enzyme methylaspartate ammonia-lyase (EC 4.3.1.2). Methylaspartate mutase requires a cobamide coenzyme and has been studied as an example of such a reaction. The enzyme has two subunits (large and small, sometimes called E and S). Examples from C. tetanomorphum: large chain, database code S32433, 485 amino acids (53.68 kDa); small chain, database code S29502, 137 amino acids (14.73 kDa).

methylate 1 to introduce (one or more) methyl groups into (a substance). 2 (in commerce) to mix or adulterate with methanol. —methylation n. See also methylation of DNA.

methylated-DNA-protein-cysteine S-methyltransferase EC 2.1.1.63; other names: 6-O-methylguanine-DNA methyl-O⁶-methylguanine-DNA-alkyltransferase. catalyses the reaction between DNA (containing 6-O-methylguanine) and protein L-cysteine to form DNA (without 6-0methylguanine) and protein S-methyl-L-cysteine. As the acceptor is in the enzyme itself this is a 'suicidal' reaction. Bacterial and mammalian enzymes have common motifs. Example from Escherichia coli: database code OGT_ECOLI, 171 amino acids (19.06 kDa).

methylation of DNA the occurrence in vertebrate DNA of varying amounts of 5-methylcytosine which arises from methylation of cytosine bases where they occur in the sequence CpG. The methylation status of DNA correlates with its functional activity: inactive genes are more heavily methylated. See also CpG islands.

3-methylcholanthrene a carcinogenic hydrocarbon, found in coal tar. It induces synthesis of cytochrome P450 mRNA.

methylcrotonyl-CoA carboxylase EC 6.4.1.4; an enzyme of the pathway for the degradation of leucine. It catalyses the formation of 3-methylglutaconyl-CoA from ATP, 3-methylcrotonyl-CoA, and HCO₃ with release of ADP and orthophosphate. Biotin is a cofactor. The 3-methylglutaconyl-CoA is then converted to 3-hydroxy-3-methylglutaryl-CoA.

5-methylcytosine a methylated base of DNA; this and Nomethyladenine are the only modified bases in the DNA of cellular organisms. In T-even phages all the C residues of DNA are 5-hydroxymethylcytosine.

methyldopa L-2-amino-2-methyl-3-(3,4-dihydroxyphenyl)propionic acid; a compound used as an antihypertensive. It is a competitive inhibitor of aromatic L-amino acid decarboxylase (dopa decarboxylase), but its effects on blood pressure may result from its metabolism to α -methylnorepinephrine which stimulates presynaptic a2 receptors, thus decreasing norepinephrine release.

methylene 1 the recommended name for the bivalent triatomic group CH2 in a molecule, whether attached to two other atoms by single bonds or to one other atom by a double bond. 2 a former name for carbene (def. 1).

methylene+ prefix (to a trivial chemical name) denoting substitution of a methylene group into the indicated parent compound (at the positions specified by appropriate locants); e.g. 5,10-methylenetetrahydrofolate (which may be shortened to 5,10-CH₂-H₄folate). Compare methenyl+.

N,N¹-methylenebisacrylamide (CH₂:CHCONH₂)₂CH₂; a cross-linking agent used in a ratio (w/w) of between 1:49 and 1:19 with acrylamide in the preparation of polyacrylamide

Methylene Blue or Swiss Blue or Basic Blue 9 CI 52015;

thiazinium chloride; a water- and ethanol-soluble blue dye; A_{max} (in water) at 663-667 nm. It is reducible to a leuko (i.e. colourless) compound, which is reoxidizable by dioxygen, and hence is useful as a redox indicator; $E^{o'}$ (pH 7.0, 30 °C) = +0.011 V. It is useful also as a stain in bacteriology and histology, e.g. being preferentially taken up by melanin-containing cells and can be used to target therapeutic agents to such cells.

3,4-methylenedioxymethamphetamine abbr.: MDMA; a phenethylamine derivative and analogue of mescaline and amphetamine that is a potent CNS stimulant and hallucinogen; popularly known as ecstasy. A controlled substance in the US Code of Federal Regulations.

S-(+)-enantiomer

2-methyleneglutarate mutase EC 5.4.99.4; systematic name: 2-methyleneglutarate carboxy-methylenemethylmutase. An enzyme that catalyses the reaction:

2-methyleneglutarate = 2-methylene-3-methylsuccinate.

It is a key enzyme in the fermentation of nicotinate to ammonia, propionate, acetate, and CO2 by the strict anaerobe Clostridium barkeri, but has been much investigated as an example of an enzyme mechanism based on the adenosylcobalamin coenzyme. 2-Methylene-3-methylsuccinate is converted to 2,3-dimethylmaleate by methylitaconate \(\Delta \)-isomerase (EC 5.3.3.6). The enzyme is a homotetramer of 70 kDa subunits: database code CBMGM1, 614 amino acids (66.67 kDa).

methylene-interrupted double bonds double bonds separated by one methylene group. The term is used especially to describe the double bonds in naturally occurring long-chain fatty acids; in many cases these are all of the Z configuration, with each pair separated by one methylene group.

methylenetetrahydrofolate dehydrogenase (NADP*) EC 1.5.1.5; systematic name: 5,10-methylenetetrahydrofolate: NADP+ oxidoreductase. other name: C1-tetrahydrofolate synthase, cytoplasmic; an enzyme involved in the interconversion of folate coenzymes that catalyses the reaction:

5,10-methylenetetrahydrofolate + NADP⁺ = 5,10-methenyltetrahydrofolate + NADPH.

One of three enzymes (see also methenyltetrahydrofolate cyclohydrolase, and formate-tetrahydrofolate ligase) necessary for the biosynthesis of purines, thymidylate, methionine, histidine, pantothenate, and formyl tRNA-Met. Example from human, a cytoplasmic trifunctional homodimer: database code C1TC_HUMAN, 934 amino acids (101.31 kDa) – this has an N-terminal domain (amino acids 1-304) with methylenetetrahydrofolate dehydrogenase and cyclohydrolase activity; the C-terminal section (305-934) forms the formyltetrahydrofolate synthetase domain; other names: mitochondrial (precursor) NAD-dependent methylenetetrahydrofolate dehydrogenase (EC 1.5.1.5)/methenyltetrahydrofolate cyclohydrolase (EC 3.5.4.9): database code MTDC_HUMAN, 344 amino acids

5,10-methylenetetrahydrofolate reductase (FADH₂) EC 1.7.99.5; an enzyme that catalyses the reaction:

5-methyltetrahydrofolate + acceptor =

5,10-methylenetetrahydrofolate + reduced acceptor.

FAD is a coenzyme. Example from Escherichia coli: database code METF_ECOLI, 296 amino acids (33.06 kDa).

methylesterase any of various enzymes that catalyse the hydrolysis of methyl esters. For example, juvenile-hormone tetramethylthionine chloride; 3,7-bis(dimethylamino)pheno- esterase (EC 3.1.1.59) of insects, other name: JH-esterase, Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

methylglucosamine

methylsulfonyl nitrophenyl carbo

catalyses the hydrolysis of methyl (2E,6E)-(10R,11S)-10,11-epoxy-3,7,11-trimethyltrideca-2,6-dienoate to form (2E,6E)-(10R,11S)-10,11-epoxy-3,7,11-trimethyltrideca-2,6-dienoate and methanol; i.e. it demethylates the insect juvenile hormones JH₁ and JH₂. Example (precursor) from the moth Heliothis virescens: database code ESTJ_HELVI, 564 amino acids (62.53 kDa); it is similar to certain other carboxylesterases and lipases. Another example, the **protein-glutamate methylesterase** of Escherichia coli, is involved in chemotaxis in this organism (see che).

methylglucosamine N-methyl-L-glucosamine; 2-deoxy-2 (methylamino)-L-glucose; a component of streptomycin.

O⁶-methylguanine a modified and, in principle, highly mutagenic base in DNA (it base pairs with T). It has a special detoxication enzyme, methylated-DNA-protein-cysteine S-methyltransferase.

7-methylguanine a modified base found in transfer RNA. See guanine (for numbering), **7-methylguanosine**.

7-methylguanosine a modified nucleoside that forms a cap at the 5'-terminus of eukaryotic mRNA. See also 7-methylguanine. methylidyne the recommended name for the trivalent diatomic group CH≡ attached to a single other group in a molecule of an organic compound. Compare methine.

methylmalonate CH₃CH(COO⁻)₂; isosuccinate 2-methylpropanedioate; the dianion of methylmalonic acid; as methylmalonyl-CoA it is an intermediate in the conversion of propionyl-CoA to succinyl-CoA. Note: methylmalonate should be distinguished from methyl malonate (two words), which is propanedioic acid dimethyl ester.

rmethylmalonic acidemia or methylmalonic aciduria any of a group of diseases, inherited as autosomal recessive traits, in which abnormally large amounts of methylmalonate occur in the blood and urine. The condition may be caused by abnormalities in either methylmalonyl-CoA epimerase or methylmalonyl-CoA mutase apoenzymes, or by three different abnormalities in adenosylcobalamin synthesis.

methylmalonyl-CoA 2-carboxypropanoyl-CoA; it can exist as the enantioners (R)- and (S)-methylmalonyl-CoA; (S)-methylmalonyl-CoA is an intermediate in the beta oxidation of odd-numbered fatty acids in animals. Propionyl-CoA is the major end product; for further metabolism, this is converted to succinyl-CoA by, first, carboxylation to (S)-methylmalonyl-CoA, which is converted by methylmalonyl-CoA epimerase to (R)-methylmalonyl-CoA, which is then converted to succinyl-CoA by methylmalonyl-CoA mutase.

methylmalonyl-CoA epimerase EC 5.1.99.1; an enzyme that interconverts (R)methylmalonyl-CoA to (S)-methylmalonyl-CoA. It is sometimes incorrectly referred to as methylmalonyl-CoA racemase (chiral centres in the CoA moiety are not affected).

methylmalonyl-CoA mutase EC 5.4.99.2; systematic name: (R)-2-methyl-3-oxopropanoyl-CoA CoA-carbonylmutase; an enzyme that converts (R)-methylmalonyl-CoA to succinyl-CoA; adenosylcobalamin is a cofactor. Example from human, homodimer (precursor): database code MUTA_HUMAN, 750 amino acids (83.01 kDa). This enzyme is required for degradation of several amino acids, odd-chain fatty acids, and cholesterol via propionyl-CoA to the tricarboxylic-acid cycle; deficiency results in methylmalonic acidemia. It is a mitochon drial enzyme (the precursor includes a transit peptide in amino acids 1-32). In some bacteria the enzyme is a heterodimer:

both subunits have homology with the human protein. The metabolic role is in the synthesis of propionate from tricar-boxylic-acid-cycle intermediates. Examples from *Propionobacter freudenreichii shermanii*, α subunit: database code MUTA_PROFR, 638 amino acids (69.39 kDa); β subunit: database code MUTB_PROFR, 728 amino acids (80.09 kDa).

2-methyl-1,4-naphthalenedione 2-methyl-1,4-naphthoquinone; see menadione.

Methyl Orange a dye used as an indicator, changing from red to orange-yellow over the pH range 3.1-4.4.

methylotroph any organism that can use certain single-carbon compounds, in a lower oxidation state than CO₂, as sole carbon source. —methylotrophic adj.; methylotrophy n.

methylotrophic yeast any yeast belonging to either of the genera *Hansenula* or *Pichia*. They are potentially valuable recombinant-DNA expression hosts as certain oxidase genes (MOX and AOX) are vastly overexpressed and their promoters are suitable for the expression of foreign proteins. See also alcohol oxidase, methylotroph.

3-methyl-2-oxobutanoate dehydrogenase (lipoamide) EC 1.2.4.4; other names: 2-oxoisovalerate dehydrogenase; branched-chain α -keto-acid dehydrogenase; branched-chain α -keto-acid decarboxylase; an enzyme activity present in a complex that catalyses the oxidative decarboxylation of oxo acids derived from branched-chain amino acids. It is similar in mechanism to the pyruvate dehydrogenase complex. This enzyme is the E₁ component of the complex, and catalyses the release of CO2 from the oxo acid and transfer of the resulting acyl group to lipoamide. Thus, for the oxo acid from valine, it catalyses the reaction of 3-methyl-2-oxobutanoate with lipoamide to form S-(2-methylpropanoyl)dihydrolipoamide with release of CO₂. Thiamine diphosphate is a coenzyme. Example from human, precursors of α and β subunits respectively: database codes ODBA_HUMAN, 445 amino acids (50.41 kDa); ODBB_HUMAN, 392 amino acids (43.07 kDa). See also [3-methyl-2-oxobutanoate dehydrogenase (lipoamide)] kinase.

[3-methyl-2-oxobutanoate dehydrogenase (lipoamide)] kinase EC 2.7.1.115; other name: branched-chain α-keto-acid dehydrogenase kinase; an enzyme that catalyses the phosphorylation by ATP of [3-methyl-2-oxobutanoate dehydrogenase (lipoamide)] with release of ADP, thereby inactivating the enzyme complex. Example (precursor) from rat: database code BCKD_RAT, 412 amino acids (46.34 kDa).

[3-methyl-2-oxobutanoate dehydrogenase (lipoamide)]-phosphatase EC 3.1.3.52; other name: branched-chain oxoacid dehydrogenase phosphatase; an enzyme that catalyses the hydrolysis of phosphate from [3-methyl-2-oxobutanoate dehydrogenase (lipoamide)] phosphate.

Methyl Red a dye used as an indicator, changing from red to yellow over the pH range 4.2-6.3. (Illustrated on p. 414.)

deficiency results in methylmalonic acidemia. It is a mitochondrial enzyme (the precursor includes a transit peptide in amino acids 1-32). In some bacteria the enzyme is a heterodimer:

Methyl Red

methylsulfonyl succinimidyl carbonate 2-(methylsulfonyl)ethyl N-succinimidyl carbonate; a reagent used for the introduction of the MSOC amino-protecting group.

5-methyltetrahydrofolate abbr.: MeTHFA or 5-CH₃-H₄folate; a member of the tetrahydrofolate group of coenzymes. One of its functions is to act as intermediate in the methylation of vitamin B₁₂, which can then react with homocysteine to form methionine. The methyl group of MeTHFA is derived from C-3 of serine via 5,10-methylene H₄folate.

methyltetrahydrofolate trap hypothesis a hypothesis to explain the accumulation of 5-methyltetrahydrofolate (5-CH₃-H₄folate) in the sera of patients with vitamin B₁₂ deficiency. It suggests that, because the only route by which 5-CH₃-H₄folate can be converted to H₄folate (required for single-carbon transfer reactions) is by the vitamin B₁₂-dependent 5-methyltetrahydrofolate-homocysteine S-methyltransferase (EC 2.1.1.13) reaction, a large proportion of the body's available folate becomes trapped as 5-CH₃-H₄folate, leading to folate deprivation.

methylthioribose 5-methylthio-D-ribose; an intermediate in the methionine salvage pathway.

methyltransferase any of the enzymes of sub-subclass EC 2.1.1, which catalyse the transfer of a methyl group. See also che, O⁶-methylguanine.

4-methylumbelliferyl abbr.: MU; a group that is attached in glycosidic linkage to various sugars to form substrates useful in the assay of glycosidases. The highly fluorescent 4-methylumbelliferone is released on enzyme action, and can be mea-

sured in alkaline solution by its fluorescence (max. 448 nm, excitation at 364 nm), which is quenched in the glycosidic substrate. See also MUG.

4-methylumbelliferone

methyne or (formerly) methine the name now recommended for the trivalent diatomic group, =CH-, attached to two other groups in an organic molecule. Such a group is commonly still known in biochemistry as methene. Compare methylidyne.

meticillin (sodium) or methicillin a semisynthetic antibiotic of the penicillin type that is lactamase resistant.

metJ the gene for the repressor (co-repressor is S-adenosylmethionine) of the methionine biosynthetic operon, and also metJ itself, in Escherichia coli. The repressor protein undergoes dimeric binding to DNA by a motif other than a helixturn-helix. Database code METJ_ECOLI, 104 amino acids (12.00 kDa).

Met-Lys-bradykinin a short name for methionyllysylbradykinin; see bradykinin.

MetMb abbr. for metmyoglobin (i.e. ferrimyoglobin).

metmyoglobin abbr.: MetMb; an old name for ferrimyoglobin.

metre or (US) meter symbol: m; the SI base unit of length, equal to the length of the path travelled by light in a vacuum during a time interval of 1/299 792 458 of a second.

metre-kilogram-second system (of electrical units) abbr.: mks system or MKS system; a system of electrical (physical) units based on the metre, kilogram, and second as fundamental units of measurement. It has now been superseded by the SI system of units.

metric 1 of, or relating to, the metre or the metric system.

2 quantitative.

+metric see +meter, +metry.

metric system a system of weights and measures, devised in France (1793-95), based on the principle that each of the physical quantities length, volume, and mass should be defined in terms of one unit whose multiples and submultiples are related by powers of ten and that all three units should be simply interrelated. The units were, respectively, the metre, the litre (one cubic decimetre), and the gram (the mass of one cubic centimetre of water at its maximum density). It has now been supplanted by the International System of Units (see SI).

metridin 1 a toxin from Metridium senile (brown sea anemone); database code TXAM_METSE, 36 amino acids (3.97 kDa). 2 or metridium proteinase A EC 3.4.21.3; other name: sea anemone protease A; an enzyme that catalyses the preferential cleavage: Tyr-|-Xaa > Phe-|-Xaa > Leu-|-Xaa; it has little action on Trp-|-Xaa.

metridium proteinase A see metridin (def. 2).

in the assay of glycosidases. The highly fluorescent 4-methylumbelliferone is released on enzyme action, and can be meaBan dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Buy neares

synthetic, nonionic substance, highly soluble in water, that is capable of forming (nonautoclavable) aqueous solutions of densities up to 1.3 g cm⁻³, useful as media for **isopycnic centrifugation** of biological particles.

metrizoate the trivial name for the 3-acetamido-5-(N-methylacetamido)-2,4,6-triiodobenzoate anion; a dense, synthetic substance used primarily as its sodium salt, which is highly soluble in water and capable of forming autoclavable aqueous solutions of densities up to 1.4 g cm⁻³, or more, such solutions being useful as media for **isopycnic centrifugation** of biological particles.

+metry comb. form denoting the process or science of measuring (something indicated or specified). —+metric adj.

metyrapone 2-methyl-1,2-di(3-pyridyl)propan-1-one; an inhibitor of the enzyme 11β -hydroxylase (steroid 11β -monooxygenase; EC 1.14.15.4); this enzyme is involved in the synthesis of cortisone, cortisol and aldosterone, its inhibition causing a rise in **corticotropin** secretion as a result of release from negative feedback on the pituitary by cortisol. Metyrapone is used in **challenge** tests of hypothalamic-pituitary function and sometimes in the treatment of **Cushing's syndrome**.

MeV symbol for megaelectronvolt (i.e. 106 electronvolts).

Mevacor a proprietary name for lovastatin.

mevaldate 1 the anion OHC-CH₂-C(CH₃)(OH)-CH₂-COO-derived from mevaldic acid; its (R)-enantiomer occurs as an enzyme-bound intermediate during the conversion of hydroxymethylglutaryl-coenzyme A to mevalonate in the biosynthesis of polyprenyl compounds. 2 any salt or ester of mevaldic acid. mevalonate 1 the anion, HO-[CH₂]-C(CH₃)(OH)-CH₂-COO-, derived from mevalonic acid; its (R)-enantiomer is a strategic intermediate derived from hydroxymethylglutaryl-CoA in the biosynthesis of polyprenyl compounds. 2 any salt

(R)-mevalonate

mevalonolactone mevalonic acid lactone; it is hydrolysed in cells to mevalonate, and is often the form in which mevalonate is administered to animals or cells, either radioaactively or non-radioactively as a metabolic precursor.

mevalonoyl the acyl group, HO-[CH₂]₂-C(CH₃)(OH)-CH₂-CO-, derived from mevalonic acid.

mevastatin or compactin 6-demethylmevinolin; a substance isolated from *Penicillium citrinum*; it is a potent inhibitor of **HMG-CoA reductase** with actions similar to **lovastatin**.

Mevinacor a proprietary name for lovastatin.

mevinolin an alternative name for lovastatin.

Meyerhof, Otto Fritz (1884–1951), German physiologist and biochemist; Nobel Laureate in Physiology or Medicine (1922) 'for his discovery of the fixed relationship between the consumption of oxygen and the metabolism of lactic acid in the muscle' [prize shared with A. V. Hill].

Meyerhof pathway see Embden-Meyerhof pathway.

Meyerhof quotient an index of the effect of the presence or absence of dioxygen on glycolysis or fermentation. It is: [(rate of anaerobic fermentation) – (rate of aerobic fermentation)]/(rate of dioxygen uptake). Assuming 6 mol ATP are formed per mol dioxygen used, a Meyerhof quotient of 6 would mean that aerobic and anaerobic energy supply are the same; a lower value indicates an increase in ATP-supplying and ATP-requiring processes on transition from anaerobic to aerobic conditions.

mfd abbr. for microfarad.

mg symbol for milligram (i.e. 10^{-3} gram).

Mg symbol for magnesium.

MHC abbr. for major histocompatibility complex.

mho a practical unit of electric conductance equal to the reciprocal of the impedance measured in ohms. For circuits containing only noninductive resistance the siemens is the preferred unit.

MHS abbr. for major histocompatibility system (i.e. major histocompatibility complex).

MIC abbr. for minimum inhibitory concentration.

or ester of meyalonic acid.

micelle microbic

specimens of macromolecules for electron microscopic examination. Freshly cleaved mica is used to support the specimen during shadowing with a metal; a backing film of carbon is then applied by evaporation normal to the shadowed surface, and both films are transferred to the grid.

micelle 1 an aggregate, of colloidal dimensions, of oriented molecules of amphipathic substances existing in equilibrium in solution with the chemical species from which it is formed; micelles are generally electrically charged. In aqueous solution the individual molecules of the micellar aggregate are oriented with their polar groups pointing towards the aqueous medium and their hydrophobic moiety directed into the centre of the micelle. 2 a hypothetical ordered region in a natural fibre such as cellulose. —micellar adj.

micellization or micellisation transformation into micelles.

micF a regulatory gene in the osmoregulatory system in Escherichia coli; micF RNA and ompF mRNA (omp = outer membrane protein) are induced by interaction of ompR with a common divergent, central promoter region. micF RNA is partly complementary to the Shine-Dalgarno region of omp C and thus represses its expression by translational control.

Michaelian of, relating to, or described by Michaelis kinetics.

Michaelis, Leonor (1875-1949), German physician and biochemist; distinguished for his contributions to the theory of hydrogen ions and to the development of the theory of enzyme-substrate combination. He also worked in Japan and latterly in the USA.

Michaelis kinetics or Michaelis-Menten kinetics a model to explain the kinetics of an enzyme-catalysed reaction, $E + S \rightleftharpoons_{k-1}^{k-1} ES \xrightarrow{k_{cat}} E + P$

$$E + S \stackrel{k_{+1}}{\rightleftharpoons} ES \stackrel{k_{cat}}{\rightarrow} E + P$$

where E is enzyme, S is substrate, ES is an intermediate complex (the Michaelis complex), and P is product. The initial velocity of the reaction, v, when [P] = 0, is given by the Michaelis equation (or Michaelis-Menten equation):

$$v = V[S]/(K_{\rm m} + [S]) = d[P]/dt$$

in which V is the limiting or maximal reaction rate (i.e. that occurring when the enzyme is saturated with substrate), and the Michaelis constant, $K_{\rm m}$, is given by:

$$K_{\rm m} = (k_{-1} + k_{\rm cat})/k_{+1}$$
.

If $k_{\rm cat} << k_{+1}$, then $K_{\rm m}$ approximates to $K_{\rm s}$, the enzyme-substrate dissociation constant (usually known as the **substrate dis** sociation constant). $K_{\rm m}$ and V are known as the Michaelis parameters. Compare Dalziel coefficient.

Michaelis pH function any one of a set of functions relating hydron concentration, [H⁺], to the acid dissociation constants for different stages of dissociation of a given polybasic acid.

Consider first the simplest example, that of a symmetrical dibasic acid, AH₂ (e.g. succinic acid). This can exist in three stages of dissociation, represented by the equilibria

$$AH_2 \stackrel{K_1}{\rightleftharpoons} AH^- \stackrel{K_2}{\rightleftharpoons} A^{2-}$$

where K_1 and K_2 are the acid dissociation constants for the respective stages of dissociation. For such a dissociation there are three Michaelis pH functions, f_0 , f_1 , and f_2 , which are defined thus:

$$f_0 = 1 + K_1/[\mathrm{H}^+] + K_1K_2/[\mathrm{H}^+]^2$$

$$f_1 = 1 + [H^+]/K_1 + K_2/[H^+]$$

$$f_2 = 1 + [H^+]/K_2 + [H^+]^2/K_1K_2$$

The total concentration of acid of all forms, [A], is given by

$$[A]_t = [AH_2] + [AH^-] + [A^{2-}];$$

by substitution for K_1 and K_2 it can be shown that

$$[A]_t = f_0[AH_2] = f_1[AH^-] = f_2[A^{2-}]$$

Hence it will be apparent that the reciprocals of the respective pH functions give the fractional concentrations of the various ionic forms of the acid at a given pH value. The theory of pH functions is independent of the chemical nature of the ionizing groups: the functions apply equally to molecules with identical ionizing groups (e.g. dicarboxylic acids, as above), to ampholytes (e.g. amino acids), and to molecules or parts of molecules in which the nature of the ionizing groups may not be known (e.g. the active centres of enzymes). For an unsymmetrical dibasic acid there are potentially four ionic forms, four dissociation constants, and thus four pH functions, but these are important in practice only if the pK values of the two dissociating groups are fairly close, as could be the situation at an active centre of an enzyme. If, on the other hand, the pK values are widely separated, as is the case with a typical amino acid, then there is effectively only one intermediate form and a set of three pH functions as above may be considered to apply.

Michel, Hartmut (1948-), German biophysicist; Nobel Laureate in Chemistry (1988) jointly with J. Deisenhofer and R. Huber 'for the determination of the three-dimensional structure of a photosynthetic reaction centre'.

micr+ see micro+ (def. 2).

micra a plural of micron.

micRNA abbr. for messenger-RNA-interfering complementary RNA (i.e. antisense RNA).

1 (concerning something) very small (e.g. micro method). 2 short for a microcomputer.

micro+ 1 symbol: μ ; the SI prefix denoting 10^{-6} times. 2 or (sometimes before a vowel) micr+ denoting very small or concerned with very small things (e.g. microbiology, microsome); abnormally small, underdeveloped (e.g. microcyte); on a small scale or concerned with small quantities (e.g. microanalysis, microbalance); of a small area or volume, or small part of a larger one (e.g. microenvironment). Compare macro+. 3 indicating amplification or magnification of something very small (e.g. microphone, microscope). 4 involving the use of a microscope (e.g. micrograph).

microaerophilic 1 describing an aerobic environment with a lower partial pressure of dioxygen than that under normal atmospheric conditions. 2 describing an organism whose maximal rate of growth occurs in such an environment.

microalbuminuria the excretion of plasma albumin in the urine at a rate above the normal range of values (5-20 µg min⁻¹) but below the threshold level (300 µg min⁻¹) for detection by routine dipstick methods and measurable only by radioimmunoassay (or other techniques of comparable sensitivity). The condition is associated with a general increase in vascular permeability and forms a sensitive indicator of diabetic nephropathy.

microanalysis any technique whereby very small amounts of substance may be analysed qualitatively or quantitatively. The term was originally used to indicate analysis of substances in the range 1-10 mg. —microanalytic or microanalytical adj.

microassay any technique whereby very small amounts of substance may be assayed. Compare microanalysis.

microbalance any balance designed to weigh very small quantities, typically between 1 µg and 1 mg.

microbe a common term for a microorganism, especially a pathogenic bacterium. —microbial adj.

microbial collagenase EC 3.4.24.3; other names: Clostridium histolyticum collagenase; clostridiopeptidase A; collagenase A; collagenase I; an enzyme that catalyses the digestion of native collagen in the triple-helical region at Xaa-|-Gly bonds. Some preference is shown for Gly at P3 and P1', Pro and Ala at P2 and P2', and hydroxyproline, Ala, or Arg at P3' (see peptidase P-sites). Example (precursor) from C. perfringens: database code A36866, 1104 amino acids (125.97 kDa).

microbiological of, pertaining to, or concerned with microbiology; effected by microorganisms.

microbiological assay any assay for a substance, especially an amino acid or vitamin, that is based on the extent of growth of a microorganism for which the analyte in question is an essential growth factor.

microbiology the science concerned with microorganisms, and Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

microbody micro

with their interactions with other organisms and the environment. —**microbiologist** n.

microbody a cytoplasmic organelle, spherical or oval in shape, and 0.1-1.5 nm across, that is bounded by a single membrane and contains oxidative enzymes, especially those utilizing H_2O_2 . Microbodies include glyoxysomes and peroxisomes.

microbore high-pressure liquid chromatography or microbore HPLC a variant of high-pressure liquid chromatography in which a column of only about 1 mm diameter is used. The advantages of the technique include greater sensitivity and a much reduced solvent consumption.

microcalorimeter a calorimeter designed to measure continuous power outputs down to 1 µW, or heat pulses down to 200 µJ.—microcalorimetry n.; microcalorimetric adj.

microcapsule any very small thin-walled capsule of plastic, wax, etc., containing a liquid, powder, etc., from which the contents may be released (by heat, impact, radiation, dissolution, or other means) in order to fulfil some specific function. See also microencapsulation.

microcarrier any of a number of preparations of finely particulate, nontoxic, nonrigid, usually transparent material of density close to unity, e.g. dextran-based beads, that enable the growth of animal cells in suspension culture, especially on a large scale. Microcarriers permit the growth of anchorage-dependent cells as a monolayer on the surface of the particles. Generally, the cells may be easily harvested, e.g. by allowing the particles to settle and then treating with a proteinase such as trypsin.

microcell 1 a small, experimentally produced eukaryotic cell-like structure in which a limited amount of genetic material is contained in a micronucleus surrounded by a rim of cytoplasm and an intact cell membrane. It is useful as a vector for the transfer of a small number of chromosomes into a normal cell by virus-induced cell fusion. 2 any small cell (def. 2), commonly with a capacity less than 1 mL.

microchemistry chemistry on a very small scale, commonly handling less than 1 mg or 1 mL of material and often requiring special small apparatus. —microchemical adj.

microcin any of a number of microbial peptide toxins that have antibiotic action. They are of diverse structure and action. Examples include microcin E492, a 6 kDa polypeptide antibiotic. It forms cation-selective channels in planar phospholipid bilayers, leading to a loss of membrane potential. Another example is microcin B17 (precursor): database code MCBA_ECOLI, 69 amino acids (6.01 kDa); residues 1-26 are a propeptide, 27-69 are microcin B17. This is a glycine-rich peptide that influence accept the perfect of perfect o

micrococcal of, pertaining to, or produced by micrococci; being a member of the genus *Micrococcus*.

Micrococcus a genus of Gram-positive, strictly aerobic, usually nonmotile coccoid bacteria of the family Micrococcaceae. The cells are commonly 1-2 μm in diameter.

microconcentrator a commercial device for the concentration and desalting of 'small' volumes (i.e. ≤2 mL) of biological samples.

microcrystal any very small crystal, especially one that is visible only under a microscope. —microcrystalline adj.

microcurie symbol: μCi or (formerly) μc; a unit of (radio)activity or of radioactive material equal to 10 6 curie.

microdeletion a DNA/chromosomal deletion that is not detectable by conventional techniques such as **Southern blotting** or microscopy.

microdensitometry the measurement of **absorbance** (i.e. optical density) over a very small finite area, such as that viewed by an optical microscope. —**microdensitometric** adj.; **microdensitometer** n.

microdialyser or (sometimes, esp. US) microdialyzer a device for microdialysis, especially one designed to minimize loss and dilution of samples.

microdialysis dialysis of a sample of small volume (commonly gamma (symbol: γ). 2 an alternative name (sometimes) for mi of less than 1 mL).

Ban dang doc môt quyển sách được tăng bởi HUY NGUYEN. Nếu ban có nhu cầu về sách sinh học, xin liên hê:

microdiffusion analysis see Conway microdiffusion method.

microdissection the dissection of small organisms or parts of organisms by means of mechanically controlled instruments viewed through an optical microscope.

microelectrode any electrode in which the sensitive element is very small and also often needle-like. It is useful for investigation of electrical phenomena in individual cells or in very small volumes.

microencapsulation the act or process of enclosing substances, solutions, etc. in microcapsules.

microenvironment a very small domain of the environment, such as that surrounding a single molecule or a functional group of a molecule, a single cell or organism, or a small group of cells or organisms. The term is used especially to distinguish zones of local difference in the overall environment.

microfarad abbr.: mfd; symbol: μ F; a unit of capacitance equal to 10^{-6} farad.

microfibre or (US) microfiber any fibre having a diameter in the range $0.1-1~\mu m$, such as used in making glass microfibre filters.

microfibril any small fibril occurring in biological material that is distinguishable only by electron microscopy, especially one of a set that make up a fibril, e.g. in cellulose.—microfibrillar adj.

microfibrillar polysaccharide one of three groups of cell-wall polysaccharides characterized by solubility differences: the main component in the plant kingdom is **cellulose** but **chitin** is found in some fungi, β -1,4-mannans in some green algae (e.g. Codiaceae) and β -1,3-xylans in other green algae (e.g. Bryopsidaceae).

microfilament a type of actin filament that contributes to the cytoskeleton of eukaryotic cells. Microfilaments are elongated structures consisting of two strands of globular actin monomers twisted into a helix with 13.5 molecules per turn. Microfilaments form the major component of the cell's contractile machinery and are implicated in cell division, cell movement, muscle contraction, nerve outgrowth, tubular gland formation, gastrulation, and neurulation. Compare intermediate filament, microtubule.

microfilter 1 any small filter, especially as used in microchemistry. 2 see microporous filter.

microfiltration filtration with a microporous filter.

microflora 1 a collective name for very small plants. 2 the flora of a microhabitat. 3 a collective name for all the microorganisms of a tissue or organ of an animal.

microfluorimeter an instrument for microfluorimetry.

microfluorimetry the measurement of intensity of fluorescence over a very small finite area, such as a single cell viewed under an optical microscope. —**microfluorimetric** adj.

microforge a device by means of which micropipettes, very small glass tools, etc. can be made while being viewed under a low-power microscope.

microfungus (pl. microfungi) any fungus whose vegetative thallus or fruiting body is too small to be seen easily with the unaided eye. Compare mould.

microglobulin 1 any plasma globulin molecule or globulin fragment of less than ≈40 kDa, e.g. Bence-Jones protein, β2-microglobulin. 2 a term sometimes used to refer to 7S immuno-globulins such as IgG. Compare macroglobulin.

β₂-microglobulin or betamicroglobulin a human plasma protein, of 11.8 kDa and containing 99 amino-acid residues, that in size, primary structure, and tertiary structure strongly resembles a single domain of the constant region of immunoglobulin molecules: it is a constituent of class I major histocompatibility complexes. Plasma levels may be elevated in hepatobiliary disease, chronic active hepatitis, and alcoholinduced liver cirrhosis.

microgram 1 symbol: μg or (esp. in pharmacy) mcg; a unit of mass equal to 10⁻⁹ kilogram or 10⁻⁶ gram; formerly called gamma (symbol: γ). 2 an alternative name (sometimes) for mi-

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

micrograph microsomal fra

micrograph or (sometimes) microgram a graphic reproduction of the image of an object as seen through a microscope.

microhabitat any habitat that is small or limited in extent and differs in character from a larger, surrounding habitat.

microheterogeneous describing a preparation of a biopolymer that superficially appears to be homogeneous but that, on refined analysis, shows slight differences in size, sequence, charge, state of aggregation, or other properties of its molecules. Such differences are believed, at least in some instances, to be attributable either to artefactual changes or to genetic differences. —microheterogeneity n.

microincineration a technique for examining the distribution of minerals in tissue sections or microorganisms. The specimen is placed on a slide, the organic material burned away in a furnace, and the nature and position of the mineral ash determined by microscopy.

microinject to inject liquid into a single cell or nerve fibre using a micropipette. —**microinjection** n.

microiontophoresis iontophoresis (def. 2) applied to very small areas of tissue.

micro-Kjeldahl method an adaptation of the Kjeldahl method for determining small amounts of nitrogen, in the range 0.1-1.0 mg. A correspondingly small flask, commonly known as a micro-Kjeldahl flask, is used for the digestion, and a Markham still may be used for the steam distillation.

microlitre or (esp. US) microliter symbol: μL or μl ; a unit of volume equal to 10^{-6} litre; formerly called lambda (symbol: λ).

micromanipulation the techniques and practice of performing very delicate operations, such as microdissection, microinjection, or the isolation of single cells, under an optical microscope, usually with the aid of a micromanipulator.

micromanipulator an instrument used in conjunction with an optical microscope for holding and manipulating very small instruments and specimens in the field of view.

micrometer 1 any instrument or device for measuring very small distances or angles. 2 or micrometer gauge a device for measuring small distances, thicknesses, diameters, etc. with great accuracy. 3 the US spelling of micrometre.

micrometer burette a micrometer syringe adapted for use as a burette.

micrometer pipette a micrometer syringe adapted for use as a pipette.

micrometer screw a screw with a fine thread of accurate and consistent pitch.

micrometer syringe a syringe for the accurate delivery of small volumes of liquid in which the plunger of the syringe is driven by a calibrated micrometer screw.

micrometre or (US) micrometer symbol: µm; a unit of length equal to 10^{-6} metre; formerly called micron (symbol: μ).

micromicro+ symbol: μμ; a former name for pico+.

micromodification alteration of the covalent structure of a macromolecule, especially a histone, by the addition of various groups, e.g. acetyl, methyl, phosphate, after the initial biosynthetic process is terminated.

micromolar symbol: μM or μM; describing a solution containing one micromole of solute per litre of solution, or a specified multiple or fraction thereof; used also of an amount-of-substance concentration similarly expressed.

micromole symbol: µmol; a unit of amount of substance equal to 10⁻⁶ mole.

micromolecule any (type of) molecule composed of a relatively small number of atoms. In practice the term is usually taken to mean any (type of) molecule that is capable of passing through the pores of dialysis tubing (as generally used) and that thus has a mass less than about 10 kDa. -micromolecular adj.

micron (pl. microns or micra) symbol: μ ; a former term for micrometre.

micronucleus a eukaryotic cell nucleus with less than the normal complement of chromosomes, produced experimentally by incubation of a cell with colchicine. —micronuclear adj.

micronutrient any chemical element that is required by living organisms in tiny quantities only, also known as trace element. The term is often extended to include organic compounds such

microorganism any noncellular or unicellular (including colonial) organism, most of which are too small to be seen with the unaided eye. Microorganisms comprise bacteria (including cyanobacteria), lichens, microfungi, protozoa, rickettsiae, virinos, viroids, and viruses, and also some algae; all prokaryotes are included. See also microbe.

microperoxisome (sometimes) a type of small peroxisome, 150-250 nm in diameter, found in all mammalian cells.

micropinocytosis (sometimes) a form of pinocytosis occurring in higher animals, especially in the transfer of dissolved macromolecules from the blood to the cytoplasm of cells, in which the pinosomes formed are very small (micropinosomes) and can only be observed in the electron microscope.

micropipette or (US) micropipet any pipette calibrated to contain or deliver a volume in the range 5-500 µL.

micropore any pore (in a gel or porous solid) whose width does not exceed about 2.0 nm. Compare macropore, mesopore. —microporous *adj.*

microprocessor a single integrated electronic circuit designed to carry out a specific set of operations, e.g. as the central processor of a computer or a control system.

microsatellite a repeating DNA segment that is similar to a minisatellite except that the overall range of size is smaller and the base core repeat unit involves a two or four nucleotide pair repeat motif. They are so named because of their resemblance to satellite DNA in having tandem repeats. The number of copies of the repeats varies not only between individuals but also between the two chromosomes of a pair.

microscope an instrument consisting of a lens or a combination of lenses that uses light or other electromagnetic radiation to make enlarged images of objects that are invisible to, or not easily seen by, the unaided eye. See also electron microscope, phase-contrast microscopy.

microscopic 1 of a size that is not visible (in detail) to the unaided eye. 2 concerned with small units. 3 relating to the behaviour of individual molecular entities. 4 or microscopical of, pertaining to, or using a microscope. Compare macroscopic. —microscopically adv.

microscopic equilibrium constant any constant describing the equilibrium of the interconversion of two particular molecular entities. Compare intrinsic constant, macroscopic equilibrium constant.

microscopic reversibility a thermodynamic principle requiring that at equilibrium the reaction pathway for the reverse of any particular chemical reaction is the exact opposite of the pathway for the forward reaction, i.e. both forward and backward reactions must pass through the same transition states or intermediates and occur with equal frequency.

microscopy the art and practice of using a microscope; investigation with a microscope.

microsecond symbol: μ s; a unit of time equal to 10^{-6} second. microsequenator an apparatus for microsequencing (see microsequence).

microsequence to sequence (def. 3) a biopolymer using a very small sample, e.g. 5-100 pmol of a protein.

microsolute an operational term used to describe any diffusible solute in a solution that also contains nondiffusible macromolecular solute(s).

microsomal of, pertaining to, or containing microsomes; being in the microsomal fraction of a homogenate of a cell or tissue.

microsomal fraction an operational term for the subcellular fraction of a homogenate of a eukaryotic cell or tissue that, on differential centrifugation, is sedimented at 10⁵ g; the fraction from some tissues, such as liver, although consisting largely of microsomes, commonly also contains free ribosomes and fragments of the plasma membrane, of the Golgi apparatus, of mitochondria, and of other subcellular structures. The morpho-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

microsome

logical constituents differ according to the tissue from which the fraction was derived.

microsome any of the small, heterogeneous, artefactual, vesicular particles, 50-150 nm in diameter, that are formed when some eukaryotic cells are homogenized and that sediment on centrifugation at 10⁵ g. Microsomes are formed mostly from disrupted endoplasmic reticulum membranes but some arise from the plasma membrane. Those formed from rough endoplasmic reticulum are studded with ribosomes on the outside (rough microsomes); those formed from smooth endoplasmic reticulum and from plasma membrane have no adhering ribosomes (smooth microsomes).

microspectrophotometer an instrument, consisting of a microscope and a spectrophotometer, used for measuring light of selected frequencies passing through, or reflected from, a very small specimen, e.g. a cell or a subcellular structure.

microspectrophotometry spectrophotometry applied to a very small specimen, using a microspectrophotometer. —microspectrophotometric adj.

microsphere one of a preparation of spherical particles of known and uniform size, usually in the range 10-40 µm in diameter, and prepared from, e.g., serum albumin or an ion-exchange resin, that may be labelled with an appropriate radionuclide and used in studies of the circulation of the blood in health or disease.

microspore the smaller of the two types of spores produced by the heterosporous plants. In seed plants the microspore is the cell from which the pollen grain develops. —microsporous adj. microstructure an alternative term for fine structure.

microsyringe a syringe for delivering volumes of gases or liquids in the range $0.1-500 \mu L$.

microtome an instrument for cutting thin sections of objects, e.g. tissues or cells, preparatory to microscopic observation.

microtrabecular lattice an irregular, three-dimensional lattice of very fine strands, up to 15 nm in diameter, sometimes termed microtrabeculae, that can be visualized in the cytoplasmic ground substance of eukaryotic cells by high-voltage electron microscopy. It forms part of the cytoskeleton.

microtubule any of the long, generally straight, hollow tubes of internal diameter 12-15 nm and external diameter 24 nm found in a wide variety of eukaryotic cells. Each consists (usually) of 13 protofilaments of polymeric tubulin, staggered in such a manner that the tubulin monomers are arranged in a characteristic helical pattern on the microtubular surface, and with the α/β axes of the tubulin subunits parallel to the long axis of the tubule. Microtubules exist in equilibrium with a pool of tubulin monomers in the cytoplasm and can be rapidly assembled and disassembled in response to various physiological stimuli; there are also a number of microtubule-associated proteins. The majority of microtubules in a cell appear to be initiated at microtubule-organizing centres and some may also become attached to the kinetochores. Microtubules are concerned in force generation in cilia and flagella, where they exist in a characteristic 9 + 2 array (a ring of nine doublet microtubules with two single microtubules in the centre), and the integrity of the microtubule network appears to be necessary for certain aspects of mitotic spindle function and for the saltatory movement of cell organelles. Compare intermediate filament, microfila-

microtubule-associated protein abbr.: MAP; any protein that binds to microtubules and modifies their properties, including proteins that induce polymerization of purified tubulin and become associated with the newly formed microtubules. Many different kinds have been found, including structural proteins and motor proteins. MAP 1 is a structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements. Example, MAP 1A from rat: database code MAPA_RAT, 2774 amino acids (299.20 kDa). The role of MAP2 is unclear; in neuronal cells it is confined to the cell body and dendrites. It changes structurally during development by alternative splicing mechanics.

anisms. Example from rat: database code MAP2_RAT, 1830 amino acids (198.83 kDa). Dynein is an example of a motor protein MAP. Compare tau protein. See also MAP kinase.

microtubule-organizing centre a region near the centre of a eukaryotic cell consisting typically of two centroles at right angles to each other and surrounded by a complex of associated proteins. The centrioles and their satellite proteins serve as initiating sites for the assembly of microtubules.

microvillin a protein of the microvilli of rat mammary cells of $M_r 200000$.

microvillus (pl. microvilli) any of the very small, finger-like projections that occur on the exposed surfaces of epithelial cells, especially where cellular function requires a maximal surface area for absorption or secretion, as in the proximal renal tubule and the small intestine, where they constitute the brush border. The projections are about 1–2 μm long and 100 nm in diameter. The core of a microvillus contains a bundle of about 40 actin filaments of uniform polarity with their 'barbed' (+) ends anchored in a cap of ill-defined amorphous material in the microvillar tip. At the base the actin filaments extend into the perpendicular network, also made up largely of actin, known as the terminal web. In the core the actin filaments are bound together by the actin-binding proteins fimbrin and villin. The renal and intestinal microvilli contain a wide range of hydrolases that are integral membrane proteins; their hydrophilic domains, containing the catalytic sites, face outwards from the cell. -microvillar adj.

microvolume a very small volume, commonly in the range 1-100 μL.

microwave radiation electromagnetic radiation of wavelengths in the range 1-300 mm (frequencies 1-300 GHz), lying between infrared radiation and most radiofrequency radiation.

middle molecule a term sometimes used for any compound in the range 350-2000 Da that accumulates in the body fluids of persons with uremia.

middle T antigen see T antigen (def. 1).

midkine other names: neurite outgrowth-promoting protein, midgestation and kidney protein, amphiregulin-associated protein (abbr.: ARAP); a heparin-binding growth/differentiation factor with neurite-promoting activity. It is a cell-surface or basement-membrane protein, induced by retinoic acid and similar to pleiotrophin. The midkine gene product is primarily detected in the embryonic period, whereas pleiotrophin is expressed most strongly in the early neonatal period. Example from human (precursor): database code MKHUMAN, 143 amino acids (15.58 kDa); residues 1-20 are the signal, 21-143 midkine.

midpoint 1 the point on a line, or a graph, that is equidistant from either end of the line or from two inflections in the graph. 2 a point in time that is half way between the beginning and the end of an event, or a series of events.

midpoint potential the electrode potential, at a given pH and temperature and 1 atm H_2 , at the midpoint of a redox titration when the activities of the reductant and the oxidant are equal.

MIF abbr. for 1 (macrophage) migration inhibition factor.

2 melanotropin release-inhibiting factor (i.e. melanostatin).

mifepristone see RU-486.

migratase an old name for mutase; e.g. lysolecithin migratase is an old name for lysolecithin acylmutase (EC 5.4.1.1).

migrate (in chemistry) (of atoms, ions, or molecules) to move from one region of a solution to another, or from a solution in one compartment to a solution in another compartment, under the influence of an electric or a centrifugal field or by diffusion. —**migration** n.

migration inhibition factor abbr.: MIF; see (macrophage) migration inhibition factor.

MIH abbr. for melanotropin release-inhibiting hormone (i.e. melanostatin).

acids (299.20 kDa). The role of MAP2 is unclear; in neuronal cells it is confined to the cell body and dendrites. It changes structurally during development by alternative splicing mech-Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

unknown function but exhibiting homology with Src and related proteins (see src). Example, database code KMIL CHICK, 647 amino acids (73.12 kDa).

milieu (pl. milieus or milieux) environment or setting.

milieu intérieur (French) the internal environment of a multicellular organism that surrounds the tissues and cells.

milk 1 the white liquid produced and secreted by the mammary glands of mature female mammals for the nourishment of their young. The milk of certain mammals, especially cows, is used as a food by humans, either as liquid milk or in the production of butter, cheese, etc. 2 any of various natural or manufactured liquids that have the appearance or consistency of milk, e.g. coconut milk, milk of magnesia. 3 to squeeze or draw milk from; to yield milk. -milky adj.

milk factor an alternative name for Bittner factor.

milk sugar an old name for D-lactose.

Miller index (in crystallography) any of a set of three integers that determine the position of a face, or internal plane, of a crystal in relation to three crystallographic axes. They are determined on the basis of the reciprocals of the intercepts of the face or plane on the crystallographic axes. [After W. H. Miller (1801-80).1

milli+ 1 symbol: m; an SI prefix denoting 10 3 times. 2 prefix denoting one-thousandth.

millicurie symbol: mCi or (formerly) mc; a unit of (radio)activity or of radioactive material equal to 10^{-3} curie.

milliequivalent symbol: mequiv or meq or mEq; a unit of amount of substance equal to 10⁻³ equivalent (def. 3); (mmol recommended).

milligram symbol: mg; a unit of mass equal to 10⁻⁶ kilogram or 10^{-3} gram.

millilitre or (US) milliliter symbol: ml or mL; a unit of volume equal to 10^{-3} litre. It is now identical to the cubic centimetre; i.e. $1 \text{ mL} = 1 \text{ cm}^3 = 10^{-6} \text{ m}^3$.

millimetre or (US) millimeter symbol: mm; a unit of length equal to 10^{-3} metre.

millimetre of mercury symbol: mmHg; a non-SI unit of pressure defined as the pressure exerted by a column exactly 1 mm high of a fluid of density that is exactly 13.5951 g cm⁻³ in a place where the acceleration of free fall is exactly 980.665 cm s^{-2} . Its use is deprecated. 1 mmHg = 1 torr = 133.32 pascal.

millimicro+ a former name for nano+.

millimicron (pl. millimicrons or millimicra) symbol: mu; a former name for nanometre.

millimolar symbol: mm or MM; describing a solution containing one millimole per litre of solution, or a specified multiple or fraction thereof; the term is also used of an amount-of-substance concentration similarly expressed.

millimole symbol: mmol; a unit of amount of substance equal to 10^{-3} mole.

Millipore 1 the proprietary name for a range of microporous and other types of membrane filters manufactured by the Millipore Corporation. 2 a water purification system, manufactured by the same company and based on reverse osmosis.

millisecond symbol: ms; a unit of time equal to 10^{-3} second.

Millon's reaction the formation of red complexes when compounds containing the hydroxybenzene group are heated with Millon's reagent. The reaction is given by proteins that contain one or more tyrosine residues. [After Auguste Millon (1812-67), French chemist.]

Millon's reagent a 15% solution of mercuric sulfate in 15% sulfuric acid. This is added to the test sample solution, which is then heated in a boiling water bath for 10 min. After cooling, a 1% aqueous solution of sodium nitrite is added to the cooled reaction mixture. Originally it was a solution of mercuric nitrate in 50% nitric acid containing some nitrous acid. It gives Millon's reaction with compounds containing the hydroxybenzene group.

Mills perspective representation or Mills representation a diagrammatic way of unambiguously representing the structural formulae of carbohydrates and their polycyclic deriva-

tives to show on a plane surface the relative configurational arrangements of substituents and bridges. It is particularly useful in instances where the Haworth representation is inconvenient, e.g. for depicting saccharides with substituents that bridge two positions on the ring. The carbohydrate in question, or its derivative, is drawn with single rings and fused rings in the plane of the surface, and with bonds to substituents or bridges above or below the plane of the rings drawn with dark lines (often wedge-shaped) or broken lines, respectively (as is customary in representations of steroids and terpenes). Hydrogen atoms in the angular positions at ring junctions are always shown but those at points of substitution may be omitted. Like Fischer projections, but unlike Haworth representations, Mills representations may be rotated in the plane of the paper without alteration of their significance. It was proposed primarily for carbohydrate structures, but resembles systems used for other types of molecule, e.g. steroids. milrinone 1,2-dihydro-6-methyl-2-oxo-5-(4-pyridinyl)nicotinonitrile; a phosphodiesterase inhibitor with vasodilating and

Milstein, César (1927-), Argentinian-born British biochemist and immunologist; Nobel Laureate in Physiology or Medicine (1984) jointly with N. K. Jerne and G. J. F. Köhler 'for theories concerning the specificity in development and control of the immune system and the discovery of the principle for production of monoclonal antibodies'.

mimetic imitating closely.

cardiostimulant activity.

+mimetic suffix (esp. in pharmacology) denoting having a similar effect to the substance or action indicated.

min symbol for minute.

mince I to disrupt tissue with a tissue grinder to the level at which there is extensive, but incomplete, rupture of cells. 2 the preparation resulting from the action of a coarse tissue grinder.

mineral 1 any naturally occurring inorganic substance of a type often obtained by mining, e.g. coal, stone, petroleum. 2 any of a class of naturally occurring inorganic substances, of definite chemical composition and physical properties and often crystalline in character. 3 of, pertaining to, or being a mineral (def. 1, 2).

mineralize or mineralise (of an organic material) to convert into, or impregnate with, a mineral or minerals. —mineralization or mineralisation n.

mineralocorticoid or mineralocorticosteroid any naturally occurring or synthetic hormonal corticosteroid that acts primarily on water and electrolyte balance by promoting the renal retention of sodium ions and excretion of potassium ions. Mineralocorticoids are produced in the outer layer (zona glomerulosa) of the adrenal cortex. Aldosterone is the most potent of the naturally occurring mineralocorticoids. Compare glucocorticoid.

mini+ comb. form denoting miniature; of smaller than usual dimensions.

minicell 1 a small cell-like body arising from a polar region of a rod-shaped bacterium by aberrant cell division. It is spherical or near-spherical in shape and devoid of chromosomal DNA; hence it does not grow or divide and is normally unable to synthesize nucleic acid or protein (but may do so if a plasmid is introduced). 2 an experimentally produced eukaryotic cell in which an intact cell nucleus is surrounded by scant cytoplasm and a cell membrane. It is prepared by enucleation of a normal mononucleate cell.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

mitochondrial carrier pr

miniexon a small exon, as found in the troponin T gene.

minigastrin a form of the peptide hormone gastrin that contains 14 amino-acid residues. It has been isolated from tumour tissue and correspoinds to residues 5-17 of human gastrin 1, having the sequence LEEEEEAYGWLDFH-amide.

minima a plural of minimum.

minimal of, being, or constituting the minimum; the least possible.

minimal medium a (synthetic) culture medium containing only those compounds essential for the growth of a wild-type organism and that is not able to support growth of an auxotroph.

minimum (pl. minimums or minima) 1 the least quantity, degree, or value possible or permissible. 2 (in mathematics) a value of a function that is less than that of any neighbouring value. 3 of, or pertaining to, a minimum or minimums.

minimum inhibitory concentration abbr.: MIC; the lowest concentration of a drug, or other substance, that just inhibits the growth of a given test organism (bacterium, etc.) in defined conditions.

minimum lethal dose abbr.: MLD; the minimum dose of a toxic substance, or organism, that will kill, within a specified time, all the animals in a test group to which it is administered.

minimum (relative) molecular mass or (formerly) minimum molecular weight the (relative) molecular mass of a compound as determined by the assay of one of its structural elements, e.g. a metal atom, a ligand, a terminal residue, etc., assuming that there must be at least one such structural element in each molecule of the compound.

minisatellite a repeat DNA segment comprising short headto-tail tandem repeats giving variable number tandem repeat-type polymorphisms, with approximate size between 1 and 30 kb. The name derives from the fact that repeat DNA segments were originally found in satellite DNA, but the overall size of the minisatellite segments and the length of individual repeats are smaller, and satellite peaks are not seen on centrifugation.

minivial a very small vial, especially a low-capacity container that can be inserted into a normal-sized sample vial used in liquid scintillation counting, to enable the (radio)activity of small-volume samples to be determined more efficiently.

minor base see minor nucleoside.

minor groove the smaller and shallower of the two grooves on the surface of a double-helical DNA molecule. Compare major groove.

minor nucleoside a nucleoside containing any of a group of purine or pyrimidine bases that occur in small amounts in most nucleic acids but in relatively large amounts in transfer RNA molecules; they are sometimes known as 'odd bases'. These are a characteristic feature of transfer RNA from all organisms. The modifications range from the simple methylation of bases or ribose sugar residues to very complex substitutions. All modifications take place after transcription of the transfer RNA genes. The importance of the modifications is thought to be related to the stability of the tertiary structure. A typical modified nucleoside is pseudouridine. See also wyosine.

minuend (in mathematics) the number (or quantity) from which another number (or quantity), the subtrahend, is to be subtracted.

minus end the end of a microtubule or actin filament at which the addition of monomers occurs least readily; the 'slow-growing' end of a microtubule or actin filament. The minus end of an actin filament is also known as the pointed end. Compare plus end.

minus 10 region and minus 35 region regions in the promoter defined by the number of nucleotides 5' from the first nucleotide transcribed, i.e. on the coding strand. The first nucleotide (the start site) of a transcribed DNA sequence is denoted as +1, the second +2; the nucleotide preceding the start site is denoted as -1. The most conserved sequence upstream (towards the 5' terminus) of DNA in Escherichia coli is a hexa-

mer centred at the -10 position (see **Pribnow hox**). It has a consensus sequence of TATAAT in which the leading TA and final T are highly conserved. -35 is the centre point of a consensus sequence involved in RNA polymerase recognition, TTGACA.

minus strand 1 the complementary strand to the parental polynucleotide strand – the plus strand (def. 1) – in bacteriophages whose genomes consist of duplex RNA. 2 any polynucleotide strand (RNA or DNA) in a viral genome that is complementary to the virus-specified mRNA – the plus strand (def. 2). 3 (sometimes) an alternative term for coding strand (of genetic duplex DNA).

minute 1 symbol: min; a non-SI unit of time equal to 60 seconds. 2 symbol: '; a unit of plane angle equal to $(\pi/10~800)$ radians, or 0.291 milliradians. There are 60 seconds (of arc) in one minute (of arc), and 60 minutes in one degree (of arc). 3 (in genetics) an empirical unit of distance between genes in a bacterial chromosome, being a measure of the time taken, in minutes, for the transfer of a particular gene during bacterial conjugation relative to an arbitrarily standardized selected origin.

7-minute phosphate or 10-minute phosphate see labile phosphate.

MIP abbr. for macrophage inflammatory protein.

misacylate or mischarge to acylate (a transfer RNA molecule) with an aminoacyl group other than the specific one.
—misacylation n.

mischarge an alternative term for misacylate.

miscible (of two or more particular liquids) capable of being mixed together to give a homogeneous liquid. Particular liquids may be completely miscible or miscible only in certain proportions. See also proofreading. —miscibility n.

mismatch repair a system for the correction of errors introduced during DNA replication when an incorrect base, which cannot form hydrogen bonds with the corresponding base in the parent strand, is incorporated into the daughter strand. Excinucleases recognize a pair of non-hydrogen-bonded bases and cause a segment of polynucleotide chain to be excised from the (less methylated) daughter strand, thereby removing the mismatched base. The resulting gap is then filled by the actions of DNA polymerase I and DNA ligase.

mispairing the occurrence of a base in one polynucleotide strand of duplex DNA that is not complementary to the corresponding base in the second polynucleotide strand.

missense codon a particular codon that has been altered so that it codes for an amino-acid residue different from the one for which it normally codes.

missense mutation any mutation causing a base substitution in a gene that results, following transcription and translation, in the incorporation of an incorrect amino-acid residue at a specific point in the polypeptide gene product. Compare non-sense mutation, samesense mutation.

mistranslation the insertion at a specific point in a polypeptide chain of an amino-acid residue that is not indicated by the corresponding codon in the mRNA molecule that is being translated.

MIT abbr. for (3-)monoiodotyrosine.

Mitchell, Peter Dennis (1920-92), British biochemist; Nobel Laureate in Chemistry (1978) 'for his contribution to the understanding of biological energy transfer through the formulation of the chemiosmotic theory'.

Mitchell hypothesis the hypothesis that mitochondrial systems can be driven by proton and electrical gradients that build up across membranes, a mechanism now referred to as chemiosmotic coupling.

mitochondria the plural of mitochondrion.

mitochondriac a biochemist with a chronic and unusually intense interest in mitochondria.

noted as +1, the second +2; the nucleotide preceding the start site is denoted as -1. The most conserved sequence upstream volved in the translocation of small molecules across the mitochondrial inner membrane. Many are translocases using an Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

mitochondrial DNA

antiport mechanism, and include carriers for pyruvate (antiport

and the enzymes and structures necessary for expression of the

antiport mechanism, and include carriers for pyruvate (antiport molecule is OH⁻), phosphate (malate), citrate (malate), phosphate (OH⁻), ADP (ATP), aspartate (glutamate), and malate (2-oxoglutarate); an example is ADP/ATP translocase 1 of yeast: database code ADT1_YEAST, 309 amino acids (34.08 kDa); this is an integral inner membrane protein, comprising a homodimer with three homologous domains in each subunit. See also OGCP.

mitochondrial DNA abbr.: mtDNA; DNA that is contained, replicated, and expressed in mitochondria. Mitochondrial DNA is double-stranded in almost all organisms studied; that from mammals has a contour length of ≈5 μm, about 15 kilobases, while that from protozoa and fungi is about five times larger. In yeast, mitochondrial DNA codes for two types of rRNA molecules, about 26 types of tRNA molecules, and about 10 proteins (which represent only about 5% of the total mitochondrial protein). The code in mitochondrial DNA differs in some respects from that in nuclear DNA (see genetic code).

mitochondrial fraction an operational term for the more rapidly sedimenting components (for example 10 000-15 000 g for 30 min) of the cytoplasmic fraction of a homogenate of eukaryotic cells or tissue. It generally consists predominantly of mitochondria but may also contain varying numbers of secretion granules, lysosomes, microbodies, or other intracellular organelles.

mitochondrial plasmid DNA a distinct class of genetic elements, found in certain wild-type strains of *Neurospora*, that show virtually no sequence homology with standard mitochondrial DNA (mtDNA) in DNA-DNA hybridization experiments and achieve high copy number without suppressive behaviour towards wild-type mtDNA.

mitochondrial matrix the gel-like material, with considerable fine structure, that lies in the matrix space, or lumen, of a mitochondrion. It contains the enzymes concerned with fatty-acid oxidation and enzymes of the tricarboxylic-acid cycle.

mitochondrial processing peptidase EC 3.4.99.41; an enzyme that catalyses the cleavage of the leader peptide from precursor proteins imported into the mitochondrion, typically ones with Arg in position P2 (see peptidase P-sites). These enzymes resemble in sequence premurein-leader peptidase. Example from Neurospora crassa; catalytic subunit (precursor): database code MPP1_NEUCR, 577 amino acids (62.96 kDa); enhancer subunit (precursor): database code MPP2_NEUCR, 476 amino acids (52.50 kDa). Both are transmembrane proteins; the enzyme requires the presence of divalent cations for activity.

mitochondrial RNA abbr.: mtRNA; any RNA molecules that are complementary to mitochondrial DNA.

mitochondrial state see respiratory state (of mitochondria).

mitochondrion (pl. mitochondria) a semiautonomous, selfreplicating organelle that occurs in varying numbers, shapes, and sizes in the cytoplasm of virtually all eukaryotic cells. It is notably the site of tissue respiration (see respiratory chain, oxidative phosphorylation). Conventionally, mitochondria are represented as elongated cylinders with a diameter of 0.5-1.0 μm; however, in living cells they show great mobility and plasticity, in some cells forming long, moving chains while in other types of cells being fixed in position near sites of high ATP consumption; e.g. in cardiac muscle they are packed between the myofibrils while in a sperm they are tightly wrapped around the flagellum. Mammalian hepatocytes each contain 1000-2000 mitochondria, which occupy roughly 20% of the cell volume. A mitochondrion has two functionally distinct lipid-bilayer membrane systems, the outer one completely surrounding the whole organelle and the inner one being infolded into cristae. These membrane systems define two mitochondrial compartments: the mitochondrial matrix and the intermembrane space. The matrix contains enzymes for the oxidation of pyruvate and fatty acids and for the tricarboxylic-acid cycle; it also contains the mitochondrial DNA

and the enzymes and structures necessary for expression of the mitochondrial genes. The inner mitochondrial membrane contains the enzymes of the respiratory chain, ATP synthetase, and specific transport proteins. The intermembrane space contains a number of kinases. The outer membrane, which is permeable to molecules of up to 10 kDa, contains monoamine oxidase, cytochrome b_5 , a number of transferases, and a fatty-acid elongation system. The mitochondrion was formerly known as a **chondriosome** and by numerous other names. See also **cercidosome**. —**mitochondrial** adj.

mitochrome a chromoprotein, or mixture of chromoproteins, released from mitochondria *in vitro* after ageing or other degradative processes. They are hemoproteins of ≈105 kDa with 1 atom of Fe per molecule, and are thought to inhibit *in vitro* oxidative phosphorylation.

mitogen any substance or agent that induces or stimulates mitosis. —mitogenic or mitogenetic adj.

mitogenic protein abbr.: MP; an alternative name for inter-

mitogillin EC 3.1.27.—; other names: allergen I/A; IgE-binding ribotoxin; a purine-specific ribonuclease that attacks 28S rRNA. The protein is a powerful allergen, an inhibitor of eukaryotic protein synthesis, and has anti-tumour activity. Its action is similar to restrictocin and ribonuclease U2. Example (precursor) from Aspergillus restrictus and A. fumigatus: database code RNMG_ASPRE, 176 amino acids (19.57 kDa).

a group of closely related aziridine antibiotics (mitomycins) produced by Streptomyces caespitosus. Mitomycin C is toxic to bacteria and mammalian cells and possesses antineoplastic activity. When administered, mitomycin C undergoes intramolecular rearrangement and reduction within cells to form a bifunctional alkylating agent that irreversibly crosslinks the two strands of duplex DNA molecules, thereby inhibiting DNA synthesis.

mitoplast a structure consisting of the inner membrane and the matrix of a mitochondrion. It is formed by removing the outer membrane and the intermembrane material by treatment of a mitochondrion with nonionic detergents under defined conditions.

mitoribosome any of the bacterial-like ribosomes found in mitochondria.

mitosis or karyokinesis the division of a eukaryotic cell nucleus to produce two daughter nuclei that contain identical numbers of chromosomes and that are identical genetically to the parent nucleus except where crossing over or mutation has occurred. It is divided into five main stages: prophase, prometaphase, metaphase, anaphase, and telophase. Mitosis is normally accompanied by cytokinesis leading to division of the cell. Compare meiosis.—mitotic adj.

mitotic coefficient or mitotic index the proportion of cells in a population that are in mitosis at a given time.

ae. These membrane systems define two mitochonpartments: the mitochondrial matrix and the interle space. The matrix contains enzymes for the
le of pyruvate and fatty acids and for the tricarcid cycle; it also contains the mitochondrial DNA

mitotic spindle

heterozygous at these loci. See also Holliday junction recombina-

mitotic spindle see spindle.

mixed acid fermentation a particular mode of bacterial fermentation of glucose that is characteristic of many members of the Enterobacteriaceae, e.g. Escherichia, Salmonella, and Shigella. It yields, as principal products, acetic, formic, lactic, and succinic acids, in varying proportions according to the organism and growth conditions.

mixed anhydride any acid anhydride formed between two different acids.

mixed-bed deionizer an apparatus for removing electrolytes from impure water (or an aqueous solution) and containing an intimate mixture of anion- and cation-exchange resins. It is frequently fitted with a device for measuring the electrolytic conductivity of the effluent.

mixed-bed resin a common but imprecise term for an intimate mixture of anion- and cation-exchange resins as used in a mixed-bed deionizer.

mixed-function oxidase or mixed-function oxygenase an older term for monooxygenase.

mixed indicator 1 a mixture, in definite proportions, of two acid-base indicators, or of an indicator and a dye, chosen so as to produce a sharp colour change over a narrow range of pH values. 2 a mixture, in definite proportions, of two or more acid-base indicators chosen so as to produce a series of colour changes over an extended range of pH values.

mixed inhibition or mixed-type inhibition inhibition of the activity of an enzyme that yields complex kinetic data that cannot be clearly categorized as either competitive or noncompetitive. This can result e.g. when the enzyme-substrateinhibitor complex undergoes the catalytic process slowly, or where binding of the inhibitor changes both k_{cat} and K_{m} .

mixed inhibitor or mixed-type inhibitor any inhibitor that produces mixed inhibition of the activity of an enzyme.

mixed labelled describing a specifically isotopically labelled compound that has more than one type of modified atom, e.g. [13C]H3-CH2[18O]H.

mixed-lymphocyte reaction or mixed-leukocyte reaction the reaction that occurs when leukocytes from two genetically differing individuals are cultured together. Small lymphocytes are transformed into immature blast cells, with synthesis of DNA, to an extent that is related to the degree of disparity between the histocompatibility antigens of the cell donors. This reaction forms the basis of a test for the acceptability of an allograft.

mixed triacylglycerol or (formerly) mixed triglyceride any triacylglycerol in which individual molecules contain acyl residues of more than one kind.

mixed-type inhibition an alternative term for mixed inhibition. mixed-type inhibitor an alternative term for mixed inhibitor.

mixotropic series a series of solvents arranged on the basis of their ability to form hydrogen bonds. It is based on the extent to which two given solvents in this series will mix; near neighbours in the series are isopartitive.

mixture (in chemistry) homogeneous or heterogeneous material in any physical state that consists of two or more chemical components that have no firm chemical bonding between them and that are physically separable.

MK abbr. for menaquinone.

mks system or MKS system abbr. for metre-kilogram-second system (of electrical units).

mL or ml symbol for millilitre.

MLD abbr. for minimum lethal dose.

M line see sarcomere.

mM or mm symbol for millimolar.

M macroglobulin a paraprotein of IgM type that is produced by individuals with Waldenström's macroglobulinemia.

mmHg symbol for the conventional millimetre of mercury.

mmol symbol for millimole.

MMP abbr. for matrix metalloproteinase.

MMPI abbr. for matrix metalloproteinase inhibitor. MMTV abbr. for mouse mammary tumour virus. Mn symbol for manganese.

mnemonic enzyme mechanism or mnemonical enzyme mechanism an enzyme mechanism proposed to explain cooperativity towards substrate shown by monomeric enzymes with only one substrate-binding site. In this mechanism free enzyme is considered to exist in two conformations, I and II, that are only relatively slowly interconvertible and that differ in their substrate-binding affinities; the binding of substrate induces a change of the enzyme to a third conformation, III, which reverts to conformation I when product is released. The behaviour of the system depends on the rate of interconversion of I and II and on the relative rates at which these forms can bind substrate. If the binding by I is more rapid than that by II, the system will show positive cooperativity, i.e. the enzyme has 'remembered' the catalytically more effective conformation; if the converse, the system will show negative cooperativity.

MNSs system one of the blood-group systems of humans, in which the antigens are the glycophorins of the erythrocytes. The MN system was the second human-blood-group system to be discovered, the first being the ABH system (see ABH antigens). The M and N antigenic sites are poorly immunogenic and antibodies to M and N antigens do not normally occur in the blood. The determinants are located at the N terminus of glycophorins A and B (GPA and GPB); polymorphism between M and N antigens on GPA is attributed to amino-acid substitutions at residues 1 (Ser/Leu) and 5 (Gly/Glu), but the N-terminal Ser¹ and Leu¹ are the primary determinants for the M and N antigens respectively. GPB carries 'N' (N-like activity), S/s, and U blood-group antigens; 'N' activity resides at the N terminus of GPB, the sequences of GPA and GPB between residues 1 and 26 being identical; the S/s antigenic determinants arise from Met/Thr polymorphism at residue 29 of GPB; and the U antigen, present in all Caucasians and most Blacks, resides between residues 33 and 39.

Mo symbol for molybdenum.

mob the genetic notation for genes involved in the mobilization of a plasmid from cell to cell.

mobile element an alternative term for transposon.

mobile phase the phase that moves in a chromatographic system; it can include the portion of the starting sample present in this phase at any given time.

mobility 1 the property of being mobile. 2 see electrophoretic

mobilization or **mobilisation** 1 the act or process of mobilizing. 2 the process by which a conjugative plasmid brings about the transfer from one cell to another of DNA to which it is not stably and covalently linked.

mobilize or mobilise to bring (resources or reserves) into use for a particular purpose, e.g. to mobilize fat by lipolysis or glycogen by glycogenolysis.

mobilizing plasmid or mobilising plasmid an alternative name for conjugative plasmid.

Möbius strip or Moebius strip any one-sided continuous surface with a single bounding curve made by twisting a ribbon through 180° and joining the ends together. When divided lengthwise it forms another Möbius strip of double the length, and is a model for the replicative behaviour of a circular chromosome that contains a single twist. [After its inventor, August Ferdinand Möbius (1790-1868), German mathematician.]

Mo cell a relatively small cell, containing round, osmophilic granules, that is believed to produce motilin. Mo cells occur in the upper small intestine of humans, mainly in the crypts; they are sparse in the lower small intestine.

modal class (in a statistical distribution) the class that contains the mode (def. 2).

mode 1 any particular way or manner of existing or of doing something. 2 (in a statistical distribution) the value of the variable occurring with greatest frequency. 3 any of the sev-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

eral wave frequencies that an oscillator can generate, or to which a resonator can be tuned to respond. —modal adj.; modality n.

modeccin a 57 kDa lectin present in the turnip-like root of the southern African plant, Modecca digitata. It is highly toxic to animals, its prime action being on the liver, and to animal cells in culture. It consists of two polypeptide subunits in disulfide linkage, the A (smaller) subunit being biologically indistinguishable from the A subunits of ricin and abrin. See also ribosome-inactivating protein.

model 1 a three-dimensional representation of an object, structure, etc., sized to be conveniently seen, handled, and studied. 2 a conceptual representation of a particular phenomenon, system, or set of experimental observations as an aid to understanding and as an object for test or for further experimentation. 3 an animal that, often as a result of mutation, mimics a pathological condition and can be used to study the pathogenesis of the condition. See also transgenic. 4 a mathematical representation of a particular phenomenon, system, or set of experimental observations as an aid to calculation and prediction. 5 to construct or create a model (def. 1, 2, 3). —modelled or (sometimes US) modeled adj.; —modelling or (sometimes US) modeling n.

model system any biological or biochemical system that is used for study because it is considered to be representative of one or more other (often more complex) systems in which similar phenomena occur or are believed to occur.

modem an electronic device, consisting of a combined modulator and demodulator, that is used to convert an output signal from one type of equipment (e.g. a computer) into a form suitable for input into another type, and vice versa. [From modulator-demodulator.]

moderator any substance that changes the rate of an enzymic or other reaction, either positively or negatively.

modification 1 (in biochemistry) see covalent modification. 2 (in genetics) any nonheritable change in the phenotype of an organism in response to variation of its environment; it includes host-controlled modification. Compare mutation.

modification enzyme any enzyme that effects covalent modification. See also restriction-modification system.

modification gene see restriction-modification system.

modification methylase a common name for any of the enzymes that methylate specific sites on a DNA molecule.

modification-restriction system an alternative name for restriction-modification system.

modifier an alternative term for effector.

modifier gene or modifying gene any gene that affects the phenotypic expression of a gene or genes at other loci.

modify 1 to alter the structure, character, activity, etc. of (something). 2 to convert a chemical compound into an analogue, especially by substitution. See also modification.

modular primer an unligated tandem arrangement of primers (usually two or three) used for the polymerase chain reaction and related experiments.

modulating codon any codon that controls the frequency with which a cistron or cistrons are transcribed.

modulation 1 adjustment or regulation of the degree or activity of something. 2 regulation of the frequency with which a cistron or cistrons is transcribed. 3 control of the activity of a regulatory enzyme by an effector. 4 (in physics) the process of changing the amplitude, frequency, or phase of a wave by combination with another wave.

modulator 1 something that modulates or brings about modulation. 2 any molecule that acts as an effector. 3 (in pharmacology) a ligand that increases or decreases the action of an agonist by combining with a distinct (allosteric) site on the receptor macromolecule.

modulator protein one provisional name for calmodulin.

module a standardized or self-contained part or unit of construction, especially one that can be used in alternative comelectronic components that comprise a larger piece of equipment. See also Appendix E. —modular adj.

moesin abbr. for membrane-organizing extension spike protein; a protein, isolated from bovine uteri, with one domain similar to one in ezrin, band 4.1, and related proteins. Moesin occurs in many cell types and tissues and is involved in connections of major cytoskeletal structures to the plasma membrane. Example from human: database code MOES_ HUMAN, 576 amino acids (67.61 kDa).

Moffitt-Yang equation or Moffitt equation a phenomenological equation, related to the Drude equation, that describes the anomalous variation of optical rotatory dispersion with wavelength shown by polypeptides containing helical sections. It is used to provide an estimate of the alpha-helical content of polypeptides and proteins. If λ is the wavelength of observation and $[m']_{\lambda}$ is the reduced mean residue rotation at that wave-

$$[m']_{\lambda} = \{a_0 \lambda_0^2 / (\lambda^2 - \lambda_0^2)\} + \{b_0 \lambda_0^4 / (\lambda^2 - \lambda_0^2)^2\},$$

where a_0 , b_0 , and λ_0 are empirical constants; a_0 is a function of contributions to the optical rotation from both the helix and the residue side-chains, as well as from the solvent, and b_0 and λ_0 are related principally to the amount of helical structure in the molecule. A value of λ_0 is chosen to give the best straight line when $[m'](\lambda^2 - \lambda_0^2)$ is plotted against $1/(\lambda^2 - \lambda_0^2)$, a good fit usually being obtained if $\lambda_0 = 212$ nm when $\lambda = 350-600$ nm. The slope of this line, $b_0\lambda_0^4$, gives a value of b_0 , whence by reference to the values found for nonhelical and fully helical synthetic polypeptides an estimate may be made of the alphahelical content of a polypeptide or protein under investigation. [After William E. Moffitt (1925-58), British physical chemist and Jen Tsi Yang (1922-95), who formulated it in 1956.]

Mohr pipette a cylindrical pipette calibrated for delivery from the zero mark to a particular chosen graduation mark. [After Carl Friedrich Mohr (1806-1879), German chemist.]

Mohr's salt ammonium ferrous sulfate; di-ammonium iron(II) sulfate hexahydrate; (NH₄)₂SO₄·FeSO₄·6H₂O.

moiety either of two, usually distinctive, component parts of a complex molecule; e.g. the steroid and saccharide moieties of a cardiac glycoside.

mol symbol for mole.

mol. abbr. for 1 molecular. 2 molecule.

umol symbol for micromole.

molal 1 denoting the concentration of a solute (or a solution as a whole) expressed as the amount of substance of the solute divided by the mass of solvent. It is measured in moles per kilogram. 2 denoting an amount-of-substance concentration measured in such terms. Compare molar.

molality symbol: m or b; a measure of concentration expressed as the number of moles (of a specified solute) per kilogram of solvent. Molality is independent of temperature. See also

molar 1 denoting an extensive physical quantity that is measured per mole (of a specified substance). It is usually denoted by the subscript m in the symbol; e.g. molar volume is the volume of one mole of a substance, and the symbol is V_m . Compare specific. 2 denoting an intensive physical quantity that is measured per mole (of a specified substance); i.e. divided by concentration. Use of the term molar in this sense is no longer recommended, except in the terms molar absorption coefficient and molar conductivity. 3 denoting the concentration of a solute (or a solution as a whole), expressed as the amount of substance of the solute divided by the mass of the solution. The recommended units are moles per litre but the convenient symbols M and M are frequently used. Compare molal.

molar absorbancy index a former name for molar absorption

molar absorption coefficient either the molar decadic absorption coefficient (symbol: ε) or the molar Napierian absorption coefficient (symbol: κ); these are, respectively, the decadic binations with others; e.g. one of a set of such assemblies of Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

solute in solution, (at a specified wavelength (or frequency) and temperature) divided by the optical path length (in cm) of the medium and by the amount-of-substance concentration of the substance; i.e. the decadic or Napierian absorption coefficients of a medium whose concentration is expressed in moles per litre. Former names: molar absorbancy index; molar absorptivity; molar extinction coefficient; molecular extinction coefficient. See also absorption coefficient.

molar absorptivity a former name for molar absorption coeffi-

molar activity an activity (def. 1) of a substance or material divided by its amount of substance (in moles). Compare specific activity.

rmolar catalytic activity the catalytic activity of an enzyme, under specified conditions, divided by the amount of substance (in moles), either of enzyme catalytic centres or of multi-centre molecules; in the latter case it is important to specify whether the measurements refer to catalytic centres or to molecules. It may be expressed in katals per mole of enzyme. If the conditions specified are such that the enzyme is saturated with substrate, the expression (which then replaces the obsolete term turnover number) will be numerically equal to the catalytic constant, in s⁻¹, for decomposition of the enzyme—substrate complex into enzyme and products, although its interpretation may be complex. Compare molar enzymic activity, specific catalytic activity.

molar concentration an old but now incorrect term for amountof-substance concentration measured in moles per litre. See molar (def. 2).

molar conductivity symbol: A ;the electrolytic conductivity of a (specified) electrolyte divided by its amount-of-substance concentration. The SI derived unit is the S m² mol⁻¹.

molar decadic absorption coefficient $\mathit{symbol}\colon \varepsilon;\ \mathit{see}\ \mathsf{molar}$ absorption coefficient.

molar ellipticity or (formerly) molecular ellipticity symbol: $[\Theta]$; an expression of circular dichroism, $\Delta \varepsilon$, at a specified wavelength, λ . It is given by the relation: $[\Theta]_{\lambda} = 3299 \ \Delta \varepsilon_{\lambda}$.

molar enzymic activity (obsolete) the phenomenological coefficient relating the enzymic activity (under specified conditions) to the molar amount of enzyme substance; it is expressed in katals per mole of enzyme. It has now been superseded by molar catalytic activity.

molar extinction coefficient a former name for molar absorption coefficient.

molarity an older (still widely used) term for amount-of-substance concentration expressed in mol dm⁻³ or mol L⁻¹. See concentration (def. 1b), molar (def. 3).

molar mass the mass of a substance divided by its amount of substance; it is commonly expressed in grams (sometimes kilograms) per mole. Compare molecular mass, relative molecular mass.

molar Napierian absorption coefficient $symbol: \kappa; see$ molar absorption coefficient.

molar optical rotation symbol: [m] or [M]; the observed optical rotation, α_{obs} , of a substance, or of a solute in solution, (at a specified wavelength (or frequency) and temperature) divided by the optical path length (in dm), l, of the medium and by its amount-of-substance concentration (in mol dm⁻³), c. It is given by:

$$[m] = \alpha_{\rm obs}/cl = [\alpha]^{\theta}_{\lambda} M_r/100$$

in deg dm² g⁻¹, where $[\alpha]^{\theta}_{\lambda}$ is the specific optical rotation.

molar optical rotatory power symbol: α_m ; it is given by the relation $\alpha_m = \alpha lcl$ in rad m^2 mol^{-1} , where α is the observed rotation in radians, c is the amount-of-substance concentration in mol dm^{-3} , and l is the optical path length of the sample in m. See also specific optical rotatory power.

molar volume symbol: $V_{\rm m}$; the volume occupied by a substance, under specified conditions of temperature and pressure, divided by its amount of substance; it is commonly expressed in litres per mole.

mold the US spelling of mould.

mole symbol: mol; the SI base unit of amount of substance, defined as the amount of substance of a system that contains as many elementary entities as there are atoms in 0.012 kilogram of carbon-12; the elementary entities must be specified and may be atoms, molecules, ions, electrons, other particles, or specified groups of such particles. One mole of a compound has a mass equal to its relative molecular mass in grams.

molecular 1 of or pertaining to a molecule or molecules. 2 consisting of or existing as molecules; (especially of certain gaseous elements) present or reacting as intact molecules rather than as atoms, ions, etc., e.g. molecular oxygen (i.e. dioxygen). 3 of dimensions comparable to those of molecules. 4 (in physical chemistry) an obsolete term meaning divided by molecular weight or expressed per gram-molecule; molar now used. 5 considered in terms of or at the level of molecules, or in terms of chemical substances or structures and their interconversions; e.g. molecular biology, molecular medicine.

+molecular comb. form indicating the **molecularity** of a chemical reaction (when qualified by a multiplicative prefix), e.g. unimolecular, bimolecular, termolecular.

molecular biology the science that strives to understand the chemical and physical basis of biological specificity and variation, especially with regard to the structure, replication, and expression of genes, and to the structure, interaction, and physiological function of gene products.—molecular biologist

molecular chaperone see chaperone.

molecular cloning or DNA cloning the isolation in a bacterial cell of a fragment of any heterologous DNA in covalent linkage with a replicon (plasmid, phage, etc.) in order to obtain a homogeneous population (i.e. clone) of DNA molecules from the progeny of such a cell. The DNA to be cloned may be a fragment of genomic DNA obtained by restriction endonuclease digestion, or a complementary DNA (cDNA). The foreign DNA is inserted into the cloning vector which has been cleaved with a restriction enzyme; the gaps between vector and insert DNA are sealed with DNA ligase. In cloning using plasmid vectors, plasmids are then reintroduced into host cells by transformation; markers on the cloning vector allow selection of plasmid-containing cells and identification of those cells that contain recombinant plasmids (rather than 'empty' vectors). To identify clones containing particular sequences, DNA from individual colonies may be screened with a labelled DNA probe by colony hybridization. In cloning using bacteriophage vectors, the ligated insert and vector are packaged into phage capsids in vitro, and then these are used to infect host bacteria.

molecular disease any disease caused by an abnormality in a single protein, usually an enzyme. This component may have an abnormal structure that makes it functionally less efficient or harmful to the organism, or it may have a normal structure but be present in reduced amount. An example is sickle-cell anemia. Overproduction of proteins, e.g. of oncogene products, may also lead to a pathological situation.

molecular distillation distillation at very low pressures (at or below 1.3 N m⁻²) when the mean free path of the molecules is of the same order as the distance between the surface of the liquid being distilled and the distillate; the molecules can therefore travel rapidly from the liquid to the distillate with relatively few collisions, and with a reduced risk of thermal denaturation or decomposition. The technique is useful in the separation and purification of fat-soluble vitamins and other natural products.

molecular dynamics the study of the relative intramolecular differences in the motions of the components of (macro)molecules

molecular ellipticity a former term for molar ellipticity.

molecular endocrinology endocrinology at the molecular level.

sure, divided by its amount of substance; it is commonly molecular entity any chemically or isotopically distinct atom, expressed in litres per mole.

Ban dang doc mot quyen sach duoc tang bởi HUY NGUYEN. Nếu ban có nhu câu về sách sinh học, xin liên hệ:

OI Just the safe

former, etc., capable of existence as a separately distinguishable entity.

molecular enzymology (sometimes) the aspects of enzymology concerned with kinetics and mechanisms.

molecular exclusion chromatography a less common name for gel-permeation chromatography.

molecular extinction coefficient a former name for molar absorption coefficient.

molecular formula a chemical formula giving the kinds and number of atoms in one molecule of a specified substance.

molecular fragmentography an alternative (less satisfactory) name for selected-ion monitoring.

molecular genetics the branch of genetics that attempts to describe genetic events in molecular terms.

molecular graphics functioning as sing. the use of computer programs for visualizing (macro)molecules, refining structures and molecular design, protein engineering, etc. Suites of programs that are commonly used include Insight, Ribbons, Midas, and O.

molecular hybridization an alternative name for hybridization analysis.

molecular ion any ion produced, especially in a mass spectrometer, when a molecule loses or gains an electron, forming a molecular cation or molecular anion, respectively.

molecularity the number of molecular entities involved in a simple, one-step, chemical reaction (it is not used to describe an overall reaction with more than one step). In the two-step reaction: $A + B \rightarrow C \rightarrow D$, the molecularity of the first step is two, i.e. it is bimolecular, and the molecularity of the second step is one, i.e. it is unimolecular.

molecular mass the mass of one molecule of a specified substance expressed in (unified) atomic mass units or daltons.

Compare relative molecular mass, molecular weight.

molecular matchmaker any of a class of proteins, also called matchmaker proteins, that cause a conformational change in one or both components of a DNA-protein binding pair to promote formation of a metastable DNA-protein complex. ATP hydrolysis occurs in the process. Such matchmaking is used extensively in repair, replication, and transcription of DNA.

molecular medicine (sometimes) the branch of medicine concerned with the biochemical mechanisms of disease processes and therapy.

molecular orbital a wave equation for one electron describing its movement in the effective field provided by the nuclei and all other electrons of a molecular entity of more than one atom.

molecular pathology the use of techniques of molecular biology to enhance the understanding, diagnosis, and therapy of disease (mainly with respect to humans).

molecular pharmacology the use of techniques of molecular biology to enhance the understanding of the mechanism of action of existing drugs, and with the help of molecular graphics to predict the structure of novel drugs, especially compounds that might bind to proteins of known structure.

molecular pK any one of the pK values of an acid with two or more dissociations. Compare group pK, titration pK.

molecular recognition the specific recognition of one molecule by another; it often includes chiral recognition.

molecular ruler 1 any rigid oligoproline crosslinking reagent of defined length. Such reagents are useful in probing the structures of biological macromolecules in solution. 2 any molecule that regulates length, e.g. nebulin.

molecular sieve any of a class of substances or materials, whether naturally occurring or artificial, that contain pores of molecular dimensions and of a closely defined range of diameters. They are useful for the separation of substances within a particular range of molecular dimensions on the basis of selective exclusion.

molecular-sieve chromatography any form of chromatography in which a separation is based mainly upon differences in molecular size and/or shape of the substances being separation. Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

arated. It includes **gel-permeation chromatography** and separations using **zeolites**.

molecular-sieve electrophoresis (sometimes) an alternative term for polyacrylamide gel electrophoresis.

molecular weight abbr.: mol. wt. or M.W.; a former name for relative molecular mass.

molecular weight cut-off or cut-off a jargon term for the nominal maximal value of the relative molecular mass of a macrosolute that can pass through an ultrafiltration membrane of a particular grade.

molecular weight marker or molecular weight standard a jargon term for any soluble polymer of accurately known relative molecular mass that serves as a reference in estimations of M_r values of polymers by techniques such as gel permeation chromatography or gel electrophoresis. Generally a set of such substances, covering a range of M_r values, is used.

molecule a structural unit of matter consisting of one or more atoms; the smallest discrete part of a specified element or compound that retains its chemical identity and exhibits all its chemical properties.

mole fraction an alternative name for amount-of-substance fraction. See concentration.

mole percent the quantity mole fraction multiplied by 10⁻²; usage no longer recommended.

Molisch test a qualitative test for free or combined aldohexoses. It depends on the formation of a purple colour when the furfural derivatives, formed when aldohexoses are heated with strong acids (e.g. H₂SO₄), react with sulfonated 1-naphthol. [After Hans Molisch (1856-1937), Austrian chemist.]

mollicute see mycoplasma.

molt the US spelling of moult.

molting hormone the US spelling of moulting hormone (i.e. ecdysterone).

mol. wt. abbr. for molecular weight (alternative to M.W.).

molybdate 1 the bivalent anion, MoO₄²⁻, derived from molybdic acid. 2 any salt of molybdic acid.

molybdenum symbol: Mo; a metallic transition element of group 6 of the (IUPAC) periodic table; atomic number 42; relative atomic mass 95.94. It consists of a mixture of eight stable nuclides of which the commonest is that of mass number 98. It forms molybdates (molybdenum(VI)) and can also exist in various lower oxidation states. Molybdenum is of low abundance in the Earth's crust and is an essential trace component of living material, where it participates in numerous redox reactions. It is a constituent of component I (or molybdoferredoxin) of the nitrogenase (EC 1.18.6.1) complex from legume nodule bacteria (bacteroids), which converts nitrogen into ammonia. There are many artificial radionuclides of molybdenum, of which the most widely used is molybdenum-99.

molybdo+ comb. form denoting containing molybdenum, e.g. molybdoprotein.

molybdoferredoxin an alternative name for component I of nitrogenase.

molybdophosphoric acid or phosphomolybdic acid a heteropolyacid of approximate formula 24MoO₃·P₂O₅·xH₂O, where x is approximately 50. It is useful in reagents for alkaloids, xanthine, uric acid, creatinine, etc.

mon+ a variant form of **mono+** (sometimes before a vowel).

Mon symbol for the montanoyl group.

monactin see nonactin.

monatomic or **monoatomic** (of a molecular entity) composed of only one atom.

monellin an ≈11 kDa protein consisting of two polypeptide chains of the same size but different sequence, linked noncovalently, isolated from the fresh fruits of the African shrub Dioscoreophyllum cumminsii, known as serendipity berry. It is intensely sweet-tasting, being 3000 times sweeter than sucrose on a mass basis, and has sequence similarities with thaumatin. A chain: database code MONA_DIOCU, 50 amino acids (5.83 kDa); B chain: database code MONB_DIOCU, 50 amino acids (5.83 kDa).

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Monod-Wyman-Changeux n

War to say a

monensin a 671 Da, open-chain macrotetrolide-like antibiotic, with many chiral centres, isolated from Streptomyces cinnamonensis. It forms stable complexes with monovalent cations, especially with Na⁺, and exhibits high Na⁺/K⁺ selectivity. These complexes are soluble in organic solvents and thus monensin can act as an ionophore for monovalent cations. It is used as a digestion-modifying feed additive in ruminants.

Monera the kingdom containing all prokaryotic organisms (i.e. bacteria and cyanobacteria) in the five-kingdom system of classification. —moneran adj., n.

mongolism an older name for Down's syndrome.

monitor 1 any instrument or device for checking, controlling, measuring, or keeping a record of some varying biological activity or chemical or physical property, e.g. absorbance, (radio)activity, concentration, pH, respiration. 2 to serve as a monitor of (some activity or property); to use a monitor.

mono+ or (sometimes before a vowel) mon+ comb. form 1 denoting one, single, onefold, once, alone; uni+. 2 (in adjectives describing physical attributes) homogeneous; e.g. monochromatic, monodisperse, monoenergetic. 3 (in generic names of chemical compounds) denoting that member of a series (a) having only one specified substituent or other chemical modification, e.g. monoacylglycerol, monoamine; or (b) comprised of only one constitutional unit, e.g. monomer, monosaccharide. 4 informal term (in specific names of chemical compounds) indicating or emphasizing the presence in a molecule of a single specified atom, group, or residue; e.g. monoiodotyrosine, adenosine monophosphate, monosodium dihydrogen phosphate. 5 (in adjectives describing compounds or substances) having a single function of the kind specified; e.g. monoacidic, monobasic, monodentate, monohydric. 6 (in names of processes or enzymes) concerned with or acting on, one or only one chemical group of the kind specified; e.g. monoiodination, monoesterase.

monoacidic (of a **base** (def. 1)) able to accept only one proton per molecule in solution.

monoacylglycerol or (formerly) **monoglyceride** any ester of glycerol in which any one of its hydroxyl groups has been acylated with a fatty acid, the other being non-esterified.

monoacylglycerol pathway a pathway in which diacylglycerols and triacylglycerols are formed by sequential acylation of monoacylglycerol by acyl-CoA. It was initially studied especially in cells of mammalian intestine, and is important during fat absorption since monoacylglycerol is then extensively absorbed from the gut; however, it is also present in a large number of other mammalian tissues. There is little evidence for this pathway in plants.

monoamine oxidase abbr.: MAO; a common name for amine oxidase (flavin-containing), EC 1.4.3.4; an enzyme, widely distributed in animal tissues, that catalyses the oxidative deamination of primary amines by a reaction between dioxygen and R-CH₂-NH₂ to form R-CHO, NH₃, and H₂O₂. It also acts on secondary and tertiary amines. It, is important in the catabol-

ism of neuroactive amines, e.g. epinephrine, norepinephrine, serotonin (5-hydroxytryptamine), and tyramine. Example from *Rattus norvegicus*: database code AOFA_RAT, 526 amino acids (59.51 kDa).

monoamine oxidase inhibitors compounds that inhibit monoamine oxidase (abbr.: MAO) and are useful as thymoleptic (antidepressant) drugs. They act by increasing the concentrations of norepinephrine and serotonin, which, because of the block on their metabolism, accumulate in the synaptic gap and exert an increased postsynaptic effect. They were discovered as a result of the observation of the euphoric side effect of the antitubercular drug isoniazid. The main groups of these drugs are (1) the cyclopropylamines, including tranylcypromine (trans-phenyl-cyclopropylamine); and (2) the propargylamines, including pargyline (N-benzyl-N-methyl-2-propynylamine. Harmine and related carboline alkaloids are reversible MAO inhibitors but are not used therapeutically.

monoatomic a variant spelling of monatomic.

monobactam any of a family of N-sulfonated monocyclic β -lactam antibiotics produced by a range of bacterial species.

monobasic 1 (of an acid) able to yield only one hydrogen ion per molecule in solution. 2 (of a salt or ester of a polybasic acid) derived by the replacement of only one of its dissociable hydrogen atoms per molecule.

monochromatic 1 or homochromatic involving, possessing, or relating to a single colour; consisting of, relating to, or emitting light (or other electromagnetic radiation) of a single frequency or wavelength. 2 an alternative term for monoenergetic. Compare heterochromatic (def. 1), polychromatic.

monochromator a device used for producing light (or other electromagnetic radiation) of essentially one frequency or wavelength, which may be fixed or selectable.

monocistronic containing as much genetic information as is contained in a single cistron.

monocistronic messenger RNA any messenger RNA molecule that carries one initiation site only and encodes the synthesis of one polypeptide chain only. It is characteristic of eukaryotes, which do not possess polycistronic messenger RNA.

monoclonal 1 of, pertaining to, being, formed by, or derived from a single clone (def. 1). 2 (sometimes) an informal name for monoclonal antibody.

monoclonal antibody or (sometimes, informal) monoclonal an immunoglobulin secreted by a single clone of antibody-producing cells, either in vivo or in culture. Such antibodies are monospecific; they can thus be useful as immunochemical reagents for the detection or assay of particular antigens. See also hybridoma.

monocomponent insulin a commercial preparation of natural insulin that has been highly purified by chromatography and is thus made essentially free of proinsulin, intermediates in the conversion of proinsulin to insulin, and breakdown products of insulin, as well as any unrelated contaminants.

monocotyledon or **monocot** any flowering plant having a single cotyledon (seed leaf) in the embryo. Such plants comprise the class Monocotyledonae.

monocyclic having a single ring of atoms in the molecule.

monocyte a large leukocyte of the mononuclear phagocyte system, $16-22~\mu m$ in diameter (in humans), with pale-staining cytoplasm and a reniform or horseshoe-shaped nucleus. Found in bone marrow and the bloodstream, monocytes are derived from pluripotent stem cells and become macrophages when they enter the tissues.

Monod, Jacques Lucien (1910-76), French microbiologist and molecular biologist; Nobel Laureate in Physiology or Medicine (1965) jointly with F. Jacob and A. M. Lwoff 'for their discoveries concerning genetic control of enzyme and virus synthesis'.

synthesis'.

monodisperse describing a colloidal system in which the dispersed phase consists of particles all of (nearly) the same size.

R-CH₂-NH₂ to form R-CHO, NH₃, and H₂O₂. It also acts on secondary and tertiary amines. It is important in the catabol-Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

monoenergetic monosacch

abbr.: MWC model; a model describing the nature of allosteric interactions in proteins. It requires an allosteric protein to be an oligomer, the protomers of which are associated in such a way that they all occupy equivalent positions. Each protomer has only one stereospecific binding site for each ligand. The protein can exist in either of two conformational states, the T form (tense form), the predominant form when unligated, and the R form (relaxed form); these states are in equilibrium. The affinity of the R form for ligand is higher than that of the T form. All binding sites in each state are deemed to be equivalent and to have identical dissociation constants, K_R and K_T for the R and T forms, respectively. The sigmoidal binding curve for any allosteric protein and a given ligand can be calculated from the allosteric constant, L, equal to the ratio [T form]/[R form] for the unligated states and the two dissociation constants. [After J. Monod, Jeffries Wyman (1901–95), US biochemist, and Jean-Pierre Changeux (1936-), French biochemist.] See also mnemonic enzyme mechanism.

monoenergetic or monochromatic (of moving particles and sometimes also photons) all having the same kinetic energy.

monoenoic denoting any alkenyl carboxylic acid containing one carbon-carbon double bond per molecule.

monoester any simple ester; i.e. any ester formed by condensation of one molecular proportion of an alcohol or phenol with one of an oxoacid.

monoesterase see phosphomonoesterase.

monofunctional having only one function or one reactive chemical group.

monoglyceride a former name for monoacylglycerol; its use is discouraged as it does not convey the intended meaning.

monognotobiotic an alternative term for exenic.

monohydric or monohydroxy describing any chemical compound containing one hydroxyl group per molecule. It is used especially of alcohols.

monoiodinated reacted with or containing only one atom of iodine per molecule.

monokine an alternative name for a cytokine produced by monocytes.

monolayer 1 an alternative name for monomolecular layer. 2 a single layer of cells grown or growing in culture.

monomer 1 any substance that can provide one or more (in number or species) of the monomeric units of an oligomer (def. 1) or of a polymer (def. 1); a molecule of such a substance. 2 a loose term for any of the component molecules (identical or nonidentical) formed by the complete dissociation of a macromolecule with quaternary structure. 3 (in molecular biology) a any protein that is made up of nonidentical structural units. b any of the structural units formed by dissociation of an oligomeric protein and corresponding to a protomer in the undissociated protein. —monomeric adj.

monomeric unit a group of atoms, derived from a molecule of a given monomer (def. 1), that comprises any one species of constitutional unit of a polymer.

monomolecular 1 relating to, consisting of, or involving a singular molecular entity. 2 (of a reaction) having a molecularity of one; unimolecular.

monomolecular layer or monolayer a layer of a substance or substances that is one molecule thick.

mononuclear 1 (of a cell) having one nucleus. 2 (of a metalion-ligand complex) containing a single central metal atom.

mononuclear phagocyte system a cell system in higher animals that comprehends all the highly phagocytic mononuclear cells and their precursors. As well as the free macrophages, it includes precursor cells and promonocytes of the bone marrow, monocytes of the bone marrow and the blood, and the tissue macrophages. The term has been proposed as a replacement for reticuloendothelial system, now held to lack precision.

mononucleosis see Epstein-Barr virus.

mononucleotide any nucleotide (def. 1); the term is used especially as the generic name of the constitutional repeating unit mononucleotide consists of the (3'- or 5'-)phosphate of a single ribonucleoside or deoxyribonucleoside. The term is extended generally to include: (1) nucleoside oligophosphates, e.g. adenosine 5'-triphosphate (ATP); (2) nucleoside diphosphate sugars, e.g. uridine 5'-diphosphate glucose (UDPG); (3) nucleoside 2',3'- and 3',5'-(cyclic)phosphates, e.g. adenosine 3',5'phosphate (cyclic AMP); (4) nucleoside phosphates derived from artificial heterocyclic bases, e.g. 5-iodo-2'-deoxycytidine 5'-triphosphate, or from ones that do not occur naturally in nucleic acids, e.g. inosine 5'-phosphate (i.e. inosinic acid; hypoxanthine riboside 5'-phosphate; IMP); and (5) certain analogous compounds such as those containing, in place of a residue of ribose or deoxyribose, a residue of ribitol, e.g. flavin mononucleotide (i.e. riboflavin 5'-phosphate; FMN), of dideoxyribose, e.g. 2',3'-dideoxyadenosine 5'-triphosphate (i.e. ddATP), or of another pentose, e.g. cytosine arabinoside 5'-triphosphate (i.e. ara-CTP). Compare oligonucleotide, polynucleotide.

monooxygenase any oxidoreductase enzyme that brings about the incorporation of only one atom of oxygen from dioxygen into the donor; such enzymes catalyse reactions of the type:

substrate + O_2 =

oxidized substrate + H_2O (+ CO_2 in many cases).

The following are examples. (1) Lysine 2-monooxygenase; EC 1.13.12.2; it catalyses the oxidation by dioxygen of L-lysine to 5-aminopentanamide, CO₂, and H₂O; FAD is a coenzyme. (2) Lysine 6-monooxygenase; EC 1.13.12.10; it catalyses the oxidation by dioxygen of L-lysine to N⁶-hydroxy-L-lysine and H₂O. (3) Tryptophan 2-monooxygenase; EC 1.13.12.3; it catalyses the oxidation by dioxygen of L-tryptophan to indole-3-acetamide, CO₂, and H₂O. (4) myo-Inositol oxygenase; EC 1.13.99.1; it catalyses the oxidation by dioxygen of myo-inositol to D-glucuronate and H₂O; iron is a cofactor. (5) Phenol 2monooxygenase; EC 1.14.13.7; other name: phenol hydroxylase; it catalyses a reaction between phenol, NADPH, and O2 to form catechol, NADP+, and H2O; FAD is a coenzyme. It is an enzyme of bacterial aromatic substrate utilization; example from Pseudomonas pickettii: database code: TBUD_PSEPI, 670 amino acids (72.79 kDa). (6) trans-Cinnamate 4-monooxygenase; EC 1.14.13.11; other names: cinnamic acid 4-hydroxylase; cinnamate 4-hydroxylase; CA4H; it catalyses a reaction between trans-cinnamate, NADPH, and O₂ to form 4-hydroxycinnamate, NADP+, and H2O. It is a cytochrome P450-thiolate enzyme; example from Jerusalem artichoke: database code: TCMO_HELTU, 505 amino acids (57.85 kDa). See also monophenol monooxygenase.

monophenol monooxygenase EC 1.14.18.1; other names: tyrosinase; phenolase; monophenol oxidase; cresolase. An enzyme involved in the formation of melanins and other polyphenolic pigments, etc. It catalyses a reaction between Ltyrosine, L-dopa, and O2 to form L-dopa, dopaquinone, and H₂O; copper is a cofactor. It has four motifs, three for the Cu site. Example from human (precursor): TYRO_HUMAN, 529 amino acids (60.33 kDa). Deficiency results in albinism.

monophosphatidyl glycerol any [1,2-diacyl-sn-glycero-3-(phospho-1-sn-glycerol)] lipid present in chloroplasts of higher plants.

monoploid (of cells or individuals) having a single set of chromosomes; i.e. in a polyploid series, having the fundamental haploid chromosome number; true haploid.

monosaccharide the generic name of the simplest carbohydrates. Monosaccharides cannot be hydrolysed to give smaller carbohydrates. They are polyhydric alcohols containing either (in aldoses) an aldehyde group or (in ketoses) a keto group and with from three to ten or more carbon atoms. Monosaccharides form the constitutional repeating units of oligo- and polysaccharides. The names and structures of the common aldoses (from triose to hexose) form the basis for of all oligonucleotides, polynucleotides, and nucleic acids. A prefixes used to describe other compounds containing a set of Ban dang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Sur Base

>CHOH groups. For structures, see illustration (note that if X = CHO and $Y = CH_2OH$ these structures also depict the common D aldoses.) An example of prefix use is the ketoheptonic acid phosphate, DAHP, 3-deoxy-D-arabino-(2)-heptulosonate 7-phosphate. By extension the stereochemical relationships are applied to substituents other than OH, e.g. in threonine. See also glycose (def. 1), heptose, hexose, pentose, tetrose, triose.

monose an obsolete term for monosaccharide.

monosodium glutamate abbr.: MSG; the monosodium salt of L-glutamic acid, widely used as a flavouring agent for its meaty taste, and the most active component of soy sauce. Consumption by adults of more than about 3.0 g can cause Chinese restaurant syndrome, characterized by a feeling of tightness, facial pressure, burning sensation, and headache. The D-enantiomer does not have the characteristic taste and up to 7.0 g can be consumed without ill effect.

monosome 1 any chromosome in a functionally diploid chromosome set that lacks a homologue. 2 a structure consisting of a single ribosome bound to a molecule of messenger RNA.

monosomic (of cells, tissues, or individuals) having one or more monosomes (def. 1).

monospecific (of an antibody or an antiserum) only able to react with a single specified antigen or antigenic determinant. monoterpene any terpene containing or derived from two isoprene units and thus containing ten carbon atoms. Monoterpenes may be acyclic or mono- or dicyclic.

monotonic (of a mathematical function) varying in such a manner that it continuously either increases or decreases as the independent variable increases. —monotonically adv.

monotopic describing a protein molecule that does not cross a cellular membrane.

monovalent an alternative term for univalent.

monoxenic see synxenic.

monozygotic 1 (of twins, triplets, etc.) derived from a single fertilized ovum. 2 any one of a set of monozygotic individuals. Compare dizygotic.

montanate 1 the trivial name for octacosanoate, CH₃-[CH₂]₂₆-COO-, the anion derived from montanic acid (i.e. octacosanoic acid), a saturated straight-chain higher fatty acid. 2 any mixture of free montanic acid and its anion. 3 any salt or ester of montanic acid. Montanate esters of long-chain alcohols occur in montan wax, beeswax, and some other natural waxes. montanoyl symbol: Mon; the trivial name for octacosanoyl, CH₃-[CH₂]₂₆-CO⁻, the acyl group derived from montanic acid

(i.e. octacosanoic acid).

Monte Carlo method a way of solving a mathematical problem by sampling methods. The procedure involves the construction of a stochastic model of the mathematical process and the performance of sampling experiments upon it. Such methods have application in molecular graphics aimed at extracting the fundamental principles of macromolecular conformation. [After the resort in Monaco famous for its casino.]

Moore, Stanford (1913-82), US protein chemist; Nobel Laureate in Chemistry (1972) jointly with W. H. Stein 'for their contribution to the understanding of the connection between chemical structure and catalytic activity of the active centre of the ribonuclease molecule' [prize shared with C. B. Anfinsen]; also noted for other work (see Stein).

Mops

Mops or MOPS abbr. for 3-(N-morpholino)propanesulfonic acid; a Good buffer substance, $pK_a(20 \text{ °C}) = 7.2$.

morgan a unit of genetic length along a chromosome, defined as the distance between two loci that show, on average, one crossover per meiotic event; it is equal to 100 map units (or Morgan's units).

Morgan, Thomas Hunt (1866-1945), US geneticist and zoologist noted for developing Drosphilia mutants and for gene mapping; Nobel Laureate in Physiology or Medicine (1933) 'for his discoveries concerning the role played by the chromosome in heredity'.

Morgan's unit an alternative name for map unit. Compare morgan.

Mörner's test a qualitative test for tyrosine in which a green coloration is produced when a tyrosine-containing sample is boiled in a solution of formaldehyde in strong sulfuric acid. [After K.A.H. Mörner (1855–1917), Swedish chemist.]

morph+ a variant form of morpho+ (before a vowel).

+morph comb. form indicating of a specified form, shape, or structure. —+morphic or +morphous adj; +morphy n.

morphiceptin a tetrapeptide amide fragment of the milk protein β-casein, structure Tyr-Pro-Phe-Pro-NH2. It relates to the N-terminal tetrapeptide of casomorphin. It is a potent and specific agonist for μ-opiate receptors, its effects on the receptor being blocked by naloxone.

morphine 7,8-didehydro-4,5-epoxy-17-methylmorphinan-3,6diol; an opiate and the most important opium alkaloid; it is a powerful, habit-forming narcotic analgesic. The diacetate ester, diacetylmorphine, is known as diamorphine or heroin. This is strongly habit forming and its manufacture, importation, and use are controlled in a number of countries.

morpho+ or (before a vowel) morph+ comb. form indicating form or structure.

morphogenesis the ensemble of the processes of development of a part, organ, or organism. —morphogenetic or morphogenic adj.

morpholine tetrahydro-1,4-oxazine; a heterocyclic compound with a six-membered oxygen- and nitrogen-containing ring. A number of N-substituted morpholines are useful as biological buffers, e.g. Mes, Mops.

morphology the branch of biology concerned with the outer form and inner structure of living organisms.

Morquio syndrome another name for mucopolysaccharidosis

nucopolysaccharidosis.
Bạn đáng đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: IV. See mucopolysaccharidosis.

mortalin other name: 75 kDa glucose regulated protein (abbr.: GRP 75); a protein that resembles heat-shock proteins in sequence, and which may be a chaperone. It is a member of the heat-shock protein 70 family, which functions as a mortality marker in fibroblasts. Mortal fibroblasts contain a protein, MOT-1, uniformly distributed in the cytosol, while in immortal fibroblasts another form of the protein, MOT-2, is concentrated in perinuclear or juxtanuclear regions. In MOT-2 there are differences at residues 618 (Val to Met) and 624 (Arg to Gly). The cytosolic form induces cellular senescence, the perinuclear form does not. Example (precursor), MOT-1 from mouse: database code GR75_MOUSE, 679 amino acids (73.45 kDa).

MOS a gene family encoding serine/threonine kinases, e.g. the human and mouse protein pp39mos; v-mos is the oncogene of the acutely transforming murine Moloney sarcoma virus (hence 'mos' from mo + s). MOS mRNA is detectable only in germ cells in testes and ovaries, and MOS expression is implicated in meiosis; directly or indirectly it stabilizes M-phase promoting factor and activates MAP kinase. The protein has homology with Src (see src) but is not a tyrosine kinase. Example from human: database code KMOS_HUMAN, 346 amino acids (37.82 kDa).

mosaic 1 a design or pattern on a surface, made up numerous separate pieces of more or less the same area but differing in some characteristic, e.g. colour, shape, texture. 2 an alternative name for chimera (used especially of animals).

mosaic model see fluid-mosaic model.

MOT-1, MOT-2 see mortalin.

mother liquor the liquid remaining after a substance has been crystallized or precipitated from a solution.

motif (in relation to protein structure) 1 a locally ordered region within the hydrophobic core of a globular protein molecule, formed by three-dimensional interaction between two or three segments of the secondary structure (α helix and/or β strand) that are near one another along the polypeptide chain. The most important types are: $(\alpha\alpha)$, $(\alpha\beta)$, $(\beta\beta\beta)$, and $(\beta\alpha\beta)$. See also domain. 2 or rule any set of amino acids forming part of the primary sequence of a protein, either contiguous or capable of being aligned to certain positions that are invariant or conserved, that is associated with a particular function; e.g.the motif GXGXXG is associated with nucleotide-binding sites. See also Appendix E.

motile (of organisms or cells) capable of independent locomotion; (of cilia, flagella, etc.) capable of spontaneous movement. —motility n.

motilin a 22-residue peptide produced by Mo cells of the mucosa of the upper small intestine and having putative hormonal activity. Its plasma level rises when food or alkali is placed in the duodenum and it stimulates contractions of the stomach and the secretion of pepsin, but its effects show marked species variation. Example from dog: database code MOTI_CANFA, sequence

FVPIFTHSELQKIREKERNKGQ

(2.685 kDa).

motor (in biology) pertaining to movement of an organ or part; pertaining to nerves or neurons involved in muscular activity.

motor protein a protein, e.g. dynein, kinesin, myosin, that propels itself along a filament or polymeric molecule. Nucleoside triphosphate hydrolysis is usually necessarily involved. A similar process is thought to be involved in the action of elongation factor G (see EF-G). These processes are referred to as chemical-mechanical coupling (or mechanochemical coupling)

Motrin a proprietary name for ibuprofen.

mould or (US) mold 1 any microfungus having a distinctive mycelium; the common name for any superficial growth of fungal mycelium. 2 a matrix for shaping a cast.

moult or (US) molt 1 to cast off periodically an outer covering of cuticle, feathers, hair, horns, skin, etc. 2 the act, process, or

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

moulting hormone or (US) molting hormone a common name for ecdysterone.

mouse-convulsion method a sensitive method for the detection and biological assay of insulin, used primarily to control the strength of pharmaceutical preparations of insulin. It is based on the finding that small doses of insulin injected into mice (0.1-1.0 µg per animal) cause convulsions. When the method is used for assay, large equal numbers of animals are injected with either of two dilutions of the test solution or of a standard and the results are analysed statistically.

mouse mammary tumour virus abbr.: MMTV; a DNA virus that causes breast cancer in mice. The virus contains a powerful enhancer DNA sequence in the terminal repeats of the genome. This activates an oncogene called wnt-1 (formerly called int-1) which is closely homologous to the Drosophila gene wingless. MMTV is often used as an expression vector especially in transgenic mice.

moving-boundary electrophoresis an analytical method of electrophoresis carried out using a Tiselius apparatus, formerly used for measuring electrophoretic mobility directly.

MOX abbr. for methanol oxidase (see alcohol oxidase).

m.p. abbr. for melting point.

MP abbr. for mitogenic protein (i.e. interleukin 1).

6-MP abbr. for 6-mercaptopurine.

MPF abbr. for M-phase-promoting factor.

M phase the period of mitosis and cytokinesis in the eukaryotic cell-division cycle. During this phase the nucleus and cytoplasm

M-phase-promoting factor or maturation-promoting factor or p34cdc abbr.: MPF; a protein complex, containing cyclin and a protein kinase, that triggers a cell to enter M phase of the cell-division cycle. Example, protein kinase of meiotic maturation of Xenopus oocytes: database code A44349, 302 amino acids (34.47 kDa).

MPP abbr. for mitochondrial processing peptidase.

M6P receptor abbr. for mannose 6-phosphate receptor.

M protein 1 a structural protein that occurs in the M lines of myofibrils of striated muscle. 2 an alternative name for galactoside permease of Escherichia coli. 3 a cell-surface protein of Gram-positive cocci, associated with virulence; it renders the organism resistant to phagocytosis. It is a cell-wall component, consisting of a coiled coil with membrane anchor. Example from Streptococcus pyogenes serotype 6 (precursor): database code M6_STRPY, 483 amino acids (53.41 kDa)

MPTP abbr. for 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine; a toxic by-product of the synthesis of heroin; it produces severe and permanent parkinsonism in primates, resulting from its oxidation by monoamine oxidase to the quaternary 1methyl-4-phenyl-pyridinium (MPP⁺) ion. The latter is a potent inhibitor of complex I of the mitochondrial electron-transport chain and a selective neurotoxin for dopaminergic neurons, by which it is taken up in the substantia nigra via the normal neuronal dopamine re-uptake system.

MRC abbr. for Medical Research Council (of the UK).

MRE abbr. for metal response element; see also response element. MRF abbr. for melanotropin-releasing factor (see MSHRH).

MRF4 abbr. for muscle specific regulatory factor 4; other name: myogenic factor 6; a DNA-binding, probably helix-turn-helix protein of the MYC family. It induces fibroblasts to differentiate into myoblasts. Example from chicken: database code MYF6_CHICK, 242 amino acids (26.32 kDa).

MRH abbr. for melanotropin-releasing hormone (see MSHRH).

MRI abbr. for magnetic resonance imaging.

MRIF abbr. for melanotropin release-inhibiting factor (i.e. melanostatin)

MRIH abbr. for melanotropin-release inhibiting hormone (i.e. melanostatin).

mRNA abbr. for messenger RNA.

mRNA binding site (ribosome) a ribosomal binding region for mRNA. In bacteria this involves ribosomal proteins S1, S3, S4, S5, S12, S18, S21, and the 3' end of 16S rRNA.

mRNA splicing the process in which excision of introns from the primary transcript of messenger RNA (mRNA) is followed by ligation of the two exon termini exposed by removal of each intron, so that mRNA consisting only of the joined exons is produced. See splicing (def. 2).

mRNP abbr. for messenger ribonucleoprotein

MRSA abbr. for methicillin-resistant Staphylococcus aureus, an organism resistant to antibiotics owing to the inability of penicillins to enter the cell (and not directly to \(\beta\)-lactamase). Compare VRE.

MS abbr. for 1 mass spectrometer or mass spectrometry. 2 magic spot (compound). 3 multiple sclerosis.

MS- abbr. for meso-.

MSA abbr. for multiplication-stimulating activity.

msDNA abbr. for multicopy single-strand DNA.

MSEL-neurophysin see neurophysin II.

MSG abbr. for monosodium glutamate.

MSH abbr. for melanocyte-stimulating hormone.

MSHIF abbr. for melanocyte-stimulating-hormone releaseinhibiting factor (i.e. melanostatin).

MSHIH abbr. for melanocyte-stimulating-hormone releaseinhibiting hormone (i.e. melanostatin).

MSHRF abbr. for melanocyte-stimulating-hormone releasing factor (i.e. MSHRH).

MSHRH abbr. for melanocyte-stimulating-hormone releasing hormone; a pentapeptide, possibly identical to the N-terminal moiety of oxytocin, that is produced in the hypothalamus. In animals that show an unambiguous response of their melanophores to melanotropin this regulating factor is believed to promote melanotropin release. Recommended name: melanoliberin; other names: melanotropin-releasing factor (abbr.: MRF); melanotropin-releasing hormone (abbr.: MRH); melanocytestimulating-hormone releasing factor (abbr.: MSHRF).

MSHRIF abbr. for melanocyte-stimulating-hormone releaseinhibiting factor (i.e. melanostatin).

MSHRIH abbr. for melanocyte-stimulating-hormone releaseinhibiting hormone (i.e. melanostatin).

MSOC abbr. for the N-(2-methanesulfonyl)ethoxycarbonyl group; it is used as an amino-protecting group, its stability to acid, lability to alkali, and resistance to hydrogenation contributing to its usefulness. It is introduced using such reagents as methylsulfonyl nitrophenyl carbonate and methylsulfonyl succinimidyl carbonate.

MSX-1 or Hox-7 a homeobox protein. Example from human: database code HMX1_HUMAN, 297 amino acids (30.96 kDa)

mtDNA abbr. for mitochondrial DNA.

MTOC abbr. for microtubule organizing centre.

mtRNA abbr. for mitochondrial RNA.

mu symbol: μ (lower case) or M (upper case); the twelfth letter of the Greek alphabet. For uses see Appendix A.

MU abbr. for 4-methylumbelliferyl.

mu chain or u chain the heavy chain characterizing immunoglobulins belonging to the class IgM.

mucic acid an old name for galactaric acid, the meso-aldaric acid derived from both D- and L-galactose.

mucilage any of numerous proteoheteroglycans, frequently

containing uronic acids, that occur widely in plants, especially Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

mucin mucopr

in seed coats. Mucilages are hard when dry, and in water they swell, but do not dissolve, to form slimy masses with adhesive properties. Compare gum. —mucilaginous adj.

mucin any of a group of widely distributed glycoproteins of high M_r that are secreted by various animal mucous cells and glands; they occur, e.g., in saliva, gastric juice, and intestinal juice. Mucins form viscous solutions that act as lubricants and protectants of the linings of body cavities and of the skin. Example from human intestine: database code HUMMUC2X, 5179 amino acids (539.70 kDa).

mucinase an alternative name for hyaluronidase.

muco+ comb. form of mucus or mucin; mucoid.

mucoid 1 any mucin-like substance or mucoprotein. 2 of the nature of or resembling mucus. 3 describing a bacterial colony that has a gummy consistency, resulting from the abundant synthesis of capsular material.

mucolipid an alternative name for ganglioside.

mucolipidosis (pl. mucolipidoses) any of a group of inherited autosomal recessive diseases of humans characterized by deficiency of a variety of lysosomal hydrolases in connective tissue cells of patients, and in fibroblasts cultured from them. Mucolipidosis I, commonly known as sialidosis, is due to a deficiency of neuraminidase that leads to accumulation of sialyl oligosaccharides, and excretion of these in the urine. In mucolipidosis II, the cytoplasm of cultured cells from affected patients contains numerous highly refractile inclusions, visible by phase-contrast microscopy. These are very large lysosomes containing heterogeneous material, mucopolysaccharides, glycolipids, and whorls of membranes, giving this the name I-cell (inclusion cell) disease. Mucolipidosis III is due to a deficiency of N-acetylglucosamine 1-phosphotransferase.

mucolytic having the ability to disrupt mucus.

muconate a trivial name for any one of the three stereoisomers (cis, cis, trans, or trans, trans) of 2,4-hexadienedioate; 1,3butadiene-1,4-dicarboxylate; OOC-CH=CH-CH=CH-COO, the dianion derived from muconic acid. The cis, cis isomer is an intermediate in the degradation of catechol by microorganisms.

muconolactone ∆-isomerase EC 5.3.3.4; an enzyme that catalyses the reaction:

2,5-dihydro-5-oxofuran-2-acetate =

3,4-dihydro-5-oxofuran-2-acetate

in the pathway for the degradation of catechol to acetyl-CoA. Example from Pseudomonas putida: database code NRL 1MLI, 96 amino acids (11.15 kDa); 3-D structure known.

mucopeptide (sometimes) an alternative name for peptidogly-

mucopolysaccharide any of a group of acid heteroglycans built up of characteristic repeating disaccharide units each consisting of an N-acylated hexosamine residue and a uronicacid residue; many mucopolysaccharides also contain sulfate. The group includes hyaluronic acid (see hyaluronate), chondroitin sulfate, dermatan sulfate, keratan sulfate, heparin, and some blood-group substances.

mucopolysaccharide storage disease any of a group of clinically progressive, hereditary diseases of humans characterized by the accumulation of mucopolysaccharides in various tissues. They include the mucopolysaccharidoses and the mucolipidoses.

mucopolysaccharidosis (pl. mucopolysaccharidoses) any of a group of clinically progressive, hereditary diseases of humans each of which is characterized by the deficiency of a single lysosomal hydrolase concerned in the degradation of mucopolysaccharides. They have been classified into a number of types. See individual entries below.

mucopolysaccharidosis I H or Hurler syndrome a mucopolysaccharidosis caused by a deficiency in lysosomal Liduronidase (EC 3.2.1.76) that affects the degradation of both dermatan sulfate and heparan sulfate. It is inherited as an autosomal recessive disorder. Subjects excrete excessive amounts

of both dermatan sulfate and heparan sulfate in the urine in the ratio of approximately 7:3. The biochemical lesion is the same as in mucopolysaccharidoses I H/S and I S, from which differentiation can only be made by clinical criteria.

mucopolysaccharidosis I H/S or Hurler-Scheie compound syndrome a mucopolysaccharidosis caused by the same deficiency in lysosomal L-iduronidase (EC 3.2.1.76) as is found in mucopolysaccharidoses I H and I S. It is inherited as an autosomal recessive disorder and it is believed to be a phenotype intermediate between these two syndromes, one mutant allele being inherited from the father and a different mutant allele from the mother. The condition can only be differentiated from mucopolysaccharidoses I H and I S by clinical criteria.

mucopolysaccharidosis IS or Scheie syndrome or (formerly) mucopolysaccharidosis V a mucopolysaccharidosis caused by the same deficiency in lysosomal L-iduronidase (EC 3.2.1.76) as is found in mucopolysaccharidoses I H and I H/S. It is inherited as an autosomal recessive disorder and it has a milder clinical course than mucopolysaccharidoses I H and I H/S, from which it can be differentiated only by clinical cri-

mucopolysaccharidosis II or Hunter syndrome a mucopolysaccharidosis caused by a deficiency in iduronate sulfatase that affects the degradation of both dermatan sulfate and heparan sulfate. It is inherited as an X-linked recessive disorder, and several different mutations of the same X-chromosome locus probably account for the different severities of the disease seen in various families. Subjects excrete excessive and roughly equal amounts of both dermatan sulfate and heparan sulfate in the urine.

mucopolysaccharidosis III A or Sanfilippo syndrome A a mucopolysaccharidosis caused by a deficiency in heparan Nsulfatase that affects the degradation of heparan sulfate. It is inherited as an autosomal recessive disorder and is indistinguishable clinically from mucopolysaccharidosis III B. Subjects excrete excessive amounts of heparan sulfate in the urine.

mucopolysaccharidosis III B or Sanfilippo syndrome B a mucopolysaccharidosis caused by deficiency in α -N-acetyl-D-glucosaminidase (EC 3.2.1.50) that affects the degradation of heparan sulfate. It is inherited as an autosomal recessive disorder and is indistinguishable clinically from mucopolysaccharidosis III A. Subjects excrete excessive amounts of heparan sulfate in the urine.

mucopolysaccharidosis IV A (or IVa) or Morquio A disease a mucopolysaccharidosis caused by a deficiency of lysosomal N-acetylgalactosamine-6-sulfatase, leading to an accumulation of keratan sulfate and chondroitin 6-sulfate. It is inherited as an autosomal recessive disorder.

mucopolysaccharidosis IV B (or IVb) or Morquio B disease a mucopolysaccharidosis caused by a deficiency of β -galactosidase leading to accumulation of keratan sulfate. It is inherited as an autosomal recessive disorder.

mucopolysaccharidosis V a former name for mucopolysaccharidosis I S

mucopolysaccharidosis VI or Maroteaux-Lamy syndrome a mucopolysaccharidosis caused by a deficiency of lysosomal Nacetylgalactosamine 4-sulfatase that affects the degradation of dermatan sulfate. Three clinically distinguishable forms are known: severe, intermediate, and mild; all are inherited as autosomal recessive disorders, with probably two or more mutant alleles at the mucopolysaccharidosis VI locus, one of which produces the severe form when homozygous and the other the mild form. Subjects excrete excessive amounts of dermatan sulfate in the urine.

mucopolysaccharidosis VII a mucopolysaccharidosis caused by a deficiency of lysosomal β -D-glucuronidase (EC 3.2.1.31) that affects the degradation of both dermatan sulfate and heparan sulfate. It is inherited as an autosomal recessive disorder.

mucoprotein any glycoprotein containing relatively large

cessive disorder. Subjects excrete excessive amounts amounts of acidic polysaccharide. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

mucosa

mucosa (pl. mucosae) or mucous membrane any of the moist membranes that line the alimentary canal, the glandular ducts, and the respiratory, urinary, and genital passages; it may be smooth, corrugated, or covered with villi. Mucous membranes consist of a surface layer of epithelium containing mucussecreting glands, and an underlying layer of connective and muscular tissue. Compare serosa. —mucosal adj.

mucotetraose symbol: McOse₄ or Mc₄ (if space is limited); the tetrasaccharide $Gal(\beta 1-3)Gal(\beta 1-4)Gal(\beta 1-4)Glc$.

mucotriaose symbol: McOse₃ or Mc₃ (if space is limited); the trisaccharide $Gal(\beta 1-4)Gal(\beta 1-4)Glc$.

mucous relating to, resembling, or secreting mucus.

mucous cell any cell that secretes mucus.

mucous gland any exocrine gland consisting predominantly of mucus-secreting cells.

mucous membrane an alternative name for mucosa. Compare serous membrane. —mucomembranous adj.

mucus the slimy, sticky, viscous secretion, consisting predominantly of mucins, that is secreted by mucous cells of the mucosae and of the external body surface of some animals.

MUG abbr. for 1 either 4-methylumbelliferyl-glucuronide or 4methylumbelliferyl- β -D-galactopyranoside. Both compounds are fluorogenic enzyme substrates that yield 4-methylumbelliferone. See also 4-methylumbelliferyl. 2 abbr. for murinoglobulin.

MUGal abbr. for 4-methylumbelliferyl-β-D-galactopyranoside (alternative to MUG).

mull a suspension of very finely ground solid in an inert liquid, especially paraffin or **Nujol**, that is used in infrared spectroscopy of the solid.

Muller, Hermann Joseph (1890-1967), US geneticist; Nobel Laureate in Physiology or Medicine (1946) 'for the discovery of the production of mutations by means of X-ray irradiation'.

Mullis, Kary B. (1944-), US biochemist; Nobel Laureate in Chemistry (1993) 'for his invention of the polymerase chain reaction (PCR) method' [prize (awarded 'for contributions to the developments of methods within DNA-based chemistry') shared with M. Smith].

multi+ comb. form denoting more than one, several. See also

multicatalytic endopeptidase complex see proteosome.

multicellular having, or consisting of, several or many cells. multichain (of a protein) consisting of two or more polypeptide chains connected by nonpeptide links.

multichannel analyser any instrument or device for sorting a heterogeneous input into a number of ranges, e.g. of frequency or energy, and determining the relative proportions in each range.

multicopy single-strand DNA abbr.: msDNA; DNA generated by bacterial reverse transcriptase and found in certain Gram-negative bacteria. The molecules are unique in being the only known naturally occurring examples of nucleic acids containing an RNA-DNA covalent link.

multidentate (of a ligand) having two or more groups through which it can be attached to a central atom. Such a ligand is able to form a bridge or a chelate.

multidimensional chromatography a technique in which a single component separated from a mixture by chromatography on one type of column may be automatically transferred, as a sample, for chromatography on another type of column in order to effect further resolution.

multienzyme the recommended class name for any protein that possesses two or more autonomous catalytic functions due to separate catalytic domains (see domain, def. 3), whether contributed by distinct subunits (see multienzyme complex), by distinct parts or an individual polypeptide chain (see multienzyme polypeptide), or by both. Excluded is any enzyme that can catalyse different reactions at the same catalytic centre. Compare enzyme complex, multienzyme system.

multienzyme cluster see enzyme cluster.

multienzyme complex the recommended subclass name for

than one type of polypeptide chain. A multienzyme complex may itself contain a multienzyme polypeptide.

multienzyme polypeptide the recommended subclass name for any multienzyme in which at least two demonstrably distinct catalytic domains of different types occur on a single polypeptide chain and are encoded by a single gene. A multienzyme polypeptide may itself be a component of a multienzyme complex. Compare multifunctional protein.

multienzyme system an operational term for any system of two or more enzymes functioning sequentially to catalyse the reactions of a metabolic pathway, so that the product of the first enzyme becomes the substrate of the second and so on. Three levels of organization of multienzyme systems may be discerned. First, the individual enzymes are independently in solution in the cytoplasm and are not directly associated with each other when acting. Second, the individual enzymes are physically associated and function together as an enzyme complex, or they occur as a multienzyme. Third and most highly organized, the individual enzymes are associated with large, supramolecular structures such as membranes or ribosomes. See also enzyme cluster, metabolon.

multidrug resistance see MDR.

multifactorial 1 involving or dependent on more than one factor or causes. 2 (in genetics) inheritance depending on more than one gene.

multifunctional protein any protein that combines two or more autonomous functions on one polypeptide chain, the functions being both independently measurable and assignable to separate domains of the protein. Such functions may or may not be catalytic (compare multifunctional protein ade2). Excluded are allosteric enzymes, proenzymes, and enzymes that can catalyse different reactions at a single reaction centre.

multifunctional protein ade2 a protein that contains phosphoribosylaminoimidazolesuccinocarboxamide synthase and phosphoribosylaminoimidazole carboxylase and is involved in the sixth and seventh steps in de novo purine biosynthesis. Example from human: database code PUR6_HUMAN, 425 amino acids (47.03 kDa); the synthase domain resides in residues 1-260, the carboxylase domain in residues 261-425.

multigenic describing character differences that are controlled by the alleles of several genes.

multiiodinated describing any compound that has been reacted so as to contain two or more atoms of iodine per molecule.

multilamellar occurring as, or made up of, several discrete layers.

multilayered film analyser a device for the rapid determination of any of a range of components present in small volumes of biological fluids. It depends on a single-use reagent slide on which the various chemicals required are present in dry form as a series of thin films. These consist successively of an indicator layer, a semipermeable layer, a reagent layer, and a spreading layer, all mounted between two transparent supports. Typically, a 10 µL sample is applied to the spreading layer, a chemical or enzymatic reaction occurs in the reagent layer, and the semipermeable layer withholds macromolecular substances from the indicator layer, where usually a dye combines with a product of the reaction to form a coloured compound. The intensity of the colour, which is proportional to the quantity of the analyte in the specimen, is measured by reflectance spectrophotometry. The concept has been extended to the use of potentiometry for the measurement of sodium and notassium.

multilocus enzyme any of a set of enzymes, with similar catalytic properties and existing in the same organism, whose amino-acid sequences are encoded in nonallelic structural genes at two or more separate loci. There may be marked variations in the expression of the individual loci in different tissues. A class of isoenzyme.

multimer any specific aggregate of (identical or nonidentical) any multienzyme in which catalytic domains occur on more molecular entities held together by noncovalent bonds. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

—multimeric adj.; multimerize or multimerise vb.; multimerization or multimerisation n.

multinucleate or multinuclear (of a cell) containing several or many nuclei.

multiphase having several phases; polyphase.

multiple codon recognition the recognition by a single tRNA molecule of more than one type of codon in mRNA.

multiple development technique a chromatographic technique in which the chromatogram is developed more than once with either the same solvent system or a different one with the aim of improving the separation.

multiple drug resistance see MDR.

multiple forms (of an enzyme) the recommended collective term to describe all proteins that possess the same (specified) enzymic activity and occur naturally in a single species. It includes, but is not limited to, isoenzymes; the term isoenzyme should be applied only to multiple forms that arise from genetically determined differences in primary structure, and some limit this to those arising from a single gene locus.

multiple myeloma or multiple myelomatosis see myeloma.

multiple sclerosis abbr.: MS; a chronic and usually progressive disease of the nervous system, also known as disseminated sclerosis, in which the myelin sheaths surrounding the axons are lost; the lesions are confined to the central nervous system. The cause is unknown, but plaques are found in which activated lymphocytes and monocytes are present; these plaques have a discrete edge and range in size from microscopic to macroscopic. The disease is characterized by a course of relapses and remissions over a number of years.

multiplet any group of two or more associated spectral lines. In electronic spectra the lines of a multiplet are very closely spaced and appear at low resolution as a single line, whereas in nuclear magnetic resonance spectra the separation may be considerable.

multiplicand (in mathematics) a number to be multiplied by another number - the multiplier - in an arithmetic multiplica-

multiplication-stimulating activity abbr.: MSA; an activity found in mammalian serum and produced by some animal cells that is required for the multiplication of animal cells in

multiplicity (in physics) the number of components in a multiplet.

multiplicity of infection the ratio of the number of virus particles to the number of susceptible cells in a given system.

multiplicity reactivation the reconstruction of viable genomes in a cell that is multiply infected with otherwise nonviable viruses.

multiplier 1 (in mathematics) any number by which another number - the multiplicand - is multiplied. 2 any instrument or device for multiplying an effect, e.g. photomultiplier.

multiply labelled describing an isotopically substituted compound that has more than one modified atom of the same element at the same position or at different positions.

multipotent (of a cell or tissue) capable of giving rise to several kinds of cells, tissues, or structures. Compare pluripotent (def. 2).

multisubstrate enzyme any enzyme that requires two or more substrates in order to catalyse a particular reaction.

multivalent an alternative term for polyvalent.

multivalent phosphorylation the phosphorylation of any hormonally regulated enzyme at a plurality of sites by two or more distinct kinase enzymes, with a resultant increase in the regulatory potential of the enzyme.

multivesicular body an intracellular structure that is lined by a single membrane and contains a number of inner vesicles that are approximately 50 nm in diameter. It is a form of secondary lysosome.

Mur symbol for a residue (or sometimes a molecule) of muramic acid

samine; the 3-Q-D-lactyl ether derivative of D-glucosamine. It occurs naturally in peptidoglycan of bacterial cell walls.

muramidase an alternative name for lysozyme. muramyl the acyl group derived from muramic acid.

muramyl-dipeptide abbr.: MDP; N-acetyl-muramyl-D-alanyl-D-isoglutamine; a synthetic, water-soluble, peptidoglycan derivative that is capable of replacing whole mycobacteria in complete Freund's adjuvant. It is highly active in stimulating antibody production against an antigen injected simultaneously. murein an alternative name for peptidoglycan.

murexide ammonium purpurate; 5,5'-nitrilodibarbituric acid monoammonium salt; a compound that forms a purple-red solution in water. It is useful as an indicator in complexometric titration of calcium, nickel, cobalt, copper, etc. with EDTA.

murexide test a colour test for uric acid and some other purines. The (solid) sample is first treated with conc. nitric acid, which is slowly evaporated away; subsequent addition of ammonia solution gives a purple colour if uric acid was present, due to formation of murexide, or a yellow colour that turns to red on heating if xanthine was present.

murine of, belonging to, characteristic of, affecting, transmitted by, or being a member of the Muridae, a family of small rodents that includes mice and rats; of or relating to the mouse genus, Mus.

murinoglobulin abbr.: MUG; a monomeric proteinase inhibitor found in blood plasma of vertebrates and invertebrates and in egg white of birds and reptiles. It has a characteristic bait region. Example, murinoglobulin 2 (MUG2) precursor from mouse: database code A2MH_MOUSE, 1451 amino acids (162.18 kDa). Compare α2 macroglobulin.

muropeptide an alternative name for peptidoglycan.

muscarine a toxic alkaloid (quaternary ammonium base) found in the red variety of Amanita muscaria (fly agaric) and some other gill fungi. It is an agonist for one type of cholinocentor

(+)-enantiomer

muramic acid symbol: Mur; 3-O-α-carboxyethyl-D-gluco- muscarinic receptor see cholinoceptor.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

muscimol

muscimol 5-aminomethyl-3-hydroxyisoxazole; an isoxazole isolated from the fungus Amanita muscaria. A hallucinogen and potent CNS depressant, it is a selective agonist of GABAA receptors.

muscle 1 a tissue made up of various elongated cells that are specialized to contract and thus to produce movement and mechanical work. 2 an organ consisting principally of muscle tissue. See cardiac muscle, smooth muscle, striated muscle. -muscular adi.

muscle contraction see sliding filament model.

muscle hemoglobin a former name for myoglobin.

muscle sugar a former name for inositol (def. 1).

muscular dystrophy any of a number of genetically determined diseases of humans in which there is progressive muscular weakness and evidence of muscle degeneration. All are characterized by creatinuria, and serum creatine phosphokinase activity is elevated in several of them. See also dystrophin.

mushroom sugar a former name for trehalose.

mustard gas sulfur mustard; bis(2-chloroethyl)sulfide; a colourless oily liquid with a very low vapour pressure. It is a powerful vesicant and also a mutagen and carcinogen. See also nitrogen mustard.

mustard oil any alkyl isothiocyanate, of general formula R-N=C=S. Such compounds have a pungent mustard-like smell and are present in the tissues of a number of plants, either free or as thioglycosides.

mut any of a family of genes whose products are involved in mismatch repair. All the following examples are from Escherichia coli. The product of mutH is a repair endonuclease that is specific for unmethylated GATC sequences: database code MUTH_ECOLI, 228 amino acids (25.36 kDa). The protein encoded by mutL is also involved in repair of mismatches in DNA and is required for activity of the dam product; database code MUTL_ECOLI, 615 amino acids (67.85 kDa). The protein encoded by mutS, again involved in mismatch repair (possibly the recognition step), has weak ATPase activity; database code MUTS_ECOLI, 853 amino acids (95.14 kDa).

mutable able or tending to undergo change or mutation. –mutability *n*.

mutable gene any gene that spontaneously mutates at a high

mutable site any site on a chromosome at which mutations

mutagen any physical or chemical agent that is capable of increasing the frequency of mutation above the spontaneous, background level. —mutagenic adj.; mutagenicity n.

mutagenesis the production of mutations.

mutagenize or mutagenise to treat (cells or organisms) with a mutagen. - mutagenized or mutagenised adj.

mutant 1 a any organism that has arisen by or has undergone mutation, or one that carries a mutant gene that is expressed in the phenotype of that organism. b a mutant gene. 2 produced by or following a mutation; having the attributes of a mutant (def. 1).

mutarotation the spontaneous change in the optical rotation of a freshly prepared solution of a pure stereoisomer, especially a carbohydrate, that is caused by epimerization, or some other structural change.

mutase any enzyme that catalyses (or apparently catalyses) an intramolecular transfer of a chemical group. Such enzymes belong to one of the following EC sub-subclasses: EC 5.4.1, transferring acyl groups; EC 5.4.2, transferring phosphoryl groups; EC 5.4.3, transferring amino groups; EC 5.4.99, transmutate to undergo or cause to undergo mutation.

mutation 1 the process by which genetic material undergoes a detectable and heritable structural change, or the result of such a change. Three categories are recognized: genome mutations, in which addition or subtraction of one or more whole chromosomes occurs; chromosome mutations, in which the structure of one or more chromosomes is affected; and gene mutations, in which the structure of a gene is altered at the molecular level. 2 any modified gene arising from a mutation (def. 1). 3 a mutant (def. 1). See also deletion, inversion (def. 4), point mutation, translocation (def. 2).

mutational heteroduplex see heteroduplex.

mutation frequency the frequency at which a mutation occurs in a population. It may or may not reflect the mutation rate, with which it is sometimes used interchangeably.

mutation frequency decline the significant and irreversible reduction in the frequency of some UV-induced mutations in bacteria during the temporary post-irradiation inhibition of protein synthesis.

mutation pressure the continued production of an allele by mutation that tends to increase the allele's frequency in the gene pool.

mutation rate 1 the probability that a particular mutation will occur per virus, cell, or organism during a reproductive cycle. 2 the frequency at which any mutation or mutational class occurs in a given population; mutation frequency.

mutator gene any gene that produces an increase in spontaneous mutation rates. Their action may be limited to certain alleles or to certain mutational pathways.

mutein a mutant protein produced by site-specific mutagenesis or other recombinant DNA technique.

muton the smallest unit of genetic material whose alteration may give rise to a mutation; commonly supposed to be a single nucleotide (pair).

MVA abbr. for mevalonic acid (use discouraged).

MVG abbr. for methoxyvinylglycine.

M.W. abbr. for molecular weight (alternative to mol. wt.).

MWC model abbr. for Monod-Wyman-Changeux model.

my+ a variant form of myo+ (before a vowel).

MYB a gene family that encodes DNA-binding proteins; v-myb is the oncogene of the acutely transforming avian myeloblastosis virus. It is highly conserved between mammalian species. The product, Myb, contains DNA-binding, transcriptional activation, and negative regulatory domains; it recognizes YAAC(G/T)G. It is notably associated with cells of the hemapoietic lineage and is essential for normal hemopoiesis. Example from human: database code MYB_HUMAN, 640 amino acids (72.38 kDa). [From 'myeloblastosis'.]

MYC a family of genes encoding short-lived nuclear regulatory proteins that act as transcription factors, e.g. pp64/pp67 (based on expressed mass). The oncogene, v-myc, was originally identified in avian myelocytomatosis virus, MC29, but is also carried by the avian retroviruses CM11 and OK-10. The protooncogene, c-myc, is a member of a family of at least seven related genes: myc, B-myc, N-myc, L-myc, P-myc, Rmyc, S-myc; B-Myc lacks the basic helix-loop-helix leucine zipper (bHLHLZ) domains of other Myc proteins. The product of c-myc binds nonselectively to DNA and (with higher affinity) to CAC[GA]TG. In normal cells myc expression is strictly dependent on mitogenic stimuli and is required for cell proliferation as well as to prevent cell differentiation. Induction of c-myc in the absence of growth factors is sufficient to drive rodent fibroblasts into the cell cycle but concomitantly induces apoptosis unless specific survival cytokines are present. Structurally, the product Myc contains an N-terminal transactivation domain that activates transcription of the gene with which it interacts, and a C-terminal bHLHLZ motif, which is known to mediate Myc dimerization and sequencespecific DNA binding. Although Myc-Myc dimers can form in solution, Myc homodimers are not detected in vivo, dimers ferring other groups.

forming with other partners, e.g. Max, which has a bHLHLZ
Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

myelin-proteolipid O-palmitoyltransfo

motif but no transactivation domain (see MAX). In vitro, Myc-Max (and Myc-Myc) dimers have been found to bind DNA with a core sequence of CACGTG. Unlike Myc, Max is a stable protein expressed constitutively in growing, resting, and differentiating cells, and is capable of binding further proteins, e.g. Mad and Mxii, which compete with Myc for binding. The myc gene may be activated to become a transforming gene by proviral insertion, chromosomal translocation, or gene amplification, but generally protein structure is not affected; Philadelphia chromosome is one example. The myc gene has been implicated in various neoplasms in birds, mice, and humans, oncogenic activation occurring mainly through constitutive and elevated expression of the Myc protein. Example from human (six motifs): database code MYC_HUMAN, 439 amino acids (48.75 kDa). [From 'myelocytomatosis'.]

myc+ a variant form of myco+ (before a vowel).

rnycarose 2,6-dideoxy-3-C-methyl-L-ribo-hexose; a component of several **macrolide** antibiotics.

mycelia the plural of mycelium.

mycelium (pl. mycelia) the network or mass of discrete hyphae that forms the body (thallus) of a fungus. —mycelial adj.

myceto+ or (before a vowel) mycet+ comb. form denoting fun-

myco+ or (before a vowel) myc+ comb. form denoting fungus. mycobacterium (pl. mycobacteria) any bacterium belonging to the genus Mycobacterium.

Mycobacterium a genus of Gram-positive, aerobic, non-motile, non-spore-forming, acid-fast bacteria of the family Mycobacteriaceae. The cells are rodlike and can form filaments or branched structures; their cell walls characteristically contain **mycolic acid**. Some species are pathogenic to humans and/or other animals, e.g. *M. tuberculosis* (the tubercle bacillus) and *M. leprae* (the leprosy bacillus).

mycobactin any of a family of siderochromes of the hydroxamic acid-derivative category, produced by various species of *Mycobacterium*. At least nine have been characterized.

mycolic acid any of a family of α -substituted β -hydroxylated very-long-chain fatty acids of general formula R_2 -CH(OH)-CH R_1 -COOH, where R_1 is a C_{20} - C_{24} linear alkyl group and R_2 is a complex C_{30} - C_{60} group of very variable structure. They occur naturally as esters of arabinose in the cell walls of *Mycobacterium* spp., *Nocardia* spp., and *Corynebacterium* spp. and as esters of trehalose in **cord factor**. See also **cyclic fatty acids**.

mycology the scientific study of fungi. —mycological or mycologic adj.; mycologist n.

mycolyl the generic name for acyl groups derived from mycolic acids.

mycophenolic acid 6-(1,3-dihydro-4-hydroxy-6-methoxy-7-methyl-3-oxo-5-isobenzofuranyl)-4-methyl-4-hexenoic acid; an antibiotic and antitumour material from *Penicillium brevicompactum*. It was first isolated in 1896, and said by **Florey** to be 'the first antibiotic produced by a mould to be crystallized'. As the morpholinoethyl ester (mycophenolate mofetil) it is an approved immunosuppressant in renal transplantation.

mycoplasma or (formerly) pleuropneumonia-like organism (abbr.: PPLO) any member of the Mycoplasmatales, an order of minute, Gram-negative, prokaryotic microorganisms that are the smallest known free-living organisms. They have no cell walls (except for some saprophytic species), are variable in form, and can pass through bacteria-retaining filters. Some are saprophytic while others are pathogenic to humans, other

animals, and plants. Mycoplasmas frequently infect tissue cultures. They were once thought to be the same as **L forms**. A newer classification replaces mycoplasma as a trivial name for members of the entire class by the term **mollicute**, and the class is called Mollicutes. The trivial name 'mycoplasma' is then restricted to members of the genus *Mycoplasma*.

Mycoplasma the main genus of mycoplasmas.

mycoprotein a commercially produced protein-containing foodstuff derived from moulds grown on carbohydrate substrates.

mycosamine 3-amino-3-deoxy-D-rhamnose; 3,6-dideoxy-3-amino-D-mannose; an amino sugar that contributes the nitrogen-containing moiety of the polyene antibiotics amphotericin B and nystatin.

mycose a common name for trehalose.

mycostatic describing any agent that inhibits the growth of fungi; fungistatic.

mycotoxin any poisonous substance produced by a fungus.

myel+ a variant form of myelo+ (before a vowel).

myelin the material that constitutes the myelin sheaths surrounding vertebrate nerve axons. It is rich in lipid, particularly in glycolipid. See also myelin protein.

myelination the process by which a nerve axon acquires a myelin sheath.

myelin protein any of the proteins that form part of the myelin **sheath**. In the following descriptions, all examples are of human precursor sequences. Myelin-associated glycoprotein, a cell adhesion molecule for postnatal neural development, is a member of the immunoglobulin superfamily. It is an integral membrane protein. Database code MAG_HUMAN, 626 amino acids (68.99 kDa). Myelin basic protein, a protein of the cytoplasmic face of the myelin membrane, is a major protein component of normal myelin of the central nervous system. Very basic in nature (pI > 10.5), it is a single-chain protein of known sequence (human and bovine) and having little tertiary structure. Administration of myelin basic protein in complete Freund's adjuvant in various experimental animals elicits experimental allergic encephalitis due to induction of delayed hypersensitivity to the protein, which is suspected of having an important role in the causation of demyelinating diseases in humans. Three forms are produced by alternative splicing. Database code MBP_HUMAN, 196 amino acids (21 arginines, 14 lysines) (21.34 kDa). P2 is probably a lipid transport protein; it is found in Schwann cells, associated with myelin basic protein. Database code MYP2_HUMAN, 131 amino acids (14.76 kDa). Po is an immunoglobulin-like membrane protein of Schwann cells of the peripheral nervous system. It is associated with a hereditary polyneuropathy (Charcot-Marie-Tooth disease type 1b). Database code MYP2_HUMAN, 131 amino acids (14.76 kDa). Myelin proteolipid protein (PLP or lipophilin) is the major myelin protein from the central nervous system, playing an important role in the formation or maintenance of the multilamellar structure of myelin. It is an integral membrane protein. Alternative splicing leads to a shorter variant. Database code MYPR_HUMAN, 276 amino acids (29.91 kDa); identical in mouse, rat, and human. Mutations are associated with Pelizaeus-Merzbacher disease, and other mutations result in dysmyelination, e.g. jimpy and rumpshaker (mouse) and MD (rat). See also Folch-Lees protein, Wolfgram proteolipid protein.

cell walls (except for some saprophytic species), are variable in form, and can pass through bacteria-retaining filters. Some are saprophytic while others are pathogenic to humans, other Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

HU.I BOJE

CoA and [myelin proteolipid] to form [myelin proteolipid] O-palmitoylprotein and CoA.

myelin sheath the sheath that surrounds the axons of vertebrate nerves. It is formed by Schwann cells in peripheral nerves and by oligodendrocytes in the central nervous system; these cells wrap up to 100 concentric layers of their plasma membrane in a tight spiral around the axons. Myelin sheaths prevent almost all electric current leakage across the covered portion of the axon membrane, thereby contributing to the rapid transmission of nerve impulses along the axons. See also myelin, myelin protein.

myelo+ or (before a vowel) myel+ comb. form 1 denoting bone marrow. 2 denoting the spinal cord. 3 denoting myelin.

myeloblast a cell of the bone marrow that is the precursor of the myelocyte.

myelocyte a nucleated cell of the bone marrow that is a precursor of the **granulocytes** of the blood.

myeloid 1 of or pertaining to bone marrow. 2 of or pertaining to the spinal cord. 3 of or resembling myelocytes.

myeloma or myelomatosis a tumour caused by the uncontrolled proliferation of a clone of immunoglobulin-producing plasma cells. It leads to multiple deposits of tumour cells in the bone marrow and an excessive production of a single type of (i.e. monoclonal) immunoglobulin molecule, which may belong to any of the major classes of immunoglobulins. In some cases either the light or the heavy chains may be produced in excess or exclusively. See also Bence-Jones protein, Waldenström's macroglobulinemia.

myeloma protein an immunoglobulin that is overproduced by a myeloma. They are single immunoglobulin types and form the basis of monoclonal antibody technology. Human examples include Bence-Jones protein. See also hybridoma.

myeloperoxidase a special name for peroxidase (def. 2) from polymorphonuclear leukocytes, so named following its isolation from the blood of patients with myeloid leukemia. It is concerned in the bactericidal action of these cells. It was originally named verdoperoxidase on account of its green colour.

Mylar the proprietary name for a type of polyethylene terephthalate polyester that forms very strong films of good transparency and high electrical resistance.

myo+ or (before a vowel) my+ comb. form denoting muscle.

myo- prefix used to distinguish common **inositol**, 1,2,3,5/4,6-cyclohexanehexol (formerly meso-inositol) from the other eight possible inositol stereoisomers.

myoblast any of the mononucleate precursor cells that fuse to form a multinucleate skeletal muscle cell.

myocardium the middle, muscular, layer of the heart wall.

—myocardial adj.

myocyte 1 a muscle cell of any type. 2 any contractile cell. myoD the gene for myoblast determination protein, it is related to MYC; the human equivalent is MYF3. Its product has simi-

lar activity to MRF4. Example from mouse: database code MYOD_MOUSE, 318 amino acids (34.18 kDa).

myofibre or (esp. US) **myofiber** a skeletal muscle fibre; it consists of a single, long, multinucleate cell, composed predominantly of a large number of myofibrils (typically 1000 or more).

myofibril any of the long, cylindrical, contractile elements, 1-2 µm in diameter, that comprise the major component of the cytoplasm of the myofibre and extend for its entire length. Each myofibril is composed in turn of numerous myofilaments. —microfibrillar adj.

myofilament either of two kinds of thin, contractile, threadlike, interdigitating structures within the myofibrils of **striated** muscle. The so-called thick filaments are about 15 nm in diameter and 1.6 µm in length, and the so-called thin filaments are about 8 nm in diameter and 1.0 µm in length.

rnyogen a name sometimes used for a number of different protein mixtures extractable with water from skeletal muscle of various species of animal. Myogen A is a crystallizable complex of aldolase and glycerol-3-phosphate dehydrogenase that can be prepared from rabbit muscle.

nred from rabbit muscle. **myosin-heavy-chain kinase** EC 2.7.1.129; an enzyme that Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

myogenic factor any of various proteins involved in muscle differentiation. They are normally produced only in muscle cells, but have been shown to activate muscle differentiation mechanisms when introduced into other cells. They include MyoD (see myoD), Myf5, and myogenin. Example from human: database code MYF4_HUMAN, 224 amino acids (25.01 kDa)

myogenin a protein involved in muscle differentiation (i.e. a myogenic factor) that induces fibroblasts to differentiate into myoblasts. It is probably a sequence-specific DNA-binding protein, similar to other members of the Myc family of helixturn-helix transcription factors (see MYC). Example from rat: database code MYOG_RAT, 287 amino acids (32.47 kDa).

myoglobin or (formerly) muscle hemoglobin or myohemoglobin abbr.: Mb; a 17.5 kDa oxygen-carrying hemoprotein that occurs in muscle, particularly in red fibres, and consists of a single polypeptide chain of 153 amino-acid residues to which a single ferroheme prosthetic group is noncovalently bound. Myoglobin binds dioxygen noncooperatively with an affinity between that of hemoglobin and that of cytochrome oxidase. It thus can accept dioxygen from hemoglobin and store it in the muscle cell for release to cytochrome oxidase when the supply becomes limiting. It also assists the direct transfer of dioxygen from the surface of the myocyte to the mitochondria. Sperm-whale myoglobin was the first protein whose three-dimensional stucture was determined by X-ray crystallography. Example from Sus scrofa domestica (domestic pig): database code NRL_1PMBA, 153 amino acids (16.93 kDa); 3-D structure known.

myoglobinuria the excretion of myoglobin in the urine.

myohaematin a historical term, used by MacMunn for the 'histohaematin' (i.e. the cytochromes) of striated muscle.

myo-inositol an alternative name for inositol (def. 1) (formerly known as muscle sugar). See also myo-.

1D-myo-inositol-trisphosphate 3-kinase EC 2.7.1.127; an enzyme that catalyses a reaction between ATP and 1D-myo-inositol 1,4,5-trisphosphate to form 1D-myo-inositol 1,3,4,5-tetrakisphosphate with release of ADP. The enzyme requires calcium. Examples of two human isoforms: database code IP3K_HUMAN, 461 amino acids (50.95 kDa); database code IP3L_HUMAN, 472 amino acids (53.41 kDa). See also inositol phosphates.

myokinase an alternative name for adenylate kinase.

myosin any of a group of related proteins with ATPase activity that occur in the contractile apparatus of both muscle and nonmuscle cells; the myosin of striated muscle is the major component of the thick filaments. Individual myosin molecules consist of two identical heavy chains of ≈200 kDa and two pairs of light chains (see light chain (def. 2)) with distinct masses that vary within the range 15-27 kDa according to the source. The N-terminal region of each heavy chain consists of a globular head with which the light chains are associated, and the remaining three-quarters of each heavy chain consists predominantly of an alpha helix, which is intertwined with its partner to form a long tail to the molecule. The head region contains binding sites for actin and for ATP, whereas aggregation with other myosin molecules to form filaments occurs at the tail region. Example from human muscle protein is a hexamer of two heavy chains and four light chains. Different isoforms exist for different muscle types. Light chain 1, skeletal muscle isoform: database code MLE1_HUMAN, 193 amino acids (20.99 kDa); light chain has an **EF hand** motif. Heavy chain, cardiac muscle \(\beta \) isoform: database code MYSB HUMAN, 1934 amino acids (222.73 kDa); five motifs. Some early preparations of myosin were denoted by letters. Thus myosin A and myosin B were actin-poor and actin-rich preparations respectively, while myosin T and L-myosin wre among the first actin-free preparations. The name myosin was originally given by F. W. Kühne in 1859 to the substance in muscle press juice which on standing at room temperature set to a gel.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

myosin-light-chain kinase

nyxo Jugger

catalyses the phosphorylation by ATP of specific threonines of myosin heavy chain with release of ADP, during chemotaxis of *Dictyostelium discoideum* (slime mould). It inhibits myosin thick filament formation. Example from *D. discoideum*: database code KMHC_DICDI, 783 amino acids (89.05 kDa).

myosin-light-chain kinase EC 2.7.1.117; other names: myosin kinase; smooth-muscle-myosin-light-chain kinase; an enzyme that catalyses the phosphorylation by ATP of myosin light chain with release of ADP. It was one of the first Ca²⁺/calmodulin-dependent protein kinases to be discovered. Its specificity is restricted to myosin light chain. In skeletal muscle, light-chain phosphorylation modulates tension during contraction. In smooth muscle, it initiates contraction. Examples from chicken: nonmuscle, database code KML2_CHICK, 1258 amino acids (139.56 kDa); muscle, database code KMLC_CHICK, 648 amino acids (73.09 kDa).

myosin-light-chain-phosphatase EC 3.1.3.53; other names: myosin light chain kinase phosphatase; myosin phosphatase; an enzyme that catalyses the hydrolysis of phosphate from myosin light-chain phosphate. Example from chicken (large chain, long form): database code A55142, 1004, amino acids (111.48 kDa).

myotonia any genetically distinct hereditary disease characterized by specific muscle malformations.

myotrophin a 12 kDa protein of hypertrophied myocardium of spontaneously hypertensive rats that stimulates protein synthesis in cultured adult rat myocytes in vitro. It contains putative consensus phosphorylation sites for protein kinase C and casein kinase II, and binds to NF-кВ. Example (fragments): database code A37902, 38 amino acids (3.96 kDa).

myotube the multinucleate structure formed by the fusion of proliferating myoblasts in culture under certain conditions. It is characterized by the presence of certain muscle-specific proteins that are not found in the myoblast and may represent a stage in the development of skeletal muscle cells.

Myr symbol for the myristoyl group.

myricetin 3,3',4',5,5',7-hexahydroxyflavone; a **flavone** that is widely distributed in plants. The name originates from *Myrica*, a genus of shrubs. Myricetin inhibits a number of enzymes, including α -glucosidase, xanthine oxidase, and glyoxalase.

myricyl or melissyl the common name for triacontyl, CH₃-[CH₂]₂₈-CH₂-, the alkyl group derived from the C₃₀ straight-chain alkane, triacontane. Myricyl palmitate is the major component of beeswax.

myristate 1 the trivial name for tetradecanoate, CH₃-[CH₂]₁₂-COO⁻, the anion derived from myristic acid (i.e. tetradecanoic acid), a saturated straight-chain higher fatty

acid and a major component of many plant and animal fats. 2 any mixture of free myristic acid and its anion. 3 any salt or ester of myristic acid.

myristin an old name for any of the glyceryl esters of myristic acid, especially the triester, trimyristin, or trimyristoylglycerol. myristoleic acid see tetradecenoic acid.

myristoyl or (formerly) myristyl symbol: Myr; the trivial name for tetradecanoyl, CH₃-[CH₂]₁₂-CO-, the acyl group derived from myristic acid (i.e. tetradecanoic acid). It occurs in most animal and plant fats and oils as acylglycerols and in phospholipids. The oils of the seeds of nutmeg (Myristica fragrans) and other members of the Myristicaceae are particularly rich sources. Compare myristyl.

myristoylation the introduction of one or more myristoyl groups into an organic compound. Protein N-myristoylation refers to the covalent attachment of a myristoyl group via an amide bond to the N-terminal Gly residue of a nascent polypeptide. This post-translational modification has only been observed in eukaryotes and is irreversible. The N-myristoyl proteins are numerous with diverse functions. In some cases the modification is essential for the biological role of the protein, while in other cases it is not essential. The process is catalysed by glycylpeptide N-tetradecanoyltransferase (EC 2.3.1.97).

myristyl 1 the common name for tetradecyl, CH₃-[CH₂]₁₂-CH₂-, the alkyl group derived from tetradecane; use deprecated. 2 a former trivial name for tetradecanoyl (myristoyl now used).

myrosinase an alternative name for thioglucosidase.

myt5 the gene for bacteriophage T5 5'-exodeoxynuclease (EC 3.1.11.3). It performs exonucleolytic cleavage in the 5' to 3' direction to yield 5'-phosphomononucleotides. Database code EXO5_BPT5, 291 amino acids (33.41 kDa). See also deoxyribonuclease.

myxamoeba or (esp. US) myxameba a nonflagellated, naked, ameboid cell that occurs in the life cycle of some slime moulds.

myxedema or (esp. Brit.) myxoedema the syndrome caused by hypothyroidism in adults. It is characterized by mucoid infiltration and coarsening of the skin, weight gain, intolerance to cold, and mental sluggishness.

myxo+ or (usually before a vowel) **myx+** comb. form indicating mucoid, mucus, or slime.

Myxobacterales the myxobacteria; an order of Gram-negative bacteria that bear extracellular slime and have a characteristic swarming habit that leads to the formation of stalked fruiting bodies. A more recent classification has suggested replacement of Myxobacterales by Myxococcales.

myxobacteria bacteria belonging to the order Myxobacterales. myxoedema a variant spelling (esp. Brit.) of myxedema.

myxomatosis a highly contagious disease of rabbits, caused by a myxoma virus, part of a subgenus of poxvirus. It is characterized by proliferative changes in the connective tissues.

Myxomycetes a large class of very primitive organisms, also known as the true or acellular slime moulds, found living saprophytically in damp conditions. Their major vegetative stage is a multinucleate migratory mass of protoplasm, from which (usually macroscopic) fruiting bodies arise.

myxovirus any of a group of negative-strand RNA animal viruses, now divided into orthomyxoviruses and paramyxoviruses.

Nn

n symbol for 1 nano+ (SI prefix denoting 10⁻⁹ times). 2 neutron; may be written as n⁰ to indicate its charge.

n symbol for 1 any (unknown or unspecified) number, especially an integer. 2 amount of substance; the substance in question may be indicated as a suffix in parentheses or by a subscript. 3 refractive index (of a nonabsorbing material); n_D symbol for refractive index measured with light of the sodium D-lines (589.0 and 589.5 nm). 4 order of reaction. 5 order of reflection. 6 haploid number of chromosomes. 7 number density.

n- prefix indicating normal (isomer); no longer used.

 $n_{\rm H}$ symbol for Hill coefficient (alternative to h).

N symbol for 1 nitrogen. 2 newton. 3 a residue of the α-amino acid L-asparagine (alternative to Asn). 4 a residue of an incompletely specified base in a nucleic-acid sequence that may be adenine, cytosine, guanine, or either thymine (in DNA) or uracil (in RNA). 5 an undetermined, unidentified, or unspecified nucleoside residue (alternative to Nuc). 6 (when suffixed to the symbol for a sugar molecule or residue) aminodeoxy+; e.g. GlcN is the symbol for 2-amino-2-deoxy-D-glucose (i.e. D-glucosamine). 7 normal (def. 1).

N symbol for 1 the SI derived physical quantity named number of entities (e.g. molecules, atoms, ions, formula units). 2 neutron number. 3 Avogadro constant $(N_A \text{ or } L \text{ now recommended})$. 4 the total number of receptors per unit area of membrane, per cell, or per unit mass of protein.

N- prefix (in chemical nomenclature) indicating substitution on nitrogen; a particular nitrogen atom may be specified by a right superscript.

 N_A symbol for Avogadro constant (alternative to L).

N_L symbol for Loschmidt constant.

Na symbol for sodium.

NA abbr. for 1 nicotinic acid. 2 noradrenaline (i.e. norepinephrine). 3 nucleic acid. 4 numerical aperture.

NAc symbol for (when suffixed to the symbol for a sugar molecule or residue) an acetylated **aminodeoxy sugar**; e.g. GlcNAc is the symbol for *N*-acetylglucosamine or 2-acetamido-2-deoxy-D-glucose.

nactin any of a group of **macrotetrolide** antibiotics produced by various strains of *Actinomyces*. The group includes **nonactin**, monactin, dinactin, and trinactin.

NAD abbr. for nicotinamide-adenine dinucleotide (when its oxidation state is unknown or unspecified). See also NAD+, NADH, NADP, NAD(P).

NAD⁺ abbr. for oxidized nicotinamide-adenine dinucleotide.

NAD+ ADP-ribosyltransferase see poly(ADP)-ribosyl transferase

NADH abbr. for nicotinamide-adenine dinucleotide (reduced). Use of NADH₂ to represent NADH is not recommended.

NADH dehydrogenase EC 1.6.99.3; systematic name: NADH:(acceptor) oxidoreductase; other names: cytochrome c reductase; type I dehydrogenase. An enzyme that catalyses a reaction between NADH and an acceptor to form NAD+ and a reduced acceptor; FAD is a coenzyme. The protein contains iron-sulfur complexes. This is a form of NADH dehydrogenase (ubiquinone), the catalytic activity of complex I of the mitochondrial respiratory chain that results from isolation procedures. The activity is modified in a way that causes the enzyme to react directly with cytochrome c as the acceptor. Example from Escherichia coli, membrane protein: database code DHNA ECOLI, 433 amino acids (47.17 kDa). The enzyme in which the acceptor is a quinone is EC 1.6.99.5; recommended name: NADH dehydrogenase (quinone); systematic name: NADH:(quinone-acceptor) oxidoreductase; it has no cofactors. In mitochondria, the enzyme is one activity of NADH-ubiquinone oxidoreductase, EC 1.6.5.3; recommended NADH:ubiquinone oxidoreductase; other names: ubiquinone reductase, type I dehydrogenase, complex I dehydrogenase. This FAD-containing enzyme catalyses the oxidation of NADH by ubiquinone to form NAD+ and ubiquinol. The protein also contains iron-sulfur complexes. This is the catalytic activity of mitochondrial complex I. Example from Neurospora crassa, NADH-ubiquinone oxidoreductase 9.6 kDa subunit and NADH dehydrogenase: database code ACP_NEUCR, 134 amino acids (14.44 kDa).

NADH dehydrogenase (ubiquinone) EC 1.6.5.3; other names: ubiquinone reductase; type I dehydrogenase; complex I dehydrogenase; a flavoprotein enzyme that catalyses the reaction:

 $NADH + ubiquinone = NAD^+ + ubiquinol.$

The flavin is FAD, and the protein also contains iron-sulfur complexes. This is the catalytic activity of mitochondrial complex I. Example from *Neurospora crassa*, NADH-ubiquinone oxidoreductase 9.6 kDa subunit and **NADH dehydrogenase**: database code ACP_NEUCR, 134 amino acids (14.44 kDa).

NADH kinase EC 2.7.1.86; an enzyme that catalyses the formation of NADPH from ATP and NADH with release of ADP.

Nadi reagent a mixture of 1-naphthol and N,N-dimethyl-p-phenylene diamine that can be oxidized by cytochrome oxidase to form indophenol blue.

NAD+ kinase EC 2.7.1.23; other name (now obsolete): DPN kinase; an enzyme that catalyses the formation of NADP+ from ATP and NAD+ with release of ADP.

NADP abbr. for nicotinamide-adenine dinucleotide phosphate (when its oxidation state is unknown or unspecified). See also NAD, NADP+, NAD(P), NADPH.

NADP+ abbr. for exidized nicotinamide-adenine dinucleotide.

NAD(P) abbr. for a coenzyme that may be NAD or NADP. **NAD(P)*** abbr. for a coenzyme that may be NAD* or NADP*.

NAD(P)*-arginine ADP-ribosyltransferase EC 2.4.2.31; other names: ADP-ribosyltransferase; mono(ADP-ribosyl) transferase; a sarcoplasmic reticulum enzyme that catalyses the formation of N^2 -(ADP-D-ribosyl)-L-arginine from NAD* and L-arginine with release of nicotinamide. It couples poly(ADP-ribose) to arginine residues in proteins. Example from rabbit: database code NART_RABIT, 327 amino acids (36.09 kDa).

NADPH abbr. for nicotinamide-adenine dinucleotide phosphate (reduced). Use of NADPH₂ to represent NADPH is not recommended.

NAD(P)H abbr. for a coenzyme that may be either NADH or NADPH. Use of NAD(P)H₂ to represent NAD(P)H is not recommended.

NADPH:adrenodoxin oxidoreductase EC 1.18.1.2; other names: adrenodoxin reductase; recommended name: ferredoxin-NADP+ reductase; a flavoprotein enzyme that catalyses the reaction:

reduced ferredoxin + NADP+ =

oxidized ferredoxin + NADPH.

The flavin is FAD. 3-D structure known; it has much α-helical structure and a **beta barrel**. The location of the cofactor binding site is known. Examples (human): database code ADRO_HUMAN, 497 amino acids (54.39 kDa); 3-D structure with 2'-phospho-5'-AMP from spinach: database code NRL_2FNR, 296 amino acids (33.47 kDa).

which the acceptor is a quinone is EC 1.6.99.5; recommended name: NADH dehydrogenase (quinone); systematic name: NADH:(quinone-acceptor) oxidoreductase; it has no cofactors. In mitochondria, the enzyme is one activity of NADH-ubiquinone oxidoreductase, EC 1.6.5.3; recommended name: NADH dehydrogenase (ubiquinone); systematic name: Ban dang doc một quyền sách duộc tạng bởi HUY NGUYÊN. NAD(P)+ transhydrogenase

nar Jugger

Re/Si and pro-R/pro-S conventions, respectively. Then, if the ring is drawn with the $-\text{CONH}_2$ group pointing to the right, the hydrogen projecting out from the plane of the paper is the pro-R hydrogen (or H_R) and that projecting back the pro-S hydrogen (or H_S). Alcohol dehydrogenases (EC 1.1.1.1) transfer to the Re face (i.e. that from which H_R points out) and use H_R . In biochemistry the pro-R hydrogen region is also labelled as H_A , and the pro-S hydrogen as H_B . Enzymes that use the pro-R hydrogen (H_A) are described as A-specific, while those that use the pro-S hydrogen (H_B) are called B-specific. See also pro-R/pro-S convention and Re/Si convention.

NAD(P)* transhydrogenase (AB-specific) EC 1.6.1.2; other names: pyridine nucleotide transhydrogenase; transhydrogenase. An enzyme that catalyses the same reaction as NAD(P)* transhydrogenase (B-specific); however, preparations from heart mitochondria are A-specific with respect to NAD* and B-specific with respect to NAD*. See also NAD(P)* stereospecificity.

NAD(P)* transhydrogenase (B-specific) EC 1.6.1.1; other names: pyridine nucleotide transhydrogenase; nicotinamide nucleotide transhydrogenase; a flavoprotein enzyme that catalyses the reaction

$$NADPH + NAD^{+} = NADP^{+} + NADH$$

(with specificity for H_B of NADPH and NADH). The flavin is FAD. The enzyme is coupled to respiration and acts as a hydrogen-ion pump. Example, bovine mitochondrial precursor: NNTM_BOVIN, 1086 amino acids (113.91 kDa). Example, two subunits of enzyme from *Escherichia coli*: α , database code PNTA_ECOLI, 510 amino acids (54.56 kDa); β , database code PNTB_ECOLI, 462 amino acids (48.67 kDa). See also NADIP)* stereospecificity.

NAD+ pyrophosphorylase see nicotinamide-nucleotide adenylyltransferase.

NAD+ synthase EC 6.3.1.5; other name: NAD+ synthetase; an enzyme that catalyses the formation of NAD+ from deamido-NAD+, ATP, and NH₃ with release of AMP and pyrophosphate. See also NAD+ synthase (glutamine-hydrolysing); nicotinamide-nucleotide adenylyltransferase.

NAD* synthase (glutamine-hydrolysing) EC 6.3.5.1; other name: NAD* synthetase (glutamine-hydrolysing); an enzyme that catalyses the formation of NAD* from deamido-NAD*, L-glutamine, ATP, and H₂O with release of AMP, pyrophosphate, and L-glutamate. Example from Escherichia coli (also called nitrogen-regulatory protein): database code NADE_ECOLI, 274 amino acids (30.56 kDa). See also nicotinamide-nucleotide adenylyltransferase.

NAF abbr. for Neu-activating factor (see neu).

NAG abbr. for N-acetylglucosamine.

NAGA abbr. for N-acetylgalactosamine.

Nagarse (proteinase) another name for a species variant of subtilisin, EC 3.4.21.62, from Bacillus subtilis; an endopeptidase with a broad spectrum of proteolytic activity.

Nagase a pseudoacronym for β -N-acetylglucosaminidase (formerly EC 3.2.1.30). This enzyme is now included with EC 3.2.1.52, β -N-acetyl-hexosaminidase.

NAIBS abbr. for nonadrenergic imidazoline binding site; see imidazoline receptors.

Na+,K+-ATPase see sodium/potassium ATPase.

nalidixic acid 1-ethyl-7-methyl-1,8-naphthyridin-4-one-3-carboxylic acid; a synthetic 4-quinolone antibiotic that is active against many Gram-negative bacteria. It specifically inhibits bacterial DNA gyrase thereby interfering with DNA synthesis. It has no apparent effect on eukaryotic DNA synthesis.

naloxone 1-N-allyl-7,8-dihydro-14-hydroxynormorphinone; one of the most effective opiate antagonists. It binds tightly to opiate receptors in the nervous system, its action depending on the 3-carbon side-chain substitution on the nitrogen. It is used as an antidote to overdosage of narcotics.

naltrexone 1-N-cyclopropylmethyl-7,8-dihydro-14-hydroxynormorphinone; the cyclopropylmethyl analogue of **naloxone**; it has similar properties but is longer acting.

NANA abbr. for N-acetylneuraminic acid (i.e. sialic acid).

nano+ symbol: n; SI prefix denoting 10-9 times. It was formerly known as millimicro (symbol: mμ).

nanogram symbol: ng; a unit of mass equal to 10^{-9} gram, or 10^{-12} kilogram.

nanometre or (US) nanometer symbol: nm; a unit of length equal to 10-9 metre. It was formerly known as millimicron (symbol: mμ).

nanomolar symbol: nm or nM; describing a solution containing one **nanomole** per litre of solution, or a specified multiple or fraction thereof; describing an amount-of-substance concentration similarly expressed.

nanomole symbol: nmol; a unit of amount of substance equal to 10⁻⁹ mole.

nanosecond symbol: ns; a unit of time equal to 10^{-9} second.

NAP-2 abbr. for neutrophil activating peptide 2; one of several peptides derived from platelet basic protein precursor. It consists of LA-PF4 without the first 15 N-terminal amino acids. It is a potent chemoattractant and activator for neutrophils.

Naphthalene Black or Naphthol Blue Black or Amido Black a dye used for staining protein on cellulose acetate or on starch or agarose gels.

Naphthol Blue Black an alternative name for Naphthalene Black. Napierian logarithm symbol: loge or ln; an alternative name for natural logarithm. [After John Napier (1550-1617), Scots mathematician who invented logarithms.]

narcosis a state of partial or complete loss of consciousness induced by a drug or drugs that have a depressant action on the central nervous system.

Centgal nervous system.

narcotic

narcotic 1 any of a heterogeneous group of drugs that is capable of inducing narcosis and noted for their analgesic action. 2 (esp. US) the trivial name for any illegal drug or abused drug. 3 of, or relating to, narcosis; of, relating to, or denoting a narcotic drug. naringenin 4',5,7-trihydroxyflavanone; the aglycon of naringin.

naringin naringenin-7-rhamnoglucoside; a compound that occurs in the flowers, fruit, and rind of the grapefruit, and is the main bitter component of grapefruit juice. See also naringenin.

nascent just formed or in the process of being formed, especially in a chemical or biochemical reaction.

Nathans, Daniel (1928-), US microbiologist and molecular biologist; Nobel Laureate in Physiology or Medicine (1978) jointly with W. Arber and H. O. Smith 'for the discovery of restriction enzymes and their application to problems of molecular genetics'.

native (of a biopolymer) undenatured, i.e. having the structure and biological activity possessed in living material.

native state of a protein or nucleic acid, the form in which it occurs in the intact cell, its three-dimensional structure depending on formation of the appropriate hydrogen bonds.

natriuresis the excretion of sodium ions in the urine.

natriuretic 1 describing any agent that promotes the excretion of sodium ions in the urine. 2 such an agent.

natriuretic hormone any of various substances present in plasma or urine that are capable of stimulating sodium excretion by the kidney and of inhibiting membrane Na⁺,K⁺-ATPase in cells from kidney and some other tissues. See natriuretic peptide.

natriuretic peptide any of several peptides, secreted by various tissues, that stimulate natriuresis. The first of the group to be identified was atrial natriuretic peptide (or atrial natriuretic factor) (abbr.: ANP; other name: type A natriuretic peptide; former names: atriopeptin; vasoactive peptide). Its discovery arose from the observation that extracts of atrial granules could bring about natriuresis. Subsequently, brain natriuretic peptide (abbr.: BNP; other name: type B natriuretic peptide and type C natriuretic peptide (CNP) were identified. Members of this family share many common features; they are produced primarily in the heart and specialized areas of the central nervous system, and induce diuresis, natriuresis, and vasorelaxation. The natriuretic effect results from direct inhibition of

natural sele

sodium absorption in the collecting duct, increased glomerular filtration, and inhibition of aldosterone production and secretion. The major constituent of atrial granules, ANP, is synthesized from a precursor, prepronatriodilatin (152 amino acids), which is cleaved to proANP (126 amino acids). The latter is strikingly homologous between many species; proANP is cleaved into an N-terminal fragment, amino-acid residues 1–98, and the biologically active hormone, residues 99–126; the amino-acid sequence of ANP (proANP 99-126) is identical in all mammalian species except at residue 12 (110 of proANP), which is methionine in humans, dogs, and cows but isoleucine in rats, mice, and rabbits. There are two genes for the precursor (prepronatriodilatin); cleavage of the latter leads to two peptides, ANP:

SLRRSSCFGGRMDRIGAQSGLGCNSFRY

and cardiodilatin-related peptide (CDP):

NPMYNAVSNADLMDFKNLLDHLEEKMPLED.

The synthesis of BNP follows a very similar course. In humans and pig a 32-amino-acid hormone is the circulating form of BNP, sequence (human)

SPKMVQGSGCFGRKMDRISSSSGLGCKVLRRH;

in rodents BNP contains 45 amino acids and is known as iso-ANP. A 17-member ring, formed by a disulfide bridge between the two cysteine residues, is essential for biological activity of ANP and BNP. See also natriuretic-peptide receptor.

natriuretic-peptide receptor any of several membrane proteins that bind natriuretic peptides and mediate their intracellular effects. Three receptors have been identified by molecular cloning: ANP_A (previously known as GC-A, ANP-R₁, or ANP_B); ANP_B (previously known as GC-B); and ANP_C. Human ANPA and ANPB each have one transmembrane domain and intrinsic guanylate cyclase activity in an intracellular domain, which is highly conserved (88% identity). At the ANPA receptor, atrial natriuretic peptide is about ten times more potent than brain natriuretic peptide, whereas type C natriuretic peptide is 50-500 times more potent than other agonists at the ANP_B receptor. ANP_C is a disulfide-linked homodimer with one transmembrane domain and no guanylate cyclase domain; it was once thought to be involved in clearance of natriuretic peptides, but may act through other second messenger systems. Examples from human; ANPA receptor: database code ANPA_HUMAN, 1061 amino acids (117.78 kDa); ANP_B receptor: database code ANPB_HUMAN, 1047 amino acids (116.88 kDa); ANP_C receptor: database code ANPC_HUMAN, 540 amino acids (59.70 kDa). All are type I membrane glycoproteins.

natural abundance the number of atoms of a given nuclide in any naturally occurring mixture of the nuclides of a particular element, expressed as a percentage or fraction of the total number.

natural killer cell see NK cell.

natural logarithm or Napierian logarithm symbol: loge or ln; see logarithm.

natural product any organic substance of biological origin, as opposed to one obtainable only by chemical synthesis. In practice the term is often restricted to mean **secondary metabolite**.

natural selection the principle that the best competitors in any given population of organisms have the best chance of breeding success and thus of transmitting their characteristics to subsequent generations. The members of any population show individual differences – anatomical, physiological, or metabolic – that affect their functional efficiency in a given environment. The less efficient members tend to die out or produce fewer offspring than the more efficient members, which are better adapted to compete for food or other resources, and so produce relatively more offspring. The principle is fundamental to modern concepts of evolution, and was first articulated, independently, by the British naturalists Alfred Russel Wallace (in 1858) and Charles Darwin (in 1859).

natural-selection theory of immunity

natural-selection theory of immunity or Jerne's theory of immunity a theory of antibody production that postulates the spontaneous presence, in the blood of an animal, of small numbers of antibody molecules against all antigens to which the animal can respond, and delegates to the antigen the sole role of carrying such specific globulin molecules from the bloodstream into cells in which these molecules can induce proliferation of a particular antibody.

Nb symbol for niobium.

NBPC abbr. for 1-[(m-nitrobenzyloxy)methyl]pyridinium chloride; a reagent useful for the immobilization of single-stranded nucleic acids on cellulose.

NBS abbr. for 1 National Bureau of Standards (of the USA) (now National Institute for Standards and Technology). 2 Nbromosuccinimide.

NCAM abbr. for neural cell adhesion molecule.

N cell a type of cell, found mainly in the upper small intestine in humans, that contains round, homogeneous granules in which neurotensin is stored. Such cells are sparse in the lower

NC-IUB abbr. for Nomenclature Committee of the International Union of Biochemistry; redesignated (in 1992) NC-IUBMB.

NC-IUBMB abbr. for Nomenclature Committee of the International Union of Biochemistry and Molecular Biology. Compare

NCS the proprietary name for a 0.6 M solution in toluene of a mixture of quaternary ammonium compounds of general formula $[(CH_3)_2R'R''N]^+OY^-$, where R' and R" are unbranched alkyl groups containing 6 to 20 carbon atoms and Y is a hydrogen atom or a lower alkyl group. It is useful for solubilizing a wide range of specimens of biological origin in organic solvents for liquid scintillation counting.

Nd symbol for neodymium.

nDNA abbr. for nuclear DNA.

NDP abbr. for any (unknown or unspecified) nucleoside diphosphate in which the diphosphate moiety is esterified at the 5' position of the glycose.

Ne symbol for neon.

NE abbr. for norepinephrine.

nearest-neighbour sequence analysis a technique that employs a 5'-32P-labelled deoxyribonucleotide substrate in the enzymic synthesis of DNA followed by enzymic degradation of the DNA specifically to 3'-deoxyribonucleotides. From knowledge of the labelled substrate used and of the labelled degradation products formed, the nearest neighbour frequency, i.e. the frequency with which a particular nucleotide is found next to a specific neighbour nucleotide in the polynucleotide chain, can be calculated.

near ultraviolet radiation ultraviolet radiation in the wavelength range 200-400 nm.

nebulin a giant protein (800 kDa) that is specific for the skeletal muscle of vertebrates; it acts possibly as a 'molecular ruler' for length regulation of the thin filament. The protein appears to have small repeats of approximately 35 amino acids. Example, partial sequence (241 amino acids) from human: database code NEBU_HUMAN.

nebulize or nebulise to convert a liquid into a mist or a spray of fine droplets. — nebulization or nebulisation n.

nebulizer or nebuliser a device for nebulizing a liquid (see nebulize); an atomizer.

necrobiosis the death of a cell or a group of cells within a tissue, whether a normal occurrence or due to a pathological process. necropsy another name for autopsy.

Ban đang đọc một quyển sách được tăng bởi HUY NGUYÊN. Nếu ban có nhu cầu về sách sinh học, xin liên hê:

necrosis the death of a portion of a tissue as a result of disease

nectary a gland that secretes the sugary fluid called nectar. Nectaries occur in many animal-pollinated flowers, to attract insects, birds, and other pollinating agents.

Nedd abbr. for NPC-expressed, developmentally down-regulated genes (NPC is an abbreviation of neural precursor cells). These genes were isolated as DNA corresponding to mRNA, the levels of which are down-regulated during mouse brain development. The products are proteins presumed to be involved in embryonic development and differentiation of the nervous system. Nedd-2 protein is a cysteine endopeptidase that may be involved in controlling cell death. Example, Nedd-2 from mouse: database code NED2_MOUSE, 171 amino acids (19.22 kDa).

Needham, Joseph (1901-95); British biochemist, embryologist, Sinologist, and science historian, noted for his multivolume Science and Civilization in China (now being continued by the Needham Research Institute, Cambridge, UK). During World War II, he proposed the formation of an international science agency, and was credited with putting the S (science) into UNESCO.

NEFA abbr. for nonesterified fatty acid. Compare FFA.

negative 1 (of an electric charge) having the same polarity as an electron. 2 (of a chemical entity) having a negative electric charge; having an excess of electrons. 3 (of a point in an electric circuit) having a lower potential than some other point to which a potential of zero is assigned. 4 (in photography) an exposed and developed photographic film or plate showing an image in reversed tones, or complementary colours, to those of the object photographed. 5 a quantity less than zero. —negativeness or negativity n.

negative chromatography a term sometimes used to denote methods of purification of substances by affinity chromatography in which a specific contaminant in a sample interacts with and is selectively retained by the adsorbent, especially as opposed to positive chromatography.

negative-contrast technique a technique used in preparing specimens for electron microscopic examination in which the specimen is mixed with an electron-dense material that penetrates the interstices of the specimen but not the material of the specimen itself. The specimen thus appears transparent against an opaque background. It is commonly called negative staining.

negative control the prevention of some biological activity caused by the presence of a specific chemical entity.

negative cooperativity a form of cooperative ligand binding in which binding of one ligand to one site on a (macro)molecule decreases the affinity at other sites for the subsequent binding of other ligands.

negative effector see effector.

negative feedback see feedback (def. 1).

negative-ion mass spectrometry a version of mass spectrometry in which negative rather than positive ions, generated from the sample by chemical ionization, are separated and measured in an appropriate instrument.

negative staining see negative-contrast technique.

negative strand another name for minus strand (def. 2); in some RNA viruses, RNA is a minus strand which does not directly code for protein. Such viruses have a replicase packaged into the capsid to enable them to synthesize the plus strands necessary for replication.

negative-strand virus or negative-stranded virus any RNA virus in which the genome consists of single-stranded RNA (i.e. minus strand) of base sequence complementary to that of the virus-specified mRNA (which is the positive, or plus, strand). Such viruses, which comprise class V in the Baltimore classification, must make a positive RNA strand before making viral proteins. See also minus strand (def. 2), plus strand (def. 2). Neher, Erwin (1944-), German biophysical chemist; Nobel

Laureate in Physiology or Medicine (1991) jointly with B.

Sakmann 'for their discoveries concerning the function of

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

single ion channels in cells'.

NEM

Sur Hearts

neplano

NEM abbr. for N-ethylmaleimide.

nematic (of a substance) being in or having a mesophilic state in which the molecules are arranged as in a series of parallel threads but not in layers. The molecules can rotate about their axes and can move in the plane orthogonal to the line of the thread. Compare smectic. See also liquid crystal.

Nembutal a proprietary name for pentobarbitone sodium; pentobarbital sodium.

N-end rule a rule stating that the *in vivo* half-life of a protein is a function of its N-terminal residues.

NENTREZ a version of **ENTREZ** for use on individual personal computers. It is available on a licensing basis free of charge to academic researchers.

neo+ comb. form 1 denoting new, recent. 2 (in chemistry) denoting an isomer of new (and therefore initially unknown) structure.

neo-Darwinism the reworking of evolutionary theory in the light of discoveries about genetics as a result of the work of Fisher, Haldane, Sewall Wright, and others. The behaviour of genes in natural populations is understood in terms of the four fundamental evolutionary forces: **natural selection**, **genetic drift**, gene flow, and **mutations**.

neoendorphin any of a small group of [Leu⁵]enkephalinrelated peptides. α Neoendorphin is the decapeptide [Leu⁵] enkephalinyl-Arg-Lys-Tyr-Pro-Lys, and β neoendorphin is the nonapeptide [Leu⁵]enkephalinyl-Arg-Lys-Tyr-Pro; both are hypothalamic opioid peptides. *See also* **proenkephalin**.

neoflavone any of a group of 4-phenyl-1,2-benzopyrones found in certain plants. Their occurrence is probably restricted to the Guttiferae and Leguminosae.—**neoflavonoid** n.

neoglycoprotein a proposed generic name for any originally carbohydrate-free protein that has been chemically derivatized by covalent attachment of carbohydrate.

neokestose $O-\beta$ -D-fructofuranosyl- $(2\rightarrow 6)-\alpha$ -D-glucopyranosyl- β -D-fructofuranoside; an isomer of **kestose** isolated from the sap of the sugar maple and produced artificially, together with kestose, by the action of yeast or mould invertase preparations on sucrose.

neolignan any of a class of phenylpropanoid dimers in which the phenylpropane units are linked head-to-tail instead of tailto-tail as in **lignans**; e.g. eusiderin from the heartwood of members of the Magnoliaceae.

neomycin an aminocyclitol antibiotic complex produced by Streptomyces fradiae. It is made up of three components: neomycin A (or neamine; a degradation product of neomycin B and neomycin C), neomycin B, and neomycin C. Neomycin causes misreading during protein synthesis in bacteria but its target site on the ribosome is apparently different from that of streptomycin. See also neosamine C.

neonatal of, relating to, or affecting a newborn animal. For human infants the neonatal period is considered to be the first month after birth.

neonate any newborn animal.

neoplasia 1 the formation of a **neoplasm** or neoplasms. 2 the formation of new tissue.

neoplasm any new and morbid formation of tissue; a tumour. **neoplastic** of, or relating to, neoplasia or to a neoplasm.

neoprene poly(2-chloro-1,3-butadiene); a synthetic rubber that is resistant to oils and organic solvents and is useful for the manufacture of flexible tubing, washers, etc. for laboratory and many other uses.

neopterin the D-erythro enantiomer of **biopterin**; its biosynthetic precursor.

neosamine C 2,6-diamino-2,6-dideoxy-D-glucose; a constituent of **neomycin** C and some other antibiotics including **kanamycin**.

neosome the suggested secondary particulate biogenic precursor of the ribosome, intermediate between the **eosome** and the completed ribosome. Neosomes in *Escherichia coli* are particles of at least two kinds, with sedimentation coefficients of 43S and 30S.

neoxanthin a carotenoid **xanthophyll** present in the leaves of all higher plants.

$$H_3C$$
 CH_3 H_3C CH_3 H_3C CH_3 H_4 CH_3 CH_4 CH_5 CH_5 CH_6 CH_6 CH_7

nephelometry a technique in which the light dispersed by a suspension is measured orthogonally to the direction of the incident light; the amount of scattered light is dependent on the number and size of the particles in the light path. Compare turbidimetry. —nephelometric adj.; nephelometrically adv.

nephr+ a variant form of nephro+ (before a vowel).

nephrectomy the surgical removal of one or both kidneys.

—nephrectomize vb.

nephro+ or (before a vowel) **nephr+** comb. form denoting kidney or kidneys.

nephrocalcin or osteocalcin-related protein precursor a calcium-binding protein found in bone. It is expressed only in kidney and is also found as a urinary acidic glycoprotein of humans and other mammals that strongly inhibits formation of calcium oxalate crystals in renal tubules. It contains γ-carboxyglutamic acid residues; a modified protein lacking these is found in patients with calcium oxalate renal calculi. Example from Mus musculus: database code OSTR_MOUSE, 95 amino acids (10.46 kDa).

nephrogenic diabetes insipidus a rare X-linked recessive genetic disorder involving renal insensitivity to vasopressin resulting in polyuria and polydipsia; it can also be acquired as a result of toxic damage to the tubules. The genetic form is associated with mutations in the V₂ receptor (see vasopressin receptor), two examples being substitution of Asp for Ala at position 132 and a frameshift mutation at position 246 leading to a premature stop codon and a truncated receptor.

nephron any of the structural and functional urine-secreting units that occur in the kidney. Typically each nephron is made up of a glomerulus, a proximal convoluted tubule, a loop of Henle, and a distal convoluted tubule.

nephropontin see osteopontin.

neplanocin A a cyclopentenyl analogue of adenosine; a natural

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYỄN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Ner

antibiotic that inhibits S-adenosylhomocysteine hydrolase and vaccinia virus multiplication.

neprilysin EC 3.4.24.11; other names: neutral endopeptidase; endopeptidase 24.11; enkephalinase; a zinc endopeptidase widely distributed on the outer surfaces of cells.

Ner symbol for the nervonoyl (i.e. (Z)-tetracos-15-enoyl) group.

Nernst, Walther Hermann (1864-1941), German physical chemist distinguished for his work on thermochemistry and chemical thermodynamics; Nobel Laureate in Chemistry (1920) 'in recognition of his work in thermochemistry'.

Nernst distribution law when, at a constant temperature, a solute distributes itself between two immiscible phases, then the ratio of its concentrations in the two phases is constant, and is described by the relation $C_1/C_2 = K$, where C_1 and C_2 are, respectively, the amount-of-substance concentrations of the solute in phases 1 and 2 at equilibrium, and K is the distribution constant. The law only applies in dilute solution.

Nernst equation a the potential, E, of an electrode reversible to one ion in a solution containing that ion is given by:

$$E = E^{o} + (RT/zF)\ln a,$$

where E^{o} is the standard potential of the electrode (relative to the standard hydrogen electrode), a is the activity of the ion to which the electrode is reversible, z is the charge number of the ion, R is the (molar) gas constant, F is the Faraday constant, and T is the thermodynamic temperature. This equation can be extended to the e.m.f. of an electrolytic cell. **b** For a redox reaction, the potential of an electrode (usually platinum or gold) immersed in a redox solution, $E_{\rm h}$, is given by:

$$E_{\rm h} = E^{\rm o} + (RT/nF)\ln(a_{\rm ox}/a_{\rm red}),$$

where $E^{\rm o}$ is the standard redox potential of the system at a given pH (usually pH 7.0), n is the number of electrons transferred in the reaction, and $a_{\rm ox}$ and $a_{\rm red}$ are respectively the activities of the oxidized and reduced species in the solution. c If two solutions are separated by a membrane permeable to only one of two (or more) ions and the activities of the ions are different on either side of the membrane then a membrane potential, $E_{\rm A}$, will be generated where

$$E_{\rm A} = (RT/zF)\ln(a_{\rm L}/a_{\rm R}),$$

where a_L and a_R are the activities respectively of the permeable ion on the left and right sides of the membrane.

Nernst heat theorem another name for a particular formulation of the third law of thermodynamics (see thermodynamics). nerolidol peruviol; 3,7,11-trimethyl-1,6,10-dodecatrien-3-ol; a widespread acyclic sesquiterpene.

(S)-(+)-(Z)-enantiomer

nerve any of the cordlike bundles, consisting of **nerve fibres** and **glia** encased in a connective-tissue sheath, that connect the central nervous system to other parts of the body. They may be motor, sensory, or of mixed function.

nerve cell an alternative name for neuron.

nerve fibre the axonal process of a **neuron** together with its covering sheath. Bundles of nerve fibres running together make up a **nerve**.

nerve gas any of various poisonous gases or volatile liquids that act by inhibiting the passage of impulses through the nervous system and neuromuscular junctions. They are commonly irreversible inhibitors of **acetylcholinesterase**.

nerve growth factor 1 any of a number of polypeptides that exert a trophic effect on neurons. They play a part in the development and maintenance of sensory neurons in dorsal root ganglia and sympathetic neurons in peripheral sympathetic ganglia. 2 abbr.: NGF; the first known member of a family of polypeptides that act as growth factors for neurons. In addition to the general properties of such nerve growth factors, it also stimulates growth and differentiation of B lymphocytes, and stimulates histamine release from mast cells. The biologically active form of NGF contains two identical polypeptide chains of 120 amino-acid residues and known sequence and exerts its action through specific receptors in the neuronal plasma membrane. It is produced by neurons, astrocytes, and Schwann cells, but also by fibroblasts, epithelial cells, activated macrophages, and smooth muscle cells. It exists as an inactive complex of two α subunits, two β subunits, and two γ subunits. The active form consists of the two \(\beta \) subunits, and is known as βNGF. Example: βNGF precursor, a homodimer, from human: database code NGF_HUMAN, 241 amino acids (26.96 kDa); four motifs; residues 122-241 comprise the homodimer subunit. Related proteins subsequently discovered in-

Nessler's rea

clude brain-derived neurotrophic factor and neurotrophins.

nerve growth factor receptor any of a family of plasma membrane integral proteins that bind nerve growth factors. Low-affinity and high-affinity binding is observed; high affinity binding, and action on effector systems, requires the presence of both the trk protooncogene product (p140prototrk) and a 75 kDa low affinity receptor glycoprotein (p75NGFR). The latter can bind nerve growth factor (def. 2), brain-derived neurotrophic factor, and neurotrophins 3 and 4, but it is apparent that considerable specificity exists in transduction of the signal depending on which member of the nerve growth factor family and which cell type is involved. Example: p75NGFR, human precursor, homodimer linked by disulfide bonds, N- and O-glycosylated; database code NGFR_HUMAN, 427 amino acids (45.13 kDa, increased by glycosylation).

nerve impulse see impulse (def. 3).

nervon or nervone the **galactocerebroside** in which the acyl group is **nervonoyl**. It was originally isolated from nervous tissue.

nervonate 1 numerical symbol: 24:1 (15); the trivial name for (Z)-tetracos-15-enoate, CH₃-[CH₂]₇-CH=CH-[CH₂]₁₃-COO-(cis isomer), the anion derived from nervonic acid, (Z)-tetracos-15-enoic acid a monounsaturated straight-chain higher fatty acid. 2 any mixture of free nervonic acid and its anion. 3 any salt or ester of nervonic acid. See also **nervonoy**!.

nervonoyl symbol: Ner; the trivial name for (Z)-tetracos-15-enoyl, CH₃-[CH₂]₇-CH=CH-[CH₂]₁₃-CO- (cis isomer), the acyl group derived from nervonic acid, (Z)-tetracos-15-enoic acid. It occurs as the acyl moiety of the cerebroside **nervon** in brain, as a major constituent of milk phosphatidylcholines and sphingolipids in, e.g., pig and human, and in sphingolipids of other tissues.

nervous of, pertaining to, mediated by, or containing nerves; neural.

nervous system the extensive network of cells specialized to carry information, in the form of nerve impulses, to and from all parts of the body. Nervous systems occur in all orders of multicellular animals other than sponges.

nervous tissue tissue from any part of the nervous system.

nesidioblast a precursor cell of a pancreatic islet cell.

nesidioblastoma a tumour of nesidioblasts.

nesidioblastosis a pathological condition in which individual blastic pancreatic duct cells differentiate abnormally into islet cells scattered among the exocrine tissue. The condition is sometimes associated with severe infantile hyperinsulinism and hypoglycemia.

nesslerize or Nesslerize to treat (a sample) with Nessler's reagent; to test for or estimate (ammonia) by such means. Also: nesslerise, Nesslerise. —nesslerization or nesslerisation n.

m and neuromuscular junctions. They are commonly ble inhibitors of acetylcholinesterase.

Nessler's reagent an alkaline aqueous solution of potassium tetrajodomercurate(11). It gives a yellow or brown colour or Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

precipitate when added to solutions containing ammonia or ammonium ions and is useful in the detection and quantitative estimation of microgram quantities of ammonia in aqueous solution. [After Julius Nessler (1827-1905), German agricultural chemist.]

nestin an intermediate-filament protein whose name derives from neuroepithelial stem cells, in which it is specifically expressed. It has significant homology, including heptad repeats, to other intermediate-filament proteins. Example from rat: database code NEST_RAT, 1805 amino acids (198.53 kDa).

netrin any of a family of proteins first isolated from chick brain as diffusible chemoattractants that guide commissural axons to their targets during development. Netrin 1 is expressed at high levels in the floor plate during the period when commissural axons are growing towards the floor plate, while netrin 2 is similarly expressed at lower levels in the ventral two-thirds of the spinal chord. D nectrin is a Drosophila homologue, expressed in midline cells of the central nervous system when commissures are forming. The proteins are related to Unc proteins (e.g. see unc-86) of the nematode Caenorhabditis elegans.

netropsin a Streptomyces-derived basic peptide antibiotic that selectively binds to A-T base pairs in the small groove of right-handed B conformations of DNA. It induces A to B conformational changes in DNA.

net sensitivity see flux control coefficient.

net synthesis increase in the total mass (of a reaction product), as opposed to any apparent increase estimated by incorporation of labelled precursor (which may arise from

neu an oncogene first described in association with a neuroblastoma after treatment of rats with ethylnitrosourea. The neu protooncogene (also known as c-erbB2, NGL, and HER2) encodes a 185 kDa transmembrane glycoprotein with intrinsic tyrosine kinase activity, related to but distinct from the epidermal growth factor receptor (EGFR). Example from rat: database code NEU_RAT, 1260 amino acids (139.03 kDa). Like other members of this receptor family, the neu gene product, Neu, possesses a cysteine-rich extracellular domain, a transmembrane domain, and an intracellular domain with tyrosine kinase activity. EGF does not bind to Neu, but a factor known as Neu-activating factor (NAF) binds specifically to Neu and will bind to EGFR. Neu was originally identified in brain, and may play a critical role in neurogenesis. The rat neu oncogene is activated via a single point mutation in the transmembrane domain, which results in constitutive activation of the tyrosine kinase domain. A similar mutation has not been found in the human neu oncogene, the association of which with human cancer through gene amplification, or overexpression of the protein product, has been supported by work with breast and ovarian cancer.

Neu 1 symbol for a residue (or sometimes a molecule) of neuraminic acid. 2 the product of the neu gene.

NeuAc or (formerly) AcNeu symbol for a residue (or sometimes a molecule) of any isomer of acetylneuraminic acid, i.e. sialic acid. See also NeuNAc, NeuOAc, neuraminic acid.

Neu-activating factor see neu.

Neuberg, Carl Alexander (1877-1956); German biochemist after whom three forms of fermentation are named.

Neuberg ester an old name for D-fructose 6-phosphate. See fructose 6-phosphate.

Neuberg's first form of fermentation the normal anaerobic alcoholic fermentation of carbohydrate by yeast to yield two moles each of ethanol and carbon dioxide per mole of glucose

Neuberg's second form of fermentation the anaerobic fermentation of carbohydrate by yeast in the presence of sodium hydrogen sulfite. The acetaldehyde formed normally, which would act as a hydrogen acceptor for the reoxidation of NADH, is trapped as its bisulfite addition product, and its

phosphate), which is reduced to sn-glycerol 3-phosphate; this is then dephosphorylated to glycerol. Thus one mole each of glycerol, acetaldehyde-bisulfite complex, and carbon dioxide is formed per mole of glucose fermented.

Neuberg's third form of fermentation the anaerobic fermentation of carbohydrate by yeast in alkaline conditions. The acetaldehyde formed normally, which would act as a hydrogen acceptor for the reoxidation of NADH, undergoes a Cannizzaro reaction to form acetic acid and ethanol, and its place is taken by dihydroxyacetone phosphate (e.g. glycerone phosphate), which is reduced to sn-glycerol 3-phosphate; this is then dephosphorylated to glycerol. Thus one mole each of glycerol and carbon dioxide, and one half mole each of ethanol and acetic acid, are formed per mole of glucose fermented.

NeuGc symbol for a residue (or sometimes a molecule) of Nglycoloylneuraminic acid. See also sialic acid.

NeuNAc or Neu5Ac symbol for a residue (or sometimes a molecule) of N-acetylneuraminic acid (i.e. sialic acid). It is used as an alternative to NeuAc to differentiate the N-acetyl from the O-acetyl derivative of neuraminic acid.

NeuOAc symbol for a residue (or sometimes a molecule) of Oacetylneuraminic acid. It is used as an alternative to NeuAc to differentiate the O-acetyl from the N-acetyl derivative of neuraminic acid. See also sialic acid.

neur+ a variant form of **neuro+** (before a vowel).

neural of, or pertaining to, a nerve or nerves, or to the nervous

neural cell adhesion molecule abbr.: NCAM; any of a family of type I membrane glycoproteins of the immunoglobulin superfamily that are involved in neuron-neuron adhesion, neurite fasciculation, outgrowth of neurites, etc. Example (precursor) of NCAM-L1 from human: database code CAML_ HUMAN, 1257 amino acids (139.77 kDa); it shows strong homology with a Drosophila protein, neuroglian.

neural crest a group of embryonic cells, derived from the roof of the neural tube, that migrate to different locations and give rise to various types of adult cells.

neuraminate 1 the anion derived from **neuraminic acid**. 2 any salt or ester of neuraminic acid.

neuraminic acid symbol: Neu; the monosaccharide 5-amino-3,5-dideoxy-D-glycero-D-galacto-nonulosonic acid; it may be regarded as the aldol-condensation product of pyruvic acid and N-acetyl-D-mannosamine. It is not found free in nature, but is the parent structure of a family of aminodeoxysugars containing nine or more carbon atoms that occur widely, especially in glycoproteins and gangliosides; they include the sialic acids.

 α -anomer

neuraminidase a former name for sialidase.

neuraminosyl a trivial name for the glycosyl group derived from **neuraminic acid** by removal of the hydroxyl group from the anomeric carbon atom of the cyclic structure.

neuraminoyl a trivial name for the acyl group derived from neuraminic acid by removal of the hydroxyl group from the carboxyl group.

neuregulin any member of a family of closely related proteins implicated as regulators of neural and muscle development, and the differentiation and oncogenic transformation of mammalian epithelia. They include the Neu differentiation factor place is taken by dihydroxyacetone phosphate (i.e. glycerone (seez neu) and the hereguling. They exert their effects through Ban đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

neurexin

neurome

binding to and activating receptors of the ErbB2/Neu receptor family. Neuregulins stimulate proliferation of Schwann cells, increase the rate of synthesis of acetylcholine receptors in cultured muscle cells, and are concentrated at nerve-muscle synapses.

neurexin any of a family of cell-surface receptors expressed from two genes in the brain and concentrated in neurons. They are cell-surface proteins implicated in axon guidance and synaptogenesis. Some are probably signalling molecules. They are highly polymorphic and include secreted variants. They contain single transmembrane regions and extracellular domains with repeat sequences similar to those in laminin A (see laminin) and agrin. Each gene contains two independent promoters so that transcription produces two classes of mRNA, which encode proteins with different N termini, the larger being referred to as α -neurexins and the shorter as β -neurexins. The former contain three epidermal growth factor domains, an O-linked sugar domain, a transmembrane domain, and a short cytoplasmic tail. The α - and β -neurexins differ in their N-terminal sequences but have identical C termini, including the sugar-rich, transmembrane, and cytoplasmic domains. Example, neurexin III-α from female Sprague-Dawley rat brain: database code RATNIIIA5, 1399 amino acids (154.09 kDa).

neurilemma or neurolemma the thin outer sheath of cells surrounding the axon (and myelin sheath) of larger peripheral nerves or surrounding the axoplasm of unmyelinated nerves.

neurite a general term for a dendrite or an axon.

neuro+ or (before a vowel) neur+ comb. form denoting a nerve or the nervous system.

neuroactive (of an agonist or antagonist) having an effect on the nervous system.

neurocalcin an EF-hand Ca2+-binding protein involved in the calcium-dependent regulation of rhodopsin phosphorylation and found in retina and brain neurons. Example (bovine): database code NECX_BOVIN, 192 amino acids (22.09 kDa).

neurochemistry the study of the chemical composition of, and the chemical reactions occurring in, nervous tissue. -neurochemical *adj.*

neurocrine 1 describing or relating to a neuron that secretes an agonist into a synapse with another neuron; describing or relating to such an agonist. 2 such an agonist, e.g. a neurotrans-

neuroendocrine 1 describing or relating to a neuron that secretes an agonist into the bloodstream; describing or relating to such an agonist. 2 such an agonist; a neurohormone.

neuroendocrine convertase EC 3.4.21.93; abbr.: NEC; other name prohormone convertase. Any of the enzymes that act at paired dibasic amino acids in precursors of hormones and other polyproteins, to cleave the precursor into individual mature proteins. The catalytic activity depends on the Asp-His-Ser charge-relay system. Substrates for NEC1 include proopiomelanocortin, renin, enkephalin, dynorphin, somatostatin, and insulin. NEC2 and NEC3 have also been described. Example from human (NEC1 precursor): database code NEC1_ HUMAN, 753 amino acids (84.12 kDa).

neuroendocrinology the study of the interrelations between the nervous system and the endocrine system. -neuroendocrinological adj.

neurofascin a chick neurite-associated glycoprotein implicated in axon extension; it is an axonal surface recognition molecule of the immunoglobulin superfamily. At the N terminus it has six immunoglobulin-like motifs, followed by four fibronectin type III motifs, a proline-alanine-threonine-rich region, a transmembrane domain, and a 113-residue cytoplasmic domain. Example from chicken: database code S26180, 1272 amino acids (142.08 kDa).

neurofibril any of the very fine fibres, visible by light microscopy, that occur in the cell bodies, axons, and dendrites of neurons.

neurofibromatosis any of a number of disorders associated

consisting of a mixture of Schwann cells and fibroblasts. See also neurofibromin.

neurofibromin other name: neurofibromatosis-related protein (NF-I); a GTPase activating protein (see GAP (def. 2)), the product of the Nfl tumour-suppressor gene, that stimulates the GAPase activity of the RAS oncogene product, thus inactivating it. It appears to be implicated in the pathogenesis of neurofibromatosis. Example from Mus musculus: database code NF1_MOUSE, 28.41 amino acids (319.59 kDa).

neurofilament a type of intermediate filament found in neurons. neuroglia an alternative name for glia.

neuroglian a probable cell-adhesion molecule, with structural similarities to neural cell-adhesion molecule L1. It is found in neurons and glia of the developing nervous system. It has a single transmembrane domain, with extracellular immunoglobulinlike and fibronectin-type domains. Example from Drosophila melanogaster (presursor): database code NRGDROME, 1239 amino acids (138.28 kDa); residues 1-23 are the signal, 24-1239 neuroglian.

neurohormone any organic compound produced by neurons and released into the circulation to act as a chemical messenger; the term is sometimes extended to all neurotransmitters whether released or not. —neurohormonal adj.

neurohumour or (US) neurohumor a neurohormone or a neurotransmitter. - neurohumoral adj.

neurohypophysis (pl. neurohypophyses) the posterior lobe of the pituitary gland, also called neural lobe or pars nervosa. It secretes the peptide hormones oxytocin and vasopressin, and also possibly some others. Compare adenohypophysis. —neurohypophyseal or neurohypophysial adj.

neurokinin A or neuromedin L or substance K the peptide hor-

His-Lys-Thr-Asp-Ser-Phe-Val-Gly-Leu-Met

derived from protachykinin & precursor. It is a member of the tachykinin family and is a potent bronchoconstrictor. The related peptide [βAla⁸]neurokinin A 4–10,

H-Asp-Ser-Phe-Val-βAla-Leu-Met-NH₂,

is a potent and selective substance K receptor agonist.

neurokinin B or neuromedin K a member of the tachykinin family that has neuroendocrine and neuroexcitatory functions, especially in the olofactory, gustatory, and visceral systems. It is a potent bronchioconstrictor. It has the sequence

Asp-Met-His-Asp-Phe-Phe-Val-Gly-Leu-Met-NH₂

database code TKNK_PIG, 10 amino acids (1.211 kDa). Neurokinin B acts through a G-protein-coupled receptor, known as NK-3, linked to the phosphatidylinositol cycle.

neurolemma a variant spelling of neurilemma.

neuroleptic any drug used to treat major psychosis, e.g. schizophrenia or mania. Such drugs include phenothiazines, e.g. chlorpromazine, and butyrophenones, e.g. haloperidol.

neurolysin EC 3.4.24.16; other name: neurotensin endopeptidase; an enzyme that catalyses the preferential cleavage in neurotensin of Pro¹⁰-|-Tyr¹¹

neuromedin B a decapeptide first isolated from porcine spinal cord. Its structure.

Gly-Asn-Leu-Trp-Ala-Thr-Gly-His-Phe-Met,

has close sequence homology to bombesin, with which it shares mitogenic and growth-promoting properties. In rat brain its concentration is highest in the olfactory bulb, but is also high in the hypothalamus, hippocampus, and spinal cord. The B in its name indicates its similarity to bombesin. Example of precursor from human (which also includes oxytocin): database code NEU1_HUMAN, 125 amino acids (12.71 kDa).

neuromedin C a neuropeptide similar in its structure,

Gly-Asn-His-Trp-Ala-Val-Gly-His-Leu-Met,

and in its actions to neuromedin B and bombesin.

with the presence of multiple neurofibromas, benign tumours neuromedin L an alternative name for neurokinin A. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

neuromedin N

nur segret

neuromedin N a hexapeptide whose C-terminal tetrapeptide is identical to that of **neurotensin**.

neuromodulator any endogenous agent that influences the function of a **neurotransmitter** but has no direct excitatory or inhibitory postsynaptic actions. The term usually implies long-latency and long-lasting effects (i.e. seconds to days).

neuromuscular of, pertaining to, or affecting both nervous and muscular tissue.

neuromuscular junction the place of contact between the motor end-plate of the fibre of a motor neuron and the membrane of a muscle fibre supplied by the neuron. Impulses are transmitted across the gap by diffusion of a neurotransmitter. Compare synams.

neuron or neurone or nerve cell a cell that is specialized for the transmission of nerve impulses. Neurons are the structural and functional units of the nervous system. Each consists of an enlarged portion, the cell body or perikaryon, containing the nucleus and from which project a variable number of thread-like processes. Of these the short branched dendrites convey impulses towards the cell body, while a longer single nerve fibre, or axon, conveys impulses away from the cell body. The axon is unbranched except at the nerve ending. —neuronal adj.

neuronatin a protein that is highly expressed in neonate mammalian brain and which may be involved in terminal brain differentiation. Example from rat: database code RNU08290, 81 amino acids (9.21 kDa).

neuropeptide (sometimes) any peptide with neuroendocrine activity.

neuropeptide K a polypeptide hormone, DADSSIEKQVALL-KALYGHGQISHKRHKTDSFVGLM-NH₂, derived from protachykinin β precursor. It exhibits a wide spectrum of activities overlapping those of other members of the tachykinin family, with which it shares the C-terminal sequence FXLM-NH₂.

neuropeptide Y or (formerly) melanostatin; abbr.: NPY; a 36-residue peptide neurotransmitter, structure YPSKPDNPGE DAPAEDMARYYSALRHYINLITRQRY-amide (human, porcine has Leu¹⁷), found in relatively high concentrations in adrenal glands, brain, and heart. It is one of the most abundant neuropeptides. It is a potent stimuulator of feeding; leptin inhibits NPY gene expression and release. NPY also regulates secretion of gonadotropin releasing hormone. It shows considerable sequence homology with peptide YY and pancreatic polypeptide. The active peptide is derived from a precursor; example (precursor) from human: database code NEUY_HUMAN, 97 amino acids (10.84 kDa). [Leu³¹, Pro³⁴]NPY is a selective agonist for a Y₁ receptor subclass. See also neuropeptide-Y receptor.

neuropeptide-Y receptor abbr.: NPY receptor or Y receptor; a membrane protein that binds neuropeptide Y (NPY) and mediates its intracellular effects. Effector pathways involve the inhibition of adenylate cyclase and of Ca²⁺ channels. The NPY receptors are seven-transmembrane-helix G-protein-coupled single polypeptides. Four types have been recognized that vary in their affinities for NPY analogues. Example of type 4 from human: database code NY4R_HUMAN, 375 amino acids (42.19 kDa). A fifth type, Y5, is sugggested to be the receptor by which NPY exerts its effects on feeding.

neurophysin any of a small number (usually two in any given animal species) of cystine-rich, single-chain polypeptides present in the neurohypophysis. Each binds specifically and stoichiometrically either to oxytocin or to vasopressin (or to certain of their analogues) and is released with the respective hormone. Neurophysin I binds oxytocin and shares a common precursor; example from Rattus norvegicus; database code NEU1_RAT, 125 amino acids (12.8 kDa); residues 1-19 are the signal peptide, 20-28 oxytocin, 32-125 neurophysin I. Neurophysin II binds vasopressin and shares a common precursor; example from R. norvegicus; database code NEU2_RAT, 168 amino acids (17.92 kDa); residues 1-23, signal; 24-32, Arg-vasopressin; 36-128, neurophysin II. See also vasopressinneurophysin 2-copeptin precursor.

neurophysin II another name for MSEL-neurophysin.

neuroscience any of the sciences dealing with the nervous system; such sciences collectively.

neurosecretion 1 the process of secretion of a substance by a (specially adapted) nerve cell. 2 a product of such a secretion; a **neurocrine** (def. 2) or **neuroendocrine** (def. 2). —**neurosecretory** adj.

neurosome (sometimes) a mitochondrion of a nerve cell.

Neurospora a genus of ascomycete microfungi. The species N. crassa has been widely used in biochemical and genetic studies. It is commonly found as a mould on bread that has been kept for too long.

neurotensin a tridecapeptide, Glp-Leu-Tyr-Glu-Asn-Lys-Pro-Arg-Arg-Pro-Tyr-Ile-Leu-OH, found in mammalian brain and gut, especially in N cells, packaged within secretory vesicles. It is released from the hypothalamus into the circulation. Although initially shown to induce hypotension, it is now known to have a wide variety of pharmacological actions, including muscle contraction; however, its true physiological role remains unclear. Example (precursor) from bovine: database code NEUT_BOVIN, 169 amino acids (19.69 kDa). This precursor gives rise to neurotensin and two other derivatives, neuromedin and neuromedin N.

neurotensin endopeptidase see neurolysin.

neurotoxin any toxin that acts specifically or primarily on nervous tissue. —**neurotoxic** adj.

neurotransmission the transmission of nerve impulses from a neuron to another excitable cell via a neurotransmitter.

neurotransmitter any chemical substance released at the distal end of the axon of a neuron in response to the arrival of a nerve impulse that, by diffusing across a synapse or other junction, is capable of transmitting the impulse to another neuron, to a muscle cell, or to another excitable cell or, in the case of inhibitory neurotransmitters, of inhibiting the transmission. The neurotransmitter is stored in synaptic vesicles in the axon terminal; it is released into the synaptic cleft on arrival of the action potential and diffuses to and stimulates receptors in the membrane of the post-synaptic cell. An essential component of the mechanism is a means to inactivate the neurotransmiter, e.g. by acetylcholinesterase action on acetylcholine. Both excitatory (see cholinoceptor, purinoceptor, and glutamate receptor) and inhibitory (see GABA receptor and glycine receptor) neurotransmitters are known.

neurotrophic factor see brain-derived neurotrophic factor.

neurotrophin abbr.: NT; any of a group of growth factors, similar to nerve growth factor but with different tissue specificities. The first to be discovered was named neurotrophin 3, as two proteins with neurotrophic properties had already been discovered (nerve growth factor and brain-derived neurotrophic factor). Neurotrophins have properties similar to these latter. Neutrophins 3 to 6 have been described. Examples (precursors, human): NT3, database code NT3_HUMAN, 257 amino acids (29.32 kDa); NT4 (formerly NT5), database code NT4_HUMAN, 210 amino acids (22.40 kDa).

neurotropic having a particular affinity for, or affecting nervous tissue.

neutral 1 being neither acidic nor basic (or alkaline). 2 having no net charge or electric potential.

neutral amino acid any amino acid containing equal numbers of potentially anionic and cationic groups, especially as distinct from acidic amino acids and basic amino acids.

neutral density filter an alternative term for **neutral filter**. **neutral fat** see **neutral lipid**.

neutral filter or **neutral density filter** (in photography and photometry) a filter that attenuates all frequencies of light uniformly so that the relative spectral energy distribution of the transmitted light is the same as that of the incident light.

neutrality the condition, quality, or state of being **neutral** (def. 1, 2) or intermediate.

opressin; 36–128, neurophysin II. See also vasopressin-neutralize or neutralise to render neutral (def. 1, 2) or ineffectives to counteract.—neutralization or neutralisation n. Bạn đáng đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

neutral lipid

ation analysis.

neutral lipid an operational term for any lipid that is soluble only in solvents of very low polarity. Neutral lipids are divided into two main groups: (1) acylglycerols (glycerides), i.e. fatty-acid esters of glycerol; and (2) waxes, i.e. fatty-acid esters of long-chain monohydroxy alcohols.

Neutral Red an indicator dye that changes colour from red to orange-brown over the pH range 6.8-8.0.

neutral solution any aqueous solution in which the activities of the hydrogen and hydroxide ions are equal. Such a solution in which water is the sole solvent has a pH of 7.00 at 25° C.

neutron symbol: n; an elementary particle of zero charge; nucleon number 1; rest mass 1.6749×10^{-27} kg (1.0086 Da); spin ½. Neutrons are present in the nuclei of all atoms (except the hydrogen atom), where they are stable; when free, a neutron has a mean life of 932 s, decaying to a proton and an electron. neutron activation analysis an alternative name for radioactiv-

neutron diffraction a technique that is similar in principle to X-ray diffraction by a crystal, and is applicable particularly to biopolymers and particulate structures. Because hydrogen atoms make a much more substantial contribution to the scattering of neutrons than to X-ray scattering the technique is useful for refining partially determined structures obtained by the use of X-rays. In rare cases it has been used for determination of absolute configuration.

neutron flux (density) the number of free neutrons passing through unit volume multiplied by their mean velocity.

neutron number symbol: N; a dimensionless physical quantity, having an integral value for any given nuclide, equal to the number of neutrons contained in the nucleus of an atom of the nuclide. Hence, it is equal to the arithmetical difference between the nucleon number, A, of the nuclide and the proton num**ber**, Z, of the relevant chemical element; i.e. N = A - Z.

neutron scattering see small-angle scattering.

neutrophil or neutrophil leukocyte or neutrophilic leukocyte the most numerous polymorphonuclear leukocyte found in the blood; a phagocytic cell of the myeloid series that is distinguished by the presence of cytoplasmic azurophil granules and other granules that take up neither acidic nor basic dyes. It plays a major role in the inflammatory response, undergoing chemotaxis towards sites of infection or wounding.

Newman projection a two-dimensional representation of a molecule in which the atoms are arranged as they would be seen if the molecule were viewed from one end along the carboncarbon bond nearest to the observer. See also conformation.

newton symbol: N; the SI derived unit of force, defined as the force required to give a mass of one kilogram an acceleration of one metre per second per second; i.e.

$$1 \text{ N} = 1 \text{ kg m s}^{-2} = 1 \text{ J m}^{-1} (= 10^5 \text{ dynes}).$$

Newton, (Sir) Isaac (1642-1727), English astronomer, mathematician, philosopher, and physicist. —Newtonian adj.

Newtonian flow the type of flow displayed by a Newtonian

Newtonian fluid any fluid whose (coefficient of) viscosity is independent of flow rate, conforming to Newton's law of viscos-

Newton's law of viscosity a law that describes the flow of almost all fluids of low relative molecular mass and also that of some solutions of macromolecules. A fluid moving between two parallel plates, in the x direction with a velocity ν , is thought of as a number of infinitesimal layers, each of which slides along the adjacent one, the frictional resistance between adjacent layers generating an orthogonal velocity gradient, in the y direction. The frictional force, f, between the fluid layers is then proportional to the area, A, of the layers and to the velocity gradient between them, such that:

$$f = \eta A(\mathrm{d}v/\mathrm{d}y),$$

where the constant η is known as the coefficient of viscosity (or viscosity for short) at the temperature of measurement; its reciprocal, $1/\eta$, is the fluidity.

new yellow enzyme an obsolete name for the enzyme Damino-acid oxidase (EC 1.4.3.3), a yellow flavoprotein (FAD) with wide specificity for D-amino acids and acting also on glycine. It was so-named to distinguish it from old yellow enzyme. See amino-acid oxidase.

New Zealand obese mouse abbr.: NZO mouse; one of a number of strains of genetically obese mice that are used in metabolic and endocrine research. The obesity is moderate in character and there is an associated hyperinsulinemia and hyperglycemia.

nexin a protein found in the axoneme of eukaryotic cilia and flagella. It forms interconnections between the microtubule outer doublets that surround the inner central pair of microtubules. See also glial-derived nexin.

nexin 1 other names: protease nexin I (abbr.: PN-I); a glycoprotein that promotes neurite extension and is an extracellular serpin-like serine protease inhibitor. Example, residues 20-398 of the human glial derived nexin precursor (GDN): database code GDN_HUMAN, 398 amino acids (43.95 kDa).

nexin 2 the secreted isoform of the Alzheimer's amyloid β -protein precursor (see \(\beta\)-amyloid peptide). See also Alzheimer's disease.

nexus (in cytology) an alternative name for gap junction.

NF-1 see CTF, neurofibromin.

NF2 abbr. for neurofibromatosis type-2 tumour suppressor; see

NF-kB a transcription factor for eukaryotic RNA polymerase II promoters. In humans the active protein is a heterodimer of two DNA-binding subunits (p50) which belong to the same family as the dorsal protein. It is found in cytoplasm as an inactive complex with an inhibitory subunit, IkB; activation of NF-kB involves its release from its inhibitory subunit. A 105 kDa protein is the precursor of the p50 subunits. These bind to the kappa-B consensus sequence, GGRNNYYCC, e.g. GGGGACTTTCC in mouse and human. Example from Gallus gallus: database code KBF1_CHICK, 984 amino acids (108.17 kDa).

NF-E1 see GATA-1.

ng symbol for nanogram.

NGF abbr. for nerve growth factor.

L-NHA abbr. for N^G-hydroxy-L-arginine.

Ni symbol for nickel.

niacin an alternative name for nicotinic acid.

niacinamide an alternative name for nicotinamide.

NICE element abbr. for nodule infected cell expression element, a name given to an AT-rich element in Sesbania rostrata leghemoglobin glb3.

NICER elements a name suggested for a family of genes that are nerve growth factor-inducible, cyclic AMP-extinguishable, and retrovirus-like, hence the acronym.

nick 1 an interruption in the covalent continuity of one strand of a double-stranded nucleic-acid molecule. 2 to produce a nick in a nucleic-acid molecule. See also nick translation.

nickase an endodeoxyribonuclease present in phage-infected Escherichia coli cells that gives rise to single-strand breaks (nicks) in duplex DNA.

nickel symbol: Ni; it is a ferromagnetic, metallic transition element of group 10 of the IUPAC periodic table; atomic number 28; relative atomic mass 58.69. It consists of a mixture of five stable nuclides of which the two most abundant are those of mass numbers 58 and 60; its commonest valence is II. Nickel's abundance in the Earth's crust is 0.018% and it is an essential Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

nicotinamide mononucle

trace element for living organisms. Several artificial radionuclides of nickel are known, including nickel-56 (γ -emitter; half-life 6.1 days) and nickel-63 (emits β - radiation, 0.066 MeV; half-life 100 years).

nicking-closing enzyme or nicking-and-closing enzyme see type I **DNA topoisomerase**.

nick translation a procedure for preparing radioactively labelled DNA, especially for use as probes in hybridization experiments. Single-stranded nicks are introduced into unlabelled DNA, usually by limited treatment with deoxyribonuclease I, exposing 3'-hydroxyl termini. Escherichia coli DNA polymerase I (at low temperature, ≈15 °C) is then used successively to incorporate radioactive nucleotides (present as dNTPs in the reaction mixture) to form a new, radioactively labelled polynucleotide strand while the $5' \rightarrow 3'$ exonuclease activity of the polymerase concomitantly hydrolyses the 5' termini ahead of the growing strand, liberating 5'-mononucleotides. The reaction thus progressively replaces nucleotide residues by their labelled counterparts in a DNA duplex, which is otherwise unchanged except for the translation of the nick, i.e. its progressive displacement towards the 3' end of the strand. (The word 'translation' in the name may be misleading as the function involved is replication.)

Nicol prism an optical device constructed of two prisms of calcite cemented together with Canada balsam, used for producing plane polarized light and/or determining its orientation. It has now largely been superseded by Polaroid filters, etc. [After William Nicol (1768–1851), British physicist.]

nicotinamide the recommended trivial name for pyridine-3-carboxamide, the amide of nicotinic acid; also called niacinamide. It is a member of the B complex of vitamins, and is nutritionally equivalent to nicotinic acid. It occurs widely in living organisms, usually in combined form.

nicotinamide-adenine dinucleotide $abbr.: NAD^+$ or NAD; if the oxidation state is not to be specified; nicotinamide(1)- β -D-riboside(5')diphospho(5')adenosine; an atypical dinucleotide containing a phosphoric anhydride linkage in place of the usual phosphodiester linkage between the component mononucleotide units, i.e. between nicotinamide mononucleotide and adenylic acid. It is the specific coenzyme in

numerous oxidoreductase enzyme reactions, although in a number it functions interchangeably with **nicotinamide-adenine** dinucleotide phosphate. In these reactions it stereospecifically accepts a hydrogen atom at position 4 of the pyridine ring, plus an electron, to form **nicotinamide-adenine dinucleotide (reduced)**. It acts also as a donor in the ADP-ribosylation of some eukaryotic and prokaryotic proteins. The α anomer is inactive as a coenzyme. Former names: codehydrogenase I; coenzyme I (Co I); cozymase; diphosphopyridine nucleotide (DPN). See also nicotinamide-adenine dinucleotide (reduced).

nicotinamide-adenine dinucleotide phosphate abbr.: NADP⁺; nicotinamide(1)-β-D-riboside(5')diphospho(5')adenosine 2'-phosphate; a coenzyme with a structure and coenzymic mechanism related to those of nicotinamide-adenine dinucleotide, although it functions as the sole coenzyme for fewer oxidoreductases and tends to be involved more in synthetic than in energy-yielding reactions. Former names: codehydrogenase II; coenzyme II (Co II); phosphocozymase; triphosphopyridine nucleotide (TPN). See also nicotinamide-adenine dinucleotide phosphate (reduced).

nicotinamide-adenine dinucleotide phosphate (reduced)

abbr.: NADPH; 3-aminocarbonyl-1,4-dihydropyridine(1)-β-Driboside (5')diphospho(5')adenosine 2'-phosphate; the reduced form of the coenzyme nictoinamide-adenine dinucleotide phosphate. As in nicotinamide-adenine dinucleotide (reduced) the carbon atom at position 4 of the 1,4-dihydropyridine ring is prochiral. See also NAD(P)* stereospecificity. Former names: reduced codehydrogenase II; reduced coenzyme II (Co IIH₂); reduced phosphocozymase; reduced triphosphopyridine nucleotide (TPNH).

nicotinamide-adenine dinucleotide (reduced) abbr.: NADH; 3-aminocarbonyl-1,4-dihydropyridine(1)-β-D-riboside(5')diphospho(5')adenosine; the reduced form of the coenzyme nicotinamide-adenine dinucleotide. The carbon atom at position 4 of the dihydropyridine ring is prochiral; removal of one of the two hydrogen atoms from position 4 (or introduction of a hydrogen atom at this position into the oxidized form) through the agency of an NAD-linked oxidoreductase is stereospecific, the two hydrogen atoms being designated pro-R (or H_A) or pro-S (or H_B), and the two corresponding aspects of the (dihydro)pyridine ring frequently being known as the A face and the B face. The α anomer is inactive as a coenzyme. Former names: reduced codehydrogenase I; reduced coenzyme I (Co IH₂); reduced cozymase; reduced diphosphopyridine nucleotide (DPNH). See also NAD(P)+ stereospecificity.

nicotinamide mononucleotide symbol: NMN; nicotin-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

ninh

amide(1)-\(\beta\)-p-riboside 5'-phosphate; the mononucleotide produced when nicotinamide-adenine dinucleotide acts as a donor of an adenylyl group in the activation of DNA ligase.

nicotinamide mononucleotide

nicotinamide nucleotide any nucleotide that contains combined nicotinamide, e.g. nicotinamide-adenine dinucleotide (reduced), nicotinamide-adenine dinucleotide phosphate (reduced).

nicotinamide-nucleotide adenylyltransferase EC 2.7.7.1; other name: NAD+ pyrophosphorylase; an enzyme that catalyses the formation of NAD+ from ATP and nicotinamide ribonucleotide with release of pyrophosphate and NAD⁺. See also NAD+ synthase, NAD+ synthase (glutamine-hydrolysing).

nicotinate pyridine 3-carboxylate; the anion derived from nicotinic acid.

nicotinate mononucleotide 3-carboxylatopyridine(1)-β-D-riboside 5'-phosphate; an intermediate in the biosynthesis of nicotinamide-adenine dinucleotide. It reacts with ATP to form desamido-NAD, which is subsequently converted to NAD by a glutamine-dependent amidation of the carboxyl group.

nicotine (S)(-)-3-(1-methyl-2-pyrrolidinyl)pyridine; the principal example of a number of related very poisonous and addictive alkaloids extractable from the dried leaves of various species of tobacco, especially Nicotiana tabacum. It is an agonist of the nicotinic class of cholinoceptors. —nicotinic adj.

nicotinic acetylcholine receptor see cholinoceptor.

nicotinic acid abbr.: NA; the recommended trivial name for pyridine 3-carboxylic acid, also known as niacin. It is a member of the B complex of vitamins, nutritionally equivalent to nicotinamide. At physiological pH values it exists virtually exclusively as the nicotinate anion.

nidogen or entactin a sulfated glycoprotein that is widely distributed in basement membranes and tightly associated with laminin. Example (precursor) from human: database code NIDO_HUMAN, 1247 amino acids (136.34 kDa).

Niemann-Pick disease an alternative name for sphingomyelin lipidosis. [After Albert Niemann (1880-1920), German physi-

nif the symbol for any gene controlling bacterial nitrogen fixation; individual genes are distinguished by suffixed capital letters, e.g. nifB, nifQ. In Klebsiella pneumoniae the nif cluster has at least 18 genes, arranged in seven distinct operons with no other interspersed genes; the total length of the nif region is ≈24 kb. The two polypeptide subunits of component I of nitrogenase and the polypeptide subunit of component II are each controlled by a single nif gene; the production and insertion of iron-molybdenum cofactor (FeMo-co) into component I appears to require three to six genes; the production of mature component II is controlled by two to four genes; two electron-transporting proteins are coded for by one gene each; and three or more genes are concerned with regulating expression of others.

pyridinedicarboxylic acid dimethyl ester; one of the dihydropyridine calcium antagonists. It is a calcium channel blocking agent inhibiting the cellular influx of calcium associated with the plateau phase of the action potential. It acts as a vasodilator, reducing blood pressure and increasing coronary blood flow.

nigericin a 725 Da, open-chain macrotetrolide-like antibiotic, with many chiral centres, isolated from Streptomyces hygroscopicus. It forms stable complexes with monovalent cations, especially with K+; these complexes are soluble in organic solvents, and thus nigericin can act as an ionophore for monovalent cations. It has some structural resemblance to monensin. **nigerose** the disaccharide 3-O-α-D-glucopyranosyl-D-glucose.

night blindness or nyctalopia the inability to see in dim light or at night. It is due to degeneration of the rod cells in the retina of the eye, which primarily mediate vision in dim light. NIH abbr. for National Institutes of Health (of the USA).

NIH shift or hydroxylation-induced migration an intramolecular migration that often occurs in the hydroxylation reactions of alkylaromatic compounds catalysed by certain mono- or dioxygenases, whereby a hydrogen atom or a substituent atom or group at the position of hydroxylation moves to an adjacent carbon atom in the aromatic ring. For example, in the hydroxylation of phenylalanine to tyrosine, catalysed by phenylalanine 4-monooxygenase (EC 1.14.16.1), the hydrogen atom at C-4 in the ring can be shown by tritium labelling to migrate to C-3. [After NIH, i.e. National Institutes of Health, where the discoverers were based.]

NIMR abbr. for National Institute for Medical Research (of the

ninhydrin the trivial name of triketohydrindene hydrate; 2,2-dihydroxy-1,3-indanedione; a pale-yellow crystalline substance, useful as a sensitive chromogenic reagent for the detection and quantification of compounds containing free amino or imino groups. The common amino acids (and the free amino groups of peptides and proteins, and various other amino compounds) give a red, violet, or blue coloration, the shade depending somewhat on conditions, whereas the imino acids proline and

nifedipine 1,4-dihydro-2,6-dimethyl-4-(2-nitrophenyl)-3,5-Bạn đang đọc một quyển sách được tặng bởi HỦY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

nitrite redu

hydroxyproline give a yellow colour. The partially reduced ninhydrin derivative, hydrindantin, is often added to the reagent solution, as it reacts with free ammonia that is formed as a side product, and in combination with ninhydrin forms the coloured

product, thus enhancing the sensitivity of the reaction. **Nir** symbol for the ribonucleoside ribosylnicotinamide.

Nir

Nirenberg, Marshall Warren (1927-), US biochemist and molecular biologist; Nobel Laureate in Physiology or Medicine (1968) jointly with R. W. Holley and H. G. Khorana 'for their interpretation of the genetic code and its function in protein synthesis'.

NissI substance a collective term for the dense regions of granular endoplasmic reticulum and free polysomes observable by microscopy within the cytoplasm of the cell body of vertebrate neurons. [After Franz Nissl (1860–1919), German neuropathologist, who first observed it.]

nitrate 1 the NO₃- ion, derived from nitric acid. 2 any salt or ester of nitric acid.

nitrate assimilation an alternative term for assimilatory nitrate reduction; see nitrate reduction.

nitrate dissimilation an alternative term for dissimilatory nitrate reduction; see nitrate reduction.

nitrate reductase 1 any of the three enzymes designated nitrate reductase (NADH) (EC 1.6.6.1), nitrate reductase (NAD(P)H) (EC 1.6.6.2), or nitrate reductase (NADPH) (EC 1.6.6.3) that reduce nitrate to nitrite coupled to the oxidation of the coenzymes indicated. They are of widespread occurrence in plants and microorganisms, where they participate in assimilatory nitrate reduction. All are flavoproteins, usually containing one atom of molybdenum per molecule. Example from Arabidopsis thaliana: database code NIA1_ARATH, 917 amino acids (103.12 kDa). 2 the microbial enzyme, designated nitrate reductase (EC 1.7.99.4), that reduces nitrate to nitrite coupled to the oxidation of various electron donors in dissimilatory nitrate reduction. Example from Bacillus subtilis: database code NARG_BACSU, 1228 amino acids (139.08 kDa). 3 the microbial enzyme, designated nitrate reductase (cytochrome) (EC 1.9.6.1), that reduces nitrate to nitrite coupled to the oxidation of a ferrocytochrome to the corresponding ferricytochrome. See also nitrate reduction.

nitrate reduction any reaction or sequence of reactions in which nitrate ion is converted to other less highly oxidized inorganic nitrogenous substances, e.g. to nitrite ion, nitrous oxide, dinitrogen, ammonium ion, or amino acids. In enzymology the term is restricted to the enzymic reduction of nitrate ion to nitrite ion, catalysed by a nitrate reductase enzyme. In biology, nitrate reduction is of two types, distinguishable by the purposes served and by the enzymes involved. Assimilatory nitrate reduction is the process occurring in higher plants, algae, and fungi, in which nitrogen from nitrate is converted into organic nitrogen-containing compounds, via the probable reaction sequence: nitrate \rightarrow nitrite \rightarrow [hyponitrite] \rightarrow hydroxylamine → ammonium → amide group of glutamine → amino acids, etc. Dissimilatory nitrate reduction or nitrate respiration is the process occurring in some microorganisms under anaerobic conditions in which nitrate functions as a terminal electron acceptor in respiratory metabolism. The nitrogen may either be converted to ammonium (which is not assimilated), a process designated ammonification of nitrate, or be converted to various gaseous compounds such as nitric oxide, nitrous oxide, and/or dinitrogen, a process designated denitrification. Compare nitrification.

nitrene the chemical entity NH or any of its substitution derivatives. It contains an electrically neutral mono-coordinate nitrogen atom with four nonbonding electrons; two of these electrons are paired while the other two have spins that may be either antiparallel (singlet state) or parallel (triplet state). Other names: azacarbene; azene; imene; imine radical.

nitric oxide nitrogen monoxide; NO; a colourless gas, only slightly soluble in water, that reacts readily with O₂ to form nitrogen dioxide, NO₂; it can form the stable cation NO⁺. It has been found to account for the action of endotheliumderived relaxing factor (EDRF). Nitric oxide is a biogenic messenger with potent actions causing inter alia vasodilation, inhibition of platelet aggregation, and reduction of endothelium adhesion; it also has anticoagulant and fibrinolytic actions. It is formed biosynthetically from L-arginine by nitric-oxide synthase in most mammalian tissues in varying amounts, including vascular endothelial cells, the central and peripheral nervous system, immune cells, lung, or liver. It activates guanylate cyclase, producing cyclic GMP. It is oxidized to nitrite, then to nitrate, which is present in the blood.

nitric-oxide synthase EC 1.14.13.39; abbr.: NOS; systematic name: L-arginine, NADPH: oxygen oxidoreductase (nitricoxide-forming). An enzyme that catalyses a reaction between L-arginine, NADPH, and O₂ in which citrulline, NADP⁺, and nitric oxide are formed; heme, FAD, FMN, and tetrahydrobiopterin are required as cofactors; the heme centre has the spectral properties of a cytochrome P450; N^ω-hydroxy-L-arginine is an intermediate, and acts as a substrate for the enzyme. Three isoforms are known: nNOS, originally expressed in neuronal tissues, and eNOS, first identified in vascular endothelial cells, are both expressed constitutively and are Ca²⁺dependent; iNOS, first identified as an enzyme inducible in macrophages and liver cells, is not Ca²⁺-dependent, but binds calmodulin with extremely high efficiency. All have consensus sequences for the binding of NADPH, FAD, FMN, and calmodulin, and a phosphorylation site for cyclic-AMPdependent protein kinase A; eNOS has an N-terminal consensus sequence for myristoylation. Inhibitors include L-N⁵-(1iminoethyl)ornithine, NG-monomethyl-L-arginine, NG-nitro-L-arginine. Example, from human endothelial cells: database code NOS3_HUMAN, 1202 amino acids (133.15 kDa).

nitrification the process by which certain soil bacteria (nitrifying bacteria) oxidize ammonium ions in decomposing organic material into nitrate ions. Nitrosomonas spp. first convert ammonium to nitrite, and Nitrobacter spp. then oxidize nitrite to nitrate. The process is important because most higher plants can assimilate nitrate much more readily than they can ammonium. Compare denitrification.

nitrify 1 (of nitrifying bacteria) to oxidize ammonium to nitrate. 2 to treat (soil) with nitrates. —nitrified or nitrifying adj. nitrifying bacteria obligately aerobic bacteria that are capable of oxidizing ammonia to nitrite, and nitrite to nitrate. See nitrification. Compare denitrifying bacteria.

nitrite 1 the NO₂ ion, derived from nitrous acid. 2 any salt or ester of nitrous acid.

nitrite reductase 1 the enzyme designated nitrite reductase (NAD(P)H) (EC 1.6.6.4) that reduces nitrite to ammonium coupled to the oxidation of either NADH or NADPH. It is a flavin-dependent enzyme that also contains siroheme; it participates in assimilatory nitrate reduction in higher plants, algae, fungi and bacteria. Example from Bacillus subtilis: database code NASD_BACSU, 805 amino acids (88.43 kDa), 2 the enzyme designated nitrite reductase (cytochrome) (EC 1.7.2.1) that reduces nitrite to nitric oxide coupled to the oxidation of ferrocytochrome c to ferricytochrome c. It is a cuproprotein and participates in denitrification processes in some microorganisms. 3 the enzyme designated ferredoxin-nitrite reductase (EC 1.7.7.1) that reduces nitrite to ammonium coupled to the oxidation of reduced ferredoxin; the enzyme in spinach leaves contains one molecule of siroheme and one iron-sulfur (Fe₂S₂) cluster per molecule. It participates in assimilatory nitrate reduction, the reduced ferredoxin being derived from the light reactions of photosynthesis. Example from Zea mays: database code NIR_MAIZE, 569 amino acids (63.34 kDa). 4 the microbial enzyme, designated nitrite reductase (EC 1.7.99.3), that reduces nitrite to nitric oxide coupled to the oxidation of various electron donors in dissimilatory nitrate reduction; the soluble in water, that reacts readily with O₂ to form enzymes from Achromobacter cycloclastes and Pseudomonas Ban đang đọc một quyển sách được tặng bởi HUY NGUYEN. Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

denitrificans contain copper: database code NIR_ACHCY, 340 amino acids (37.01 kDa).

nitro the chemical group -NO₂ in a molecule of an organic compound.

nitro+ prefix (in chemical nomenclature) 1 indicating the presence of a **nitro** group in an organic compound. 2 (in chemical technology) indicating that a chemical compound is a nitrate ester.

Nitroblue Tetrazolium see Nitrotetrazolium Blue.

nitrogen 1 symbol: N; a nonmetallic element of group 15 of the IUPAC **periodic table**; atomic number 7; relative atomic mass 14.0067. There are two natural stable nuclides of relative masses 14 (99.635 atom percent) and 15 (see **nitrogen-15**); its commonest valences are III and IV. Nitrogen occurs naturally in the form of diatomic molecules of the gas dinitrogen (see below) and in combined form in numberless organic molecules in all forms of life. See also **nitrogen-13**. 2 dinitrogen or molecular **nitrogen** symbol: N₂; a diatomic nonflammable gas. It constitutes 75.5% by mass, or 75.06% by volume, of the Earth's atmosphere, and undergoes exchange with organically combined nitrogen via the processes of the **nitrogen cycle**. Liquid nitrogen, b.p. 77.36 K, is commonly used as a coolant or freezing agent.

nitrogen-13 the artificial radioactive nitrogen nuclide 13 N. It emits a positron (β^+ -particle) (1.19 MeV max.) and no gamma radiation; it has a half-life of 9.96 min.

nitrogen-15 heavy nitrogen; the stable, naturally occurring nitrogen nuclide ¹⁵N; relative abundance in nitrogen 0.365 atom percent. It is extensively used as a tracer in studies of nitrogen metabolism and in nuclear magnetic resonance.

nitrogenase an enzyme complex that catalyses the ATP-dependent process of biological fixation of atmospheric nitrogen, summarized by the equation:

$$N_2 + 8H^+ + 6e^- \rightarrow 2NH_4^+$$
.

The electrons may be donated by either 3 reduced ferredoxin (this enzyme is EC 1.18.6.1) or 6 reduced flavodoxin (this enzyme is EC 1.19.6.1), depending on the bacterial species, the following summary being based on the systems utilizing ferredoxin. Nitrogenase consists of two oxygen-sensitive components, known as component I (other names: dinitrogenase; MoFe protein; molybdoferredoxin) and component II (other names: dinitrogenase reductase; Fe protein; azoferredoxin), in the molar ratio 1:2. Component I is a tetramer made up of two different polypeptide chains of about 50 and 60 kDa, each present twice; the tetramer also contains two Mo atoms, around 30 Fe atoms and about 30 acid-labile sulfide groups, some of the Mo, Fe, and S being present as iron-molybdenum cofactor (abbr.: FeMo-co). The extremely oxygen-sensitive component II is a dimer of identical, ≈30 kDa, polypeptide chains; each dimer contains four Fe atoms and four acid-labile sulfide groups. Electrons from a donor, which may be NADPH, are transferred, via reduced ferredoxin, to component II; then, in the presence of Mg²⁺ and ATP, they are passed to component I where Mo(vi) atoms are reversibly reduced to Mo(iv), the electrons ultimately being used in three two-electron steps to reduce dinitrogen to ammonium with concomitant hydrolysis of 4-5 molecules of ATP per two electrons transferred. Nitrogenase also catalyses ATP-dependent partial reductions of some other small-molecule substances that are isoelectronic with dinitrogen, e.g. acetylene, azide, cyanide, and nitrous oxide. The biosynthesis of nitrogenase is controlled by the nif cluster of genes. Example from Klebsiella pneumoniae: the subunits are named from the nif genes; the enzyme consists of (i) a Mo-Fe protein (component I) with two α (NifD) and two β (NifK) subunits with 30-32 Fe, 2 Mo, and S (inorganic); database codes NIFD_KLEPN, 483 amino acids (54.10 kDa) and NIFK_KLEPN, 520 amino acids (58.34 kDa); (ii) an Fe protein (NifH, component II, four motifs) homodimer (one 4Fe-4S cluster per dimer); database code NIFH_KLEPN, 292 amino acids (31.74 kDa). Associated proteins are NifE (database code NIFE_KLEPN, 457 amino acids (50.10 kDa)) and NifN (database code NIFN_KLEPN, 461 amino acids (50.51 kDa)) – these are involved in FeMo-co biosynthesis; NifM (database code NIFM_KLEPN, 266 amino acids (30.58 kDa)) is involved in synthesis/activation of NifH.

nitrogenase reductase another name for dinitrogenase reductase; i.e. component II of **nitrogenase**.

nitrogen balance 1 (in physiology) the **balance** (def. 1) of the nitrogen content of the nutrients and the excretory products of an organism. 2 (in agriculture) the net loss or gain of the nitrogen content of soil that results from removal of nitrogen by cropping, leaching, etc. and addition of nitrogen by nitrogen fixation or addition of nitrogenous fertilizers.

nitrogen base an alternative term for nitrogenous base.

nitrogen cavitation an alternative name for pressure homogenization.

nitrogen cycle the complex series of chemical processes by which various inorganic and organic nitrogenous compounds are interconverted and maintained in equilibrium in the biosphere. It consists essentially of nitrogen fixation, nitrification, and denitrification, together with assimilatory and dissimilatory nitrate reduction and the interconversion of nitrogenous organic matter and ammonium. Individual reactions in the series may be effected by microorganisms, plants, or animals, with contributions from nonbiological processes such as manufacture of nitrogenous fertilizers, the action of lightning, and emission of combustion products.

nitrogen equilibrium the state of **nitrogen balance** (def. 1) when nitrogen intake equals nitrogen excretion.

nitrogen fixation any biological or nonbiological process that converts atmospheric dinitrogen into inorganic nitrogenous compounds; the meaning is often extended to include the biological assimilation of ammonium so produced. Biological nitrogen fixation occurs by the action of the enzyme nitrogenase, found in certain species of bacteria – the nitrogen-fixing bacteria.

nitrogen mustard any of a group of bis(2-chloroalkyl)amines, as typified by the volatile base bis(2-chloroethyl)ethylamine, CH₃-CH₂-N(CH₂-CH₂Cl)₂, a nitrogen-containing analogue of **mustard gas**. They are potent alkylating agents, vesicants, and mutagens. They cross-link DNA chains and have been used as immunosuppressive and antineoplastic agents.

nitrogenous 1 of or relating to **nitrogen**. 2 of or relating to any substance containing nitrogen in combined form.

nitrogenous base or nitrogen base a generic term for ammonia or any trivalent compound of nitrogen that can be regarded as a derivative of ammonia; all except quaternary ammonium compounds are weakly basic in character. In biochemistry, the term usually denotes any purine or pyrimidine; now generally shortened to base.

nitrogen regulatory protein abbr.: NR protein; any of several proteins of a regulatory system for transcriptional control of the glutamine-ammonia ligase, and for its regulation at the structural level. Transcriptional regulation is mediated by the proteins NR_I, that when phosphorylated acts as a transcriptional activator of the gene glnA and NR₁₁, a kinase that converts NR_I to NR_I-P, the phosphorylated, active form. Another protein P_{II}, prevents this phosphorylation, thereby preventing transcriptional activation. P_{II} can be uridylylated at Tyr⁵¹ to P_{II}-UMP by a uridylyl transferase, and then does not inhibit NR_I phosphorylation, so activating transcription. This occurs when the level of nitrogen is low. Regulation at the structural level of glutamate ammonia ligase involves adenylylation by adenylyl transferase, which inactivates it. Adenylyl transferase is activated by P_{II}. In the presence of P_{II}-UMP, adenylyl transferase is inactivated, and glutamate-ammonia ligase reverts to a non-adenylylated, active form. Uridylylation of P_{II} thus results in activation of transcription of glutamate-ammonia ligase, and its activation at the structural level. Example of P_{II} from Escherichia coli, a homotrimer: database code GLNB_ ECOLI, 112 amino acids (12.41 kDa). Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. nitroglycerin

Sart transfer

nitroglycerin 1,2,3-propanetriol trinitrate; a compound that is used industrially in the manufacture of dynamite, and pharmacologically as an antianginal and coronary vasodilator. Its action in the latter case results from its conversion to nitric oxide.

nitrophenyl a group that is linked to a variety of compounds to form artificial substrates for enzymes. The nitrophenol released by the enzyme action can then be measured spectrophotometrically at 400 nm (4-nitrophenol) or 420 nm (2-nitrophenol) to follow the enzyme reaction, the esterified form having a maximal absorption at a much lower wavelength. Typical substrates are 4-nitrophenylacetate (for carboxylesterase, lipase), 4-nitrophenyl-N-acetylgalactosaminide (galactosaminidase), 4-nitrophenyl-N-acetylgucosaminide (glucosaminidase), and 2-nitrophenylbutyrate (cholinesterase).

nitroprusside test a test for free thiol groups based on the red coloration given on reaction of thiol-containing compounds with ammoniacal sodium nitroprusside, sodium nitrosopenta-cyanoferrate(III), Na₂[Fe(CN)₅NO]. Nitroprusside also reacts with ketones and is used in tests for ketone bodies in urine. The proprietary Acetest tablets contain a mixture of glycine, sodium nitroprusside, disodium phosphate, and lactose. In the presence of glycine, acetoacetate or acetone forms a blue-purple colour. A positive reaction indicates the presence of ≥5 mg dL⁻¹ and 10 mg dL⁻¹ for urine and blood respectively.

nitros+ a variant form of **nitroso+** (before a vowel).

N-nitrosamide any organic compound in which a **nitroso** group is attached to an amide nitrogen, e.g. N-methyl-N-nitrosourea. See also **N-nitrosamine**.

M-nitrosamidine any organic compound in which a **nitroso** group is attached to an amidine nitrogen, e.g. N-methyl-N'-nitro-N-nitrosoguanidine. See also **N-nitrosamine**.

M-nitrosamine any organic compound of general formula R₁R₂NNO. They are stable compounds formed by the action of nitrous acid on secondary amines with concurrent monodealkylation, and also on some tertiary amines. Most nitrosamines are strongly carcinogenic and their metabolites are strong mutagens. **M-nitrosamides** and **M-nitrosamidines** are unstable nitroso compounds that decompose in neutral or alkaline conditions to produce powerful alkylating agents. They are widely used as experimental mutagens. They are carcinogenic in any tissue with which they come into contact.

nitroso the chemical group -NO in a chemical compound.

nitroso+ or (before a vowel) **nitros+** prefix (in chemical nomenclature) indicating the presence of a **nitroso** group in a chemical compound; in C-nitroso compounds the -NO is attached to carbon (e.g. nitrosobenzene) and in N-nitroso compounds it is attached to nitrogen.

S-nitroso-N-acetylpenicillamine abbr.: SNAP; an S-nitrosothiol reagent that stimulates guanylate cyclase and mimics the action of nitric oxide.

S-nitroso-N-acetyl-p-penicillamine

Nitrotetrazolium Blue or Nitroblue Tetrazolium a dye very similar in structure to Tetrazolium Blue (see tetrazolium salt), differing only in that each of the two tetrazolium groups has a nitrophenyl group in place of a phenyl group.

nitrous acid the very unstable monobasic acid HNO₂. It reacts with amines, including purine and pyrimidine amines, to form the corresponding hydroxy compounds, and is thus mutagenic.

ganic compound. It has an unpaired electron, and is useful in spin-labelling, its derivatives being stable free radicals.

NK cell abbr. for natural killer cell; a large granular lymphocyte that recognizes structures on the surface of virally infected cells, which it kills, probably through the mediation of a **perforin**.

NKSF abbr. for NK stimulating factor. See interleukin 12.

Nie symbol for the α -amino acid norleucine (now known as 2-aminohexanoic acid, symbol: Ahx).

NLS abbr. for nuclear localization signal.

nm symbol for nanometre.

nM or nm symbol for nanomolar.

NMDA abbr. for N-methyl-D-aspartate.

NMDA receptor see glutamate receptor.

NMN abbr. for nicotinamide mononucleotide.

nmol symbol for nanomole.

NMP abbr. for any (unknown or unspecified) nucleoside monophosphate in which the phosphate group is esterified at the 5' position of the glycose moiety.

NMR or nmr abbr. for nuclear magnetic resonance.

Nn symbol for the nonyl group.

Nno symbol for the nonanoyl group.

nNOS see nitric-oxide synthase.

No symbol for nobelium.

nociceptive causing pain or injury; reacting to a painful stimulus.

nociceptor any receptor that reacts to painful (i.e. nociceptive) stimuli; a pain-sense organ.

node 1 a knob, lump, or swelling; a constriction, especially when serially repeated (along the length of something). 2 (in botany) the point on a stem to which a leaf or a lateral branch is attached. 3 (in physics) a point of zero or minimum displacement in a standing wave or a system of such waves. See also node of Ranvier. —nodal adj.

node of Ranvier any of the constrictions in the myelin sheath that occur at regular intervals along the length of a myelinated nerve fibre. [After Louis Antoine Ranvier (1835–1922), French pathologist.]

NOD mice abbr. for nonobese diabetic mice.

nodoc a name sometimes used for **anticodon** (formed by reversing the letters of the word codon).

nodule bacterium or nodule-forming bacterium a common name for any bacterium of the genus Rhizobium, found as endosymbionts in root nodules. The bacterium specifically infects root cells of Leguminosae, and causes the development of root nodules, in which it loses its outer membrane and becomes dependent on plant metabolism. It is then morphologically differentiated from the free-living form and known as a bacteroid. In return it fixes nitrogen for the plant. See nitrogenase.

NOE abbr. for nuclear Overhauser effect.

NOESY abbr. for nuclear Overhauser effect spectroscopy.

nogalamycin an antitumour antibiotic material obtained from *Streptomyces nogalater*. It contains the carbohydrate component **nogalose**.

nogalose 6-deoxy-3-C-methyl-L-mannose 2,3,4-trimethyl ether; a carbohydrate component of **nogalamycin**.

noggin a dorsalizing factor localized to Spemann's organizer in Xenopus laevis embryos. Database code A43343, 222 amino acids (25.77 kDa).

nitroxide the divalent group =N_O' in a molecule of an or-Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có như cầu về sách sinh học, xin liên hệ:

noise analysis

nonhistone pr

ment, or other system, that degrades the amount of useful information extractable. Compare signal-to-noise ratio.

noise analysis the technique whereby the amplitude and frequency of random fluctuations in the membrane potential of an excitable cell are used to investigate changes in conductance of single ion channels induced, e.g., by a drug or neurotransmitter.

nojirimycin 5-amino-5-deoxy-D-glucose; an antibiotic isolated from several strains of *Streptomyces*. It occurs as a pyranose-like structure with -NH- replacing the usual -O-. It inhibits intestinal α -glucosidase and pancreatic α -amylase.

nominal describing an approximate value assigned to some quantity as a guide to its real value (which may vary according to circumstances).

nomogram or **nomograph** any chart or diagram consisting of scaled lines and used for facilitating calculations, especially one consisting of three lines scaled for different related variables such that a straight line joining chosen values of two variables will intersect the third scale line at the related value of the third variable. —**nomography** n.; **nomographic** adj.

non+ 1 prefix denoting negation; absence of; opposite or reverse of; e.g. nonabsorbable, nonacylated, nonconductor, noncyclic, nonmetal, nonspecific. 2 a variant form of **nona+** (sometimes before a vowel).

nona+ or (sometimes before a vowel) **non+** comb. form denoting nine, ninefold, nine times.

nonacosa+ comb. form denoting twenty-nine, twenty-nine fold, twenty-nine times.

nonacosane a linear C₂₉ hydrocarbon, CH₃-[CH₂]₂₇-CH₃. **nonactin** a neutral macrotetrolide antibiotic produced by several *Streptomyces* spp. It transports alkali cations through membranes with high selectivity for K⁺, but also for NH₄⁺. It is one of a related series including monactin, dinactin, and tri-

nonadeca+ comb. form denoting nineteen, nineteen fold, nineteen times.

nactin.

nonaethyleneglycol mono-n-dodecyl ether a nonionic $C_{12}E_9$ detergent; see C_xE_y .

nonanoate or pelargonoate 1 the anion CH₃-[CH₂]₇-COO-, derived from nonanoic acid (i.e. pelargonic acid). 2 any salt or ester of nonanoic acid.

nonanoyl or pelargonoyl symbol: Nno; the univalent acyl group CH₃-[CH₂]₇-CO-, derived from nonanoic acid (i.e. pelargonic acid)

nonaqueous lacking water; applied especially to solvents whether polar or nonpolar.

nonbonding electrons an alternative name for lone pair.

noncoded amino acid or uncoded amino acid any α -aminoacid residue occurring in a polypeptide or protein for which no codon exists, e.g. γ -carboxyglutamic acid, hydroxylysine, hydroxyproline, oxyproline. Residues of these amino acids are formed from residues of the corresponding coded amino acids by post-translational modification of the polypeptide chain.

noncoding region or **noncoding sequence** any segment of a nucleic-acid molecule for which there is no recognized gene product; it may sometimes play a structural role in the organization of the molecule. See also **intron**.

noncoding strand or template strand a term that is variously, and confusingly, applied to either of the two strands of genomic duplex DNA. It is now the term recommended for de-

noting the strand that is complementary in its sequence of bases to messenger RNA (mRNA) transcribed from the DNA; it thus functions as the template for synthesis of mRNA, which then contains the sequence present in the **coding strand** of duplex DNA (except for uracil in RNA serving in place of thymine in DNA). In some bacteria and viruses, alternate segments of both strands of duplex DNA may be noncoding. Other names: antisense DNA; antisense strand; complementary strand; minus strand; transcribing strand. Compare complementary DNA.

noncompetitive antagonism (in pharmacology) the phenomenon occurring when agonist and antagonist can be bound simultaneously, in which antagonist binding reduces or prevents the action of the agonist; e.g. channel block of the nicotinic receptor, or inhibition by adrenoceptor antagonists of the response to tyramine.

noncompetitive inhibition inhibition of an enzyme in which inhibition results from binding of the inhibitor at a different site on the enzyme surface from that at which the substrate binds, without interference with substrate binding.

nonconjugative plasmid any plasmid that cannot bring about transfer of DNA by **conjugation**.

nonconservative replication of DNA or dispersive replication of DNA see replication of DNA.

noncoupled solute translocation the translocation of a solute across a membrane that is not coupled to the translocation of another solute, in either the same or the opposite direction. See facilitated diffusion, uniport.

noncovalent describing an interaction between atoms and/or molecules that does not involve the formation of a covalent bond between them.

noncyclic electron flow (in photosynthesis) see photophosphorylation.

 ${\bf noncyclic\ photophosphorylation}.$

nondiffusible material material that is not diffusible in the restricted sense of its being incapable of passing through a diffusion barrier, especially through a semipermeable membrane used in dialysis. *Alternative terms recommended by IUPAC*: retentate, dialysis residue, or residue.

nondissymmetric a term formerly used to describe an achiral molecule that possesses an alternating axis of symmetry but that (unlike a symmetric molecule) lacks a simple axis of symmetry; the converse of dissymmetric. An important example is citric acid, which has a one-fold alternating axis but no simple axis; thus its pair of carboxymethyl groups on carbon-3 are not geometrically equivalent. See also prochiral.

nonelectrolyte any substance that is neither an electrolyte nor a conductor of electrons.

nonessential amino acid any amino acid that can be synthesized in the body in an amount corresponding to need, and
hence for which there is not an absolute dietary requirement.
The extent to which a particular amino acid is nonessential in
any one species depends on the stage of development and
physiological state of the subject. The following L-amino acids
are nonessential for the maintenance of nitrogen equilibrium
in an adult human: alanine, arginine, asparagine, aspartic
acid, cysteine, glutamic acid, glutamine, glycine, histidine, hydroxyproline, proline, serine, and tyrosine. Arginine and histidine are, however, essential in growing children.

nonesterified fatty acid abbr.: NEFA; 1 an alternative name for free fatty acid. 2 a collective term for the total of free fatty acids in a sample, especially of blood.

nonheme iron or (esp. Brit.) nonhaem iron any iron in a biological sample or structure that is not chelated in heme groups. In nonheme-iron proteins the iron is often present in iron-sulfur clusters.

nonhistone protein or nonhistone chromosome protein any member of a highly heterogeneous group of 10-150 kDa tissue-specific proteins associated with DNA in cell nuclei. They are thought to play a part in the control of gene expression. See also high mobility group proteins.

nopalini

nonhomologous (of chromosomes or chromosome segments) not homologous (def. 4).

nonideal describing any gas or solution that does not behave like an ideal gas or ideal solution, respectively. —nonideality n.

Nonidet the proprietary name for a range of nonionic detergents that are essentially octyl- or nonyl-phenoxypolyethoxyethanols. For example, see NP-40. Compare Triton.

non-insulin-dependent diabetes an alternative name for type 2 diabetes mellitus.

noninvasive 1 not invasive. 2 (of a clinical investigative technique or procedure) carried out without penetrating the skin.

nonionic having or yielding no ions; the term is used especially of nonionic detergents.

nonionic detergent any detergent whose molecules cannot

non-lactose-fermenter a jargon term for any genus, species, or strain of microorganism that does not ferment lactose.

nonmediated transport an alternative name for unmediated transport.

non-Newtonian fluid any fluid that does not conform to Newton's law of viscosity, i.e. one whose (coefficient of) viscosity is not independent of flow rate.

nonose any aldose having a chain of nine carbon atoms in the

nonoverlapping code see overlapping code.

nonpermissive restrictive; not permissive.

nonpermissive cell any cell that does not support infection by a particular lytic virus; in a small percentage of instances the virus may transform a nonpermissive cell.

nonpolar 1 lacking polarity. 2 or apolar (of a chemical group or substance) lacking a significant permanent dipole moment.

nonpolar bond 1 any covalent bond that is not appreciably polarized. 2 (sometimes) an alternative term for hydrophobic interaction

nonpolar solvent a loose term denoting any solvent with low ionizing power and hence low solvating power.

nonproductive binding or dystopic binding the binding of a substrate in an unreactive mode at the active site of an enzyme, leading to the formation of a nonproductive, or abortive complex.

nonproductive complex an alternative name for abortive complex.

nonprotein amino acid any amino acid that does not naturally occur as a constituent residue of proteins. Over 200 such amino acids are known to be produced in higher plants. Although they often contribute to the nitrogen pool of the plants, their specific function is unknown. Nonprotein amino acids also occur in animals but to much less degree, the most prominent examples being argininosuccinate, citrulline, and ornithine.

nonprotein nitrogen abbr.: NPN; the part of the nitrogen content of a substance (or fluid) that is not contained in the proteins present. The term is used especially of blood or serum, wherein urea accounts for about half the total NPN.

nonradioactive having no radioactivity; in practice the term is often used to refer to substances having a normal or natural nuclidic composition, ignoring any contribution from minimal proportions of naturally occurring radionuclides such as the carbon-14 content of natural organic materials.

nonradioactive tracer (sometimes) a labelled substance that can be detected and estimated by virtue of some property other than radioactivity (such as colour, fluorescence, or a difference in stable-isotope ratio).

nonreducing end the end of a linear oligosaccharide or polysaccharide that does not carry a potential hemiacetal or hemiketal (i.e. reducing) group.

nonsecretor see secretor gene.

nonselectively labelled describing a labelled compound in which the position(s) and the number of the labelling nuclide(s) are both undefined.

nonsense codon or nonsense triplet any one of the nucleotide

nal termination of translation and release of the polypeptide chain from the site of synthesis. A codon that is nonsense in one strain of an organism may nevertheless code for an amino acid in another strain containing an appropriate suppressor gene (see nonsense suppressor). UGA sometimes codes for selenocysteine and, in mitochondria, for Trp. In mitochondria AGA is a nonsense codon rather than UGA. Compare missense codon.

nonsense mutation any mutation in a DNA molecule that results in an alteration of a sense codon to a nonsense codon in the mRNA transcript, the translation of which leads to the formation of a truncated polypeptide gene product. Compare missense mutation.

nonsense suppressor any tRNA molecule that is able to insert an amino-acid residue into a growing polypeptide chain at a nonsense codon in an mRNA molecule. It has an altered anticodon, produced as a result of a suppressor mutation.

nonshivering thermogenesis abbr.: NST; a mechanism of rapid heat production in response to cold that does not involve muscular contractions. It is important during the neonatal period, during cold adaptation of a number of small mammals, and during the arousal period of animals that hibernate. Heat is produced in the mitochondria of brown adipose tissue in response to the presence in the inner mitochondrial membrane of a specific 32 kDa protein. This protein uncouples the respiratory chain and is inducible by norepinephrine. It is known as brown fat uncoupling protein.

nonsuppressible insulin-like activity abbr.: NSILA; insulinlike activity that is not suppressible by specific antisera to insulin. The activity in serum was once thought to be in two protein fractions: a minor component (abbr.: NSILA_s), soluble in acidic aqueous ethanol; and a major component (abbr.: NSILA_n), precipitable by acidic aqueous ethanol and now known to be an artefact. The activity is now attributed to insulin-like growth factors.

nontranscribing strand (of duplex DNA) see coding strand. **nonulose** any **ketose** having a chain of nine carbon atoms in the molecule.

nonyl symbol: Nn; the alkyl group CH₃[CH₂]₇CH₂-, derived from nonane.

nonyl glucoside n-nonyl- β -D-glucopyranoside; a mild, nonionic detergent, CMC 6.5 mM. Compare heptyl glucoside, hexyl glucoside, octyl glucoside.

nopaline N-(1-carboxy-4-guanidinobutyl)glutamic acid; N^2 -(1,3-dicarboxypropyl)arginine; a rare amino-acid derivative that is produced by a certain type of crown-gall tissue (see crown-gall disease); one of a group of opines. The genes responsible for the synthesis of nopaline are part of the **T-DNA** from a Ti-plasmid.

nopalinic acid or ornaline N-(1-carboxy-4-aminobutyl)glutamic acid; N^2 -(1,3-dicarboxypropyl)ornithine; one of a group of opines found in plant tumours occurring in crown-gall disease.

triplets UAA (ochre), UAG (amber), and UGA (opal) that sig-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYỄN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

nor+

nor+ prefix (in chemical nomenclature) denoting 1 replacement of one side-chain methyl group by a hydrogen atom, e.g. norepinephrine, 19-nortestosterone. Replacement of two or three methyl groups is denoted by the prefix dinor+ or trinor+, respectively (in terpene nomenclature the prefix nor+ formerly denoted removal of all replaceable methyl groups; hence, e.g., 8,9,10-trinorbornane was formerly known as norbornane). 2 elimination of one methylene group from a chain or ring of carbon atoms; it is used especially for steroids, e.g. 23-nor- 5β -cholanoic acid, A-nor- 5β -androstane, norophthalmic acid. Elimination of two or three methylene groups is denoted by the prefix dinor+ or trinor+, respectively. 3 an isomer with an unbranched hydrocarbon chain, e.g. norleucine, norvaline; use discouraged.

noradrenaline an alternative name for norepinephrine.

noradrenergic (sometimes) 1 an (adrenergic) nerve cell that itself liberates noradrenaline (i.e. norepinephrine). 2 a cell or receptor that is stimulated preferentially by norepinephrine. -noradrenergically adv.

norepinephrine or noradrenaline or levarterenol (-)-(3,4-dihydroxyphenyl)-2-aminoethanol; a hormone secreted by the adrenal medulla, and a neurotransmitter in the sympathetic peripheral nervous system and in some tracts in the central nervous system. It is also the demethylated biosynthetic precursor of epinephrine in the adrenal medulla. It has a powerful lipolytic action, mediated by cyclic AMP, and is an agonist for adrenoceptors, inducing arteriolar constriction and raised systolic and diastolic arterial blood pressure.

R-(-)-enantiomer

Norit the proprietary name for a commercially produced activated carbon, useful as an adsorbent.

norleucine symbol: Ahx or (formerly) Nle; 2-aminohexanoic acid; a nonprotein α -amino acid. See also nor+ (def. 3).

norm+ a variant form of **normo+** (before a vowel).

normal 1 not deviating from an established pattern; approximating to an average, or within the usual range (of values). 2 (in organic chemistry) symbol: N; (of a solution) containing one equivalent (def. 4) of a specified substance (of specified equivalence factor) in one litre of solution. Use now not recommended. 3 (in organic chemistry) a chemical compound that has an unbranched chain of carbon atoms; the names of such compounds may be prefixed by 'n', as in n-butane. However, this is not the currently recommended terminology. 4 (in biology) not diseased or not having been exposed to an experimental procedure. 5 (in mathematics) (of a straight line or plane) at a right angle (to another straight line or plane).

normal distribution or Gaussian distribution any continuous frequency distribution of events, observations, etc. characterized by a symmetrical bell-shaped curve of the frequency of x, f(x), against the value of x, that is represented by the equation:

$$f(x) = [1/\sigma(2\pi)^{0.5}]e^{-(x-\mu)^2/2\sigma^2}$$

where μ is the mean and σ is the standard deviation.

normality (in chemistry) the chemical concentration of a solution expressed as the number of equivalents (def. 4) of a specified substance (of specified equivalence factor) per litre. Use now not recommended.

normal range (in clinical chemistry) the range of values of a particular characteristic within which 95 percent of observations made on presumed normal healthy individuals fall. It is useful as a reference in the investigation of disease.

normal saline an alternative and less suitable name for physiological saline.

normal solution a solution in which the amount-of-substance concentration of the equivalent (def. 3) of the reagent is one mole per litre; the equivalence factor of the reagent should be specified. Not now recommended. See also normal (def. 2).

normal temperature and pressure abbr.: NTP or N.T.P. or ntp; a former term for standard temperature and pressure.

normetadrenaline an alternative name for normetanephrine.

normetanephrine or normetadrenaline 3-O-methylnorepinephrine; an inactive metabolite of norepinephrine produced by the action of catechol O-methyltransferase.

normo+ or (before a vowel) **norm+** comb. form denoting normal; used especially in biology and medicine to indicate within the normal range. See also eu+.

normoblast a normal precursor cell to an erythrocyte, characterized by condensation of the nucleus into a homogeneous densely staining body. Normoblasts are normally found only in hemopoietic tissue. —normoblastic adj.

normocyte an erythrocyte of normal colour, shape, and size. normocytic adj.

normoglycemia or (esp. Brit.) normoglycaemia an alternative term for euglycemia. —normoglycemic or (esp. Brit.) normoglycaemic adi.

normotensive having an arterial blood pressure within the normal range for the particular group to which the subject be-

Norrish, Ronald George Wreyford (1897-1978), British physical chemist; Nobel Laureate in Chemistry (1967) jointly with G. Porter, the prize being shared with M. Eigen 'for their studies of extremely fast chemical reactions, effected by disturbing the equilibrium by means of very short pulses of energy'.

norsteroid any steroid that, relative to a parent compound, lacks either one axial methyl group or one methylene group in a side chain, or that has one ring contracted by one carbon atom. See also nor+.

Northern blotting or Northern transfer any blotting in which the primary electrophoresis is performed with RNA, which is subsequently hybridized to radioactive DNA. The term was coined to distinguish the process from Southern blotting, which is performed with DNA.

Northrop, John Howard (1891–1987), US biochemist and protein chemist; Nobel Laureate in Chemistry (1946) jointly with W. M. Stanley 'for their preparation of enzymes and virus proteins in a pure form' [prize shared with J. B. Sumner].

norvaline symbol: Avl (from aminovaleric) or Ape (from aminopentanoic) or (formerly) Nva; 2-aminovaleric acid (now the preferred trivial name); 2-aminopentanoic acid; a nonprotein α -amino acid. See also nor+ (def. 3).

NOS abbr. for nitric-oxide synthase.

noso+ or (before a vowel) **nos+** comb. form indicating disease.

nosocomial 1 associated with a hospital. 2 a disorder (e.g. an infection) acquired during a hospital stay that is unrelated to the primary condition of the patient. A nosocomial infection can refer to hospital workers as well.

nosogenesis an alternative term for pathogenesis. —nosogenic or nosogenetic adj.

nosography a written systematic classification and description of diseases.

nosology the branch of medicine dealing with the classification

of diseases. notatin a name sometimes still used for glucose oxidase. No-

tatin was so called because it is produced in considerable quantity by some microfungi, e.g. Penicillium notatum.

notch a gene, found in Drosophila, that encodes a protein essential for the proper differentiation of ectoderm. Expression recommended.
of the *notch* gene is under the control of neurogenic genes. The Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

gene product is a transmembrane protein with 36 EGF-like repeats; database code NOTC_DROME, 2703 amino acids (288.81 kDa).

notexin a phospholipase A_2 (EC 3.1.1.4) from snake venom that acts as a presynaptic neurotoxin. The reaction is Ca²⁺-dependent. Example (precursor) from the Australian tiger snake, Notechis scutatus scutatus: database code PA2 3_NOTSC, 119 amino acids (13.66 kDa); 3-D structure known.

noviose 6-deoxy-5-C-methyl-L-lyxo-hexose 4-methyl ether; a carbohydrate component of novobiocin.

novobiocin an antibiotic produced by Streptomyces spheroides, S. niveus, and certain other species; it is active against Gram-positive and some Gram-negative bacteria. In susceptible organisms it is a specific inhibitor of (DNA) gyrase, interacting with the B subunit, and thereby interfering with DNA synthesis.

noxa (pl. noxae) anything that is harmful to living organisms. —noxious adi.

Np symbol for neptunium.

NP-40 polyethyleneglycol-p-isooctylphenyl ether; a polyoxyethylene nonionic detergent, CMC 0.05-0.3 mM. Proprietary name: Nonidet P40.

NPC abbr. for neural precursor cell (see **Nedd**).

NPN abbr. for nonprotein nitrogen.

NPY abbr. for neuropeptide Y.

nRNA abbr. for nuclear RNA.

NR protein abbr. for nitrogen regulatory protein.

ns symbol for nanosecond (i.e. 10^{-9} s).

NSF abbr. for National Science Foundation (of the USA).

NSF protein abbr. for N-ethylmaleimide-sensitive fusion pro-

NSILA abbr. for nonsuppressible insulin-like activity.

NSP abbr. for N-succinimidyl propionate, a propionylating

NST abbr. for nonshivering thermogenesis.

NT abbr. for neurotrophin.

N terminus or sometimes N terminal the end of any peptide chain in any (poly)peptide or protein at which the 2-amino function of a constituent α -aming acid (or the 2-imino function of an α -imino carboxylic acid) is not attached in peptide linkage to another amino-acid residue. This function may bear an acyl group or other function in nonpeptide linkage; when it is a free amino group (and also protonated and positively charged at neutral or acidic pH values), the chain end may then be alternatively termed the amino terminus (or NH2 terminus) or amino terminal (or NH₂ terminal). However, 'amino terminus' is often used loosely for any N terminus. Compare C terminus. —N-terminal adj.

NTP 1 abbr. for any (unknown or unspecified) nucleoside (5'-)triphosphate. 2 (in clinical biochemistry) abbr. for 5'-nucleotidase (EC 3.1.3.5). 3 or N.T.P. or ntp; abbr. for normal temperature and pressure; stp (i.e. standard temperature and pressure) now used.

NTPase abbr. for nucleoside triphosphatase.

NTP polymerase see polynucleotide adenylyltransferase.

nu symbol: v (lower case) or N (upper case); the thirteenth letter of the Greek alphabet. For uses see Appendix A.

nu body or v body or deoxyribosome a type of spheroid particle seen on electron-microscopic examination of chromatin; now thought to be the same as a nucleosome.

Nuc symbol for an undetermined, unidentified, or unspecified nucleoside residue; alternative to N.

nucle+ a variant for of **nucleo+** (before a vowel).

nuclear 1 of, pertaining to, or contained within the nucleus of a cell. 2 of, pertaining to, or concerning an atomic nucleus. 3 of, pertaining to, or operated by energy derived from fission or fusion of atomic nuclei.

nuclear area an alternative name for nucleoid (def. 2).

nuclear atom or central atom (of a coordination entity) the atom to which all other atoms are directly attached.

nuclear body an alternative name for nucleoid (def. 2).

nuclear division or nuclear fission the division of the nucleus of a cell, especially by mitosis or meiosis.

nuclear emulsion a fine-grained photographic emulsion designed for recording the tracks of subatomic particles within it.

nuclear envelope or nuclear membrane the membrane that surrounds the nucleus of a eukaryotic cell. It is a double membrane composed of two lipid bilayers separated by a gap of width 20-40 nm (the perinuclear space). The outer nuclear membrane is continuous with the endoplasmic reticulum of the cell and is sometimes studded with ribosomes. At specialized regions (nuclear pores) the outer nuclear membrane is connected to the inner nuclear membrane.

nuclear filament-related protein abbr.: NUF1; an essential component of the nucleoskeleton with a role in crosslinking filaments or anchoring other molecules. Example from yeast: database code NUF1_YEAST, 944 amino acids (111.66 kDa).

nuclear fission 1 (in biology) an alternative term for nuclear division. 2 (in physics) see fission (def. 1).

nuclear fraction an operational term for the material deposited by low-speed centrifugation of a homogenate of eukaryotic cells or tissue. It consists predominantly of nuclei together with unbroken cells.

nuclear fusion 1 (in biology) the fusion (def. 3) of the nuclei of a heterokaryon leading to the formation of a hybrid cell. 2 (in physics) see fusion (def. 4).

nuclear isomer (in physics) see isomer (def. 2).

nuclear lamina the electron-dense layer lying on the nucleoplasmic side of the inner membrane of a cell nucleus. The polypeptides of the lamina are thought to be concerned in the dissolution of the nuclear envelope and its re-formation dur-

nuclear localization signal abbr.: NLS; a sequence of amino acids seven to nine residues long within a protein, normally at sites away from the N or C terminus, that acts as a signal for the localization of the protein within the nucleus. Characteristically, NLSs are rich in basic residues, but include also one or more prolines.

nuclear magnetic resonance abbr.: NMR or nmr; the phenomenon that occurs when atomic nuclei that possess a mag-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

nuclear magnetic resonance spectroscopy

Dur to stay

netic moment are placed in a constant magnetic field of high intensity and are simultaneously exposed to electromagnetic radiation of an appropriate frequency in the radiofrequency region, whereby the nuclei are caused to change from a low-energy to a high-energy state with the absorption of energy. Nuclei that display this phenomenon include those of the nuclides protium, tritium, carbon-13, nitrogen-15, fluorine-19, and phosphorus-31; all these nuclei have nonzero spins and, therefore, magnetic moments. See also nuclear magnetic resonance spectroscopy.

nuclear magnetic resonance spectroscopy abbr.: NMR spectroscopy or nmr spectroscopy; absorption spectroscopy in the radiofrequency region based on the phenomenon of nuclear magnetic resonance. Unless otherwise qualified the term usually denotes nuclear magnetic resonance spectroscopy of protium atoms, also known as proton magnetic resonance spectroscopy (abbr.: pmr spectroscopy). Nuclei of the same nuclide in different chemical environments give rise to distinguishable spectral lines, the positions, intensities, widths, and multiplicities of which give considerable information about the structure of complicated molecules containing such nuclei. The technique is also useful for determination of the concentrations of particular substances in complex environments, including that of an intact mammal. Compare electron spin resonance spectroscopy, magnetic resonance imaging.

nuclear magneton symbol: μ_N ; a quantity of magnetic moment, given by $\mu_N = eh/4\pi m_p = (m_e/m_p)\mu_B$, where e is the elementary charge, h is the Planck constant, m_e and m_p are the rest masses of an electron and a proton respectively, and μ_B is the **Bohr magneton**. It is a fundamental physical constant, of value 5.050 786 6(17) \times 10⁻²⁷ J T⁻¹.

nuclear matrin see matrin.

nuclear medicine the branch of medicine concerned with the use of radioactive nuclides for diagnosis or treatment of disease, or for medical research.

nuclear membrane an alternative name for nuclear envelope.

nuclear mitotic apparatus protein abbr.: NuMA; one of a family of abundant coiled-coil nuclear proteins located in the nucleus during interphase, but which, when the nuclear envelope disassembles in prometaphase, rapidly redistribute to the developing spindle poles. Example from human: database code S33414, 45 amino acids (4.73 kDa) (one of multiple forms).

nuclear Overhauser effect or nuclear Overhauser enhancement abbr.: NOE; in nuclear magnetic resonance spectroscopy, a phenomenon in which saturation of an electron resonance by the simultaneous application of a radiofrequency field causes, under appropriate conditions, a considerable increase in the polarization of the interacting nuclei and hence in the NMR signal produced.

nuclear Overhauser effect spectroscopy abbr.: NOESY; in nuclear magnetic resonance spectroscopy advantage can be taken of the fact that the energy states of the spins of two nuclei subject to the nuclear Overhauser effect (NOE) are slightly perturbed by the mutual dipolar coupling (the effects of J-coupling are ignored). A perturbation of the populations of the states of one of the spins will lead to a transfer of the populations between the upper and lower energy states of the second spin, thereby modifying the resonance intensity. The NOE can be either positive or negative depending on the nuclei involved and the rapidity of the relative motions of the two spins. The strength of the dipolar coupling is distance dependent. Thus measurements of the NOE between two nuclei can lead to the estimation of the distance between them. Conversely, if the distance between the two nuclei is fixed (e.g. in a bond), then the NOE measurement can yield an indication of the dynamic motions in the molecule. Two-dimensional spectroscopy, known as 2D NOESY, is used to elucidate dipolar coupling networks present in complex biomolecules, using the NOEs between individual ¹H nuclei in the molecule. The network of NOEs obtained provides a basis for the determination

of the three-dimensional structure in solution. Applications include the structures of small proteins and nucleic acids as well as protein-drug and protein-nucleic acid complexes.

nuclear pore any of the numerous similar discrete openings in the nuclear envelope of a eukaryotic cell, where the inner and outer nuclear membranes are joined. The nuclear pores are the central feature of a complex which has a mass of ≈125 MDa in higher eukaryotes and are estimated to contain about 100 different polypeptides. The complex constitutes a diffusion channel about 9 nm in diameter through which proteins enter the nucleus and ribonucleoproteins leave. Small proteins enter freely but the entry of larger proteins is controlled by a mechanism of active transport. Such proteins contain within their primary structure one or more clusters of basic amino acids which comprise the nuclear localization sequence (abbr.: NLS). Two steps are involved: binding to the nuclear envelope, followed by energy-dependent transit through the complex. Four soluble proteins have been shown to assist in the process: karyopherin α, other name: importin α (the NLS receptor), karyopherin β, other name: importin β (which mediates binding to the nuclear pore complex), a small guanosine triphosphatase (abbr.: GTPase), Ran, and p10/NTF2 (a protein of hitherto ill-defined function but now claimed to coordinate the Ran-dependent association and disassociation reaction). Ran cycles between a GDP- and GTP-bound form and is thereby involved in the consumption of energy for the protein import. The exchange factor for Ran (RCC1) is located inside the nucleus whereas its GTPase-activating protein (Rab-GAP1 or RAN1) is cytoplasmic. Much less is known about the mechanism whereby the export of ribonucleoprotein is controlled. RNA itself does not seem to leave the nucleus.

nuclear rest see nucleoid (def. 4).

nuclear transformation transformation of a nuclide; the change of one nuclide into another.

nuclease any enzyme within subclass EC3.1, that catalyses the hydrolysis of ester linkages in nucleic acids. Nucleases with sugar specificity are referred to as ribonucleases or deoxyribonucleases; endonucleases create internal breaks, while 5'- and 3'-exonucleases remove nucleotide residues from the indicated end. Some nucleases are specific for double- or single-stranded nucleic acids.

nucleate 1 or nucleated possessing a nucleus. 2 to form, to act as, or to provide with, a nucleus or nuclei. 3 any salt of a nucleic acid.

nucleation 1 the act or process of nucleating or forming a nucleus. 2 (in chemistry) a the aggregation of molecules to form a polymer or a new phase within a medium. b (also known as seeding) the addition of a small quantity of finely divided crystalline material to a supersaturated solution in order to promote crystallization.

nuclei the plural of nucleus.

nucleic acid abbr.: NA; any single- or double-stranded polynucleotide of molar mass in the range 20 kDa to 40 GDa or more. Nucleic acids are either **deoxyribonucleic acids** (DNA) or **ribonucleic acids** (RNA). The phosphoric residue linking any constituent mononucleotide residue to the next bears one free hydroxyl group, which is weakly acidic. They are universal constituents of living matter and are concerned with the storage, transmission, and transfer of genetic information.

nucleics an informal collective term sometimes used for nucleotides, nucleosides, and nucleobases, whether constituents of nucleic acids or compounds of low M_r , and including their metabolic relatives and synthetic analogues.

nuclein the name given by J. F. Miescher (1844-95) to an unusual phosphorus-containing material that he was able to isolate from the nuclei of pus cells, now known to have been **nucleoprotein**.

nucleinase a name once proposed to designate the enzymes now known as **nucleases**.

nucleo+ or (before a vowel) nucle+ comb. form denoting 1 nucleus or nuclear. 2 nucleic acid.

Bur House

nucleobase any nitrogenous base that is a constituent of a nucleoside, nucleotide, or nucleic acid.

nucleobindin a DNA-binding protein containing a signal peptide, leucine zipper, and basic amino acid-rich regions. It was derived from a cell line from the lupus erythematosus-prone mouse MRL/T. Example (precursor) from human: database code NUBN_HUMAN, 460 amino acids (53.67 kDa).

nucleocapsid the structure within a virus that comprises the proteinaceous capsid and the genomic nucleic acid. In enveloped viruses the nucleocapsid is surrounded by an envelope.

nucleocidin 4'-C-fluoroadenosine 5'-sulfamate; an analogue of adenylate produced by *Streptomyces calvus*, and the first naturally occurring derivative of a fluorosugar to be described. It has antibiotic activity against trypanosomes and inhibits translation in both eukaryotic and prokaryotic systems.

nucleocytoplasmic (of a structure or process) occurring between the nucleus and the cytoplasm; (of a property) relating the nucleus to the cytoplasm.

nucleodisome a structure consisting of two **nucleosomes** and isolable under certain conditions from some forms of chromatin.

nucleohistone any nucleoprotein consisting of DNA and histone(s).

nucleoid 1 resembling a nucleus. 2 the part or parts of a prokaryotic cell containing the genome and functionally equivalent to the nucleus of a eukaryotic cell. The meaning is sometimes extended to include the electron-dense inner zone observable in certain viruses. Other names: bacterial nucleus; chromatinic body; karyoid; nuclear area; nuclear body; nucleoid body; prokaryon. 3 the nucleus-like structure liberated from a eukaryotic cell by mild lysis. It contains histone-free supercoiled DNA within a flexible cage of RNA and protein. 4 or nuclear rest the nuclear residue sometimes observable in an erythrocyte. 5 the very dense core of a microbody.

nucleolar DNA or ribosomal **DNA** the DNA comprising the **nucleolar organizer(s)**.

nucleolar organizer or nucleolus organizer the portion of the genome of a eukaryotic cell that is associated with the nucleolus and contains the genes from which 45S ribosomal-precursor RNA is transcribed.

nucleolar phosphoprotein B23 or nucleophosmin or numatrin a monomeric, or under some conditions disulfide-linked dimeric, nucleolar protein that binds to single-stranded nucleic acids and may be bound to rRNA in the nucleolus. Example (precursor) from human: database code B232_HUMAN, 294 amino acids (32.54 kDa).

nucleolin or protein C23 the major nucleolar protein of growing eukaryotic cells believed to function in pre-rRNA processing and ribosome assembly. It is a phosphoprotein found associated with intranucleolar chromatin and periribosomal particles. Example from human: database code NUCL_HUMAN, 706 amino acids (76.13 kDa).

nucleolus (pl. nucleoli) a small, dense body one or more of which are present in the nucleus of eukaryotic cells. It is rich in RNA and protein, is not bounded by a limiting membrane, and is not seen during mitosis. Its prime function is the transcription of the nucleolar DNA into 45S ribosomal-precursor RNA, the processing of this RNA into 5.8S, 18S, and 28S components of ribosomal RNA, and the association of these components with 5S RNA and proteins synthesized outside the nucleolus. This association results in the formation of ribonucleoprotein precursors; these pass into the cytoplasm and mature into the 40S and 60S subunits of the ribosome. —nucleolar adj.

nucleolytic capable of causing hydrolysis of nucleic acid. **nucleon** a neutron or a proton.

nucleonics the branch of physics concerned with the practical applications of nuclear phenomena.

nucleon number or mass number symbol: A; a dimensionless physical quantity, having an integral value for any given nuclide, equal to the total number of nucleons (i.e. protons and

neutrons) contained in the nucleus of an atom of the nuclide; it also is the integer nearest to the numerical value of the relative atomic mass of that nuclide and is equal to the arithmetical sum of the **neutron number**, N, of the nuclide and the **proton number**, Z, of the relevant chemical element: i.e. A = N + Z. The nucleon number may be attached to the symbol for the chemical element as a left superscript, or to the name of the element as a suffix; e.g. ¹⁴C, or carbon-14.

nucleophile or **nucleophilic reagent** any reagent that is preferentially attracted to a region of low electron density in a chemical reaction. *Compare* **electrophile**.

nucleophilic 1 of, pertaining to, or being a nucleophile; having or involving an affinity for regions of low electron density in a chemical reactant. 2 describing a chemical reaction in which a nucleophilic reagent participates.

nucleophilic catalysis catalysis by a Lewis base, which donates an electron pair to the reactant.

nucleophilic displacement an alternative term for nucleophilic substitution reaction.

nucleophilicity the relative reactivity of a nucleophile, measured in terms of the relative rate constants of different nucleophiles towards a common reactant.

nucleophilic reagent an alternative term for nucleophile.

nucleophilic substitution reaction or nucleophilic displacement a chemical reaction in which a **nucleophile** effects heterolytic substitution in another reactant, both bonding electrons being supplied by the nucleophile.

nucleophosmin see nucleolar phosphoprotein B23.

nucleoplasm all the protoplasm contained within the nuclear envelope of a living cell. —**nucleoplasmic** adj.

nucleoplasmin a heat-stable acidic protein present in the nucleoplasm of many cell types. It forms complexes with histones and functions in the assembly of nucleosomes in the formation of chromatin. Example from *Xenopus laevis*: database code NUPL_XENLA, 200 amino acids (22.02 kDa).

nucleoprotamine any nucleoprotein consisting of DNA and protamine(s).

nucleoprotein any complex of a protein with a deoxyribonucleic acid (deoxyribonucleoprotein) or a ribonucleic acid (ribonucleoprotein).

nucleosidase any enzyme that hydrolyses the N-glycosidic bond in a **nucleoside** (or in a nucleotide or some other derivative of a nucleoside). Such enzymes are classified within the sub-subclass EC 3.2.2, i.e. enzymes that hydrolyse N-glycosyl compounds.

nucleoside 1 symbol (for a residue of an undetermined, unknown, or unspecified nucleoside): N or Nuc; any **glycosylamine** that is a component of a nucleic acid and that consists of a nitrogenous base linked either to β -D-ribofuranose (forming a ribonucleoside, as in RNA) or to 2-deoxy- β -D-ribofuranose (forming a deoxyribonucleoside, as in DNA). The base is either a purine (linked at N-9) or a pyrimidine (linked at N-1, or in the case of pseudouridine at C-5). 2 any compound that is a glycosylated heterocyclic nitrogenous base; the glycose moiety commonly is ribose, but is sometimes a different sugar or a modified sugar; e.g. cytarabine $(1-\beta$ -D-arabinofuranosylcytosine).

nucleoside antibiotic any of a group of nucleosides (def. 2) that are not components of nucleic acids but are produced by various microorganisms and fungi (especially Streptomyces spp.), and have antibiotic activity. They contain unusual nitrogenous bases and/or unusual sugars (or sugar derivatives), and may also contain one or more additional components. Examples include cordycepin, nucleocidin, puromycin, and showdomycin.

nucleoside cyclic phosphate or cyclic nucleotide any nucleotide that consists of a nucleoside doubly esterified with one [ortho]phosphate molecule on its glycose moiety (usually at the 3' and 5'positions, but sometimes at the 2'- and 3'-positions) e.g. cyclic AMP.

al to the total number of nucleons (i.e. protons and nucleoside diphosphatase EC 3.6.1.6; systematic name: nuc-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

nucleotide-binding

Hur Hause

leoside diphosphatase phosphohydrolase; an unspecific enzyme that hydrolyses a number of nucleoside diphosphates to a nucleoside monophosphate and orthophosphate. Substrates include IDP, GDP, UDP, and D-ribose 5-phosphate. There is also the more specific guanosine-diphosphatase, EC 3.6.1.42; systematic name: GDP phosphohydrolase, which hydrolyses guanosine diphosphate to guanylic acid and orthophosphate; example from yeast: database code GDA1_YEAST, 518 amino acids (56.76 kDa).

nucleoside diphosphate any nucleotide that consists of a nucleoside esterified with diphosphate on its glycose moiety (usually at the 5' position, when the symbol is NDP).

nucleoside diphosphate reductase EC 1.17.4.1; recommended name: ribonucleoside-diphosphate reductase; systematic name: 2'-deoxyribonucleoside-diphosphate:oxidized thioredoxin 2'-oxidoreductase; other name: ribonucleotide reductase. A nucleotide reductase enzyme, present in most organisms, that catalyses the formation of a 2'-deoxyribonucleoside diphosphate, oxidized thioredoxin, and H₂O from a ribonucleoside diphosphate and reduced thioredoxin. It requires iron and ATP. The enzyme from Escherichia coli is formed from B2 protein (dimer of β chains; Fe-binding subunit, 3-D structure known) and B1 (dimer of a chains), which contains a disulfide/sulfhydryl redox system; it is the enzyme responsible for the biosynthesis of deoxyribonucleotides from ribonucleotides, e.g. in de novo biosynthesis. The B2 dimer contains two Fe(III) ions (one on each monomer) that form a Fe³⁺-O-Fe³⁺ group. This forms a free radical centre (involving an enzyme tyrosyl residue) that abstracts a hydrogen from the ribose (ultimately from the 2' position, but the mechanism is complex). This leads to loss of the 2'-OH. Hydride ions are lost from enzyme sulfhydryl groups to react with these OH· groups to form water, resulting in formation of disulfide groups. The hydrogen abstracted by the free radical centre is returned to what now becomes 2'-deoxyribose. The enzyme's disulfide groups are reduced in turn by thioredoxin. There is an allosteric site on the B1 subunit dimer; ATP acts at this site as an activator and dATP as an inhibitor, in a complex interaction with a second site that determines the specificity of the enzyme towards different nucleotides. Example from E. coli, a chain: database code RIR1_ECOLI, 761 amino acids (85.64 kDa); β chain: database code RIR2_ECOLI, 375 amino acids (43.34 kDa). A nucleoside triphosphate reductase is produced when the organisms are growing anaerobically.

nucleosidediphosphosugar or nucleoside diphosphate sugar or nucleotide sugar any nucleotide (def. 2) in which the distal phosphoric residue of a nucleoside 5'-diphosphate is in glycosidic linkage with a monosaccharide (or a derivative of a monosaccharide).

nucleoside monophosphate see nucleoside phosphate.

nucleoside phosphate or nucleoside monophosphate any nucleotide that consists of a nucleoside esterified with [ortho]phosphate on its glycose moiety (usually at the 5'-position, when the symbol is NMP).

nucleoside-triphosphatase abbr.: NTPase; EC 3.6.1.15; an unspecific diphosphate phosphohydrolase enzyme that catalyses the hydrolysis of the distal diphosphate bond in various nucleoside triphosphates, with formation of [ortho]phosphate and the corresponding nucleoside diphosphate. It acts also on certain other diphospho-compounds.

nucleoside triphosphate any nucleotide that consists of a nucleoside esterified with triphosphate on its glycose moiety (usually at the 5'-position, when the symbol is NTP).

nucleoside triphosphate reductase EC 1.17.4.2; recommended name: ribonucleoside-triphosphate reductase; systematic name: 2'-deoxyribonucleoside-triphosphate:oxidized thioredoxin 2'-oxidoreductase. A nucleotide reductase enzyme found in Lactobacillus leichmannii (and presumably related organisms). It catalyses the formation of a 2'-deoxyribonucleoside triphosphate, oxidized thioredoxin, and H₂O from a ribonucleoside triphosphate and reduced thioredoxin. It re-

quires cobalt and ATP. Example from L. leichmannii: database code LBARTR, 739 amino acids (81.85 kDa).

nucleosome a particle that forms the primary packing unit of DNA in chromatin. Nucleosomes give electron micrographs of decondensed chromatin a 'beads-on-a-string' appearance, and are released on mild digestion of eukaryotic nuclei with micrococcal endonuclease. Each consists of a segment of duplex DNA, 160-240 base pairs long, with associated histone; about 146 base pairs of the DNA comprise a core particle and the remainder form the linker DNA. The core particle is a disklike structure, 11 nm in diameter and 5.7 nm thick, consisting of two molecules each of histones H2A, H2B, H3, and H4 with approximately two superhelical turns of double-stranded DNA wound round it. In the intact nucleosome, an average of one molecule of histone H1 is on the exterior of each core particle and appears to mediate the packing together of adjacent nucleosomes in condensed chromatin. See also nu body.

nucleotidase any phosphoric monoester hydrolase enzyme that catalyses the hydrolysis of a nucleotide (def. 1, 2) to yield a nucleoside and orthophosphate. The principal ones are classified under three EC numbers (1) EC 3.1.3.31; recommended name: nucleotidase; enzymes having a wide specificity for 2'-, 3'-, and 5'-nucleotides, and that also hydrolyse glycerol phosphate and 4-nitrophenyl phosphate; (2) EC 3.1.3.6; recommended name: 3'-nucleotidase; an enzyme having a wide specificity for 3'-ribonucleotides; these enzymes hydrolyse a 3'-ribonucleotide to a ribonucleoside and orthophosphate. Some such enzymes are not sugar specific. Example, nuclease PA3 (deoxyribonuclease PA3) from Penicillium sp: database code NUP3_PENSQ, 270 amino acids (29.18 kDa). (3) EC 3.1.3.5; recommended name: 5'-nucleotidase; an enzyme having a wide specificity for 5'-ribonucleotides. These enzymes hydrolyse a 5'-ribonucleotide to a ribonucleoside and orthophosphate. Example, (precursor) human ecto-nucleotidase (CD73): database code 5NTD_HUMAN, 574 amino acids (63.29 kDa).

nucleotide 1 or mononucleotide or nucleoside [mono]phosphate any compound that consists of a nucleoside (def. 1) esterified with [ortho]phosphate at either the 3'- or the 5'-hydroxyl group of its glycose moiety (ribonucleosides giving ribonucleotides, and deoxyribonucleosides giving deoxyribonucleotides). Nucleotides are the constitutional units into which nucleic acids are broken down by partial hydrolysis and from which they are considered to be built up. 2 any compound consisting of a nucleoside (def. 2) that is esterified with [ortho]phosphate or an oligophosphate at any hydroxyl group on its glycose moiety. In this sense the term includes nucleoside cyclic phosphate, nucleoside diphosphate, nucleoside diphosphosugar, nucleoside triphosphate, and pyridine nucleotide. 3 any compound containing a moiety of a nucleotide (def. 1, 2). Included are: any carrying an additional phosphoric group at another position on the glycose moiety; any formed (actually or conceptually) from two or more such nucleotides, whether the same or not, joined together in phosphoric-ester linkage (to form an oligonucleotide or a polynucleotide); and, in certain instances, any formed from such a nucleotide joined through a phosphoric anhydride link either to a second nucleotide or to some other phosphate ester. Exceptionally, the term includes also certain analogous compounds (especially flavin mononucleotide, and hence also flavin-adenine dinucleotide) that, being derivatives of ribitol, are not true nucleoside phosphates or else are not formed exclusively from them.

nucleotide-binding fold or nucleotide-binding pocket a common structural feature that is possessed by numerous dehydrogenase enzymes utilizing either of the nucleotide coenzymes NAD or NADP as the acceptor. X-ray crystallographic analysis shows that the coenzyme fits in a pocket made by the folding of the polypeptide chain. Many such enzymes combine specifically with blue agarose owing to putative structural similarity of the bound dye (Reactive Blue 2) to the coenzyme, a property that can be exploited in the separation and purification of these enzymes by affinity chromatography.

nucleotide coenzyme

nut Just Base

A similar property is shown by some other nucleotide-binding enzymes (and also by certain other proteins that do not bind nucleotides).

nucleotide coenzyme any **nucleotide** (def. 2, 3) that is either (1) a coenzyme (e.g. nicotinamide-adenine dinucleotide), or (2) a substrate-carrier in an anabolic reaction (e.g. uridine diphosphate glucose).

nucleotide-gated channel see ion channel.

nucleotide reductase see nucleoside diphosphate reductase, nucleoside triphosphate reductase.

nucleotide sugar an alternative name for nucleoside diphosphate sugar.

nucleotide unit the repeating unit of a polynucleotide chain, defined typically by the sequence of atoms from the phosphorus atom at the 5' end of any one of its component glycose residues to the oxygen atom at the 3' end of the same residue and including all the atoms of the glycose residue and its attached phosphoric residue and nucleobase; atypically, the nucleotide unit at the 5' end of a chain may lack a phosphate group. Nucleotide units in a given chain are numbered sequentially from the chain's 5' end irrespective of the presence or absence of a phosphate group on the 5'-terminal unit.

nucleotidyl the acyl group formed from a nucleoside [mono]phosphate by removal of a hydroxyl group from its phosphoric group.

nucleotidyltransferase an enzyme of subclass EC 2.7.7; such enzymes transfer a nucleotidyl group to a reactant. Possession of such activity is a common mechanism of drug resistance (especially to aminoglycoside antibiotics) in bacteria. An example is gentamicin 2"-nucleotidyltransferase (EC 2.7.7.46); systematic name: NTP:gentamicin 2"-nucleotidyltransferase; other name: 2"-aminoglycoside nucleotidyltransferase. It catalyses a reaction between NTP and gentamicin to form pyrophosphate and 2"-nucleotidylgentamicin. This enzyme can be isolated from Escherichia coli and Klebsiella pneumoniae plasmids, and confers resistance to kanamycin, gentamicin, dibekacin, sisomicin, neomycin, and tobramycin by adenylating the 2"-OH group of these antibiotics. Example from E. coli: database code AADB_ECOLI, 177 amino acids (19.85 kDa).

nucleus (pl. nuclei) 1 (in biology) the most conspicuous organelle of a eukaryotic cell; it contains the chromosomes and (except for some activity in mitochondria) is the sole site of DNA replication and of RNA synthesis in the cell. Usually a spheroidal body, it is separated from the cytoplasm by the nuclear envelope. 2 (in physics) atomic nucleus the positively charged central part of an atom, with which is associated almost the whole of the mass of the atom but only a very small part of its volume. It is composed of nucleons, i.e. protons and neutrons. 3 (in organic chemistry) a characteristic arrangement of atoms, especially a ring structure, that occurs in a series of related organic compounds; e.g. the benzene nucleus. 4 a particle on which a crystal, droplet, or bubble forms in a fluid.

nuclide any individual species of atom, whether stable, metastable, or unstable, that is characterized by the constitution of its nucleus and by its nucleon number, proton number, and nuclear energy state; its mean life must be long enough for the species to be observable. Nuclides having the same proton number but different nucleon numbers or different nuclear energy states are termed isotopic nuclides, or isotopes. Nuclides having the same nucleon number but different proton numbers are termed isobaric nuclides, or isobars. Nuclides having the same neutron number but different proton numbers are termed isotonic nuclides, or isotones. A given nuclide may be specified by attaching its nucleon number either to the name of the relevant chemical element as a suffix, or to the symbol for the chemical element as a left superscript; the proton number may be attached to the symbol as a left subscript; e.g. carbon-14, ¹⁴C, or ¹⁴C. A metastable nuclide (i.e. one with an elevated nuclear energy state) may be differentiated from its counterpart with the same nucleon number by attaching the suffix m to the nucleon number; e.g. technetium-99m or $^{99m}_{43}$ TC. (Absence of a nucleon number attached to its name or symbol implies the presence of all isotopes of the element in natural abundance.) —nuclidic adj.

nude a mutant strain of mouse or rat that lacks a thymus gland and hence is devoid of T lymphocytes. A linked locus also produces hairlessness, hence the name.

NUF1 abbr. for nuclear filament-related protein.

Nujol a proprietary name for a high-boiling-point fraction of liquid paraffin widely used for making mulls for infrared spectroscopy. It is also used medicinally as a laxative, and was referred to by the poet e. e. cummings in *Poem*, or *Beauty Hurts Mr. Vinal*: '...little liver pill-/hearted-Nujol-needing-There's-A-Reason...'.

null a minimum or zero value, especially of an electric current. **null cell** an alternative term for **null lymphocyte**.

nullisomic 1 describing a cell, organism, strain, etc. that lacks one or more pairs of homologous chromosomes. 2 such a cell, organism, strain, etc.

null lymphocyte or **null cell** a **lymphocyte** that is not recognizable as either a B lymphocyte or a T lymphocyte.

null method or zero method a method of measurement in which a zero reading in a sensitive, but not necessarily calibrated instrument, e.g. a galvanometer, enables an unknown value of some property to be deduced by comparison with reference values.

NuMA abbr. for nuclear mitotic apparatus protein.

numatrin another name for nucleolar phosphoprotein B23.

number 1 a concept or expression of quantity reckoned in ones or units; a particular value of such a quantity (which may be integral or zero). 2 the symbol or group of symbols used to represent a number (def. 1); numeral; figure. 3 a numeral or string of numerals used for identification (of something, especially a member of a sequence). 4 to assign numbers to (members of a series); to label with a number or numbers.

number-average molar mass see average molar mass.

number-average relative molecular mass or (formerly) number-average molecular weight see average relative molecular mass.

number concentration symbol: C; see concentration (def. 1d). number fraction symbol: δ ; the number of defined particles or elementary entities of a specified component of a system divided by the total number of defined particles in the system.

numerical aperture (in optics) abbr.: NA; the arithmetic product of the refractive index of the medium in which the objective (lens) of a microscope is situated and the sine of half the angle of view of the objective. The resolving power of the lens is proportional to its numerical aperture.

nurse cell a cell that is connected by cytoplasmic bridges to an oocyte and thereby conveys macromolecules to the growing oocyte.

nus any of three Escherichia coli genes that are involved in transcriptional termination. Their gene products are as follows. NusA is a protein that binds to RNA polymerase, RNA, rho, and the antitermination protein pN, the product of the N gene. It may also bind to NusB. It participates in both the termination and antitermination of transcription. Database code NUSA_ECOLI, 495 amino acids (54.81 kDa). NusB is involved in the transcription termination process at certain sites during normal bacterial growth and is essential for the function of pN. Database code NUSB_ECOLI, 139 amino acids (15.67 kDa). NusG is involved in transcription antitermination. Database code NUSG_ECOLI, 181 amino acids (20.51 kDa).

NutraSweet a proprietary name for aspartame.

nutrient 1 any chemical substance that can be used by an organism to sustain its metabolic activities. 2 serving as or conveying nourishment. 3 (in microbiology) describing a solid or liquid medium that is able to support the growth of a range of nutritionally undemanding chemoorganotrophs.

part with the same nucleon number by attaching the **nutrition** 1 the supply of substances (i.e. nutrients) required by Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

nutritional mutant

NZO_m

an organism, directly or indirectly, for its metabolic activities, i.e. for the provision of energy, for growth, and/or for the renewal of degraded components. 2 the act or process of supplying or receiving nutrients. 3 the scientific study of the nutrient requirements of particular organisms and of the supply of those nutrients. —nutritional adj.

nutritional mutant a mutant strain of a microorganism (alga, bacterium, or fungus) that requires a supply of one or more growth factors in addition to those required by the wild type, i.e. a mutation in a prototroph to form an autotroph.

nutritive 1 containing nutrient(s). 2 of, concerned in, or promoting nutrition.

nux vomica the dried seeds of the Indian tree, Strychnos nuxvomica. They are a source of strychnine, brucine, and other poisonous alkaloids.

Nva symbol for the α -amino acid norvaline (now known as 2aminovaleric acid, symbol: Avl).

Nycodenz the proprietary name for N,N'-bis(2,3-dihydroxypropyl)-5-[N-(2,3-dihydroxypropyl)acetamido]-2,4,6-triiodoisophthalamide; a dense, synthetic, nonionic substance, highly soluble in water, that is capable of forming (autoclavable) aqueous solutions of densities up to 2.1 g mL⁻¹. It is one of several synthetic water-soluble triiodobenzene derivatives designed for use as intensifiers in radiology that have found use in isopycnic gradient fractionation of biological particles.

nyctalopia the medical term for night blindness.

nylon any of a class of synthetic thermoplastic substances, characterized chemically as long-chain polyamides and formed by condensation polymerization of dicarboxylic acids with diamines. They have high melting points, are insoluble, tough, resistant to fracture, and exhibit low friction. Hence they are useful in the manufacture of laboratory apparatus for which these properties are advantageous. Nylon can be formed into fibres or sheets and used for coatings, fabrics, and many other products. It is also used as an alternative to nitrocellulose in hybridization membranes.

nystatin a mycosamine-containing polyene antifungal antibiotic complex (three components) produced by Streptomyces noursei and other Streptomyces spp. It is very similar to amphotericin B in its properties and mechanism. Two proprietary names are Fungicidin and Mycostatin.

NZO mouse abbr. for New Zealand obese mouse.

Oo

0+ prefix (in peptide hormone nomenclature) denoting ovine.

o- prefix (in chemical nomenclature) denoting ortho-. Compare m-, p-.

O symbol for 1 oxygen. 2 a residue of the ribonucleoside orotidine (alternative to Ord).

O- prefix (in chemical nomenclature) indicating substitution on oxygen; a particular oxygen atom in a molecule may be specified by suffixing an appropriate superscript.

OA abbr. for ovalbumin.

OAA abbr. for oxaloacetic acid, or oxaloacetate.

OAG abbr. for 1-oleoyl-2-acetyl-glycerol.

Oakley-Fulthorpe technique a simple double immunodiffusion method that can be used for quantitative determination of antigen concentrations; it is essentially a development of the Oudin technique. As originally described, the antiserum in 1% agar is placed at the bottom of a cylindrical tube above which is placed a layer of 1% agar gel in 1% saline, and 0.5% o-cresol (as a preservative). Subsequently a bacterial filtrate (containing antigen) is layered onto the agar-saline gel and the tube then incubated at 37 °C. Disks or lines of flocculation of antigen-antibody complexes are produced in the agar-saline gel, from whose positions the concentration of antigen(s) may be determined. [After C. L. Oakley and A. J. Fulthorpe, who described the technique in 1953.]

O antigen 1 any of the lipopolysaccharide-protein somatic antigens of the cell walls of Gram-negative bacteria, especially those of the Enterobacteriaceae. They are useful in the serological classification of Salmonella, Shigella, and other bacteria. 2 (sometimes) an alternative name for H antigen (present on erythrocytes of blood group O); see blood-group substance.

ob see oblob.

obelin a luminescent protein that is obtained from the jellyfish *Obelia geniculata*. It is similar to **aequorin** in properties and use

obese having an excessive amount of body fat. —obesity n.

objective (in optics) the lens or system of lenses in an optical instrument (especially a compound microscope) that is positioned nearest to the object to be viewed.

oblate 1 having an equatorial diameter longer than the polar diameter. 2 describing an **ellipsoid of rotation** (including a spheroid) generated by rotation of an ellipse about its minor axis. 3 describing any protein of **oblate** (def. 1) dimensions as observed in hydrodynamic measurements. Compare **prolate**.

obligate by necessity, or without option; used especially of the nature of the environment or of the mode of life of an organism; e.g. obligate aerobe (see aerobe), obligate anaerobe (see anaerobe). Compare facultative.

O blood-group substance see ABO system.

ob/ob the genotype symbol for any of a number of strains of mouse with an inherited form of severe obesity, due to a homozygous recessive autosomal mutation on chromosome 6. Such animals display marked hyperglycemia and insulin resistance. A protein named **leptin**, or OB protein, has been implicated in the control of fat mass and is a product of the ob mutant gene, being deficient in ob/ob mice.

obtuse angle any plane angle greater than 0.5π rad or 90° and less than π rad or 180° .

Oc symbol for the octyl group.

Occam's razor a variant spelling of Ockham's razor.

occlude 1 to block or obstruct (a passage, tube, opening, etc.). 2 (in chemistry) to take up and retain something in the interstices of a solid; e.g. to absorb a gas into a metal or to entrap liquid within crystals during their formation. —occlusion n.

occludin an integral membrane protein that localizes in tight junctions in chick liver. There are four putative membrane-

spanning segments within the N-terminal half. Example from chick: database code A49467, 504 amino acids (55.80 kDa).

occult concealed or hidden; not apparent to the unaided eye.

occult blood blood that is present in a sample in such small quantities, e.g. in feces, that it can only be detected by chemical testing or by microscopy.

occult virus a virus whose presence in a host is inferred but whose isolation or detection cannot be achieved.

occupancy 1 the state or condition of being filled or occupied. 2 the number of similar sites occupied, usually expressed as a fraction or percentage of the total number available. It can refer, e.g., to the number of receptors on a cell surface occupied by a particular agonist or to the number of atomic orbitals of a particular subshell filled by electrons.

occupation theory of agonist action a theory stating that the magnitude of the response to an agonist is directly proportional to the fraction of specific receptors occupied by molecules of the agonist; it assumes that the binding of agonist to receptor is reversible. According to this theory the response will increase to a maximal value when all the receptors are occupied. Compare rate theory of agonist action.

Ochoa, Severo (1905–93), Spanish-born US biochemist; Nobel Laureate in Physiology or Medicine (1959) jointly with A. Kornberg 'for their discovery of the mechanisms in the biological synthesis of ribonucleic acid and deoxiribonucleic [sic] acid'.

ochratoxin any one of several **mycotoxins** produced by the fungus Aspergillus ochraceous, other Aspergillus spp., and Penicillium spp.; the major component, ochratoxin A, is a complex, chlorine-containing derivative of L-phenylalanine that inhibits phosphoenolpyruvate carboxykinase (EC 4.1.1.49). These toxins may occur on contaminated foodstuffs such as corn (maize), peanuts, storage grains, etc.

ochratoxin A

ochre codon or **ochre triplet** symbol: UAA; one of the three terminator codons or **nonsense codons** found in messenger RNA.

ochre mutant any cell or virus carrying an ochre mutation.

ochre mutation a mutation that gives rise to an **ochre codon** at an abnormal position in a messenger RNA molecule.

ochre suppressor any of a number of mutations, occurring in Escherichia coli, that suppress an ochre codon in messenger RNA thereby allowing insertion of one of several alternative amino acids into a polypeptide chain at that site. The mutation results in changed anticodons of the transfer RNA molecules, consequent on single-base substitution in their DNA coding sequences. Ochre suppressors also suppress amber codons.

ochronosis the presence of brown-black pigment in the skin, cartilage, and other tissues due to **alcaptonuria**.

Ockham's razor or Occam's razor a maxim stating that when explaining something there should be a minimal number of assumptions. Entia non sunt multiplicanda praeter necessitatem (entities should not be multiplied except from necessity). [After William of Ockham (1285-1349), English philosopher.] Oco symbol for the octanoyl group.

OCS the proprietary name for a commercial xylene-fluor mixture suited to the liquid-scintillation counting of a wide range of toluene- and xylene-soluble organic samples, especially specimens solubilized in **NCS**.

oct+ a variant form of **octa+** (sometimes before a vowel).

OCT (in clinical chemistry) abbr. for ornithine carbamoyltransferase.

OCT a family of genes encoding transcription factors for eukaryotic RNA polymerase II promoters. The proteins contain a POU domain and contribute to the naming of that domain. They are leucine zipper proteins and bind to octamer sequences. Examples from human: Oct-1, a factor for snRNA and histones: database code OCT1_HUMAN, 743 amino acids (76.40 kDa); Oct 2, a factor for immunoglobulin promoters: database code OCT2_HUMAN, 478 amino acids (51.02 kDa).

octa+ or octo+ or (sometimes before a vowel) oct+ comb. form denoting eight, eightfold, eight times.

octacosa+ comb. form denoting twenty-eight, twenty-eight-fold, twenty-eight times.

octacosanoate see montanate.

octacosanoyi see montanoyi.

octadeca+ comb. form denoting eighteen, eighteenfold, eighteen times.

octadecadienoic acid any straight-chain fatty acid having eighteen carbon atoms and two double bonds per molecule. Linoleic acid (see linoleate) is the all-Z-(9,12)-isomer and is a constituent of most vegetable oils and animal fats. The all-E-isomer of this acid is linolelaidic acid, a constituent of the seeds of Chilopsis linearis, which also contain the all-E-(10,12)-isomer. A number of other isomers have been synthesized chemically.

octadecanoic acid the systematic name for stearic acid; see stearate

octadecapentaenoic acid any straight-chain fatty acid having eighteen carbon atoms and five double bonds per molecule. The *all-Z*-(3,6,9,12,15)-isomer occurs naturally in dinoflagellates.

octadecatetraenoic acid any straight-chain fatty acid having eighteen carbon atoms and four double bonds per molecule. Several isomers occur naturally, including the 3E,9Z,12Z,15Z-isomer, found in seed oil, and the all-Z-(6,9,12,15)-isomer, found in fish oil. The 9Z,11E,13E,15Z-isomer and the all-E-(9,11,13,15)-isomer are α - and β -parinaric acid respectively, from Parinarium laurinum; both isomers are used as fluorescent probes.

octadecatrienoic acid any straight-chain fatty acid having eighteen carbon atoms and three double bonds per molecule. A number of isomers occur naturally, the most prominent being the all-Z-(9,12,15)-isomer, (9,12,15)-linolenic acid; the all-Z-(6,9,12)-isomer is (6,9,12)-linolenic acid (see linolenate). See also columbinic acid, eleostearate.

octadecenoic acid any straight-chain fatty acid having eighteen carbon atoms and one double bond per molecule. (Z)-Octadec-9-enoic acid (i.e. oleic acid; see oleate) is the isomer found widely, often in high proportion, in plant and animal lipids, especially in olive oil. The 5E- and 6Z-(petroselenic acid; see petroselenate) isomers are found in seed oils; the 6E- isomer is named petroselaidic acid, and the 9E- isomer is elaidic acid, a common constituent of fats and oils (see olaidate). The 11E- and 11Z-isomers are, respectively, transand cis-vaccenic acid (see vaccenate).

octaethyleneglycol mono-*n*-decyl ether a nonionic $C_{10}E_8$ detergent (see C_*E_*).

octaethyleneglycol mono-n-dodecyl ether a nonionic $C_{12}E_8$ detergent (see C_xE_y).

octahedral coordination coordination in which six ligands are disposed about a central atom as if at the vertices of an octahedron enclosing that atom.

octahedron (pl. octahedra) any solid geometrical figure having eight plane triangular faces, 12 edges, and six tetrameric vertices. In a regular octahedron the faces are congruent equilateral triangles and may be considered to consist of two equal

pyramids opposing each other on the same square base. —octahedral adj.

octamer 1 an eight-base sequence element that is common in eukaryotic **promoters**. The consensus sequence is ATTTGCAT. It binds a number of transcription factors (see OCT). 2 any polymer of a protein having eight subunits, e.g. β -lactoglobulin at pH 4.7 below 4°C. 3 an assembly of eight histones containing two each of H2A, H2B, H3, and H4, that forms the histone core of the nucleosome.

octanoate or (formerly) caprylate 1 systematic and preferred name for the anion, CH₃-[CH₂]₆-COO⁻, derived from octanoic acid (formerly known as caprylic acid). 2 any mixture of octanoic acid and its anion. 3 any salt or ester of octanoic acid.

octanoyl or (formerly) capryloyl or caprylyl symbol: Oco; the univalent acyl group, CH₃-[CH₂]₆-CO-, derived from octanoic acid (formerly known as caprylic acid).

octet 1 any group of eight. 2 (in chemistry) (esp. valency) a stable group of eight electrons constituting an electron shell of an atom

octo+ a variant form of octa+.

octonic acid any monocarboxylic **aldonic** acid formally derived from an octose by oxidation at C-1.

octopamine β -hydroxytyramine; 1-(p-hydroxyphenyl)-2-aminoethanol; the D(-)-enantiomer is a biogenic amine, about one-tenth as active as norepinephrine, formed by the β -hydroxylation of tyramine by dopamine β -hydroxylase. It is found in the salivary glands of *Octopus* spp. and of *Eledone moschata*.

R-(-)-enantiomer

octopine 1 N-(1-carboxy-4-guanidinobutyl)-L-alanine; N²-(1-carboxyethyl)-L-arginine; D-octopine (i.e. N²-(D-1-carboxyethyl)-L-arginine) is an **opine** found in the tumours of crowngall disease in plants and in the muscles of certain invertebrates. The genes responsible for the synthesis of octopine are part of the **T-DNA** from a **Ti-plasmid**. 2 any opine that, like octopine itself, is an N-substituted derivative of alanine. Octopine was first isolated from the muscles of Octopus, but is found in other cephalopod species and lamellibranchs. The guanidine group can undergo phosphorylation to phosphooctopine, which acts as a **phosphagen**. Compare **octopinic acid**.

D-octopine

octopinic acid N-(1-carboxy-4-aminobutyl)-L-alanine; N²-(1-carboxyethyl)-L-ornithine; D-octopinic acid (i.e.N²-(D-1-carboxyethyl)-L-ornithine) is an **opine** found in the tumours of crown-gall disease of plants; it is a member of the **octopine** (def. 2) family.

octobe any aldose having a chain of eight carbon atoms in the

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

octulose

octulose any ketose having a chain of eight carbon atoms in the

octyl symbol: Oc; the alkyl group, CH₃-[CH₂]₆-CH₂-, derived from octane.

octyl glucoside n-octyl β -D-glucopyranoside; a mild nonionic detergent, aggregation number 84, CMC 20-25 mM. The α glucoside isomer has also been used, e.g. for crystallization of membrane proteins. The lack of absorbance at 228 nm is an advantage in the use of these compounds. Compare heptyl glucoside, hexyl glucoside, nonyl glucoside, octyl maltoside.

octyl maltoside *n*-octyl β -D-maltopyranoside; a mild nonionic detergent, CMC 23 mM. Compare octyl glucoside.

octyl thioglucoside n-octyl 1-thio- β -D-glucopyranoside; a mild nonionic detergent, CMC 9 mM, with properties similar to other alkyl glucosides.

ocular 1 of or concerned with the eye or vision. 2 or eyepiece the lens or system of lenses in an optical instrument (especially a compound microscope) that is positioned nearest to the eye. ocytocin (sometimes) a variant spelling of oxytocin.

od or **o.d.** abbr. for outside diameter.

OD or **O.D.** abbr. for optical density (now called absorbance). Oe symbol for oersted.

oedema an alternative spelling (esp. Brit.) of edema.

oenanthate an alternative spelling (esp. Brit.) of enanthate (see heptanoate).

oenology an alternative spelling (esp. Brit.) of enology.

oersted symbol: Oe; the cgs unit of magnetizing force or magnetic field strength;

1 oersted = $10^3/4\pi$ amperes per metre (= 79.58 A m⁻¹).

[After Hans Christian Oersted (1777–1851), Danish physicist and chemist who discovered the phenomenon of electromagnetism.l

17β-oestradiol an alternative spelling (esp. Brit.) of 17β-estradial

OEt symbol for the ethoxy group, CH₃-CH₂-O- (alternative to

off-rate the constant, k_{-1} , for the dissociation step in any binding equilibrium, e.g. $LB \rightarrow L + B$ in the equilibrium L + B =LB, where L represents ligand and B the molecule it binds; the rate of dissociation of a ligand from the bound complex. The dimensions of k_{-1} are time⁻¹. Compare dissociation constant, on-

OGCP abbr. for oxoglutarate/malate carrier protein; a mitochondrial inner membrane integral protein that plays an important role in several processes, including the malateaspartate shuttle, gluconeogenesis from lactate, and nitrogen metabolism. Example from human: database code M2OM_ HUMAN, 313 amino acids (33.91 kDa). See also mitochondrial carrier proteins.

+ogen a variant form of +gen (after a consonant).

Ogston concept or three-point attachment hypothesis a concept formulated to explain the inherent differing reactivities, often expressed in an enzymic reaction, of identical chemical groups in a prochiral molecule. It states that there must be at least three points of attachment of a substrate molecule to the active site of an enzyme. It is similar to the Easson-Stedman model. [After Alexander George Ogston (1911-96), British biophysicist who formulated it in 1948.]

25-OHD₃ abbr. for 25-hydroxycholecalciferol; calcidiol; use not recommended.

1,25-(OH)₂D₃ 1,25-dihydroxycholecalciferol; abbr. for calcitriol; use not recommended.

24,25-(OH)₂ D_3 abbr. for 24(R),25-dihydroxycholecalciferol; (24R)-hydroxycalcidiol; use not recommended.

25,26-(OH)₂D₃ abbr. for 25,26-dihydroxycholecalciferol; 26hydroxycalcidiol; use not recommended.

1,24,25-(OH)₃ $\mathbf{D_3}$ abbr. for 1,24(R),25-trihydroxycholecalciferol; calcitetrol; use not recommended.

OHHL abbr. for N-(3-oxohexanoyl)-L-homoserine lactone.

ohm symbol: Ω ; the SI derived unit of electric resistance, defined as the resistance between two points on a conductor through which a current of one ampere flows as the result of a potential difference of one volt applied between the points, the conductor not being the source of any electromotive force; i.e. $1 \Omega = 1 \text{ V A}^{-1}$. [After Georg Simon Ohm (1787–1854), German

Ohm's law a law stating that under constant conditions the current, I, flowing through a given conductor is proportional to the potential difference, U, applied across it. The law is often expressed in the form U = IR, where the proportionality constant, R, is the resistance of the conductor.

+oic suffix (in chemical nomenclature) denoting the carboxyl group, -COOH. It is added to the systematic name of an unbranched alkane (or substituted alkane) to denote its modification to the corresponding alkanoic (i.e. carboxylic) acid by formal conversion of a methyl group to a carboxy group; e.g. hexanoic acid, CH₃-[CH₂]₄-COOH, formally derived from hexane, CH₃-[CH_{2]4}-CH₃. It is used also in the trivial names of certain carbocyclic and heterocyclic carboxylic acids; e.g. benzoic acid, furoic acid.

+oid suffix forming adjectives and (associated) nouns 1 denoting likeness to, or having the form of (something specified); e.g. colloid (i.e. gluelike substance). 2 generated by rotation of (the geometrical figure specified); e.g. ellipsoid (i.e. solid figure derived from an ellipse). 3 belonging to the class or group represented by (the type member specified); e.g. steroid (i.e. compound belonging to the same chemical family as sterols). –+oidal *adi*.

oil any of a large, heterogeneous group of neutral, flammable substances that are liquid at room temperature and are characteristically soluble in relatively nonpolar solvents but only sparingly soluble in aqueous solvents. There are three main distinctive groups: (1) animal and vegetable oils, which usually consist predominantly of triacylglycerols but may contain varying amounts of fatty-acid esters of other alcohols; (2) mineral oils, derived from petroleum, coal, shale, etc., which consist predominantly of hydrocarbons; and (3) essential oils.

oil body an alternative name for spherosome.

oil-immersion objective an objective lens in a light microscope designed to be used with a layer of a special oil between the object (or its coverslip) and the lens. The oil is of the same refractive index as the glass of the lens. This arrangement maximizes the numerical aperture and hence the resolving power of the lens.

Oil Red O a stain for lipid it is widely used for staining lipopro-

t who formulated it in 1948.]

Oil Red O

oilseed rape or colza the common name for Brassica campestris, a species of rape grown as a source of rapeseed oil.

okadaic acid a polyether fatty acid, $M_r = 804.9$, used as a potent inhibitor of **protein phosphatases**, especially the PP-1 and PP-2A types. It does not inhibit protein tyrosine kinases and does not activate protein kinase C. It is a tumour promoter, and is implicated as the causative agent of diarrhetic shellfish poisoning. Its name derives from *Hilichondria okadaii*, a marine sponge that feeds on *Prorocentrum lima*, a dinoflagellate from which it is isolated. See structure below.

Okazaki fragment or Okazaki piece or Okazaki segment any of the relatively short polydeoxyribonucleotides that are formed, concomitantly with the continuous replication of one of the two strands of a duplex DNA molecule, as intermediates during the discontinuous replication of the other strand. Such fragments are synthesized from mononucleotides in a direction opposite to that of the movement of the replication fork; then, as replication proceeds, they are covalently joined through the action of a polynucleotide ligase to form a long daughter polynucleotide chain, the lagging strand. These fragments appear to be 1000–2000 residues long in Escherichia coli and 100–200 residues long in mammalian cells; a proportion of them may have RNA primer attached. [After Reiji Okazaki (1930–1975), Japanese molecular biologist.]

OK cell abbr. for opossum kidney cell; any cell of a culture derived from this organ and used to study α_{2C} adrenoceptors.

+ol suffix (in chemical nomenclature) indicating the presence of a hydroxyl group attached to a carbon atom.

+olate suffix used as an alternative to +oxide (def. 1).

old yellow enzyme an obsolete name for the enzyme NADPH dehydrogenase (EC 1.6.99.1), a yellow flavoprotein (FMN in yeast, FAD in plants). Compare new yellow enzyme.

Ole symbol for the oleoyl (i.e. (Z)-octaden-9-enoyl) group.

oleandrose 2,6-dideoxy-3-O-methyl-arabino-hexose; the L
enantiomer is a component of some cardiac glycosides.

L-oleandrose

oleate 1 numerical symbol: 18:1(9); the trivial name for Z-octadec-9-enoate, CH₃-[CH₂]₇-CH=CH-[CH₂]₇-COO⁻ (cis isomer), the anion derived from oleic acid (i.e. Z-octadec-9-enoic acid), a monounsaturated straight-chain higher fatty acid. See also octadecenoic acid, oleic family.2 any mixture of free oleic acid and its anion. 3 any salt or ester of oleic acid. Compare elaidate, vaccenate.

oleate desaturase see phosphatidylcholine desaturase.

olefin an older name for an alkene. -olefinic adj.

oleic family (of polyunsaturated fatty acids) a series of polyenoic acids in which the hydrocarbon chain terminates with the alkenyl grouping CH₃-[CH₂]₇-CH=CH- (as in oleic acid); there are three other series, i.e. the linoleic family, linolenic family, and palmitoleic family. The oleic family can be synthesized from acetyl-CoA: palmitoyl-CoA is first synthesized by the fatty-acid synthase (see fatty-acid synthase complex); next, by chain elongation and action of desaturases, stearoyl-CoA, oleoyl-CoA, and longer chain fatty acyl-CoA compounds are synthesized; then from their respective CoA derivatives, the cognate fatty acids are formed. The series includes (all-Z)-eicosa-5,8,11-trienoic acid. In essential fatty acid deficiency in mammals, longer chain polyunsaturated fatty acids of the oleic family are synthesized, and partially substitute for long-chain polyunsaturated fatty acids of the linoleic family. See also eicosenoic acid, eicosatrienoic acid, Mead acid.

olein an old name for any of the glyceryl esters of oleic acid (see oleate), especially the triester, triolein (i.e. trioleoylglycerol).

oleo (US) abbr. for oleomargarine.

oleomargarine an alternative name (esp. US) for margarine.

oleosome an alternative name for spherosome.

oleoyl or (formerly) oleyl symbol: Ole; the trivial name for (Z)-octadec-9-enoyl, CH₃-[CH₂]₇-CH=CH-[CH₂]₇-CO- (cis isomer), the acyl group derived from oleic acid (i.e. (Z)-octadec-9-enoic acid). It occurs very widely in natural lipids. Compare elaidoyl, vaccenoyl. See also oleic family.

1-oleoyl-2-acetylglycerol abbr.: OAG; an activator of protein kinase C.

oleum fuming sulfuric acid; a solution of SO_3 in concentrated $H_2SO_4 \rightarrow H_2SO_7$.

oleyl 1 a common name for Z-octadec-9-enyl, CH₃-[CH₂]₇-CH=CH-[CH₂]₈- (cis isomer), the monoalkenyl group derived from Z-octadec-9-ene; use deprecated. 2 an old and misleading trivial name for Z-octadec-9-enoyl; oleoyl now used.

olfactomedin a major glycoprotein component of the extracellular matrix of olfactory neuroepithelium. Example (precursor) from *Rana catesbeiana*: database code OLFM_RANCA, 464 amino acids (52.51 kDa).

okadaic acid

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

olfactory receptor any of a group of integral membrane proteins thought to be involved in effecting the sense of smell. They are similar to other G-protein-coupled receptors; several are known (or suspected). Example, presumed olfactory receptor-like protein HGMP07E from human: database code OLFE_ HUMAN, 312 amino acids (35.17 kDa); five motifs.

+olide suffix (to the chemical name of an aliphatic hydrocarbon) denoting conversion to a lactone having the same number of carbon atoms as the parent hydrocarbon.

oligo abbr. (colloquial) for oligonucleotide.

oligo+ or (before a vowel) olig+ comb form denoting 1 few, little, not much, or not many. 2 (in chemistry and biochemistry) a small number of (the component specified); e.g. oligopeptide. 3 (in pathology) deficiency or insufficiency of (some thing or some attribute); e.g. oliguria. Compare multi+, poly+.

oligo-2',5'-adenylate synthetase an enzyme of the sub-subclass EC 2.7.7 that binds double-stranded RNA and polymerizes ATP into $pppA(2'p5'A)_n$ oligomers; the latter activate the latent RNase L causing it to cleave single-stranded RNAs. The enzyme is induced by interferons. It is a homotetramer, associated with many different subcellular fractions. In humans, two forms, E16 and E18, are produced by alternative splicing of the same gene. Examples from human, E16: database code 25A1_HUMAN, 364 amino acids (41.73 kDa); E18: database code 25A2_HUMAN, 400 amino acids (46.00 kDa).

oligodendrocyte a type of glial cell that forms and supports the myelin sheath around axons in the central nervous system of vertebrates. In contrast to the **Schwann cell**, which performs this role in peripheral neurons for a single axon, one oligodendrocyte is involved in the myelination of several axons.

oligo-1,6-glucosidase (EC 3.2.1.10), other names: sucraseisomaltase; limit dextrinase; isomaltase; an enzyme that catalyses the hydrolysis of $1,6-\alpha$ -D-glucoside linkages in isomaltose and dextrins produced from starch and glycogen by α-amylase. Example, isomaltase from Bacillus cereus: database code O16G_BACCE, 558 amino acids (65.94 kDa). A similar enzyme is intestinal human enzyme, which has sucrase/maltase activity; EC 3.2.1.48): database code SUIS_ HUMAN, 1827 amino acids (209.17 kDa).

oligohistidine the homopolypeptide of histidine; the term is used in referring to a histidine tail.

oligomer 1 (in chemistry and biochemistry) any substance or type of substance that is composed of molecules containing a small number - typically two to about ten - of constitutional units in repetitive covalent linkage; the units may be of one or of more than one species. Depending on the branch of chemistry concerned, an oligomer may or may not be considered to be a variety of polymer. 2 (in molecular biology and enzymology) any multimeric protein that contains a finite, relatively small, number of identical subunits (i.e. protomers) that are not in covalent linkage but in a state of reversible association with each other; the protomers may themselves each consist either of single polypeptide chains (i.e. monomers) or of two or more reversibly associated (identical or nonidentical) monomers. This definition is based exclusively on the identity of the subunits and does not restrict the number of polypeptide chains each identical subunit may contain. —oligomeric adj.; oligomerize or oligomerise vb.; oligomerization or oligomerisa-

oligomycin any of a group of closely related macrolide antibiotics produced by an actinomycete similar to Streptomyces diastatochromogenes. Oligomycin B is an inhibitor of oxidative phosphorylation in mitochondria, interfering with the passage of hydrons through the F₀ component of H*-transporting ATP synthase, and of photophosphorylation in chloroplasts. Oligomycin D (rutamycin) is useful as an antifungal agent. (Illustrated opposite.)

oligomycin sensitivity-conferring protein abbr.: OSCP; a protein component of mitochondrial ATP synthase that is required for the binding of the F₁ component to the F₀ compon-

OH H₃C

> oligomycin A oligomycin B: 28-oxo oligomycin C: 12-deoxy oligomycin D: 26-demethyl

oligonucleotide abbr. (colloquial); oligo; any molecule that contains a small number (two to about ten) of nucleotide units connected by phosphodiester linkages between (usually) the 3' position on the glycose moiety of one nucleotide unit and the 5' position on the glycose moiety of the adjacent one.

oligopeptide any molecule that contains a small number (2 to about 20) of amino-acid residues connected by peptide linkages.

oligophosphate 1 any ion or salt of an oligophosphoric acid - an acid containing commonly two or three, but sometimes four or more, phosphoric residues connected by anhydride linkages. 2 any mixture of a free oligophosphoric acid and its various anions. 3 or oligophosphoric ester any ester of an oligophosphoric acid.

oligosaccharide any molecule that contains a small number (2) to about 20) of monosaccharide residues connected by glycosidic linkages.

oligosaccharin any of a group of regulatory oligosaccharides, including a fungal heptaglucoside and a plant oligogalacturonide, that are released from cell walls and control functions such as growth, development, reproduction, and defence against disease. They also include xyloglucans.

N-oligosaccharyltransferase an enzyme that transfers an oligosaccharide with high mannose content from a lipidlinked oligosaccharide donor to an asparagine acceptor site on newly synthesized glycoproteins. It has three subunits: ribophorins I and II, and a 48 kDa subunit, database code (precursor) OST4 HUMAN, 456 amino acids (50.71 kDa).

oligotrophic describing a habitat, especially a lake or other mass of water, that is poor in nutrients capable of supporting the growth of aerobic plants and microorganisms, and (in the case of a lake, etc.) that hence contains abundant dissolved dioxygen at all depths.

olivomycin one of several related components of a complex of antibiotics produced by Streptomyces olivoreticuli. It has been investigated for antineoplastic activity. It is used as a dye specific for G-C base pairs, and stains the R bands first demonstrated in Giemsa staining.

+oma (pl. +omas or +omata) suffix denoting a tumour.

OMe symbol for the methoxy group, CH₃-O- (alternative to

omega symbol: ω (lower case) or Ω (upper case); the twentyfourth and last letter of the Greek alphabet. For uses see Appendix A.

Omega an alternative name for Mega-8.

omega-oxidation or ω-oxidation a minor oxidative metabolic pathway of fatty acids, particularly those of medium chainlength, in which the methyl group that contains the carbon ent of the enzyme system. See also H*-transporting ATP synthase. atom furthest from the carboxyl group of such an acid is oxi-Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Just Bayes

dized first to a hydroxymethyl group and ultimately to another carboxyl group.

omega protein or ω -protein an alternative name for type I DNA topoisomerase.

omeprazole the nonproprietary pharmaceutical name for 5-methoxy-2-{[(4-methoxy-3,5-dimethyl-2-pyridinyl)methyl]sulfinyl}-1H-benzimidazole, a gastric proton-pump inhibitor. It blocks both basal and stimulated secretion of acid in the stomach by reversibly inhibiting H+/K+-transporting ATPase (EC 3.6.1.36) in the cell membranes of parietal cells within the oxyntic glands of the gastric mucosa. It is useful clinically in the treatment of erosive reflux esophagitis, benign peptic ulcer, and Zollinger-Ellison syndrome. Proprietary name: Losec.

omicron symbol: o (lower case) or O (upper case); the fifteenth letter of the Greek alphabet.

ommatidium any of many identical structural units of the compound eye found in many invertebrates. In *Drosophila*, each consists of eight photoreceptor cells and 12 accessory cells. In sevenless and bride-of-sevenless mutants, one of the photoreceptor cells fails to develop.

ommatin a type of ommochrome.

ommatochrome an alternative name for ommochrome.

ommin a type of ommochrome.

ommochrome or ommatochrome any of a large group of yellow, brown, red, or violet natural polycyclic pigments especially commonly found in the Arthropoda, particularly in the ommatidia of the compound eye. They all contain a phenoxazine nucleus and are formed biologically from tryptophan via kynurenine. Ommochromes are divided into two groups: ommatins, which are alkali-labile, of low relative molecular mass, and rather weakly coloured; and ommins, which are alkalistable, and of higher relative molecular mass and more strongly coloured than the ommatins.

OMP abbr. for orotidine monophosphate; see orotidine phosphate. OMP decarboxylase abbr. for orotidine-5'-phosphate decarboxylase, a reaction carried out by the multifunctional enzyme uridine 5'-monophosphate synthase.

+onate noun suffix denoting the anion, a salt, or an ester of an aldonic acid. See also uronate.

onco+ comb. form denoting 1 tumour. 2 volume.

oncofetal parvalbumin see oncomodulin.

oncogen any agent that causes oncogenesis; the term embraces carcinogen.

oncogene any gene associated with the causation of cancer. The first oncogenes to be characterized were isolated from acutely transforming retroviruses; it was found subsequently that the retroviral oncogenes (v-onc) were related to, and probably derived from, normal cellular genes (c-onc), which came to be termed protooncogenes; these in most cases are involved with growth control. The derivation of oncogenes from protooncogenes is presumed to be the consequence of mutations in protooncogenes after capture by the virus, removing regulatory constraints from the protooncogene or its product. This may result from (1) deletions of portions of the oncogene; (2) mutation of the oncogene resulting in a protein product that is in an active state even in the absence of any normally required stimulus; (3) translocation of the gene from the normal site of expression, resulting in an altered gene product

with aberrant function; or (4) amplification of the gene resulting in inappropriate expression or overexpression of the product. Protooncogenes function in normal cells in growth and differentiation pathways. They and their oncogenic counterparts can be grouped into categories based on their roles in these processes. Some have products that act as growth factors (e.g. sis, int-2) or growth-factor receptors (e.g. fms, neu, kit). Others encode signal-transduction molecules normally activated by growth-factor receptors (e.g. ras, raf, mos, and src family members). Others encode proteins that function in the nucleus (e.g. myc, myb, fos, jun) where they influence the expression of other genes. For further details see under individual oncogenes. Strictly speaking, those genes carried by DNA tumour viruses, such as SV40 and adenoviruses, should also be construed as oncogenes. Unlike the retroviral genes, however, they appear to have no cellular counterparts but instead operate by subverting the actions of cellular genes (such as protooncogenes) that normally function to control cell growth. See also FMS, FOS, int-2, JUN, KIT, MOS, MYB, MYC, neu, RAF, RAS. sis. src.

oncogenesis the production or formation of neoplastic tumours or a neoplastic tumour, whether benign or malignant; the term embraces carcinogenesis.

oncogenic (of an agent) causing the formation of a neoplastic tumour or tumours; of or pertaining to **oncogenesis**; the term embraces carcinogenic. —**oncogenicity** n.

oncology the branch of medicine concerned with the study and treatment of neoplastic tumours. —**oncological** adj.; **oncologist** n.

oncolysis the destruction of neoplastic tumours or tumour cells, whether spontaneous or in response to treatment. —oncolytic adj.

oncomodulin other names: parvalbumin beta; oncofetal parvalbumin; an EF-hand Ca²⁺-binding protein that may function in a similar manner to calmodulin. Expression is limited to early embryonic stages, the placental cytotrophoblasts, and neoplastic tissues. Example from human: database code ONCO_HUMAN, 108 amino acids (12.01 kDa).

oncornavirus an old name for a group of RNA tumour viruses now classified in the subfamily Oncovirinae. See retrovirus.

oncostatin M abbr.: OSM; a polypeptide cytokine, produced by activated T cells and PMA-treated monocytes, that inhibits the growth of a variety of cancer cells, but stimulates growth of AIDS-Kaposi's sarcoma-derived cells and normal fibroblasts. It is a member of the interleukin 6 subfamily. It exists as a monomer. Example from human (precursor): database code ONCM_HUMAN, 252 amino acids (28.48 kDa); residues 1-25 are the signal, 26-234 oncostatin M, and 235-252 a propeptide.

oncotic pressure the **colloid osmotic pressure** of plasma proteins; it is important as an index of the flow of water between the blood and the fluid in the tissues.

+one noun suffix denoting ketone.

one-carbon compound an alternative name for C₁ compound.

one cistron-one polypeptide hypothesis an alternative name for the one gene-one polypeptide hypothesis.

one gene-one antigen hypothesis a hypothesis stating that each of the genes in a tissue transplant governing the host's reaction to it is responsible for the manufacture of a particular transplantation antigen and for that antigen alone. It was first formulated by W. Beadle and E.L. Tatum.

one gene-one enzyme hypothesis a hypothesis, developed from the one gene-one reaction hypothesis, stating that every enzyme is synthesized under the control of a different individual gene. It was subsequently refined into the one gene-one polypeptide hypothesis.

tions in protooncogenes after capture by the virus, removing regulatory constraints from the protooncogene or its product. This may result from (1) deletions of portions of the oncogene; (2) mutation of the oncogene resulting in a protein product that is in an active state even in the absence of any normally required stimulus; (3) translocation of the gene from the normal site of expression, resulting in an altered gene product Ban dang doc một quyển sách được tặng bởi HUY

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

the genetic control of polypeptide synthesis had been eluci-

one gene-one reaction hypothesis a hypothesis stating that every specific biochemical reaction is under the ultimate control of a different gene. It was later redefined as the one gene-one enzyme hypothesis.

+onic suffix denoting the formal conversion of an aldose to the corresponding aldonic acid; e.g. glucose gives rise to gluconic acid.

+onium noun suffix denoting a cationic molecular entity in which a heteroatom is bonded to one more univalent ligand than is normal for a neutral molecule containing that heteroatom and therefore bears a formal positive charge; e.g. ammonium, H₄N⁺; dimethylammonium, (CH₃)₂H₂N⁺; diphenyliodonium, $(C_6H_5)_2I^+$; trialkylsulfonium, R_3S^+ (where R = alkyl). See also carbonium ion (def. 2).

ONPG abbr. for ortho-nitrophenyl- β -D-galactopyranoside; a chromogenic substrate used for the detection and assay of β galactosidase activity.

on-rate the constant, k_{+1} , for the association step L + B \rightarrow LB in the equilibrium L + B = LB, where L represents ligand and B the molecule it binds; the rate of association of ligand to form a complex. The dimensions of k_{+1} are time⁻¹. Compare association constant, off-rate.

Onsager, Lars (1903-76), Norwegian-born US physical chemist noted for his work on the theory of dielectrics and for his research into nonequilibrium thermodynamics; Nobel Laureate in Chemistry (1968) for 'the discovery of the reciprocal relations bearing his name, which are fundamental for the thermodynamics of irreversible processes'.

Onsager theory an extension of the Debye-Hückel theory of dielectrics. See also Kirkwood theory.

ontogeny or ontogenesis the entire sequence of events in the development of an individual organism during its lifetime. Compare phylogeny. —ontogenic or ontogenetic adj.

oo+ comb. form denoting ovum or egg.

oocyte (in zoology) a cell of an animal ovary that undergoes meiosis to form an ovum. A primary oocyte is formed by differentiation of an oogonium and then undergoes the first division of meiosis to form a polar body and a secondary oocyte. Following fertilization of the egg, the secondary oocyte undergoes the second meiotic division to form the mature ovum and a second polar body.

oogenesis the complete process of formation and maturation of an ovum from a primordial female germ cell. -oogenetic adj.

oogonium (pl. oogonia) 1 (in zoology) a cell of an animal ovary that undergoes repeated mitosis, eventually forming oocytes. 2 (in botany) the female reproductive organ in certain algae and fungi. —oogonial adj.

OP abbr. for organophosphorus. See organophosphate.

opal codon or opal triplet symbol: UGA; one of the three terminator codons or nonsense codons in a molecule of messenger

opalescence a milky iridescence, similar to that of opal. The opalescence of some solutions is due to the reflection of light by very fine suspended particles. —opalescent adj.; opalesce vb. opal mutant any cell or virus carrying an opal mutation.

opal mutation a mutation that gives rise to an opal codon at an

opal suppressor any of a number of mutations, occurring in Escherichia coli, that suppress an opal codon in messenger RNA thereby allowing insertion of one of several alternative amino acids into a polypeptide chain at that site. The mutation results in changed anticodons of the transfer RNA molecules, consequent on single-base substitution in their DNA coding sequences.

open chain (in chemistry) 1 a chain of atoms in a molecule that is not formed into a ring, i.e. one that has two (or more) free ends. 2 open-chain an alternative term for acyclic.

open circle any circular duplex DNA structure containing one or more single-stranded nicks. Such a structure will dissociate at high pH into two (or more) single-stranded structures.

open circuit (in physics) an incomplete electrical circuit, i.e. one with infinite impedance.

open-loop system a type of system, e.g. a metabolic pathway or an electrical circuit, in which control is not exerted by feedback, each operation or activity being affected only by those earlier in the sequence. Compare closed-loop system.

open reading frame abbr.: ORF; a series of codon triplets, deduced from a DNA sequence, that include a 5' initiation codon running through to a termination codon, and representing a putative or known gene. The problem often arises, e.g. in screening DNA libraries, of determining whether a stretch of DNA represents a gene. For this to be the case, it must, apart from including appropriately placed initiation and termination codons, be of a suitable length and should fulfil certain criteria indicating that the correct reading frame has been selected. Methods for checking this include the RYN method.

open system (in thermodynamics) any geometrically defined volume that can exchange both energy (e.g. heat or work) and matter with its surroundings. Compare adiabatic system, closed system.

open tetrapyrrole see phycobilin.

operand a quantity or function on which a mathematical operation is to be performed.

operating system (in computing) the software that handles input-and-output, file handling, and provides the command language and other user interfaces.

operator 1 (in genetics) a DNA sequence within an operon (under negative promoter control) to which a specific repressor protein can bind, thereby regulating the functioning of a structural gene or group of genes. 2 (in mathematics) a symbol (i.e. an alphabetic character, term, or special symbol) representing a particular operation to be performed on an operand or operands; e.g. Σ (= sum of), d/dx (= differentiate with respect to the variable x), + (= add to).

operon a unit of coordinated and regulated gene activity found in prokaryotes, by means of which the control of the synthesis of a protein or a group of (usually functionally associated) proteins is determined. It consists of a segment of genomic DNA containing a structural gene or a linear sequence of structural genes (which are transcribed as a single unit), together with one or more regulatory regions such as an operator (def. 1). See also Jacob-Monod model, lac operon.

ophidin a trivial name for 2-methylcarnosine; N^{α} -(β -alanyl)-2methylhistidine; a constituent of snake muscle.

ophiobolin a class of sesterterpene produced only by fungi; there are six types based on the ophiobolane structure shown.

abnormal position in a molecule of messenger RNA. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYỄN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

ophthalmic

optical rot

ophthalmic of, or pertaining to, the eye.

ophthalmic acid N-[N-(y-glutamyl)- α -aminobutyryl]glycine; an analogue of glutathione in which the thiol group is replaced by a methyl group. It was originally isolated from the lens of the eye.

opiate 1 any of a group of narcotic drugs structurally related to and including morphine all of which are derived from opium. Apart from morphine the group includes codeine, papaverine, and thebaine. The term is sometimes extended to include the opioids (def. 1) and any other naturally occurring, semisynthetic, or synthetic narcotic substance with similar properties and whose morphine-like effects may be reversed by recognized morphine antagonists. 2 consisting of or containing opium; having narcotic properties similar to those of opium.

opiate receptor a membrane receptor for opiates (see opicid receptor.)

opine any of a class of unusual derivatives of basic amino acids not found in normal plant tissue but found in plant tissue that has been transformed by oncogenic plasmids from agrobacteria. The class includes the **nopaline** and **octopine** families.

opiocortin an alternative name for opiomelanocortin.

opioid 1 any nonalkaloid having opiate-like pharmacological effects that can be reversed by naloxone or other recognized morphine antagonists. 2 describing any substance having such properties.

opioid peptide any naturally occurring peptide that is an opioid (def. 1). Five main groups are recognized: (1) [Leu]-enkephalin and [Met]enkephalin; (2) dynorphin, α and β neoendorphin, and several other peptides that arise (or are presumed to arise) from enkephalin precursors; (3) α , β , γ , and δ endorphins, all of which are formed from β lipotropin; (4) various pronase-resistant peptides present in body fluids, e.g. β casomorphin (in bovine milk); (5) sundry other peptides whose opiate-like action appears to be indirect. [Note: In the past, the terms 'endorphin' and 'opioid peptide' were often used synonymously; it is now recommended that the former should be restricted to those opioid peptides that are derived from β lipotropin.]

opioid receptor any site on a cell surface that interacts in a highly selective manner with an opiate or an opioid (def. 1) and that mediates its prime pharmacological action; types μ , δ , and κ , and possibly σ have been distinguished on the basis of their response to β endorphin (End), dynorphin A (Dyn), [Met]enkephalin (Met), and [Leu]enkephalin (Leu); the potency being, for μ : End > Dyn > Met > Leu; for δ : End = Leu = Met > Dyn; and for κ : Dyn >> End >> Leu = Met. Morphine and its analogues are primarily µ agonists, but also have activity on δ and κ receptors. Effector pathways for all of these types are G-protein-mediated, μ and δ depressing cyclic AMP levels and opening a G-protein-modulated K^+ channel, κ inhibiting a G-protein-modulated Ca²⁺ channel. Some opioids also bind to other receptors known as σ, but morphine has a very low affinity for these receptors and naloxone does not block its action.

opiomelanocortin or **opiocortin** a polypeptide, present in the intermediate lobe of the pituitary gland, that includes within it the entire sequences of the peptide hormones **corticotropin**, α and β melanocyte stimulating hormone, β and γ lipotropin, and β endorphin. It is formed from proogiomelanocortin.

opium the milky, air-dried exudate from incised, unripe seed capsules of the opium poppy, *Papaver somniferum*, and some other species. Opium contains approximately 20 alkaloids, the most significant of which are codeine, morphine, papaverine, and thebaine.

OPLC abbr. for overpressure(d) layer chromatography.

OPRTase see orotate phosphoribosyltransferase.

opsin 1 any of a group of hydrophobic glycoproteins that occur in the visual pigments of vertebrates in equimolecular combination (as Schiff's bases) either with 11-cis-retinal – in iodopsin and rhodopsin – or with 3,4-didehydro-11-cis-retinal – in cyanopsin and porphyropsin. These opsins are of ≈35-40 kDa and consist of single-chain polypeptides glycosylated with two branched oligosaccharides. See also photopsin, scotopsin. 2 any of a group of proteins of ≈25 kDa that occur in combination with retinal in the purple-membrane pigments present in some strains of Halobacterium halobium; e.g. bacterioopsin (in bacteriorhodopsin), haloopsin (in halorhodopsin), and slowopsin (in slow-cycling rhodopsin).

opsonify a less common word for opsonize.

opsonin any blood-serum protein that, when combined with microorganisms or other particulate material (e.g. foreign erythrocytes), increases the latter's susceptibility to phagocytosis. The two main classes are immunoglobulin G antibodies and the C3b and IC3b fragments formed from the C3 component of complement; other classes include fibronectin and the soluble mannose-binding protein of serum. An opsonin molecule acts by linking the surface of the particulate matter to a specific receptor on the surface of a phagocytic cell; commonly this receptor is either an Fc receptor (recognizing the Fc domain of an IgG immunoglobulin molecule) or a CR3 receptor (recognizing the IC3b fragment of complement). —opsonic adj.

opsonize or **opsonise** or (less commonly) **opsonify** to render (microorganisms or other particulate material) more susceptible to phagocytosis by coating with **opsonin**. —**opsonization** or **opsonisation** or **opsonification** n.

optic 1 or optical of or pertaining to the eye or the sense of sight; aiding vision. 2 a less common word for optical (def. 1, 2).
optical 1 or optic of, pertaining to, or involving light. 2 or optic of or pertaining to optics. 3 a less common word for optic (def. 1).

optical activity the ability (of chiral substances or their solutions, and chiral crystals) to rotate the plane of polarization of a transmitted beam of plane-polarized light. There is usually a correspondence between **chirality** of molecules and optical activity. See also **chiroptical**.

optical antipode an older term for enantiomer.

optical density a term (no longer recommended) for absorbance. optical isomer an older term for enantiomer.

optical isomerism an older term for enantiomerism.

optically active having or displaying optical activity; the term is often used interchangeably with **chiral**.

optically inactive lacking optical activity (through being either achiral or racemic).

optical purity the ratio (usually expressed as a percentage) of the **specific optical rotation** of a sample of an enantiomeric substance to the specific optical rotation of a pure single enantiomer of the substance. *Compare* enantiomeric purity.

optical rotation or rotation 1 the phenomenon of rotation of the plane of polarization of plane-polarized light on its transmission by (solutions of) chiral substances, and by chiral crystals. By convention, optical rotation is designated as rightwards, or positive — and termed dextrorotation — when it is clockwise as seen by an observer looking towards the light source, and designated as leftwards, or negative — and termed levorotation — when it is anticlockwise. 2 or optical rotatory power the ability of (a solution of) a chiral substance to effect such rotation, an effect that is normally associated with optical activity. 3 symbol: α; any measure, expressed in angular degrees, of such ability under specified conditions; see molar optical rotation, specific optical rotation.

in. It is formed from prooniomelanocortin.

Cal rotation, specific optical rotation.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

- optical rotatory dispersion abbr.: ORD; the variation of optical rotation with the wavelength or frequency of the transmitted light. The shape of an optical rotatory dispersion spectrum of a solution of a macromolecule often gives useful information about the conformation of the solute. See also circular dichroism, Cotton effect.
- optical rotatory power an alternative term for optical rotation (def. 2).
- optical system any arrangement of diffraction gratings, lenses, mirrors, prisms, etc., frequently within a specific instrument and used for a specific purpose.
- **optics** 1 (functioning as sing.) the branch of physics concerned with the nature, properties, and behaviour of (visible) light and with the characteristics of optical devices, instruments, and systems. The term is extended to other kinds of electromagnetic or particulate radiation in so far as they have similar properties to light. 2 a collective term for an arrangement of optical components (in an instrument); the optical properties of such an arrangement.
- **OPTLC** abbr. for overpressured thin-layer chromatography. See overpressure(d) layer chromatography.
- oral of or pertaining to the mouth; adminstered by mouth.
- orbit 1 a closed circular or near-circular course taken by a moving body (often around something). 2 the depression in the skull that contains the eye. 3 to move in or as if in an orbit (def. 1). See also orbital.
- orbital 1 any wave function, Ψ, of an electron in a molecular entity. It is characterized by a particular energy value and a unique set of three quantum numbers; the counterpart in wave mechanical theory of an electron orbit in Niels Bohr's concept of atomic structure. Any particular orbital may be occupied either by one electron or by two electrons of opposed spins, or it may be unoccupied. The square of the value of Ψ at any point can be interpreted as the probability of the electron being located at that point, or as the average fractional charge density at that point. See also atomic orbital, molecular orbital, pi orbital, sigma orbital. 2 of, relating to, occupying, or moving in or as if in an orbit (def. 1). 3 belonging to the orbit (def. 2).
- **orbital shaker** a device designed to impart an orbital motion to flasks, tubes, etc. with the purpose of mixing their contents and facilitating the transfer of gases from the gaseous to the liquid phase. It is useful especially for growing cultures of cells.
- orcinol test or Bial's test a colorimetric test specific for aldopentoses. The sample is heated with strong acid to convert any aldopentose present to furfural (i.e. 2-furaldehyde), which is then reacted with orcinol (i.e. 5-methyl-1,3-benzenediol) in the presence of ferric chloride to give a blue-green compound extractable into amyl alcohol. The test is used for the determination of RNA and the detection of pentosuria. [After Manfred Bial (1870-1908), German physician.]
- **ORD** abbr. for optical rotatory dispersion.
- Ord symbol for a residue of the ribonucleoside orotidine (alternative to O).
- **order 1** (in chemistry) sequence (of residues in a polymer). 2 order of reaction. 3 (in taxonomy) a category consisting of a number of similar families (sometimes only one family). One or more orders make up a class. 4 (in mathematics) the number of times a function must be differentiated to obtain a particular derivative. 5 (in mathematics) the number of columns or rows in a determinant or a square matrix. 6 order of magnitude.
- ordered mechanism or ordered pathway (for an enzymic reaction involving two substrates, $A + B \rightleftharpoons C$) a mechanism in which the enzyme, E, must necessarily first bind to one substrate, e.g. $E + A \rightleftharpoons EA$, and then to the second substrate, thus EA + B = EAB, this ternary complex then reacting to form the product, EAB \rightleftharpoons E + C. Compare random mechanism.
- **order of magnitude 1** a tenfold range of magnitude extending from a particular value either upwards or downwards. 2 a magnitude expressed to the nearest power of ten.
- order of reaction symbol: n; the sum of the exponents of the concentration terms in the rate equation for an elementary CH₂CH₂-; glycyl, H₂NCH₂C(=0)-; ribosyl, C₃H₉O₄-. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

- chemical reaction considered in one direction only. It may also be applied to certain composite reactions.
- **order of reflection** symbol: n; the integer, n, in the equation of
- **ordinate** the vertical, or y, coordinate in a plane rectangular (Cartesian) coordinate system. Compare abscissa.
- **ORF** abbr. for open reading frame.
- organ any part of the body of a multicellular organism that is adapted and/or specialized for the performance of one or more vital functions. The term is sometimes extended to include organelles of unicellular organisms.
- organ culture a category of tissue culture, in which an organ, part of an organ, or an organ primordium, after removal from an animal or plant, is maintained in vitro in a nutrient medium with retention of its structure and/or function.
- organelle any discrete structure in a unicellular organism, or in an individual cell of a multicellular organism, that is adapted and/or specialized for the performance of one or more vital functions.
- organic 1 of, pertaining to, or derived from an organism or organisms. 2 of, pertaining to, or affecting an organ or organs. 3 of, relating to, or being a compound of carbon, whether or not of natural origin. 4 of any element contained in an organic compound. 5 any organic compound.
- organic chemistry the branch of chemistry concerned with the compounds of carbon in covalent linkage, whether natural or artefactual, including most compounds of biological origin but excluding some simple carbon compounds, e.g. oxides, sulfides, and cyanides. See also organic compound.
- organic compound any compound containing carbon in covalent linkage; various simple carbon compounds, especially carbon dioxide, carbonic acid, and salts and ions of carbonic acid, are usually excluded.
- organiser a variant spelling of organizer.
- organism any unicellular or multicellular prokaryote or eukaryote, usually extended to include various noncellular nucleic-acid-containing infective agents such as viruses.
- **organizer** or **organiser** (in embryology) any part of an embryo that, through substances produced by it, stimulates the morphological development and differentiation of other parts.
- organo+ comb. form denoting organic (def. 1, 2, 3).
- organogenesis the formation and development of organs in an organism. - organogenetic adj.
- organoleptic affecting, involving, or making use of the sense organs, especially those of smell and taste.
- organomercurial 1 or organomercury of, pertaining to, or being an organic compound containing mercury, especially one in which a mercury atom is linked directly to one or more carbon atoms. 2 or organomercury compound any such compound.
- organometallic 1 or organometal of, pertaining to, or being a metal-containing organic compound, especially one in which a metal atom is linked directly to one or more carbon atoms. 2 or organometal compound any such compound.
- organophosphate 1 any organic compound containing a phosphoric (including fluorophosphoric, thiophosphoric, etc.) residue in amide, anhydride, ester, or thioester linkage. 2 any of a number of organophosphorus compounds originally developed as nerve gases, but formerly used as agricultural insecticides and as anthelmintics, the best known being diisopropylphosphofluoridate. These compounds inhibit serine proteases (including acetylcholinesterase, crucial for nerve transmission) by blocking an essential serine residue. See also aminoethylbenzenesulfonylfluoride, diisopropyl fluorophosphonate, phenylmethylsulfonyl fluoride.
- organotroph an alternative term for heterotroph(e).
- organotrophic 1 heterotrophic; see heterotroph(e). 2 of, pertaining to, or influencing the formation or nourishment of bodily organs.
- organyl any organic substituent group, regardless of functional type, that has a single free valence at a carbon atom; e.g. ethyl, CH_3CH_2- ; glycyl, $H_2NCH_2C(=0)-$; ribosyl, $C_5H_9O_4-$

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Sur Heart

origin (in mathematics) the point of intersection of a set of (usually two or three) coordinate axes; the point whose coordinates are all zero. —**original** adj.

O-ring a toroidal ring, usually of circular cross-section, made of neoprene or similar material and useful as a fluid- or gastight seal between particular parts of a device while permitting relative movement between them.

Orn symbol for a residue of the α -amino acid L-ornithine.

ornaline an alternative name for nopalinic acid.

ornithine symbol: Orn; α, δ -diaminovaleric acid; 2,5-diaminopentanoic acid; an amino acid only rarely found in proteins. L-Ornithine is an intermediate in the biosynthesis of arginine (see ornithine-urea cycle) and, in plants, of pyrrolidine and tropane alkaloids; it was first found as its dibenzoyl conjugate, ornithuric acid. D-ornithine is a component of bacitracin A.

ornithine acetyltransferase see glutamate N-acetyltransferase. ornithine carbamoyltransferase abbr. (in clinical chemistry): OCT; EC 2.1.3.3; systematic name: carbamoyl-phosphate:L-ornithine carbamoyltransferase; other names: ornithine transcarbamylase; citrulline phosphorylase. An enzyme of the ornithine-urea cycle that catalyses a reaction between carbamoyl phosphate and L-ornithine to form L-citrulline and orthophosphate. It is deficient in congenital hyperammonemia. Example, product of arg1 gene in Escherichia coli: database code ECARGI, 334 amino acids (36.93 kDa).

ornithine decarboxylase EC 4.1.1.17; systematic name: L-ornithine carboxy-lyase; an enzyme that catalyses the decarboxylation of L-ornithine to putrescine and CO₂; pyridoxal-phosphate is a coenzyme. It is the first enzyme of polyamine biosynthesis; its activity increases in the cell in response to many agonists, especially those stimulating cell growth. Example from Neurospora crassa: database code DCOR_NEUCR, 484 amino acids (53.24 kDa).

ornithine transacetylase see glutamate N-acetyltransferase.

ornithine-urea cycle or ornithine cycle or arginine-urea cycle or urea cycle a cyclic metabolic pathway, present in mammals and other ureotelic animals, that converts waste nitrogen, in the form of highly toxic ammonium, to essentially nontoxic urea, which may then be excreted. Urea is formed by hydrolysis of L-arginine to L-ornithine, the cycle being completed by conversion of ornithine to L-citrulline by carbamoylation with carbamoyl phosphate (previously formed by enzymic combination of carbon dioxide and ammonium with phosphate from ATP), reaction of the citrulline with L-aspartate to form L-argininosuccinate, and cleavage of this to produce fumarate and regenerate arginine. The cycle is also sometimes called the Krebs cycle or the Krebs-Henseleit cycle, after its discoverers. The role of argininosuccinate was revealed by the US biochemist, Sarah Ratner (1903-), in 1954.

ornithuric acid N,N'-dibenzoylornithine; a detoxication product of benzoic acid found in the excreta of birds.

Oro symbol for a residue of the pyrimidine base orotate.

orosomucoid or α_1 -acid glycoprotein a \approx 40 kDa, water-soluble plasma protein; it consists of a single polypeptide chain with two intrachain disulfide bonds and carrying five branched, highly sialylated oligosaccharide units attached to the β -carboxyl groups of asparagine residues. Certain alleles of the gene encoding this protein have been found to be significantly increased in patients with different types of carcinoma. Exam-

ple from human: database code A1AG_HUMAN, 201 amino acids (23.51 kDa).

orotate 1 symbol: Oro; uracil-6-carboxylate; 1,2,3,6-tetrahydro-2,6-dioxo-4-pyrimidine carboxylate; the anion of orotic acid (i.e. uracil-6-carboxylic acid). It is an intermediate in the biosynthesis of pyrimidine nucleotides from aspartate. 2 any mixture of orotic acid and its anion. 3 any salt or ester of orotic acid.

orotate phosphoribosyltransferase abbr.: OPRTase; EC 2.4.2.10; other names: orotidylic acid phosphorylase; orotidine-5'-phosphate pyrophosphorylase; an enzyme of the pathway for de novo biosynthesis of pyrimidines. It catalyses the formation of orotidine 5'-phosphate from orotate and 5-phospho-α-D-ribose 1-diphosphate, releasing pyrophosphate. Orotidine 5'-phosphate is decarboxylated to uridine 5'-phosphate by orotidine-5'-phosphate decarboxylase. Example, human protein: database code PYR5_HUMAN, 480 amino acids (52.16 kDa) – this contains domains for OPRTase (residues 1-214) and orotidine 5'-phosphate decarboxylase (residues 221-480). Deficiency causes the recessive disease orotic aciduria type 1.

orotic aciduria a rare hereditary disorder of pyrimidine synthesis in humans that is characterized by retarded growth, hyperchromic anemia unresponsive to the usual hematinics, and an excessive excretion of orotate in the urine. It is due to deficiency in the activities of either orotate phosphoribosyltransferase (EC 2.4.2.10) or orotidine-5'-phosphate decarboxylase (EC 4.1.1.23), or both. The condition results in the subject being a 'pyrimidine auxotroph' and can be effectively treated by administration of uracil, which both rectifies the pyrimidine deficiency and indirectly leads, through the effect of cytidine triphosphate on aspartate transcarbamoylase, to inhibition of orotate synthesis.

orotidine symbol: O or Ord; 6-carboxylatouridine; orotate riboside; $1-\beta$ -D-ribofuranosylorotate; a ribonucleoside occurring primarily as its 5'-phosphate, orotidylic acid but produced by certain mutants of *Neurospora crassa* and excreted in relatively large amounts in the urine of cancer patients treated with 6-azauridine. It is not known to be a component of ribonucleic acid.

orotidine monophosphate abbr.: OMP; an alternative name for any **orotidine phosphate**, but in particular for orotidine 5'-phosphate.

orotidine phosphate orotidine monophosphate (abbr.: OMP); any phosphoric monoester or diester of orotidine. Of the three possible monoesters – the 2'-phosphate, the 3'-phosphate, and the 5'-phosphate – and the two possible diesters – the 2',3'-phosphate and the 3',5'-phosphate – only orotidine 5'-phosphate is known to occur naturally (the locant therefore being omitted if no ambiguity may arise).

orotidine 5'-phosphate or 5'-orotidylic acid or 5'-phosphooro-tidine or 5'-O-phosphonoorotidine symbol: Ord5'P; alternative recommended names for orotidine monophosphate (abbr.: OMP), orotidine 5'-(dihydrogen phosphate), orotate ribonucleotide. (The locant is commonly omitted if there is no ambiguity as to the position of phosphorylation.) It is the immediate biosynthetic precursor of uridine monophosphate uridylic acid, UMP, to which it is converted by decarboxylation. Thus it is important also as an intermediate in the biosynthesis of other pyrimidine nucleotides from UMP.

ording this protein have been found to be significantly orotidine-5'-phosphate decarboxylase EC 4.1.1.23; other name: orotidylic decarboxylase; an enzyme that catalyses the Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

orotidine-5'-phosphate pyrophosphorylase

decarboxylation of orotidine 5'-phosphate to UMP a reaction carried out by the multifunctional enzyme 5'-monophosphate synthase. Example from *Neurospora crassa*: database code DCOP_NEUCR, 397 amino acids (43.85 kDa).

orotidine-5'-phosphate pyrophosphorylase see orotate phosphoribosyltransferase.

protidylate 1 either the monoanion or the dianion of orotidylic acid. 2 any mixture of orotidylic acid and its anions. 3 any salt or ester of orotidylic acid.

orotidylic acid the trivial name for any phosphoric monoester of orotidine. The position of the phosphoric residue on the ribose moiety of a given ester may be specified by a prefixed locant – see orotidine phosphate. However, 5'-orotidylic acid is the ester commonly denoted, its locant usually being omitted if no ambiguity may arise. 5'-Orotidylic acid is also an alternative recommended name for orotidine 5'-phosphate.

orotidylic acid phosphorylase see orotate phosphoribosyltransferase.

orotidylic decarboxylase see orotidine-5'-phosphate decarboxylase.

ortho (followed by to) at a position in a benzene ring adjacent to a particular (specified) substituent.

ortho-abbr.: o-; prefix (in chemical nomenclature) denoting an isomer of a disubstituted monocyclic aromatic compound in which the substituents are attached at positions 1 and 2 of the ring. Compare meta-, para-.

ortho+ or (before a vowel) orth+ comb. form 1 straight or upright; perpendicular (to) or at a right angle (to); correct. 2 a (in inorganic chemistry) denoting the most hydrated acid of a series of oxoacids formed from any one of certain anhydrides, or the anion or a salt formed from such an acid. The term is now approved only for orthoboric acid, H₃BO₃; orthosilicic acid, H₄SiO₄; orthophosphoric acid, H₃PO₄; orthoperiodic acid, H₅IO₆; and orthotelluric acid, H₆TeO₆. Compare meta+ (def. 2), pyro+. b (in organic chemistry) similarly denoting hypothetical acids of general formula RC(OH)₃ or C(OH)₄ or real esters of such acids, e.g. trimethyl orthoacetate, CH₃-C(OCH₃)₃; tetramethyl orthocarbonate, C(OCH₃)₄.

ortho- and **peri-fused** describing a polycyclic compound in which one ring contains two, and only two, atoms in common with each of two or more rings of a contiguous series of **ortho-** fused rings. Such compounds have *n* common faces and <2*n* common atoms.

orthochromatic 1 (of a dye or stain) imparting, or capable of imparting, its own colour to a structure. 2 (of a structure) assuming, or capable of assuming, the same colour as that of a dye or stain with which it is treated. Compare metachromatic.—orthochromatically adv.

orthodox conformation the conformation adopted by a mitochondrion in the resting state when the [ATP]/[ADP] ratio is high. This is the usual conformation of mitochondria seen in electron micrographs of thin sections of intact tissue.

ortho-fused describing a polycyclic compound in which any two adjacent rings contain two, and only two, atoms in common. Such compounds have *n* common faces and 2*n* common atoms.

orthogonal 1 (of axes, lines, planes, surfaces, etc.) mutually at right angles; perpendicular to one another. 2 (in statistics) (of

a set of variates) being, or regarded as being, statistically independent.

orthograde see anterograde.

orthologous describing genes of similar function but occurring in different species.

orthomyxovirus any of a group of RNA animal viruses, in class V of the Baltimore classification, consisting of enveloped, pleomorphic particles 80–120 nm in diameter. The nucleocapsids are helical, 6–9 nm in diameter, and of variable length, and contain segmented RNA (minus strand); this is transcribed by a virion polymerase into complementary RNA molecules, which act as messengers. The group includes the influenza A, B, and C viruses.

orthophosphate an alternative name for phosphate (used especially to distinguish from metaphosphate or pyrophosphate). See also ortho+(def. 2a).

orthotopic transplant any tissue graft transplanted into the normal position of that tissue in the body of the recipient.

Compare heterotopic transplant.

Os symbol for osmium.

osamine an alternative name for aminodeoxysugar.

osazone any 1,2-bis(arylhydrazone); i.e. any condensation product of the type RNH-N=CR-CR'=N-NHR formed between an α -dicarbonyl compound (e.g. a 2-ketoaldose) and hydrazine or a substituted hydrazine. α -Hydroxy- and α -amino-carbonyl compounds will also form osazones through oxidation of the corresponding [mono]hydrazones initially formed. See also **phenylosazone**.

oscillator an instrument or device for producing oscillations, especially an electronic device that produces an alternating output of known frequency.

oscillin a 33 kDa protein identified in sperm that induces oscillations in intracellular Ca²⁺ concentrations in mammalian eggs. It is considered to be involved in Ca²⁺ oscillations which serve as the essential trigger for egg activation and early development of the embryo.

oscillograph an instrument for producing a graphical record of an oscillating value.

oscilloscope an instrument for producing a temporary visual record of an oscillating value. A **cathode-ray oscilloscope**, based on the **cathode-ray tube**, provides a visual image of electrical signals, in the form of a graph of the signal over time.

OSCP abbr. for oligomycin sensitivity-conferring protein.

+ose noun suffix 1 originally indicating related to glucose, as either an isomer (e.g. galactose) or a polymer (e.g. cellulose, maltose), now also extended to other sugars (e.g. arabinose, fructose, sucrose) or classes of sugars (e.g. aldose, furanose, ketose, hexose, pentose, pyranose). 2 indicating the primary products of hydrolysis of a biopolymer; e.g. proteose, peptose.

Ose (in glycolipid nomenclature) symbol for a monosaccharide residue. A numerical subscript denotes the number of connected monosaccharide units in the oligosaccharide component, and a prefix of two or three characters represents the trivial name of the oligosaccharide; e.g. GbOse₃ (i.e. globatriaose), nLcOse₄ (i.e. neolactotetraose), McOse₃Cer (i.e. mucotriosylceramide).

oside an alternative term for glycoside.

+oside noun suffix denoting glycoside.

+osis noun suffix denoting 1 a process or state (e.g. metamorphosis, narcosis, necrosis, osmosis). 2 a diseased condition (e.g. nephrosis, tuberculosis). 3 an increase or excess (of something) (e.g. glycogenosis, leukocytosis). See also +otic.

oskar one of the maternal effect genes in Drosophila melanogaster. It organizes the germplasm and directs localization of the germ-cell determinants. Oskar protein is required to keep oskar RNA and staufen (another maternal effect gene) protein at the posterior pole. Three other genes (capu, spir, and stau) are required for the initial localization of the oskar product to the posterior pole of the oocyte. Database code of expressed protein OSKA_DROME, 606 amino acids (69.21 kDa).

osM

osM or **osm** symbol for osmolar (osmol L⁻¹ now recommended). **OSM** abbr. for oncostatin M.

osmiophilic (of a structure or substance) having an affinity for, or staining readily with, osmium tetroxide; e.g. osmiophilic globules (plastoglobuli) in plastids.

osmium tetroxide osmium(VIII) oxide; OsO4; a volatile, evilsmelling, moderately water-soluble, electron-dense substance used for fixing specimens for microscopy, especially electron microscopy, and used chemically in the hydroxylation of alkenes. The vapour is highly poisonous.

osmo+ comb. form denoting 1 osmosis. 2 smell, odour.

osmoceptor see osmoreceptor.

osmol symbol for osmole.

osmolal 1 describing a solution that contains one osmole (of a specified solute), or an indicated number of osmoles, per kilogram of solvent; used also of a specified solute in such a solution. 2 describing an amount-of-substance concentration expressed in osmoles (of a specified solute) per kilogram of solvent. Compare osmolar. See also osmolality.

osmolality the concentration of osmotically active particles in an aqueous solution expressed in osmoles per kilogram of solvent. For a nondissociating substance the osmolality is equal to the molality, whereas for a substance that dissociates in aqueous solution the osmolality is greater than the molality to an extent dependent on the number of particles into which the substance dissociates and on the position of the equilibrium.

osmolar 1 describing a solution that contains one osmole (of a specified solute), or an indicated number of osmoles, per litre of solution; used also of a specified solute in such a solution. 2 abbr.: osM or osm; describing an amount-of-substance concentration expressed in osmoles (of a specified solute) per litre of solution. Compare osmolal. See also osmolarity.

osmolarity the concentration of osmotically active particles in an aqueous solution expressed in **osmoles** per litre of solution. For a nondissociating substance the osmolarity is equal to the molarity, whereas for a substance that dissociates in aqueous solution the osmolarity is greater than the molarity to an extent dependent both on the number of particles into which the substance dissociates and on the position of the equilibrium. Compare osmolality.

osmole symbol: osmol; the amount of substance that contains, or gives rise to, one mole of osmotically active particles when in aqueous solution.

osmometer 1 or membrane osmometer any device for demonstrating the phenomena of osmosis and osmotic pressure; any instrument for measuring osmotic pressure. 2 an apparatus for measuring the acuteness of the sense of smell. -osmometric adj.; osmometry n.

osmophile any organism that grows preferentially (or only) in media of relatively high osmotic pressure, such as ones with a high salt or sugar content. —osmophilic adj.

osmoreceptor or osmoceptor a sensory cell, or group of such cells, that is specialized to react to changes in environmental osmotic pressure, e.g. of blood plasma or of a tissue fluid. Osmoreceptors are located in the hypothalamus, in the main arteries, and at other sites.

osmoregulation the sum of the processes by which organisms regulate their internal contents of water and solutes. —osmoregulatory adj.

osmosis the spontaneous net flow of solvent by diffusion through a semipermeable membrane from a phase where the solvent has a higher chemical potential to one where the solvent has a lower chemical potential. The flow continues until the chemical potential of the solvent becomes the same on both sides of the membrane or until it is countered by a difference in hydrostatic pressure either generated or applied. --osmotic adj.; osmotically adv.; osmose vb.

osmotic coefficient symbol: ϕ_m (on a molality basis) or ϕ_x (on a mole fraction basis); the ratio of the actual to the ideal osmotic pressure of a given solution at a specified temperature;

i.e. a representation of the departure of the solution from ide-

osmotic pressure symbol: II; the excess hydrostatic pressure that must be applied to a solution in order to reduce to zero the net flow of pure solvent into it by osmosis. The osmotic pressure of a dilute solution is equal to the pressure the solute would exert if it could exist as a gas at the same temperature, T, and the same amount-of-substance concentration, c; thus it may be expressed by a relation analogous to the gas equation, i.e. $\Pi = \nu cRT$ where ν is the (average) number of particles into which one solute molecule is dissociated under the given conditions, and R is the gas constant. Osmotic pressure is a colligative property of a solution. See also colloid osmotic pressure, oncotic pressure.

osmotic shock any disruption or other disturbance caused to suspended cells or cell organelles by a sudden change in the osmotic pressure of their suspending medium.

osmotolerant describing a cell or organism that is tolerant to a wide range of osmotic pressures in its environment.

osone any 2-ketoaldose; use not recommended.

ossein the organic material, consisting mainly of collagen, that remains after treatment of bone with dilute acid to dissolve out the inorganic components.

ossify to make into bone or to become bone. —ossification n. **osteo+** or (before a vowel) **oste+** or (sometimes) **ost+** comb. form denoting bone.

osteoblast a mesenchymal cell that secretes the organic matrix of bone (i.e. osteoid, consisting chiefly of collagen); as the matrix becomes calcified the osteoblast becomes trapped and is known as an osteocyte.

osteocalcin other names: γ-carboxyglutamic acid-containing protein; bone GLA-protein (abbr.: BGP); a protein that binds Ca²⁺ and apatite; the binding depends on γ-carboxyglutamic acid residues (three per molecule) formed by vitamin K-dependent carboxylation. Example (precursor) from human: database code OSTC_HUMAN, 100 amino acids (10.95 kDa).

osteoclast a large, multinucleate macrophage that erodes bone matrix and is able to tunnel deep into the substance of compact bone. Osteoclasts are formed by the fusion of blood monocytes and play an important role in the remodelling of bone and the removal of dead bone.

osteocyte an osteoblast when it has become trapped in a lacuna of the bone matrix and is no longer able to divide or secrete appreciable amounts of new matrix. Osteocytes are connected by fine cellular processes that pass through the bone canaliculi.

osteogenesis the processes of bone formation; ossification.

osteogenesis imperfecta a genetically heterogeneous group of human diseases in which there is disorder of connective tissue affecting not only bone but also tendons, ligaments, fascia, etc. The bones are unusually brittle and liable to fracture and in osteogenesis imperfecta congenita in the neonate there is evidence that the collagen of bone matrix may be abnormal.

osteoid 1 the unmineralized bone matrix secreted by osteoblasts; it consists chiefly of collagen. 2 resembling bone.

osteolysis the breakdown and dissolution of bone, especially through disease. —osteolytic adj.

osteomalacia a clinical condition of adults characterized by softening and deformation of the bones due to a failure to maintain their mineralization. It has a wide variety of possible causes, of which dietary deficiencies of vitamin D, calcium, or phosphate are the commonest.

osteonectin see SPARC.

osteopontin other names: bone sialoprotein 1; urinary stone protein; secreted phosphoprotein 1 (abbr.: SPP-1); nephropontin; uropontin; a bone-specific sialoprotein produced by cells in osteoid matrix but independently discovered from several different functions. It can form a bridge between cells and the mineral in the matrix, and is found at high concentrations on the cement lines where bone formation follows resorption. It is also found in the kidney, and plays a principal role in urinary Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

stone formation. In arterial smooth muscle cells, its level increases in atherosclerotic plaques. It is secreted, binds calcium, and binds covalently to fibronectin. It has an RGD integrin-binding sequence and is one of the major ligands for the vitronectin receptor. It is phosphorylated on serine, and is an O- and N-glycosylated protein. There are two forms from alternative splicing. Example (precursor) from human: database code OSTP_HUMAN, 314 amino acids (35.38 kDa).

osteoporosis a clinical condition characterized by a general or local reduction in bone mass with little alteration in gross composition. This causes the affected bones to become porous, brittle, and liable to fracture. Generalized osteoporosis is often hormonal in origin.

Ostwald, Friedrich Wilhelm (1853-1932), Russian-born German chemist; noted also for his work on electrochemistry and for the invention of an industrially important process for the catalytic oxidation of ammonia to nitric acid; Nobel Laureate in Chemistry (1909) 'in recognition of his work on catalysis and for his investigations into the fundamental principles governing chemical equilibria and rates of reaction'.

Ostwald dilution law a relationship, deduced by Ostwald (1888), between the amount-of-substance concentration, c, and the degree of dissociation, α , of a weak electrolyte. It is given by:

$$\alpha^2 c/(1-\alpha) = K,$$

where K is the apparent dissociation constant of the elec-

Ostwald pipette a pipette for measuring small volumes of liquids, especially viscous liquids. It features a capillary stem and delivery jet and a shoulderless bulb near the jet. Various modifications have been described.

Ostwald viscometer a simple capillary viscometer.

+osyl suffix indicating a glycosyl group.

+otic suffix forming adjectives and nouns 1 affected by (e.g. necrotic) or relating to (e.g. osmotic). 2 causing (e.g. mitotic, narcotic). —+otically adv.

ouabain or G-strophanthin a cardiac glycoside whose carbohydrate moiety is L-rhamnose, obtained from the seeds of Strophanthus gratus. It is a specific inhibitor of the membranebound sodium pump Na+,K+-ATPase (see sodium/potassium ATPase) of animal cells.

Ouchterlony technique a development of double immunodiffusion, effected in two dimensions so that comparisons can be made between two or more antigen-containing samples in their reaction with one antiserum. The particular pattern of precipitation lines or arcs formed enables conclusions to be drawn regarding the identity, partial identity, or nonidentity of antigens in the various samples examined. [After O. Ouchterlony, French immunologist.]

Oudin technique a simple, single immunodiffusion technique, effected in one dimension, in which a solution of an antigencorporated in a gel in a tube; antigen diffuses into the gel, where it reacts with antibody to form one or more precipitation bands. [After Jacques Oudin (1923-).]

ounce symbol: oz; a unit of mass, equal in the avoirdupois system to one-sixteenth of a pound (= 28.3495 grams). This must be distinguished from the troy ounce (equal to 480 grains, 31.1035 grams).

outer membrane 1 (in eukaryotes) the more external of the two membranes that surround a chloroplast, a mitochondrion, or a nucleus. 2 (in prokaryotes) the layer of lipopolysaccharide, lipoprotein, and protein that lies external to the peptidoglycan in the cell wall of a Gram-negative bacterium.

outer membrane protein P68 see pertactin.

outlier (in statistics) any member of a set of observations that is so far removed in value from the remaining members that its validity is questionable.

ov+ a variant form of **ovi+** (before a vowel).

ova the plural of ovum.

ovalbumin abbr.: OA; a ≈44.5 kDa glycoprotein, also called egg albumin, that is the major protein of egg white from hens' eggs. Each molecule consists of a single polypeptide chain and carries a single oligosaccharide chain containing only mannose and N-acetylglucosamine residues; one or two phospho groups also may be present. It is included in the serpin family. It is synthesized by the oviduct under hormonal control. Although it is a secreted protein, it has no N-terminal signal peptide. Example from chicken: database code OVAL_CHICK, 385 amino acids (42.70 kDa); 3-D structure known.

ovarian hormone any of the numerous steroid hormones secreted by the ovary.

ovary 1 (in zoology) the gonad of a female animal; vertebrates have a pair of ovaries. The ovary contains oocytes from which ova are produced, and it also secretes various steroid hormones. Its activity is cyclical and is controlled by gonadotropin(s). 2 (in botany) the enlarged basal part of a carpel or a syncarpous gynecium of a flower that contains one or more ovules. —ovarian adj.

overgrowth 1 excessive growth; hyperplasia. 2 a later but more vigorous growth by another strain or species of organism that supplants one already existing.

Overhauser effect or Overhauser enhancement see nuclear Overhauser effect.

overlap peptide a fragment, produced by partial hydrolysis of a polypeptide or protein, that contains both the N-terminal part of the sequence of one further peptide fragment and the C-terminal part of the sequence of a second further peptide fragment, and enables those two to be placed in the correct position in the overall sequence of the parent compound during protein sequencing procedures.

overlapping code a code in which one element of a code-word forms part of an adjacent code-word in an encoded piece of information. A triplet code (such as the genetic code, where the code-words are codons) may be either: a fully overlapping code, in which one code-word consists of the elements at positions n, (n+1), (n+2), and the next code-word consists of the elements at positions (n+1), (n+2), (n+3); or a partially overlapping code, in which adjacent code-words comprise elements at n, (n+1), (n+2), and those at (n+2), (n+3), (n+4). In a nonoverlapping code, such as the genetic code proved to be, no element of one code-word forms part of an adjacent code-

overlapping gene any gene whose polynucleotide sequence overlaps, wholly or in part, that of another gene in the same stretch of a genome. The codons may or may not be in the same reading frame. In mitochondria and some viruses, some mRNAs are synthesized by the transcription of the same DNA using different reading frames.

overpressure(d) layer chromatography abbr.: OPLC; a chromatographic technique that gives some of the advantages of high-pressure liquid chromatography to thin-layer chromatography, containing sample is placed above a column of antiserum in-Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. overshoot

oxidation

tion. The sorbent layer is completely covered by a flexible membrane under external pressure and the solvent is pumped continuously through the sorbent layer.

overshoot the extent to which a control system causes the variable being controlled to go initially beyond its final equilibrium position.

ovi+ or ovo+ or (before a vowel) ov+ comb. form denoting ovum or egg.

oviduct (in zoology) the tube through which ova are conveyed from the ovary to the exterior or to some intermediate organ such as the uterus. In mammals it is known more commonly as the Fallopian tube or uterine tube.

oviductin other name: gp43 processing protease; a high molecular weight glycoprotein that is secreted by the nonciliated secretory cells of the oviduct and later transferred to the zona pellucida of the oocyte during oviductal transit. It processes a 43 kDa glycoprotein of the oocyte envelope during its transit through the duct. Example from golden hamster: database code MAU15048, 635 amino acids (69.36 kDa).

ovine abbr.: o or (formerly) O; of, belonging to, characteristic of, obtained from, or being sheep or a sheep; resembling a sheep, sheeplike.

ovo+ a variant form of ovi+.

ovoflavin or oviflavine a former name for riboflavin.

ovoinhibitor a contaminant of crude ovomucoid that, unlike pure ovomucoid, inhibits chymotrypsin as well as trypsin.

ovomucoid a glycoprotein found in egg white from hens' eggs; it is an inhibitor of trypsin. Example from Gallus gallus: database code IOVO_CHICK, 210 amino acids (22.59 kDa).

ovothiol a novel thiohistidine compound from sea-urchin eggs that confers NAD(P)H-O₂ oxidoreductase activity on ovoperoxidase.

ovotransferrin an alternative name for conalbumin.

ovulate to discharge an egg or eggs from an ovary. —**ovulation**

ovule 1 (in botany) a structure in the ovary of a seed plant that develops into a seed after fertilization of the egg cell within it. 2 (in zoology) a small, especially immature, ovum or egg.

ovum (pl. ova) (in zoology) strictly, an unfertilized egg cell, i.e. female gamete, which contains a haploid nucleus and which on fertilization has the unique ability to develop into a new individual. In many animals, mammals included, oogenesis is arrested and meiosis is not completed until after fertilization of the secondary oocyte, hence in these animals an ovum in the strict sense cannot exist. However, the term is often applied instead either to the secondary oocyte or to the product resulting from the second meiotic division after fertilization.

OWL a composite protein database (University of Leeds, UK). See Appendix E.

oxa+ or (sometimes before a vowel) **ox+** prefix (in chemical nomenclature) denoting replacement of a methylene group in a specified acyclic or monocyclic hydrocarbon by an oxygen atom. For certain natural products, (e.g. tetrapyrroles), the meaning is extended to denote replacement of a noncarbon atom (with any attached hydrogen atoms) by an oxygen atom.

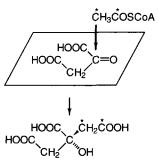

oxalacetate an alternative name for oxaloacetate.

oxalate 1 the trivial name for ethanedioate, "OOC-COO", the dianion of oxalic acid, i.e. ethanedioic acid. It occurs in many plants, especially sorrels of the genera Oxalis and Rumex, and is highly toxic to animals. Normally, small amounts are formed in humans and excreted in the urine; larger amounts occur in patients with hyperoxaluria. The calcium salt is virtually insoluble in water, a property that is valuable in the determination of calcium and in the use of oxalate in vitro as an anticoagulant. 2 any mixture of free oxalic acid and its monoions and dianions. 3 any salt or ester of oxalic acid.

oxalo the univalent acyl group, HOOC-CO-, derived from oxalic acid by loss of one hydroxyl group. See also oxalyl (def. 1). **oxalo+** prefix indicating the presence of an **oxalo** group.

oxaloacetate or oxalacetate abbr.: OAA; 1 the trivial name for

 $^{-}OOC-CO-CH_2-COO^{-}$ (keto form) or $^{-}OOC-C(OH)=$ CH-COO- (enol form); the dianion of oxaloacetic acid. It is an important intermediate in metabolism, especially as a component of the tricarboxylic-acid cycle. The stereochemistry of the citrate (Si)-synthase reaction is shown below.

2 any mixture of free oxaloacetic acid and its mono- and dianions. 3 any salt or ester of oxaloacetic acid.

oxalosis the renal and extrarenal deposition of calcium oxalate (see oxalate) seen in patients with hyperoxaluria.

oxalosuccinate 1 the trivial name for 2-oxotricarballylate (formerly α-ketotricarballylate); 1-oxopropane-1,2,3-tricarboxylate; OOC-CO-CH(COO-)-CH₂-COO-; the trianion of oxalosuccinic acid. It is an enzyme-bound intermediate in the conversion of isocitrate to 2-oxoglutarate by isocitrate dehydrogenase (NAD+) in the tricarboxylic-acid cycle. 2 any mixture of free oxalosuccinic acid and its mono- and dianions. 3 any salt or ester of oxalosuccinic acid.

oxaluria an alternative name for hyperoxaluria.

oxalyl 1 (in biochemistry) (sometimes) an alternative name for **oxalo.** 2 (in chemistry) the divalent diacyl group, -CO-CO-, derived from oxalic acid by loss of both hydroxyl groups.

OXBOX a 13 bp sequence (present in the region -123 to -674 bp) of the heart and skeletal muscle gene for the adenine nucleotide translocator and also in the promoter region of the gene for human ATP synthase β subunit. It appears to be a positive translational element.

oxene a reactive species of oxygen involved in the hydroxylation reaction catalysed by cytochrome P450; it is iron-bound oxygen which is electron deficient but electrically neutral -P450-Fe³⁺-O. It reacts with the bound substrate to release the hydroxylated substrate with the regeneration of P450-Fe³⁺.

oxidant the chemical species that accepts one or more electrons in a redox reaction; i.e. the species that undergoes reduction in such a reaction. Compare reductant.

oxidase any oxidoreductase that catalyses a reaction in which dioxygen is the electron acceptor (i.e. oxidant).

oxidase test a test for the presence of cytochrome c oxidase in bacteria that depends on the oxidation of tetramethyl-pphenylenediamine to a violet-coloured product. It is useful for primary characterization, especially of Gram-negative organ-

oxidation 1 the action or process of reacting with oxygen, especially the addition of oxygen to a substance. 2 the loss or removal of hydrogen from a substance. 3 the loss or removal of one or more electrons from a molecular entity, with or without concomitant loss or removal of a proton or protons. In this sense, oxidation is the opposite of, and is always coupled to. reduction. 4 the increase to a more positive value of the oxidation number of an atom, whether the atom is uncharged or charged, and whether free or covalently bound. —oxidative adj.

 α -oxidation see alpha-oxidation. **B-oxidation** see beta-oxidation. ω-oxidation see omega-oxidation.

oxidation level or oxidation state the status of an organic comnate *(formerly* ketosuccinate); oxobutanedioate; pound in terms of whether it can be considered to undergo ox-Bạn đàng đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

oxidation number

idation or reduction (or neither) upon conversion to a related compound. If conversion involves oxidation, the parent compound is said to have a higher oxidation level than the product; if conversion involves reduction, the parent compound is said to have a lower oxidation level. The term is thus used in a relative rather than an absolute sense. See also oxidation num-

- oxidation number or oxidation state a number assigned to a particular atom in a molecular entity that represents, actually or notionally, the charge on that atom. Thus, atoms of pure elements have an oxidation number of zero; in molecules of simple electrovalent compounds the oxidation number of each component atom is equal to the charge on the respective ion; and in molecules of covalent compounds the notional charge on a particular atom is derived by assigning electrons to the more electronegative partner in each bond involving the atom in question. By convention, hydrogen is considered to have an oxidation number of +1 when in combination with nonmetals. The oxidation number of a carbon atom can range from -4 (e.g. in CH₄) through zero (e.g. in CH₂O or solid C) to +4 (e.g. in CO₂). The oxidation number of an atom may be indicated by a Roman numeral; e.g. iron(III) oxide, ferric oxide, Fe₂O₃. The algebraic sum of the oxidation numbers of all the atoms in any molecular entity must equal the charge on that entity.
- oxidation potential a measure of the tendency of a substance to oxidize spontaneously through loss of electrons. It is the standard potential of the half-reaction: $A \rightarrow A^{n+} + ne$ and is equal to the reduction potential but of opposite sign.

oxidation-reduction an alternative term for redox.

- oxidation-reduction indicator an alternative term for redox
- oxidation-reduction potential an alternative term for redox potential.
- oxidation state 1 an alternative term for oxidation number. 2 an alternative term for oxidation level (less preferred).
- oxidative deamination deamination with concomitant oxidation, as in the enzymic conversion, regardless of the nature of the electron acceptor, of an α -amino acid to an α -oxo acid. Compare reductive amination.
- oxidative decarboxylation decarboxylation with concomitant oxidation, as in the enzymic conversion, regardless of the nature of the electron acceptor, of an α -oxo acid (actually or formally) to a carboxylic acid containing one less carbon atom.
- oxidative metabolism an alternative term for respiration (def.
- oxidative pentose phosphate pathway or hexose monophosphate shunt an alternative route additional to glycolysis in plants that generates: (1) NADPH when it is not being formed by photosynthesis; (2) ribose 5-phosphate required in the biosynthesis of nucleosides; and (3) erythrose 4-phosphate required for biosynthesis of shikimic acid, a key intermediate in the formation of aromatic rings. See also pentose phosphate pathway.
- oxidative phosphorylation or respiratory-chain phosphorylation the phosphorylation of ADP to ATP that accompanies the oxidation of a metabolite through the operation of the respiratory chain. The overall reaction may be summarized by the

$$AH_2 + 0.5O_2 + xP_i + xADP \rightarrow A + (x+1)H_2O + xATP$$

where AH₂ is an oxidizable metabolite, A is the product of the oxidation, P_i is inorganic orthophosphate, and x has a value between 1 and 3 depending on the nature of AH₂ and the functional state of the respiratory chain. The proton gradient built up across the inner mitochondrial membrane by the proton pumps of the respiratory chain drives ATP synthesis by the H*-transporting ATP synthase. See also chemiosmotic coupling hy-

oxide 1 (in inorganic chemistry) any binary compound of oxygen and some other element. 2 an alternative generic name for any cyclic ether that is an oxirane; such a compound is named as the oxide of the alkene from which it may be formed through addition of an atom of oxygen across the double bond; e.g. ethylene oxide, C₂H₄O. 3 a term used in some languages for ether. 4 any compound in which an oxygen atom has been attached to a heteroatom of a precursor compound. This definition includes compounds of general formulae: RC≡NO (nitrile oxides; e.g. benzonitrile oxide), >C=N(O)R or R,R',R"NO (N-oxides, amine oxides; e.g. trimethylamine oxide); and R,R'SO (S-oxides, sulfoxides; e.g. methionine Soxide; dimethyl sulfoxide).

- +oxide or +olate suffix denoting 1 an anion formed by loss of a proton from the hydroxyl group of an alcohol or phenol; e.g. ethoxide ion, C₂H₅O⁻. 2 a compound of such an anion with a cation; e.g. sodium phenoxide (i.e. sodium phenolate), C₆H₅ONa. See also epoxide, hydroperoxide, hydroxide, nitroxide, peroxide, sulfoxide, superoxide.
- oxidize or oxidise 1 to undergo or effect oxidation. 2 to form or cause to form a superficial layer of oxide on a metal. Compare **reduce**. — oxidization or oxidisation n.
- **oxidizer** or **oxidiser** 1 a less common name for **oxidizing agent**. 2 a device for effecting a particular oxidation.
- oxidizing agent or oxidising agent any substance or mixture used for effecting oxidation.
- oxidoreductase the systematic name for any enzyme of class EC 1. These enzymes catalyse oxidation-reduction (i.e. redox) reactions and the class comprises dehydrogenases, oxidases, and reductases.
- **oxidoreduction** an alternative term for redox.
- **oximeter** any photometric device for (continuously) measuring the oxyhemoglobin/hemoglobin ratio in blood, either in vivo or in vitro.
- **oxine** the trivial name for 8-hydroxyquinoline; 8-quinolinol. With many species of metal ion this compound forms waterinsoluble chelate complexes and thereby is useful in analysis. It is also a disinfectant, and, as the copper chelate, is an effective fungicide.
- **oxirane** 1 the class name for any compound containing a threemembered saturated ring comprising two carbon atoms and one oxygen atom. 2 the systematic name for the type member of this class, known commonly as ethylene oxide, C₂H₄O.
- **oxo** 1 the chemical group consisting of an oxygen atom, =0, doubly bonded to another atom (often of carbon) in a molecular structure. When bonded to a carbon atom it forms the carbonyl group, >C=O. Compare oxy. 2 or (formerly) oxo+ modifying the class-name of a chemical compound to indicate the presence of an oxo group as a substituent in place of two hydrogen atoms; e.g. oxocarboxylic acid. The position of substitution may be specified by a predfixed locant; e.g. 17-oxosteroid. See also keto (def. 3). Compare oxo (def. 1).
- **oxo+** or (sometimes before a vowel) **ox+** 1 prefix (in chemical nomenclature) indicating substitution of a doubly bonded oxygen atom into a specified compound or group by the (formal or actual) oxidation of a methylene group, >CH2, to a keto group, >C=O, or of a methyl group, -CH₃, to a formyl group, -CH=O, with the production of a ketone or an aldehyde respectively; e.g. oxoglutaric acid (see oxoglutarate), 3,6dioxohexanoic acid (or 5-formyl-3-oxopentanoic acid). Compare **axo** (def. 2). **2** comb. form denoting presence of one or more (singly or doubly bonded) oxygen atoms in a molecular structure; e.g. oxoacid, oxonium.
- oxoacid 1 the recommended term for any compound whose molecular structure contains oxygen, at least one other element, and at least one atom of hydrogen bound to oxygen, and also that yields a conjugate base (see oxoanion) by loss of a hydron. Examples include: hypochlorous acid, ClOH; sulfurous acid, O=S(OH)2; nitric acid, (O=)NOH; [ortho]phosphoric O=P(OH)₃; and also any phosphonic acid, RP(=O)(OH)₂, and any carboxylic acid, RC(=O)OH (where R = H or hydrocarbyl). See also oxocarboxylic acid. 2 or oxo acid or oxyacid or oxy-acid the traditional name, now obsolete, for any acid having oxygen in its acidic function, as opposed Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. oxo acid

to a 'hydracid' where oxygen is lacking (e.g. hydrochloric acid,

oxo acid 1 see oxocarboxylic acid. 2 a variant of oxoacid (def. 2). 3-oxoacid CoA-transferase EC 2.8.3.5; other name: succinyl-CoA:3-ketoacid-CoA transferase; an enzyme that catalyses

succinyl-CoA + 3-oxo acid = succinate + 3-oxoacyl-CoA.

In mammals it converts plasma acetoacetate that has been taken up by tissues into acetoacetyl-CoA for further metabolism. Example from pig: database code A41771, 520 amino acids (56.34 kDa).

3-oxoacyl-[acyl-carrier protein] reductase (NADH) EC 1.1.1.212; an enzyme that catalyses the reduction by NADH of 3-oxoacyl-[acyl-carrier protein] to (3R)-3-hydroxyacyl-[acylcarrier protein] with formation of NAD⁺. This is one of the steps of fatty-acid synthesis in plants. Compare fatty acid synthase complex.

oxoanion or (formerly) oxo anion or oxyanion or oxy-anion any of the possible anions formable from a molecule of an oxoacid (def. 1) by loss of one or more hydrons.

oxobutanedioate see oxaloacetate.

oxocarboxylic acid the recommended name for any carboxylic acid that contains an aldehydic group attached to, or/and one or more ketonic groups contained in, its principal chain or parent ring system, i.e. any into which one or more oxo groups have been substituted. The term is commonly shortened to oxo acid, but the full name should be used wherever confusion with oxoacid is possible. The older term keto acid is often still used (see keto (def. 3)).

17-oxogenic steroid or (formerly) 17-ketogenic steroid any urinary corticosteroid or its metabolites that can be estimated by the Zimmermann reaction after oxidation to the corresponding 17-oxo steroid.

oxoglutarate or (formerly) ketoglutarate; 1 2-oxoglutarate or α-oxoglutarate 2-oxopentanedioate; OOC-[CH₂]₂-CO-COO-; the dianion of 2-oxoglutaric acid (i.e. 2-oxopentanedioic acid), an α -oxo (carboxylic) acid. It is a key constituent of the tricarboxylic-acid cycle and a key intermediate in amino-acid metabolism. In the cycle it is formed by oxidative decarboxylation of isocitrate and converted into a further oxidative decarboxylation reaction to succinyl-coenzyme A. It may also be formed from or converted into glutamate (and thus several other amino acids indirectly) by transamination, or formed by degradation of lysine via glutarate and 2-hydroxyglutarate. The older name α-ketoglutarate is often still used. 2 3-oxoglutarate or β -oxoglutarate acetonedicarboxylate; 3-oxopentane--OOC-CH₂-CO-CH₂-COO-; the dianion 3-oxoglutaric acid (i.e. 3-oxopentanedioic acid), a β -oxo (carboxylic) acid. It is a product of the action of the mould Aspergillus niger on citrate.

oxoglutarate decarboxylase see oxoglutarate dehydrogenase

oxoglutarate dehydrogenase complex an enzyme complex, closely analogous in mechanism to the pyruvate dehydrogenase **complex**. It accomplishes the overall reaction:

2-oxoglutarate + CoA + NAD⁺ =

succinyl-CoA + CO_2 + NADH.

It consists of three activities: oxoglutarate dehydrogenase (lipoamide), the E₁ component; dihydrolipoamide S-succinyltransferase, the E₂ component; and dihydrolipoamide dehydrogenase, the E₃ component (this being identical to the E₃ component of the pyruvate dehydrogenase complex).

oxoglutarate dehydrogenase (lipoamide) EC 1.2.4.2; other names: oxoglutarate decarboxylase; a-ketoglutaric dehydrogenase; an enzyme that catalyses the reaction between 2oxoglutarate and lipoamide to form S-succinyldihydrolipoamide with release of CO₂. This is the E₁ component of the oxoglutarate dehydrogenase complex. Thiamine diphosphate is a coenzyme. Examples: 2-oxoglutarate dehydrogenase E₁ component (α-ketoglutarate dehydrogenase) from Escherichia coli: database code ODO1_ECOLI, 933 amino acids (104.93 kDa); E₁ component (precursor) from human: database code ODO1_HUMAN, 1003 amino acids (113.11 kDa).

oxoglutarate/malate carrier protein see OGCP.

2-oxoisovalerate dehydrogenase see 3-methyl-2-oxobutanoate dehydrogenase (lipoamide).

oxolinic acid 5-ethyl-5,8-dihydro-8-oxo-1,3-dioxolo[4,5g]quinoline-7-carboxylic acid; a 4-quinolone antibiotic with antibacterial activity through inhibition of bacterial DNA gyrase.

oxonium 1 or (formerly) hydronium or hydroxonium the ion. H₃O⁺, formed by covalent linkage of a hydron to a single water molecule. Compare H+(aq). 2 any organic entity in which an oxygen atom is linked to three groups (one or two of which may be -H) and bears a formal single positive charge.

(5-)oxoproline symbol: Glp or <Glu; the recommended trivial name for pyroglutamic acid; pyrrolidone carboxylic acid; 5oxopyrrolidine-2-carboxylic acid; a noncoded amino acid. It occurs at the N terminus of certain peptide hormones and is an intermediate in the γ -glutamyl cycle. Compare oxyproline.

oxo steroid or keto steroid any steroid having an oxo substituent in its molecular structure, whether in the ring system (as part of a ketonic group) or in a side chain (as part of either a ketonic or an aldehydic group). The position of substitution may be specified by a prefixed locant. The term 17-oxo steroid (or 17-keto steroid) usually refers specifically to any of a group of androgens and their metabolites that are present in urine and that can be extracted and estimated by the Zimmermann reaction. The amount of steroids excreted in the urine has been used as an index of androgen production in the body.

oxosuccinate see oxaloacetate.

oxphos a colloquial term for oxidative phosphorylation.

OXT abbr. for oxytocin.

oxy the chemical group consisting of an oxygen atom, -O-, singly bonded to two carbon atoms in a molecular structure, e.g. of an epoxide, an ester, or an ether. Compare oxo.

oxy+ prefix denoting 1 (in organic chemical nomenclature) the presence of an oxygen atom directly attached (by single covalent bonds) to two moieties of the same indicated parent compound, with formation of a symmetrical ether, where there is a functional group or substituent in the parent compound that has priority over 'ether' for citation as the principal characteristic group; e.g. 3,3'-oxydipropanoic acid (not bis(3-carboxypropyl) ether). See also epoxy+. 2 (obsolete in organic chemical nomenclature but retained in pharmaceutical nomenclature) substitution of a hydroxyl group for a hydrogen atom; e.g. oxyproline (now hydroxyproline), oxytetracycline. 3 (in inorganic chemical nomenclature) formation of a 'basic' (i.e. double) salt containing the oxide anion, O²-, and a specified second anion; e.g. bismuth oxychloride (i.e. bismuth chloride oxide). 4 or oxy- presence of oxygen in the acidic function of an acid or in the corresponding moiety of a derived anion (obsolete; see oxoacid (def. 2), oxoanion). comb. form indicating. 5 dioxygen; e.g. oxybiotic, oxyhemoglobin, oxyhydrogen. 6 oxidation; e.g. oxycellulose. 7 acid; e.g. oxyntic.

oxyacid or oxy-acid a variant of oxoacid (def. 2).

oxyanion or oxy-anion (formerly) a variant of oxoanion.

oxybiontic or oxybiotic living in the presence of oxygen; aerobic.

oxycellulose any of the various materials obtained by the oxidation of cellulose. Such materials are useful as cation-exchangers or for fabrication into lint and gauzes.

oxygen 1 symbol: O; a nonmetallic element of group 16 of the (IUPAC) periodic table; atomic number 8; relative atomic mass 15.9994. Naturally occurring oxygen consists of a mixture of three stable nuclides of relative masses 16 (99.759 atom percent), 17 (0.037 atom percent), and 18 (0.204 atom percent). The latter, commonly known as heavy oxygen, is useful as a tracer in studies of chemical and biochemical reaction meche. Examples: 2-oxoglutarate dehydrogenase E_l com- anisms. The commonest valence is two. Oxygen is the most Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

abundant element in the biosphere: in the atmosphere it occurs elementally in the form of molecules of the diatomic gas dioxygen, which comprises 20.95% by volume of dry air, and as traces of the gas ozone (i.e. trioxygen). The atmosphere also contains small amounts of the oxygen compounds carbon dioxide and water (vapour); almost half by weight of the surface of the Earth consists of oxygen in combined form, principally as water and silicates. 2 or molecular oxygen symbol: O2; the common name for the gas correctly known as dioxygen.

oxygen-15 the radioactive nuclide of oxygen, ¹⁵O. It is prepared in a cyclotron by bombarding 17N with deuterons, the products being ${}^{1}8O$ and neutrons. It emits a positron, β^{+} (0.511 MeV), and has a half-life of 2 min; it is used in positron emission tomography.

oxygenase any oxidoreductase enzyme catalysing a reaction in which dioxygen is the electron acceptor. Such enzymes may be either monooxygenases or dioxygenases (with the exception of certain uncharacterized enzymes forming EC sub-subclass 1.13.99).

oxygenate 1 to mix, supply, or treat with dioxygen; to saturate a fluid, especially blood, culture medium, etc., with dioxygen. 2 to cause the combination of an oxygen-carrying or oxygen-storing protein with dioxygen; to undergo such a reaction. —oxygenation n.

oxygenator an apparatus for oxygenation, especially of blood. oxygen cycle the sum total of the processes via which atmospheric dioxygen is exchanged with the oxygen combined in organic compounds and carbon dioxide. Photosynthetic organisms, using solar energy, generate dioxygen from water and liberate it into the atmosphere, while heterotrophic cells take up atmospheric dioxygen to oxidize organic compounds and thereby provide energy. Compare carbon cycle.

oxygen debt the oxygen deficit that develops when a normally aerobic organism or tissue cannot increase its oxygen uptake sufficiently to match a temporarily increased energy requirement, as in muscular exercise. After the increased energy requirement ceases, this deficit has to be made good by a continuing increased rate of oxygen uptake until normal aerobic metabolism is restored.

oxygen demand see biochemical oxygen demand, chemical oxygen

oxygen electrode a device for measuring dioxygen activity in a liquid or gas. It consists essentially of a silver-silver chloride anode in saturated potassium chloride solution and a platinum or gold cathode. When an electric potential is applied between these electrodes dioxygen is electrolytically reduced at the cathode, the current flowing being proportional to the dioxygen activity when the applied potential is 0.5-0.8 V. The electrodes are either directly exposed to the sample or, in the Clark electrode, separated from it by a thin dioxygen-permeable membrane in order to prevent deposition of interfering substances on the cathode.

oxygen quotient (sometimes) the metabolic quotient with

respect to dioxygen, symbol: \mathbf{Q}_{0_2} . oxyhemoglobin symbol: HbO₂; the fully oxygenated form of hemoglobin. It is bright red in colour and has a characteristic absorption spectrum.

oxyhydrogen reaction an alternative name for knallgas reaction.

oxymyoglobin symbol: MbO₂; the fully oxygenated form of myoglobin. It is bright red in colour and has a characteristic absorption spectrum.

oxyntic acid-secreting; applied especially to the hydrochloric acid-secreting parietal cells of the gastric mucosa.

oxyntomodulin an alternative name for glucagon-37; see enteroglucagon.

oxyproline an older name for hydroxyproline. Compare 5-oxopro-

oxysome an alternative name for elementary particle (def. 2).

oxytetracycline 5-hydroxytetracycline; an antibiotic that is similar in action to tetracycline. Proprietary names include Terramycin.

oxytocin or (sometimes) ocytocin abbr.: OXT; a heterodetic cyclic nonapeptide amide,

Cys¹-Tyr-Ile-Gin-Asn-Cys⁶-Pro-Leu-Gly-NH₂

(Cys¹ and Cys⁶ form a disulfide bond). It is one of the two (or possibly more) hormones secreted by the neurohypophysis of the pituitary gland. It facilitates the ejection of milk by stimulating the myoepithelial cells in the mammary gland, and it may also aid parturition by stimulating contraction of the uterus. It is synthesized as a polypeptide precursor that is cleaved to oxytocin and neurophysin 1 (for database code see neurophysin). Oxytocin was the first peptide hormone to be chemically synthesized. [Note: the spelling ocytocin is preferred on etymological grounds, the name being derived from the Greek okytokos, fast birth, rather than from the Greek oxys, acid, sharp; however, the spelling oxytocin is in wide use, esp. in the English language.] See also vasopressin.

oxytocin receptor any of a number of membrane proteins that bind oxytocin and mediate its intracellular effects. Structurally they are of the seven-transmembrane-domain type, characteristic of G-protein-coupled receptors, and activate the phosphatidylinositol cycle. Example from Sus scrofa: database code OXYR_PIG, 386 amino acids (42.52 kDa).

+oyl suffix (in chemical nomenclature) denoting conversion (of a mono- or dicarboxylic acid) to the corresponding mono- or divalent acyl group by removal of hydroxyl from the carboxyl group; e.g. the univalent acyl group, hexanoyl, CH3-[CH2]4-CO-, is derived from hexanoic acid, CH3-[CH2]4-COOH. It is used also when the carbonyl oxygen atom of the acyl group has been replaced by =NH, $=N-NH_2$, =N-OH, or =S. See also +vl.

oz symbol for ounce.

ozone symbol: O₃; trioxygen; a colourless, highly reactive gas present in the stratosphere, where it is formed under the influence of short-wavelength ultraviolet radiation. It is also normally present in trace amounts in air, and is formed by the action of sunlight on hydrocarbons and nitrogen oxides - present in vehicle emissions. The latter process can lead to harmful accumulations of ozone at or near ground level. In contrast, stratospheric ozone protects the biosphere from highly damaging ultraviolet radiation, especially UV-C.

ozonolysis a method used for locating a double bond in an alkene. The alkene is treated with ozone, and the resulting ozonide is then cleaved to form two carbonyl compounds, one from each moiety of the parent compound.

p symbol for 1 pico+ (SI prefix denoting 10⁻¹² times). 2 the negative logarithm to the base ten, as in pH, pK. 3 proton; it may be written as p⁺ to indicate its charge. 4 a phosphoric residue (alternative to P). 5 the protein product of a gene; it is prefixed to the product's molecular mass to designate a particular entity, e.g. **p53**. **6** (in atomic spectroscopy) electron state l = 1.

p symbol for 1 pressure (alternative to P). 2 partial pressure of a gas. The gas may be specified by a subscript or in parentheses; e.g. p_{O_2} or $p(O_2)$. 3 pyranose form (in monosaccharide symbolism); e.g. Glep, glucopyranose; GalpA, galactopyranuronic acid. 4 pitch height (of a helix). 5 (bold italic) (electric) dipole moment (of a molecule), alternative to μ (bold italic). 6 (bold italic) momentum. 7 probability (alternative to P).

p- prefix (in chemical nomenclature) denoting para-. Compare

p₅₀ symbol for the partial pressure of a gas at which a binding protein is 50% saturated with it.

PLR symbol for the proportion of receptors or binding sites occupied by ligand L.

PLR* symbol for the proportion of receptors in which ligand L occupies its binding site(s), and which are in an active state.

PR symbol for the proportion of receptors or binding sites free

P symbol for 1 peta+ (SI prefix denoting 10¹⁵ times). 2 poise. 3 phosphorus. 4 a residue of the α -amino (strictly, cyclic α alkylamino) acid proline (alternative to Pro). abbr. for 5 phosphate or a phosphoric group, as in ATP. 6 (in genetics) parental generation. 7 a site near a peptidase cleavage site (see peptidase P-site).

P_i symbol for inorganic phosphate.

P symbol for 1 pressure (alternative to p). 2 radiant power (alternative to Φ). 3 probability (alternative to p). 4 parity (of a wave function).

p53 a 53 kDa nuclear phosphoprotein originally discovered attached to large T-antigen in cells transformed with simian virus **40**. It is a probable human cell cycle regulator and trans-activator (see trans-acting) that acts negatively to regulate cellular division by controlling a set of genes required for this process; one of the genes activated is an inhibitor of cyclin-dependent protein kinases. p53 acts as a tumour suppressor in some (not all) tissues; mutations in the p53 gene are the most common genetic alterations in human cancers. Wild-type p53 can suppress or inhibit the transformation of cells in culture either by viral or cellular oncogenes, and introduction of wild-type cDNA into a transformed cell in culture stops growth. Hence the p53 gene is classed as a tumour-suppressor gene. Three functional domains of p53 have been defined: an N-terminal transcriptional activation domain (residues 1-42), a central DNA-binding domain (residues 120-290), and a C-terminal regulatory domain (residues 311-393). The DNA-binding domain recognizes a DNA motif in genes that are activated by p53, and mutations in p53 that are associated with human cancers generally cluster in its DNA-binding domain. Database code WT1_ HUMAN, 449 amino acids (49.13 kDa).

PO a myelin protein.

P1 a temperate bacteriophage whose natural hosts are Shigella spp. but which was used formerly for generalized transduction in Escherichia coli and is currently used as the basis for the P1 cloning vector, which can carry up to 100 kbp insert DNA. Pl prophage is a plasmid.

P2 a myelin protein.

P65 see synaptotagmin I.

P81 see ezrin.

P450 or P-450 any of a group of widely occurring heme-containing proteins that embraces various separately classified enzymes. They are named from the location of the Soret band

(see cytochrome absorption bands) of the reduced CO complex at 450 nm. The group includes unspecific monooxygenase (EC 1.14.14.1), camphor 5-monooxygenase (EC 1.14.15.1), alkane 1-monooxygenase (EC 1.14.15.3), steroid 11β-monooxygenase (EC 1.14.15.4), cholesterol monooxygenase (side-chain-cleaving) (EC 1.14.15.6), prostacyclin synthase (EC 5.3.99.4), thromboxane-A synthase (EC 5.3.99.5), and probably chloride peroxidase (EC 1.11.1.10). This type of enzyme is also known as cytochrome P450 (see this for more detail) and considered as a btype cytochrome. The name heme-thiolate protein has been proposed on the grounds of a thiolate ligand at the heme being responsible for the group's unusual spectral and catalytic properties.

P680 or pigment 680 a type of chlorophyll a, having an absorption maximum at 680 nm, that constitutes the reaction centre of photosystem II in most species. It has a redox potential of >+0.81 V; the oxidized form, P680⁺, is a powerful oxidant that can abstract electrons from water with the evolution of dioxygen. See also chlorophyll.

P700 or pigment 700 a type of chlorophyll a, having an absorption maximum at 700 nm, that constitutes the reaction centre of photosystem I. It has a redox potential of approximately +0.5 V, its electron being used ultimately to reduce NADP via ferredoxin. See also chlorophyll.

P870 the special pair of bacteriochlorophyll a in the photosynthetic reaction centre of bacteria, so named because they have an absorption maximum of 870 nm.

P960 the special pair of bacteriochlorophyll b in the photosynthetic reaction centre of bacteria, so named because they have an absorption maximum of 960 nm.

Pa symbol for pascal.

pA₂ the negative logarithm to the base 10 of the molar concentration of antagonist that makes it necessary to double the concentration of agonist needed to elicit the original submaximal response.

p[A]₅₀ the negative logarithm to the base 10 of the [A]₅₀ of an agonist. pEC₅₀ is the corresponding term for the EC₅₀ of an agonist (often used interchangeably with $[A]_{50}$).

PAB or PABA abbr. for para-aminobenzoate; para-aminobenzoic acid. See p-aminobenzoic acid.

PABA test an indirect test of pancreatic function in which the synthetic peptide N-benzoyl-L-tyrosyl-p-aminobenzoic acid (BT-PABA) is administered orally, usually with a small amount of [14C]-p-aminobenzoic acid (PABA). Normally the peptide is hydrolysed by chymotrypsin to PABA, which is absorbed and excreted in the urine, but in pancreatic insufficiency hydrolysis is much reduced.

pacemaker reaction any metabolic reaction whose rate depends on factors other than the amounts of enzyme or substrate. An enzyme catalysing such a reaction may be termed a pacemaker enzyme.

pachyman see callose.

pachytene the third phase of prophase I in meiosis.

package 1 (in cell biology) to surround (one or a number of macromolecules) with a membrane in the formation of a mature secretory granule. 2 (in virology) to enclose the nucleicacid core of a virus particle with a protein shell (the capsid) to form a mature virion; to encapsidate.

packing (in chromatography) the material (whether active solid, liquid held on solid support, or swollen gel) that is introduced into a column and that consists of or contains what is to become the stationary phase during a chromatographic

packing density the ratio of the minimum (or actual) volume of an object, such as a molecule in a crystal or in solution, to the total volume it occupies. For a macromolecule or region of Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liễn hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

a macromolecule, it is the ratio of the volume enclosed by the van der Waals envelope of all atoms in the molecule or region to the total volume of the molecule or region. Theoretical values are 0.74 for close-packed spheres, 0.91 for infinite cylinders, and 1.0 for a continuous solid.

packing fraction the ratio of the relative atomic mass of a particular nuclide minus its nucleon number divided by its nucleon number. It is positive for the lightest and heaviest nuclides and negative for nuclides of intermediate mass.

Paclitaxel a proprietary name for taxol.

PAF abbr. for platelet-activating factor.

PAGE abbr. for polyacrylamide gel electrophoresis.

PAGIF abbr. for polyacrylamide gel isoelectric focusing. See polyacrylamide gel electrophoresis.

PAH abbr. for para-aminohippurate; para-aminohippuric acid. pair see base pair.

paired the gene for a sequence-specific DNA-binding homeobox segmentation protein in Drosophila melanogaster. It is one of a number of pair-rule genes, each of which specifies a simple alternation with a repeat distance of two segments. Their protein products are characterized by four motifs, referred to as the paired box. Example from D. melanogaster: database code HMPR_DROME, 613 amino acids (65.43 kDa).

paired box see paired, Pax genes.

pair-rule gene see paired.

PaJaMa experiment the nickname for a bacterial mating experiment carried out at l'Institut Pasteur, Paris, that showed that induction and repression of the enzyme β -galactosidase in Escherichia coli are regulated by two closely linked genes, one of which produces a cytoplasmic repressing substance that blocks the expression of the other. [From the names of the experimenters: Pardee, Jacob, and Monod.]

Palade, George Emil (1912-), Romanian-born US cell biologist; Nobel Laureate in Physiology or Medicine (1974) jointly with A. Claude and C. R. M. J. de Duve 'for their discoveries concerning the structural and functional organization of the cell.'

palindrome 1 any linear arrangement of symbols, such as letters or digits, that has the same sequence from either end; e.g. noon, radar; 75311357; 'Madam, in Eden I'm Adam'. 2 (in molecular biology) or palindromic sequence a popular name for a DNA sequence with a twofold rotational axis of symmetry (dyad symmetry). Confusingly the term is used in at least two distinguishable senses: (1) to describe a region of local twofold rotational symmetry in duplex DNA, e.g.

> 5'-GAATTC-3' 3'-CTTAAG-5'

and (2) to describe a sequence in a single polynucleotide strand that contains an inverted repeat, e.g. 5'-TGA-AGT-3'. It is also sometimes applied to a region of either a single- or a double-stranded polynucleotide that is capable of forming one or more hairpins containing palindromes of the first type; an example is shown at cruciform. Examples of palindromes are operators and restriction sites but, in general, any stem-loop in RNA must have a corresponding palindrome in the DNA from which the RNA was transcribed. —palindromic adj.

pallidin any of a group of endogenous carbohydrate-binding proteins (lectins) produced by cells of the slime mould Polysphondylium pallidum during differentiation. Similar to discoidin, they may be concerned in cell adhesion.

palmitate 1 numerical symbol: 16:0; the trivial name for hexadecanoate, CH3-[CH2]14-COO-, the anion derived from palmitic acid (i.e. hexadecanoic acid), a saturated straightchain higher fatty acid. 2 any mixture of free palmitic acid and its anion. 3 any salt or ester of hexadecanoic acid. See also palmitoyl.

palmitate synthase see fatty-acid synthase complex.

palmitic acid hexadecanoic acid; a saturated straight-chain fatty acid having sixteen carbon atoms per molecule, and a major component of plant and animal fats, See palmitate.

pancreatic hormone or pancreatic polypeptide abbr.: PP: a
Ban dang doc một quyển sách được tạng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liền hệ:

palmitoleate 1 numerical symbol: 16:1(9); the trivial name for (Z)-hexadec-9-enoate, $CH_3-[CH_2]_5-CH=CH-[CH_2]_7-COO^-$, the anion derived from palmitoleic acid, (Z)-hexadec-9-enoic acid, a monounsaturated straight-chain higher fatty acid. 2 any mixture of free palmitoleic acid and its anion. 3 any salt or ester of 9-hexadecenoic acid. See also palmitoleoyl.

palmitoleic family (of polyunsaturated fatty acids) a series of polyenoic acids in which the hydrocarbon chain terminates with the alkenyl grouping CH₃-[CH₂]₅-CH=CH- (as in palmitoleic acid (see palmitoleate)); there are three other series of such acids, i.e. the linoleic family, linolenic family, and oleic family. Members of the palmitoleic family can be synthesized from palmitic acid via palmitoleic acid by chain elongation and/or desaturation, but in mammals not from linoleic, (9,12,15)linolenic, or oleic acids; the series includes cis-vaccenic acid.

palmitoleoyl symbol: APam; the trivial name for (Z)-hexadec-9-enoyl, $CH_3-[CH_2]_5-CH=CH-[CH_2]_7-CO-$ (cis isomer), the acyl group derived from palmitoleic acid (i.e. (Z)-hexadec-9enoic acid). It is a relatively minor component of plant and animal lipids. The chain is synthesized metabolically by the action of a Δ^9 -desaturase on palmitoyl-CoA.

palmitoyl symbol: Pam; the trivial name for hexadecanoyl, CH₃-[CH₂]₁₄-CO-, the acyl group derived from palmitic acid (i.e. hexadecanoic acid). This is one of the major fatty-acid components of plant and animal lipids; together with stearic acid it represents a high proportion (often around 30%) of the fatty-acid content of dietary and other lipids. It acts as a precursor in mammals for a family of unsaturated fatty acids in which all double bonds are nine or more carbons from the methyl terminus. The chain is synthesized metabolically from acetyl-CoA as palmitate (in mammals) or palmitoyl-CoA (in yeast), the product of fatty-acid synthase. See fatty-acid synthase complex.

1 or cetyl a common name for hexadecyl, palmityl $CH_3-[CH_2]_{14}-CH_2-$, the alkyl group derived from hexadecane. 2 a former name (now incorrect) for palmitoyl.

palytoxin any of a group of structurally very similar potent neurotoxins isolated from the marine zoanthid Palythoa toxica or other Palythoa spp. Each consists of a single carbon chain of 115 carbon atoms containing 64 chiral centres and seven double bonds, and terminating in nitrogen-containing groups; there are 128 carbons in all and a further double bond in a methylene group. The chain bears numerous hydroxyl groups and a number of methyl groups, and in several places it is folded and formed into pyran rings. Palytoxin is the most deadly nonproteinaceous material isolated, having 50 times the toxicity of tetrodotoxin in mice. The number of stereoisomers is $2^{64} = 18446744073709551620$ (not including possible E/Z variations at the double bonds!).

Pam symbol for palmitoyl (i.e. hexadecanoyl).

pancreas a compound gland, occurring in the abdominal cavity of most vertebrates, that has both exocrine and endocrine functions. The major (exocrine) part consists of acinar tissue, which secretes pancreatic juice into the upper part of the gut (duodenum in mammals). Within this acinar tissue are scattered numerous (endocrine) islets of Langerhans, containing notably A cells, secreting glucagon, B cells, secreting insulin, and D cells, secreting somatostatin. —pancreatic adj.

pancreastatin a 49-residue peptide hormone that acts as an inhibitor of glucose-induced insulin release from the pancreas. It also inhibits exocrine pancreatic excretion. It was originally isolated from porcine pancreas, where it is colocalized with insulin, glucagon and somatostatin, but is synthesized as part of the sequence of chromogranin A and is thus found in tissues where the chromogranin gene is expressed, including most endocrine cells.

pancreatic cholera an alternative name for Verner-Morrison syndrome

pancreatic diabetes an older term for insulin-dependent diabetes mellitus.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

pancreatic islet

crystallizable polypeptide present in the **PP cells** of the pancreas, first detected as an impurity in insulin preparations. Avian pancreatic polypeptide, known as aPP, has been isolated from chicken and turkey pancreas; bovine, human, ovine, and porcine homologues, known as bPP, hPP, oPP, and pPP, respectively, have also been identified. All have 36 amino-acid residues with C-terminal tyrosinamide and show considerable sequence homologies. The PP level in the plasma rises rapidly after feeding, especially with protein foods; the hormone appears to act as a regulator of pancreatic and gastrointestinal functions; sequence from human: APLE-PVYPGDNATPEQMAQYAADLRRYINMLTRPRY(NH₂); database code (precursor) PAHO_HUMAN, 95 amino acids (10.43 kDa) also contains an icosapeptide of uncertain physiological role (residues 69-88).

pancreatic islet an alternative name for islet of Langerhans.

pancreatic juice a slightly alkaline digestive juice secreted by the exocrine pancreas into the upper part of the small intestine. It contains numerous enzymes and inactive enzyme precursors including a-amylase, chymotrypsinogen, lipase, procarboxypeptidase, proelastase, prophospholipase A₂, ribonuclease, and trypsinogen. Its high concentration of hydrogencarbonate ions helps to neutralize the acid digesta from the stomach.

pancreatic lipase a Ca²⁺-requiring triacylglycerol lipase (EC 3.1.1.3) that is secreted into the intestine by the exocrine pancreas when this is stimulated by cholecystokinin in response to ingestion of food. Its role is to degrade triacylglycerols, partially or completely, to fatty acids and glycerol in the intestine; it acts at an ester-water interface. It is a glycoprotein with sequence similarity with other lipases. Example (precursor) from human: database code LIPP_HUMAN, 465 amino acids (51.10 kDa).

pancreatic polypeptide abbr.: PP; another name for pancreatic hormone.

pancreatic thread protein or pancreatic stone protein (abbr.: PSP); a C-type lectin that may inhibit spontaneous calcium carbonate precipitation, and one of the major secretory proteins of the human exocrine pancreas. It is found in acinar cells of pancreas and (in smaller amounts) in the brain. It is a major soluble protein of human pancreatic calculi and a Ca²⁺binding phosphoprotein present in zymogen granules of pancreatic acinar cells and secreted in pancreatic juice of normal subjects and calculus formers. It inhibits calcium carbonate precipitation from the juice. The protein is rich in aromatic amino acids. Between pH 5.4 and 9.2 it undergoes reversible fibril formation. It is also typically characteristic of infant brains. There is increased expression of PSP-like proteins in Down's syndrome and Alzheimer's disease. Example (precursor) from human: database code LITH_HUMAN, 166 amino acids (18.71 kDa).

pancreatic trypsin inhibitor abbr.: PTI; a serine proteinase inhibitor, correctly known as pancreatic secretory trypsin inhibitor. A crystallizable protein trypsin inhibitor isolated from bovine pancreas, it forms a crystalline complex with trypsin and is relatively heat-stable in trichloroacetic acid solution. Its physiological role is to control trypsin activation of zymogens. The bovine protein is of known sequence: NILGRE-AKCTNEVNGCPRIYNPVCGTDGVTYSNECLLCMENKERQTPVLIQKSGPC. The 3-D structure is also known, and it is a favoured model for testing protein-folding algorithms. Example (bovine): database code IPST_BOVIN, 56 amino acids (6.16 kDa). It was also formerly known as Kunitz and Northrop inhibitor.

pancreozymin abbr.: PZ; a putative hormone having secretagogic activity on the exocrine pancreas and extractable from duodenal mucosa. It is now known to be identical with **cholecystokinin**.

panose an oligosaccharide, Glc(α1-6)Glc(α1-4)Glc; it is found acid.
 in the fungus Aspergillus niger.

panose

pantetheine N-pantothenylcysteamine; the D-enantiomer is a growth factor for *Lactobacillus bulgaricus*, and is an intermediate in the pathway for the biosynthesis of coenzyme A in mammalian liver and some microorganisms.

pantoate 1 the anion, HO-CH₂-C(CH₃)₂-CH(OH)-COO⁻, derived from pantoic acid (i.e. (R)-2,4-dihydroxy-3,3-dimethyl-butyric acid). 2 any salt or ester of pantoic acid.

pantoic acid

pantothenate 1 the anion, $HO-CH_2-C(CH_3)_2-CH(OH)-CO-NH-CH_2-CH_2-COO^-$ (i.e. N-pantoyl- β -alanine anion), derived from pantothenic acid, a B vitamin complex; only the D-(R)-enantiomer is biologically active. 2 any salt of pantothenic acid.

pantothenic acid

pantothenyl the acyl group, HO-CH₂-C(CH₃)₂-CH(OH)-CO-NH-CH₂-CH₂-CO-, derived from pantothenic acid; coenzyme A is a D-(R)-pantothenyl derivative.

pantoyl 1 the acyl group, HO-CH₂-C(CH₃)₂-CH(OH)-CO-, derived from pantoic acid, 2,4-dihydroxy-3,3-dimethylbutyric acid.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

papain

papain or papaya peptidase I EC 3.4.22.2; a cysteine endopeptidase obtained from the latex, leaves, and unripe fruit of the papaya (or pawpaw) tree, Carica papaya. It will preferentially hydrolyse peptide bonds at the carbonyl end of Arg, Lys, and Phe residues (but never Val), with preference for large hydrophobic residues at the P2 position. It also has esterase, thiolesterase, transamidase, and transesterase activity. Papain is unusually stable to elevated temperatures and to denaturing agents and consists of a single polypeptide chain of 212 amino-acid residues. Example from C. papaya: database code

known; a and B regions. papaverine 1-[(3,4-dimethoxyphenyl)methyl]-6,7-dimethoxyisoquinoline; a constituent of opium that acts as a smooth muscle relaxant; this action is thought to be due to phosphodiesterase inhibitory activity and blockade of membrane calcium chan-

NRL_1PPD, 212 amino acids (23.40 kDa); 3-D structure

paper chromatogram the visible result of a chromatographic separation effected on paper.

paper chromatography abbr.: PC; a technique of chromatography, applicable to microgram quantities of soluble substances, in which specially prepared filter paper, chromatography paper, forms the support for the stationary phase. The latter is commonly a film of water held by adsorption on the cellulose fibres of the paper and in equilibrium with a water-immiscible liquid or liquid mixture, which forms the mobile phase. A solution of a sample is applied near one end of a strip of paper, allowed to dry, and the mobile phase allowed to flow over the strip from that end. If the sample consists of only one component, development using an appropriate method of detection will reveal a single spot at a characteristic distance from the origin relative to that travelled by the mobile phase; in general, a mixture will give rise to a number of spots each occupying a different and characteristic position. Separations occur essentially by partition between the mobile and stationary phases, with some contribution, under certain conditions, attributable to adsorption or ion-exchange onto the paper support. An elaboration of the technique uses a square of paper on which two successive separations are effected at rightangles using mobile phases of differing separatory powers to produce a two-dimensional pattern of spots on the paper. With suitable treatment of the paper and an appropriate choice of the composition of the two phases, reversed-phase partition chromatography on paper may be effected. Since cellulose is chiral, some enantiomer separations are possible.

paper electrophoresis a type of zone electrophoresis on (filter)

Papovaviridae a family of DNA viruses, most or all of which are, under suitable conditions, oncogenic in vertebrate hosts. The virion, 45-55 nm in diameter, consists of a nonenveloped icosahedral capsid with 72 capsomeres, and contains a circular DNA genome.

papovavirus any virus belonging to the family Papovaviridae. The name derives from papilloma, polyoma, and vacuolating agent, an early name for simian virus 40.

PAPS abbr. for 3'-phosphoadenosine-5'-phosphosulfate; i.e.

adenosine 3'-phosphate 5'-phosphosulfate.

paramagno

para 1 characterized by or relating to (substitution at) two ring-carbon atoms separated by two others in a monocyclic aromatic compound. 2 (followed by to) at a position in a benzene ring next but two to a particular (specified) substituent. See also para-.

para+ or (before a vowel) par+ prefix indicating beside or near; beyond; resembling; defective or abnormal.

para- abbr.: p-; prefix (in chemical nomenclature) denoting an isomer of a disubstituted monocyclic aromatic compound in which the substituents are attached at positions 1 and 4 of the ring. Compare meta-, ortho-.

parabiont either individual of a pair united in parabiosis.

parabiosis the state or condition of two individual animals being functionally united, either naturally, as in Siamese twins, or as a result of an experimental procedure. —parabiotic adj.

paracasein an alternative name (esp. US) for casein (def. 2). paracetamol see acetaminophen.

paracrine 1 describing or relating to a regulatory cell that secretes an agonist into intercellular spaces in which it diffuses to a target cell other than that which produces it; describing or relating to such an agonist. 2 such an agonist; a paramone. Compare endocrine, neurocrine, neuroendocrine.

paracrystal any assemblage of molecules or particles having a certain degree of order but one that is insufficient for it to be considered a true crystal. - paracrystalline adj.; paracrys-

paradaxin or pardaxin any of several ichthyotoxic, neurotoxic peptides, isolated from the defence secretion of the Red Sea Moses sole fish, Paradachirus marmoratus, or the Pacific sole, Paradachirus pavoninus, that act as a shark repellent. Each consists of 33 amino acids, with hydrophilic C-terminal and hydrophobic N-terminal regions and with physical and pharmacological similarities with melittin but no sequence homology. Example, paradaxin P-2 from P. pavoninus: database code PAP2_PARPV, 33 amino acids (3.32 kDa).

paraffin 1 an obsolete term for alkane. 2 or paraffin oil or kerosene or kerosine any liquid mixture, consisting mainly of alkanes, with a boiling point range of 150-300 °C and relative density range of 0.78-0.82. 3 an alternative name for paraffin wax. Compare liquid paraffin.

paraffin wax any waxy mixture of higher alkanes, obtained as a residue from the distillation of petroleum, with a relative density of ≈0.9 and a melting point range of 45-65 °C.

Parafilm the proprietary name for a flexible, moisture-proof, thermoplastic tissue useful for temporarily sealing small containers.

parafollicular cell an alternative name for C cell (when found in the thyroid gland).

parafusin an evolutionarily conserved phosphoglycoprotein involved in exocytosis. It is rapidly dephosphorylated via a Ca²⁺-dependent process when secretagogues induce exocytosis in competent cells. Example from Paramecium tetraurelia: database code PARPARAFUS, 475 amino acids (52.94 kDa).

parahematin or (esp. Brit.) parahaematin a former name for ferrihemochrome.

parallel 1 (in biochemistry) describing a pair of linear structures, such as two polynucleotide or polypeptide chains, that are polarized or asymmetric in the same direction. 2 (in physical chemistry) denoting the spins of a pair of electrons, occupying the same atomic or molecular orbital, that are described by the same spin quantum number. Compare antiparallel. 3 (in electricity) describing an electrical component that is connected to the same two points in a circuit as another component; describing two or more components that are so

parallel dichroism see dichroic ratio.

parallelism the quality or state of being parallel; similarity in corresponding details or in evolutionary pattern.

paramagnetism the property displayed by substances that have a positive but small magnetic susceptibility, due to the par+ a variant form of para+ (before a vowel).

presence in them of atoms with permanent magnetic dipoles

Bạn đang đợc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

paramecium

caused by unpaired electron spins (with a contribution from the orbital motion of the electrons). These dipoles tend to align themselves in the direction of an applied magnetic field but no permanent magnetism is conferred on such substances. Compare diamagnetism, ferromagnetism. —paramagnetic adj.

paramecium (pl. paramecia) any freshwater protozoan belonging to the genus Paramecium. Typically 50-300 µm in length, they are ovoid and uniformly ciliated. See also kappa particle.

parameter 1 (in mathematics) an unknown quantity that is a constant in a particular context but that may have different values in other (similar) contexts; e.g. the coefficient b in the general equation, y = bx + c, representing a family of straight lines. 2 (in statistics) a numerical characteristic of a population (as opposed to that of a sample of such a population). 3 any distinguishing characteristic of something, especially one to which a measured value is or can be ascribed. —parametric adi.

paramomycin an aminoglycoside antibiotic produced by Streptomyces paromomycinus. Its actions are similar to those of neomycin.

paramone a proposed name for paracrine agonist, derived as a contraction of 'paracrine hormone'.

paramylon a storage polysaccharide occurring in Euglena gracilis. It comprises a backbone of $\beta 1 \rightarrow 3$ -glucopyranose units with side chains joined by $\alpha 1 \rightarrow 6$ linkages.

paramyosin a two-chain, coiled-coil, α-helical ≈200 kDa protein that forms the core protein of the thick filaments of a number of invertebrate muscles.

paramyxovirus any of a group of RNA animal viruses of the family Paramyxoviridae (distinguish from the genus Paramyxovirus), in class V of the Baltimore classification, consisting of enveloped, pleomorphic particles ≈150 nm in diameter with helical nucleocapsids, 1000 nm long and 18 nm in diameter. They contain single-stranded RNA (minus strand) of 7 MDa plus virion polymerase. The group includes viruses causing mumps, measles, Newcastle disease of chickens, and distemper of dogs, and the morbilliviruses, pneumoviruses, and parainfluenza viruses.

paranemic describing the nature of the coiling of a doublestranded helix in which the two strands are not intertwined, i.e. they may be separated without uncoiling. Compare plec-

parapepsin I an alternative name for pepsin B.

parapepsin II an alternative name for porcine gastricsin (i.e.

paraprotein name originally given to any plasma protein that gave an abnormal band on electrophoresis, derived from para+ + protein. Usually such a protein is a monoclonal immunoglobulin derived from neoplastic plasma cells and present at abnormally high concentration in the blood plasma. Such proteins are seen as a discrete band in the gamma-globulin region, but they may appear elsewhere if the paraprotein is IgA or IgM. Examples are proteins characteristic of a myeloma, e.g. Bence-Jones protein, amyloid proteins, Waldenstrom's macroglobulinemia, or cryoglobulins. Some paraproteins are not abnormal, e.g. the immunoglobulin that arises as a result of a severe bacterial infection.

paraproteinemia or (esp. Brit.) paraproteinaemia the presence in blood plasma of paraprotein.

Paraquat methyl viologen; 1,1'-dimethyl-4,4'-bipyridynium dichloride; a nonselective herbicide whose action requires direct contact with the plant. It is highly toxic to humans and other animals if ingested in undiluted form.

parasite any organism that spends all or part of its life cycle in (endoparasite) or on (ectoparasite) another living organism of a different species (its host), from which it obtains nourishment and/or protection, and to which it is usually detrimental. Compare symbiont.

parastatin a 73-amino-acid peptide hormone, M_r 11 000, that inhibits parathyrin secretion. Porcine parastatin has the aminoSVEAGLPLQVRXYLEEKKEEEGSANRRPEDQELESLSAI-EAELEK. Activity resides in a 19-amino-acid N-terminal fragment; that from rat has the sequence: LSFRARAYGF-RDPGPQLRR. It is synthesized as part of the sequence of chromogranin A.

parinaric

paratartaric acid an old name for racemic (DL)-tartaric acid. The resolution of this acid into the D- and L-enantiomers by Pasteur was a landmark experiment in stereochemistry. See tartaric acid

parathion O,O-diethyl O-p-nitrophenyl phosphorothioate; a compound that acts as an inhibitor of cholinesterase through covalent bonding to the esteratic site of the enzyme. It is used as a chemical warfare agent and insecticide.

Parathormone a proprietary name for parathyrin.

parathyrin or parathyroid hormone (abbr.: PTH); a 9.5 kDa polypeptide hormone, consisting of a single chain of 83 amino-acid residues (bovine). It is synthesized in parathyroid tissue by proteolysis of a 12.5 kDa prohormone. Parathyrin acts in conjunction with calcitonin and other hormones to control calcium and phosphate metabolism; it elevates the blood calcium level by dissolving the salts in bone and preventing their renal excretion. Example (precursor) from human: database code PTHY_HUMAN, 115 amino acids (12.85 kDa). Proprietary name: Parathormone.

parathyroid 1 situated near the thyroid gland. 2 of, pertaining to, or produced by the parathyroid gland. 3 the parathyroid gland.

parathyroid gland an endocrine gland of higher vertebrates; there are typically two pairs, located near or within the thyroid. They develop from the gill pouches, and secrete parathyrin. parathyroid hormone abbr.: PTH; an alternative name for

paratope the part of an antibody, formed by the hypervariable loops of the variable regions, that binds to an epitope.

paratose 3,6-dideoxy-D-glucose; 3,6-dideoxy-D-ribo-hexose; a monosaccharide that occurs in type A O-antigen chains of the lipopolysaccharide on the outer membrane of certain species of Salmonella.

Parazoa a subkingdom of multicellular invertebrate animals comprising the sponges (phylum Porifera).

parenchyma 1 (in botany) in higher plants, any soft tissue consisting of thin-walled, relatively undifferentiated living cells. 2 (in zoology) the tissue constituting the essential or specialized part of an organ, as distinct from supportive tissue, blood vessels, etc. —parenchymal adj.; parenchymatous adj.

parenchymal liver cell see hepatocyte.

parent 1 any organism that has given rise to another such organism, whether sexually or asexually. 2 a precursor of some derived entity; applied, e.g., to a cell, a virus, a chromosome or molecule of DNA, or a radionuclide. 3 parent compound (in chemical nomenclature) the member of a group of related compounds that has the simplest chemical structure and that forms the basis for naming the others. —parental adj.

parenteral 1 located or occurring outside the intestine. 2 any route other than via the gastrointestinal tract, especially by injection. —parenterally adv.

parietal 1 of, pertaining to, or forming part of the wall of a body cavity or similar structure; e.g. the hydrochloric-acidsecreting parietal cells of the gastric mucosa, also known as oxyntic cells. 2 of or relating to the parietal bones of the skull. parietal layer see serous membrane.

parinaric acid any octadeca-9,11,13,15-tetraenoic acid; two isomers are found in Parinarium laurinum, namely the acid sequence: LSFRAPAYGFRGPGLQLRRGWRPSSRED- (9Z,11E,13E,15Z)-isomer (a- or cis-parinaric acid) and the Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Parkinson's disease partition fun

(9E,11E,13E,15Z)-isomer (β - or trans-parinaric acid). Both are useful as probes in membrane studies, trans-parinaric acid especially, as it partitions preferentially into the less fluid regions of membrane lipids with increased quantum yield. They inhibit neutrophil elastase.

α-parinaric acid

β-parinaric acid

Parkinson's disease or parkinsonism a progressive disorder of the central nervous system characterized by tremor and impaired muscular coordination, thought to be due to defective dopaminergic transmission in some parts of the brain. There is a loss of dopaminergic neurons connecting the substantia nigra with the striatum, resulting in loss of dopaminergic inhibition in the striatum, with resulting cholinergic hyperactivity. Therapy is aimed at replacement of dopamine, achieved by administration of L-dopa, which is converted to dopamine within the brain (dopamine itself does not cross the blood-brain barrier). See also MPTP. [After James Parkinson (1755-1824), British palaeontologist and surgeon, who first described the disease in 1817.1

Park nucleotide UDP-N-acetylmuramyl pentapeptide; an intermediate in the biosynthesis of peptidoglycan in the cell walls of most bacteria. [After James Theodore Park (1922-).]

parotid gland either of a pair of salivary glands situated near each ear in mammals. The duct runs forwards and empties into the oral cavity.

PARP abbr. for 1 procyclin. 2 proline/arginine-rich protein.

parsimony 1(in computing) an algorithm used for determining sequence relationships in macromolecules. 2 (in genetics) the construction of evolutionary trees from protein and nucleicacid sequences. It maximizes the genetic likeness associated with common ancestry, whilst minimizing the incidence of convergent mutation, and provides a way to find the best genealogical hypothesis from sequence data.

parthenocarpy the formation of fruit without the setting of seeds. It occurs naturally, but can be induced by spraying flowers with gibberellic acid (see gibberellin) to produce crops of seedless fruit.

parthenogenesis the development of a new individual from an unfertilized female gamete. - parthenogenetic adj.; parthenogenetically adv.

partial agonist an agonist that is unable to evoke the maximal response of a biological system, even at a concentrations sufficient to saturate the specific receptors.

partial derivative (in mathematics) the derivative of an expression containing two or more independent variables that is obtained by differentiating the expression with respect to only one of them, the remaining variable or variables being considered constant.

partial hydrolysate any mixture of monomers and oligomers resulting from a limited degree of chemical hydrolysis of a biopolymer or from its exposure to a specific hydrolytic enzyme.

partial inhibition (sometimes) a type of nonlinear enzyme inhibition in which saturation of the enzyme with inhibitor does not decrease the rate of the enzyme-catalysed reaction to zero. partial inverse agonist an inverse agonist that evokes a sub-

maximal response in a biological system, even at a concentration sufficient to saturate the specific receptors. At high concentrations it will diminish the actions of a full inverse agonist. Compare antagonist, partial agonist.

partially overlapping code see overlapping code. partially overlapping gene see overlapping gene.

partial molar quantity a function of any particular extensive property (e.g. enthalpy, entropy, Gibbs energy, heat capacity, internal energy, volume) of a specified component of a singlephase multicomponent system that describes how that property varies, at constant pressure and temperature, with variation of the concentration of the component when the change in the property is expressed per mole of the component. Partial molar Gibbs energy is more usually known as chemical potential. Compare partial specific quantity.

partial pressure symbol: p_B or p(B) (for a gas B); the pressure exerted by one particular gas in a mixture of nonreacting gases. It is defined as the pressure the gas would exert if it alone were present and occupied the whole volume of the mixture at the same temperature, and is equal to the product of the amount-of-substance fraction of the gaseous component in question and the total pressure of the gaseous system. Compare tension. See also p₅₀.

partial pressures, law of see Dalton's law of partial pressures.

partial specific quantity a function of any particular extensive property (e.g. enthalpy, entropy, Gibbs energy, heat capacity, internal energy, volume) of a specified component of a single-phase multicomponent system that describes how that property varies, at constant pressure and temperature, with variation of the concentration of the component when the change in the property is expressed per unit mass of the component. Compare partial molar quantity.

partial specific volume (of a solute) symbol: v_B ; an instance of a partial specific quantity, defined as the change in volume of a solution on addition of a small amount of a solute B, expressed per unit mass of added solute and extrapolated to infinite dilution. The cgs unit (in which values are often listed) is cm³ g⁻¹ and the SI unit is m³ kg⁻¹.

particle 1 an extremely small piece or portion of (esp. solid or colloidal) matter. 2 elementary particle. —particulate adj.

particulate enzyme any enzyme that is bound to an insoluble cellular or subcellular structure or that has been artefactually or artificially attached to particulate material.

particulate radiation any form of radiation consisting of a stream of particles, especially alpha radiation, beta radiation, or neutron radiation emanating from a radioactive source.

partition 1 (in chemistry) or distribution the equilibration of a solute between two phases (usually of differing composition); the result of such a process. 2 (in genetics) the events that lead to the separation of chromosomes or to the segregation of plasmids into daughter cells in prokaryotic organisms.

partition chromatography any form of chromatography in which separation of the components of a mixture is based mainly on differences between the solubilities of the components in the stationary phase (in gas chromatography) or on differences between the solubilities of the components in the mobile and stationary phases (in liquid chromatography).

partition coefficient or distribution coefficient symbol: α or $K_{\rm p}$; the ratio of the equilibrium concentrations of a pure substance dissolved in two phases that are in contact, at a specified temperature. The partition coefficient is independent of the concentrations provided that no chemical interaction occurs with either (or both) of the phases and that the presence of the solute does not affect their immiscibility.

partition function symbol: Z; a dimensionless mathematical function, derived by the application of statistical mechanical theory, that can be used to derive the average distribution of Ban đang đoc một quyển sách được tăng bởi HUY NGUYEN. Nếu ban có nhu cấu về sách sinh học, xin liên hệ:

partition law

Sur naste)

the internal energy of a system in terms of its partition between all its molecular inhabitants.

partition law or distribution law the principle that a solute, when added to a system consisting of two phases, will, at a given temperature, distribute itself between the two phases in proportion to its solubility in each of the two phases separately. Henry's law is a particular case of the partition law. See also Nernst distribution law.

parturition the act or process of giving birth to offspring.

parvalbumin any of a group of closely related ≈12 kDa muscle proteins that bind calcium ions. Parvalbumin α is a muscle EF-hand Ca²⁺-binding protein, that may be involved in muscle relaxation. Example from human: database code PRVA-HUMAN, 109 amino acids (11.93 kDa). Parvalbumin β is known as oncomodulin.

parvovirus any of a group of small, animal viruses, in class II of the Baltimore classification, consisting of a naked capsid, 20-25 nm in diameter, and containing linear, single-stranded DNA of 1.2-1.8 MDa. Parvoviruses are highly resistant to chemical and physical agents.

parvulin a peptidylprolyl isomerase isolated from Escherichia coli. It does not have any function as an immunophilin. Database code CYPC_ECOLI, 92 amino acids (10.10 kDa).

PAS abbr. for 1 p-aminosalicylic acid. 2 periodic acid-Schiff; see periodic acid-Schiff reaction.

pascal symbol: Pa; the SI derived unit of pressure or stress. It is equal to a force of one newton per square metre; i.e.

$$1 \text{ Pa} = 1 \text{ N m}^{-2} = 1 \text{ J m}^{-3}$$
.

[After Blaise Pascal (1623-62), French mathematician and philosopher, who discovered the relationship between barometric pressure and altitude.]

passage (in biology) the action or process of (serially) subculturing cells or microorganisms, especially with a view to adapting them to a changed environment.

passage number (in cell culture) the number of subcultures performed after the original isolation of the cells from a primary source.

passenger or passenger DNA any specific DNA fragment introduced into a cloning vector or other cloning vehicle.

passive diffusion an alternative name for simple diffusion (used especially to emphasize its distinction from active transport). Compare facilitated diffusion.

passive immunity immunity in an individual due to the presence of antibody or primed lymphocytes derived from another, already immune, individual.

Pasteur, Louis (1822–95), French chemist, microbiologist, and immunologist; distinguished for his pioneer work in stereochemistry (in terms of symmetry rather than molecular constitution), for his recognition of the role of microorganisms in fermentation, for his invention of the technique of heat treatment of certain fluids to prevent microbial spoilage, now known as pasteurization, and for devising methods of immunization against certain diseases.

Pasteur effect or (formerly) Pasteur-Meyerhof effect either the phenomenon that occurs in facultatively anaerobic cells whereby oxygen inhibits glycolysis or fermentation, or its converse whereby the rate of glycolysis or fermentation increases when oxygen is excluded. Compare Crabtree effect.

pasteurization or pasteurisation a method of heat-treating milk or similar fluids to improve storage qualities and destroy pathogenic bacteria, without markedly altering taste and nutritional characteristics. Pasteurization of milk involves heating to 65 °C for 30 minutes or to 72 °C for 15 minutes followed by rapid cooling to below 10 °C.—pasteurize or pasteurise vb.

Pasteur pipette or pasteur pipette a simple, disposable, ungraduated, dropping or transfer pipette constructed by drawing out a short length of narrow glass tubing to form a long fine tip and operated commonly by means of an attached rubber or PVC hulb or test. Analogous devices are available

moulded in low-density polyethylene, with integral bulb and sometimes calibrated. Also (esp. US): Pasteur pipet, pasteur pipet.

Pasteur reaction the putative chemical reaction once considered to link fermentation and respiration and to account for the Pasteur effect.

patatin any of a family of glycoproteins that form 40% of the soluble protein of potato tubers. They serve as potato somatic storage proteins, and also have enzyme activity involved in host resistance. They have lipid acylhydrolase activity. Example (precursor): database code PATO_SOLTU, 386 amino acids (42.44 kDa).

patch an intermediate stage in the formation of a cap (def. 2) on the surface of a cell, e.g. of a lymphocyte.

patch-clamp technique a technique whereby the conductance change of a single ion channel of an excitable membrane is measured directly. A very small electrode tip is sealed onto a patch of cell membrane, thereby making it possible to record the flow of current through individual ion channels in the patch. See also Neher, Sakmann.

path see light path.

+pathic see +pathy.

patho+ or (before a vowel) **path+** comb. form denoting disease or clinical disorder.

pathobiochemistry 1 the study of the biochemical processes associated with disease. 2 the processes themselves.

pathogen any agent, especially any living organism, that can cause disease.

pathogenesis the generation and production, or the origin and development, of a disease. —pathogenetic adj.

pathogenesis-related proteins proteins synthesized in plants in response to attack by fungal or bacterial pathogens. They are small proteins that belong to a limited number of families, characterized by six motifs. Example, pathogenesis-related leaf protein P14 from tomato: database code PR14_LYCE, 130 amino acids (14.24 kDa).

pathogenic (capable of) causing or producing disease. —pathogenicity n.

pathological or pathologic 1 of, or pertaining to, pathology.2 causing, relating to, involving, or caused by disease.

pathology 1 the branch of medical science concerned with the causes and nature of disease and with the effects of disease on the structure and functioning of the organism. 2 the sum of the changes that occur in an organism as the result of a specific disease.—pathologist n.

pathophysiology 1 the study of the physiological processes associated with disease. 2 the processes themselves.

pathway 1 the chain of reactions undergone by a given molecular entity or class of such entities in a particular ecosystem.
2 metabolic pathway.

pathway engineering the use of genetic engineering to change either the kinetics or the products of a metabolic pathway.

+pathy comb. form denoting 1 feeling, sensitivity. 2 disease of a (specified) part or kind. 3 a method of treating disease. — pathic adj.

patulin 4-hydroxy-4*H*-furo[3,2-*c*]pyran-2(6*H*)-one; a carcinogenic metabolite with antibiotic activity isolated from several fungi, particularly *Aspergillus* and *Penicillium* spp.

pauci+ comb. form indicating few.

paucidisperse describing a colloidal system whose dispersed phase consists of particles of only a few sizes. —**paucidispersity** n.

ber or PVC bulb or teat. Analogous devices are available **Pauli** Wolfgang (1900–58), Austrian born US physicist: Nobel Ban dang dọc một quyền sách được tặng bởi HUY NGUYEN. Nếu bàn có như cầu về sách sinh học, xin liên hệ:

Pauli exclusion principle

pectinest

Laureate in Physics (1945) 'for the discovery of the Exclusion Principle, also called the Pauli Principle'.

Pauli exclusion principle or exclusion principle or Pauli principle the principle that no two electrons in an atom can be described by the same set of four quantum numbers.

Pauling, Linus Carl (1901-94), US chemist and peace campaigner; Nobel Laureate in Chemistry (1954) 'for his research into the nature of the chemical bond and its application to the elucidation of the structure of complex substances'; Nobel Laureate for Peace (1962).

Paulus filtration method a method for studying the binding of a ligand microsolute to a macrosolute. It is applicable to small amounts of material and is particularly useful for a system having a relatively low binding constant. It involves equilibration of a series of mixtures of macrosolute and ligand in a suitable solvent, then separation of unbound ligand from macrosolute-plus-bound-ligand by ultrafiltration through anisotropic membrane filters of an appropriate retentivity. The amount of microsolute retained with the macrosolute on each filter is then estimated by, e.g., radioactivity measurement or another sensitive technique. [After H. Paulus.]

Pauly's reagent a chromogenic reagent for imidazoles and phenols, consisting of a freshly prepared solution of diazotized sulfanilic acid (or other aromatic amine). In the presence of alkali, this reacts with histidine to give a red colour and with tyrosine to give an orange colour. It is useful for the identification of these amino acids on paper chromatograms.

Pavlov, Ivan Petrovich (1849-1936), Russian physiologist and experimental psychologist; Nobel Laureate in Physiology or Medicine (1904) 'for his work on the physiology of the saliva glands'. See also salivary juice.

Pax genes abbr. for paired box genes. The paired box is a conserved DNA sequence that plays a role in development. Pax genes encode a family of transcriptional regulators specifically expressed during the development of a wide range of structures and organs, including: Pax-1, paraxial mesoderm derivatives; Pax-2, urogenital system; Pax-3, neural crest and pre-myoblast migration; and Pax-6, eye and nose.

paxillin an adhesion protein, associated with vinculin, that becomes phosphorylated in response to a number of stimuli, phosphorylation being associated with focal adhesion. It is also associated with dysfunction of cadherin-dependent cell-cell contacts and with cell spreading. Example from human: database code HSU14588, 557 amino acids (60.87

Pb symbol for lead.

PBD see biphenylylphenyloxadiazole.

PBG abbr. for porphobilinogen.

PBI abbr. for protein-bound iodine.

PBP abbr. for pencillin-binding protein.

pBR322 a cloning vector.

PBS abbr. for phosphate-buffered saline.

PC abbr. for 1 paper chromatography. 2 phosphocreatine. 3 phosphatidylcholine. 4 personal computer.

pCa symbol for the negative logarithm of the concentration (or strictly the activity) of calcium ions in a specified solution.

PCA abbr. for perchloric acid.

P-cadherin placental cadherin.

PCB abbr. for pyruvate carboxylase.

PCCase abbr. for propionyl-CoA carboxylase.

PCMB abbr. for p-chloromercuribenzoate, or p-chloromercuribenzoic acid.

PCMBS abbr. for p-chloromercuribenzenesulfonate, or pchloromercuribenzenesulfonic acid.

PCP abbr. for 1-(1-phenylcyclohexyl)piperidine (see phencyclidine).

PCR abbr. for polymerase chain reaction.

p.d. abbr. for (electric) potential difference.

Pd symbol for palladium.

PDB abbr. for protein database; a database containing 3-D pro-

include the atomic coordinates is referred to as 'PDB format' or 'Brookhaven format' (after the Brookhaven National Laboratory at Upton, Long Island, New York, USA).

PDBu abbr. for phorbol 12,13-dibutyrate, a phorbol ester.

PDD abbr. for phorbol 12,13-didecanoate, a phorbol ester.

PD-ECGF abbr. for platelet-derived endothelial cell growth fac-

PDGF abbr. for platelet-derived growth factor.

pDNA abbr. for plasmid DNA.

P domain a domain of highly conserved cysteine residues, disulfide-bonded in the pattern 1-5, 2-4, 3-6, associated with highly conserved alanine, glycine, and tryptophan residues. Such domains are found in secretory polypeptides from animals.

Pe symbol for the pentyl group.

PE abbr. for 1 phosphatidylethanolamine. 2 potential energy.

peak 1 a sharp increase followed by a sharp decrease in a physical quantity that varies with distance, frequency, time, etc. 2 (in chromatography) the portion of a differential chromatogram recording the changes in detector response or eluate concentration while a given component of the applied mixture emerges from a chromatographic column. 3 the maximum value of a peak (def. 1, 2).

pEC₅₀ see p[A]₅₀.

PEC-60 a 60-amino-acid endogenous regulatory polypeptide abundant in intestinal tissue and also found in the central nervous system. It inhibits the formation of cyclic AMP and activates Na+,K+-ATPase. It is structurally related to pancreatic secretory trypsin inhibitor and inhibits insulin secretion. Example from Sus scrofa (precursor): database code PE60_PIG, 86 amino acids (9.63 kDa).

PECAM abbr. for platelet endothelial cell adhesion molecule; a class of adhesion molecules represented by PECAM-1 (or CD31), a member of the immunoglobulin superfamily. It is constitutively expressed on endothelial cells, platelets, granulocytes, monocytes, and T cells, and participates in homophilic binding (i.e. binding to itself). It is required for transmigration of leukocytes across the endothelium during extravasation. Example from human (precursor): database code PEC1_HUMAN, 738 amino acids (82.54 kDa), residues 1-27, signal; 28-738, PECAM.

pectate any salt or ester of pectic acid.

pectic acid the form of pectin (def. 1) that is essentially free of methyl ester groups.

pectic substance an alternative name for pectin (def. 1).

pectin 1 or pectic substance any mixture of complex, colloidal, macromolecular plant galacturonans containing a large proportion of D-galactopyranosyluronic acid residues in $(\alpha 1 \rightarrow 4)$ linkage, the carboxyl groups of which may be esterified to varying degrees by methyl groups or be partially or completely converted to salts; some D-arabinose and D-galactose residues nearly always occur in addition, and residues of certain other sugars are sometimes present. M_r is usually in the range 1 \times 10^4 –4 × 10⁵. Pectins are important matrix polysaccharides of plant cell walls, especially those of higher plants, sometimes constituting as much as one-third of the dry matter; they also occur in some plant juices. Certain fruits are particularly rich in pectin. 2 (in commerce) a whitish, water-soluble powder prepared from the rind of citrus fruits or apple pomace by extraction with dilute acid and consisting essentially of pectin (def. 1). It is used inter alia in the preparation of jams because of its ability to form gels in the presence of sucrose at high concentrations.

pectinase see polygalacturonase.

pectinesterase EC 3.1.1.11; other methylesterase, pectin methoxylase; an enzyme that hydrolyses pectin to methanol and pectic acid. It is found in plant cell walls. One role may be concerned with cell-wall metabolism during fruit ripening. Example from Lycopersicon esculentum (tomato): PME1_LYCES, 317 amino acids (34.55 tein and nucleic-acid structures. A database of the files that kDa).

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

pectinic acid the form of **pectin** (def. 1) in which a high proportion of the carboxyl groups are esterified with methanol.

pectin lyase EC 4.2.2.10; an enzyme that catalyses a *trans* elimination to convert pectin to oligosaccharides with unsaturated (C-4,C-5) terminal residues. Although often described as 4-deoxy-6-methyl-α-D-galact-4-enuronosyl groups, they are more accurately termed 4-deoxy-6-methyl- β -L-threo-hex-4-enopyranouronosyl groups. Example (precursor) from Aspergillus niger: database code PLYA_ASPNG, 379 amino acids (39.85 kDa).

pectin sugar an old name for L-arabinose.

PEG abbr. for polyethylene glycol.

PEI abbr. for the poly(ethyleneimine) group,

pelargonate another name for nonanoate.

pelargonoyl another name for nonanoyl.

pellagra a disease of animals, including humans, arising from a dietary deficiency of nicotinic acid, especially in the absence of sufficient dietary tryptophan to generate adequate amounts of nicotinamide coenzymes metabolically. This situation can occur when the diet consists largely of maize (corn). Pellagra is characterized by scaly dermatitis on exposed skin surfaces, diarrhoea, and depression.

pellagra-preventative factor abbr.: PP factor or PPF; a former name for nicotinic acid or nicotinamide.

pellet a small compressed mass of material, especially such a mass deposited at the bottom of a tube by centrifugation of a suspension.

pellicle a thin skin, membrane, or film.

pellicular 1 of, relating to, or being in the form of a pellicle.
2 describing a type of column packing, used in high-pressure liquid chromatography, in which the stationary phase is present as a thin layer on the surface of tiny glass beads.

Peltier effect the phenomenon whereby heat is given out, or absorbed, when an electric current passes across a junction between two dissimilar materials. See thermacouple. Compare Seebeck effect. [After Jean Peltier (1785–1845), French physicist.]

penatin an obsolete name for glucose oxidase.

penetrance (in genetics) the degree to which a particular genotype is expressed in a population phenotype. If every individual carrying a dominant mutant gene shows the mutant phenotype, the gene is said to show complete penetrance.

penicillamine 3-mercapto-D-valine; β , β -dimethylcysteine; 2-amino-3-methyl-3-mercaptobutyric acid; the D-enantiomer is a characteristic degradation product of penicillin-type antibiotics. It is a potent chelator of heavy metal ions, hence it is used clinically in the treatment of **Wilson's disease** and of poisoning by metals such as copper, lead, and mercury.

penicillic acid 3-methoxy-5-methyl-4-oxo-2,5-hexadienoic acid (exists in equilibrium with lactone form); a toxic antibiotic metabolite obtained from several fungi. It bears no relationship to penicillin or its degradation products. (Illustrated opposite.)

penicillin 1 the generic name for a range of related antibiotics, whether produced naturally during the growth of various microfungi of the genera *Penicillium* and *Aspergillus* or of semisynthetic origin, that contain the condensed β -lactam—thiazolidine ring system:

where R is any one of a variety of acyl groups such as: phenylacetyl, C₆H₅-CH₂-CO- (in penicillin G, penicillin II, benzylpenicillin); phenoxyacetyl, C₆H₅-O-CH₂-CO- (in penicillin V); and D-adipyl, HOOC-CH(NH₂)-[CH₂]₃-CO- (in penicillin N, also called cephalosporin N). Only those enantiomers having the D-configuration at C-2 of the thiazolidine ring show antibiotic activity. The parent substance, 6-aminopenicillanic acid, in which R is H, has little intrinsic antibiotic activity but is important as the naturally occurring starting point for the semisynthesis of artificial penicillins, e.g. ampicillin, in which R is aminophenylacetyl, $C_6H_5\!\!-\!\!CH(NH_2)\!\!-\!\!CO\!\!-$. All penicillins are readily inactivated by chemical or enzymic hydrolysis of the strained four-membered β -lactam ring, cold dilute acid yielding **penicillamine**, and alkali or penicillinases and other β lactamases forming the corresponding substituted penicilloic acids. The penicillins generally have extremely low toxicity to animals and a high antibacterial activity, especially against Gram-positive organisms, the spectrum of activity varying somewhat with the nature of the group R. They act by inhibiting cross-linking of peptidoglycan in the cell wall of growing bacterial cells, the consequent structural weakness of the wall rendering the cells sensitive to osmotic lysis. 2 the (hypothetical) substance 6-formamidopenicillanic acid, used only in combination in trivial names of certain penicillins (def. 1), e.g. benzylpenicillin.

penicillin acylase EC 3.5.1.11; recommended name: penicillin amidase; an enzyme that catalyses the hydrolysis of penicillin to a fatty-acid anion and 6-aminopenicillinate. There are several enzymes that differ in specificity for the fatty acid. Examples: penicillin V acylase (or penicillin V amidase), a homotetramer from Bacillus sphaericus, database code PAC_BACSH, 338 amino acids (37.42 kDa); penicillin G acylase (or penicillin G amidohydrolase) from Escherichia coli, database code PAC_ECOLI, 846 amino acids (94.54 kDa) – the latter sequence represents a zymogen for a periplasmic enzyme comprising a signal (amino acids 1-26), an α subunit (27-235), a spacer (236-289) and a β subunit (290-846); the active enzyme is a heterodimer (α,β). See also 6-amino-penicillanic acid.

penicillin amidase the recommended name for penicillin acylase.

penicillinase a trivial name for any β -lactamase that acts preferentially on penicillins.

line ring system:

penicillin-binding protein abbr.: PBP; any of various bacterial proteins that are capable of binding penicillin(s) covalently. Such proteins appear to be located predominantly, if not solely, in the cytoplasmic membrane of all species of bacteria in which peptidoglycan occurs in the cell wall. These proteins are believed to catalyse reactions in the later stages of cell-wall synthesis and there is a strong presumption that at least one of them catalyses the insertion of nascent peptidoglycan into the cell wall. In Gram-negative bacteria some penicillin-binding proteins are known to be involved in the maintenance of cell shape or in cell elongation or septation. Another is a carboxypeptidase, example from Haemophilus influenzae (precursor): database code DACA_HAEIN, 393 amino acids (43.41 kDa).

penicillin G acylase see penicillin acylase.
penicillin V acylase see penicillin acylase.
penicilloic acid any of a range of compounds of structure:

and produced by cleavage of the β -lactam ring of **penicillins** (def. 1) by enzymic or alkaline hydrolysis.

penta+ or (before a vowel) **pent+** comb. form denoting five, fivefold, five times.

pentacosa+ comb. form denoting 25, 25-fold, 25 times.

pentadeca+ comb. form denoting 15, 15-fold, 15 times.

pentafunctional arom polypeptide a polypeptide that catalyses five consecutive enzymatic reactions in prechorismate polyaromatic amino-acid biosynthesis, i.e the second to sixth steps in the biosynthesis from chorismate of the aromatic amino acids (the shikimate pathway). It occurs in some yeasts and other fungi and in Euglena gracilis. It contains: 3-dehydroquinate synthase, 3-dehydroquinate dehydratase, shikimate 5-dehydrogenase, shikimate kinase, and EPSP synthase. Example from yeast: database code ARO1_YEAST, 1588 amino acids (174.55 kDa). Residues 1-392 = 3-dehydroquinate synthase; residues 404-866 = EPSP synthase; residues 887-1060 = shikimate kinase; residues 1061-1293 = 3-dehydroquinate dehydrogenase; and residues 1306-1588 = shikimate dehydrogenase.

pentagastrin the trivial name for (N-tert-butyloxycarbonyl- β -alanyl)-L-tryptophanyl-L-methionyl-L-aspartyl-L-phenylalaninamide; a synthetic analogue of gastrin that consists of the latter's C-terminal tetrapeptide amide sequence with an added protected N-terminal β -alanyl residue. It is used in the pentagastrin test as a gastrin analogue to stimulate gastric-acid secretion, which is then measured. Secretion is sometimes high in patients with duodenal ulceration and low in patients with gastric ulcer, but this is too variable to be of great use in diagnosis. See also calcitonin.

pentamer 1 any oligomer consisting of or derived from five monomers. 2 the group of five capsomeres in an icosahedral virus capsid.

pentanoate another name for valerate.

pentanoyl another name for valeryl.

pentaose a pentasaccharide in which all the residues are of one type and uniform linkage. *Compare* **pentose**.

pentaric acid any aldaric acid obtained by oxidation of a pentose at C-1 and C-5.

pentasaccharide any oligosaccharide composed of five monosaccharide units. Pentasaccharides occur in small amounts in plants, e.g. **verbascose** in soybeans.

pentaxin or pentraxin any of a family of proteins with a discoid appearance under electron microscopy, having five non-covalently bound subunits. The family includes C-reactive protein, serum amyloid P-component, and neuronal pentaxins. Exam-

ple from human, neuronal pentaxin II (precursor): database code NPX2_HUMAN, 430 amino acids (46.81 kDa); residues 1-15 are the signal, 16-430 neuronal pentraxin II; residues 226-430 contain the pentaxin domain.

pentitol any **alditol** having a chain of five carbon atoms in the molecule.

pentobarbital 5-ethyl-5-(1-methylbutyl)barbiturate; a major barbiturate drug. *One proprietary name* is Nembutal.

pentolinium test a test in which **pentolinium**, a sympathetic ganglion blocking drug, is used to reduce catecholamine secretion; failure to achieve reduction may indicate a **pheochromocytoma**.

penton a capsomere that is surrounded by five other capsomeres in an icosahedral virus capsid.

pentonic acid any monocarboxylic acid (aldonic acid) formally derived from a pentose by oxidation at C-1.

pentosan a glycan that yields only pentoses on hydrolysis.

pentose any **aldose** having a chain of five carbon atoms in the molecule. *Compare* **pentaose**.

pentose cycle an alternative name for pentose phosphate pathway.

pentose nucleic acid abbr.: PNA; a former term for ribonucleic acid.

pentose phosphate pathway or hexose monophosphate pathway a complex series of extramitochondrial metabolic reactions by which glucose 6-phosphate is oxidized with formation of carbon dioxide, ribulose 5-phosphate, and reduced NADP, the ribulose 5-phosphate then entering a series of reactions in which a number of sugar phosphates containing between three and seven (or eight) carbon atoms are successively interconverted. One consequence of these interconversions is the nonoxidative regeneration of glucose 6-phosphate, which then can enter the pathway for another cycle of oxidative decarboxylation and skeletal rearrangement, the eventual result being the complete oxidation of one molecule of glucose with the formation of six molecules of carbon dioxide and 12 molecules of NADPH. The pathway thus provides (in some organisms or tissues) an alternative route to (or shunt of) part of the glycolytic pathway; it also provides ribose 5-phosphate for nucleotide synthesis and (in some organisms) other intermediates for biosynthesis. Of special importance is D-erythrose 4-phosphate, required for the biosynthesis of aromatic amino acids and many other materials by the shikimate pathway. In higher plants many of the enzymes of the pathway function in the reverse direction as part of the reductive pentose phosphate cycle. Other names: hexose monophosphate shunt; pentose cycle; phosphogluconate (oxidative) pathway; Warburg-Dickens pathway; Warburg-Dickens-Horecker pathway. See also glucose-6-phosphate dehydrogenase, phosphogluconate, phosphogluconate dehydrogenase (decarboxylating), transaldolase, transketolase.

pentosuria the presence of excessive amounts of pentose in the urine. Two types may be distinguished: (1) essential pentosuria, in which daily excretion of 1-4 g L-xylulose (normal <60 mg) occurs due to an inherited diminished activity of the NADP-linked L-xylulose reductase (EC 1.1.1.10), an enzyme of the glucuronate pathway that converts L-xylulose to xylitol; (2) alimentary pentosuria, in which excretion of up to 100 mg of L-arabinose or L-xylose occurs following ingestion of unusually large amounts of such fruits as cherries, grapes, and plums.

pentraxin see pentaxin.

pentulose any **ketose** having a chain of five carbon atoms in the molecule. There are two enantiomeric pairs of pentuloses having the carbonyl group at C-2, these being the D- and L-isomers of ribulose, *erythro-2*-pentulose, and of xylulose, *threo-2*-pentulose.

pentyl symbol: Pe; the alkyl group, CH₃-[CH₂]₃-CH₂-, derived from pentane.

PEP abbr. for phosphoenolpyruvate.

PEPCK abbr. for phosphoenolpyruvate carboxykinase.

serum amyloid P-component, and neuronal pentaxins. Exampelomer a virus-coded proteinaceous knob or spike, numbers Ban dang doc mot quyen sach duoc tang boi HUY NGUYEN. Neu ban co nhu câu ve sach sinh hoc, xin liên hê:

of which project from the peplos (i.e. **envelope** (def. 3)) of an enveloped virus particle. Peplomers may have cell-receptor, hemagglutinating, or neuramidinase activity.

peplos an alternative name for envelope (def. 3).

pepsin 1 any of a small family of closely related aspartic proteinase enzymes of 31-36 kDa that together give rise to the principal proteinase activity of gastric juice of vertebrates. The family includes pepsin A, pepsin B, pepsin C (i.e. gastricsin), and pepsin D. Pepsins have maximal activity at pH values in the range 2-3; they preferentially catalyse hydrolysis of peptide bonds formed from hydrophobic amino-acid residues, the detailed specificity varying somewhat between the different pepsins. 2 an alternative name for pepsin A.

pepsin A or pepsin abbr. (in clinical chemistry): PPS; the recommended name for the predominant enzyme (EC 3.4.23.1) of the pepsin family. It is a single-chain phosphoprotein of (in the pig) 327 amino-acid residues, formed by limited proteolysis of pepsinogen A. It preferentially cleaves peptide bonds where the residues on either side are formed from hydrophobic amino acids; for example, in the B chain of insulin it cleaves Phe¹-|-Val², Gln⁴-|-His⁵, Glu¹³-|-Ala¹⁴, Ala¹⁴-|-Leu¹⁵, Leu¹⁵-|-Tyr¹⁶, Tyr¹⁶-|-Leu¹⁷, Gly²³-|-Phe²⁴, Phe²⁴-|-Phe²⁵, and Phe²⁵-|-Tyr²⁶ bonds (compare pepsin B). The unphosphorylated form of porcine pepsin A is called pepsin D.

pepsin B or parapepsin I a pig enzyme (EC 3.4.23.2) of the pepsin family. It is a single-chain phosphoprotein of 332 amino-acid residues, formed by limited proteolysis of pig pepsinogen B. It has little activity towards hemoglobin as substrate (compare gastricsin), but degrades gelatin. Its specificity on the B chain of insulin is more restricted than pepsin A; it does not cleave Phe¹-|-Val², Gln⁴-|-His⁵, or Gly²³-|-Phe²⁴.

pepsin C an alternative name for gastricsin.

pepsin D unphosphorylated pig pepsin A.

pepsinogen a precursor (i.e. zymogen) of a pepsin enzyme; pepsinogens A, B, and C give rise to pepsin A, pepsin B, and pepsin C (i.e. gastricsin) respectively. Pepsinogens are secreted by the chief cells of the gastric mucosa of vertebrates. In pepsinogen, the active site is conformationally masked at neutral pH, and exposed as the pH falls after secretion into the stomach. The first bond breakage causes the release of residues 1-16, leaving a peptide known as pseudopepsin. Thereafter, a further 28 residues are removed in stages to form the active enzyme. Pepsinogen C is also secreted by the mucosa of the proximal duodenum. Example from human: database code PEPA_HUMAN, 388 amino acids (41.93 kDa): this is the pepsinogen precursor with a signal peptide; pepsin is from residue 63 to the end.

pepstatin A N-isovaleryl-L-valyl-L-valyl-3-hydroxy-6-methyl-4-aminoheptanoyl-L-alanyl-3-hydroxy-6-methyl-4-aminoheptanoic acid; a peptide, isolated from broth cultures of *Streptomyces* spp., that inhibits pepsin and other aspartic proteinases, notably cathepsin D, renin, and fungal acid proteinases.

peptaibophol or **peptaibol** any of a group of peptide amide antibiotics, 15–24 residues long and containing up to 40% α -aminoisobutyric acid residues. The members of this group, emerimicin, zervamicin IIA, antiamoebin I, sizukacillin A, and **alamethicin**, are all capable of altering the permeability of phospholipid bilayers. The N termini are acylated and the C-terminal carboxyl groups are in amide linkage with phenylalaninol.

peptic 1 of, pertaining to, caused by, or containing pepsin.2 of, pertaining to, or promoting digestion.

peptidase or peptide hydrolase or protease any enzyme that hydrolyses peptide bonds. The group includes the exopeptidases, such as the aminopeptidases and carboxypeptidases, (sub-sub-classes EC 3.4.11-19) and the endopeptidases (sub-subclasses EC 3.4.21-99). The 1992 revision of Enzyme Nomenclature (published for IUBMB by Academic Press) should be consulted for more detail.

peptidase substrates; in describing the specificity of peptidases, it is useful to have a convention for identifying the residues on either side of the cleaved bond; the following model is often followed (the cleaved, or scissile bond is indicated as -|-, and the N terminus is as usual to the left):

-P3-P2-P1-|-P1'-P2'-P3'-.

Compare peptidyl site.

peptide any compound containing two or more amino-acid residues joined by amide bond(s) (see peptide bond) formed from the carboxyl group of one amino acid (residue) and the amino group of the next one. The term peptide usually applies to compounds in which the amide bond(s) are formed between C-1 of one α-amino acid (residue) and N-2 of another, but it includes compounds in which the residues are linked by other amide bonds. See also oligopeptide, polypeptide.—peptidic adj.

peptide antibiotic any member of a diverse group of antibiotics containing amino-acid residues, some of which are often of the D-form, linked to one another by peptide bonds, to hydroxy acids by depsipeptide bonds, and frequently also to additional components; the structure is often cyclic. The group includes the bacitracins, gramicidins, polymyxins, and tyrocidins.

peptide bond or peptide linkage any amide bond formed between two amino acids (or amino-acid residues). The term usually denotes the amide bond (sometimes called the eupeptide bond) formed between an α -amino group of one amino acid and an α -carboxyl group of another amino acid, but it also includes any amide bond (sometimes called an isopeptide bond) formed from an amino group and a carboxyl group either or both of which are in other positions in the contributing amino acids.

peptide chain or polypeptide chain any discrete linear sequence of amino-acid residues linked by eupeptide bonds, especially in a larger molecular structure. See peptide bond.

peptide HI abbr.: PHI; a 27-residue peptide amide, also known as PHI-27, found in intestinal tissue, brain, respiratory tract, and pancreas. It stimulates insulin secretion and pancreatic exocrine secretion, causes vasodilation, increases intestinal fluid transport, relaxes smooth muscle, and is a potent prolactin-releasing factor. It shows sequence homology with gastric inhibitory polypeptide, glucagon, secretin, and vasoactive intestinal polypeptide; human PHI has the sequence

HADGVFTSDFSKLLGQLSAKKYLESLM-NH₂

(porcine PHI has Arg¹² and Ile²⁷; bovine has Tyr¹⁰, Arg¹², and Ile²⁷). It is named after the single-letter codes, H and I, for the histidine and isoleucine residues at the N and C termini respectively of the porcine and bovine peptides.

peptide histidine valine 42 abbr.: PHV 42; a peptide with N-terminal histidine and C-terminal valine, having 42 residues derived from residues 81–122 of prepro-vasoactive intestinal peptide.

peptide hormone or polypeptide hormone any peptide with hormonal activity in animals, whether endocrine, neuro-endocrine, or paracrine. Such substances form a very diverse group physiologically, and the boundary between peptide hormones and protein hormones is somewhat indistinct.

peptide hydrolase another name for peptidase.

peptide linkage 1 an alternative name for peptide bond. 2 chemical linkage between structural components of a molecule by means of peptide bonds.

peptide map a pattern, characteristic of a particular polypeptide or protein, produced by partial hydrolysis followed by two-dimensional fractionation of the resultant peptides (and amino acids) by chromatography and/or electrophoresis.

peptide nucleic acid a synthetic DNA analogue with an N-(2-aminoethyl)glycine backbone that mimics DNA in forming a **heteroduplex**.

sulted for more detail.

peptide agonist from its nerve endings, whether into a synapse with another neuron, into intercellular fluid, or directly into the bloodstream.

peptide synthesis 1 (in biology) see protein and peptide biosynthesis. 2 (in chemistry) the synthesis, by chemical means, of peptides. A number of strategies are possible, including automated methods. The first step is the protection, in the aminoacid reactants, of reactive groups not involved in peptide bond formation (see protecting groups); peptide-bond formation is then achieved by activation of the carboxyl group, which is reacted with the free α -amino group of another amino acid. A variety of methods have been used for activation of the carboxyl group but a frequently used method is to react it with Nhydroxysuccinimide or a derivative to form an acyl succinimido ester, which reacts under mild conditions with free amino groups. Normally, and always in automated methods, the carboxyl group of the first amino acid is attached to a resin, by a bond that is easily detached later, so that the desired product, the growing peptide chain, remains attached to the resin which facilitates its purification; this technique, called solid-phase peptide synthesis, was pioneered by Merrifield.

peptide unit (in crystallography) any sequence of atoms in a peptide chain that may be represented by the general formula -CHR-CO-NH-, where R denotes the side chain of an amino-acid residue. Compare amino-acid residue.

peptide YY abbr.: PYY; a 36-residue peptide amide originally found in porcine upper small intestinal tissue. It is a gut hormone that inhibits exocrine pancreatic secretion. Members of this family regulate numerous physiological processes, including appetite, gastrointestinal transit, anxiety, and blood pressure. It shows sequence homology with neurotensin and pancreatic hormone, having the amino-acid sequence:

YPIKPEAPGEDASPEELNRYYASLRHYLNLVTR- $QRYNH_2$.

It is named after the single-letter code, Y, for the tyrosine residues at its N terminus and the tyrosine amide at its C terminus.

peptido+ comb. form indicating the presence of peptide linked to some other (specified) component(s).

peptidoglycan or murein any of a class of glycoconjugates found only in bacterial cell walls and consisting of strands of glycosaminoglycan cross-linked by oligopeptides to form a huge and rigid network. There are characteristic differences between peptidoglycans of eubacteria and those of archaebacteria. The glycosaminoglycan strands are formed of alternating residues, usually N-acetylated or N-glycoloylated, of D-glucosamine and either muramic acid (in Bacteria) or Ltalosaminouronic acid (in Archaea); the carboxyl groups of the muramic-acid residues are commonly joined in amide linkage to oligopeptides containing residues of both L- and Damino acids whereas those of the L-talosaminouronic-acid residues are linked to peptides consisting of L-amino acids only. The peptide side-chains of adjacent polysaccharide strands are sometimes crosslinked between a carboxyl group of one peptide moiety and an amino group of another, either directly by a peptide bond or indirectly by an interpeptide bridge consisting of one to several amino-acid residues.

peptidyl the acyl group formed from a peptide by removal of the hydroxyl group from its C-terminal carboxyl group.

peptidylprolyl isomerase abbr.: PPIase; EC 5.2.1.8; systematic name: peptidylproline cis-trans-isomerase; an enzyme that irreversibly converts prolyl residues within a polypeptide chain from a trans to a cis configuration; the reaction is:

peptidylproline ($\omega = 180$) = peptidylproline ($\omega = 0$).

It accelerates protein folding. There are at least two families of enzymes with this activity. One is identical to **cyclophilin**, an **immunophilin** that is the major high-affinity binding protein of the immunosuppresive drug **cyclosporin A**. Another class of immunophilins that exhibit isomerase activity are the FK506c.

binding proteins (see FKBP). The physiological role of these proteins is unresolved. The peptide Ala-Pro inhibits the reaction but is not a substrate. Example from human: database code FKB3_HUMAN, 141 amino acids (15.64 kDa).

peptidyl site or P-site or (more correctly) peptidyl-tRNA site the ribosomal site to which a newly elongated peptidyl-tRNA molecule is transferred from the aminoacyl site during the sequence of polypeptide biosynthesis reactions, and at which it displaces the tRNA molecule remaining from the previous elongation step. Compare peptidase P-site. See also ribosome.

peptidyltransferase EC 2.3.2.12; the ribosomal enzyme that catalyses the elongation step in polypeptide synthesis:

peptidyl- $tRNA_1$ + aminoacyl- $tRNA_2$ =

 $tRNA_1 + peptidyl-aminoacyl-tRNA_2$.

It is an activity of the large ribosomal subunit involving, in bacteria, ribosomal proteins L2, L3, L4, L15, and L16, and 23S rRNA. See also peptidyl site.

peptidyl-tRNA the form in which a growing polypeptide chain is held to a ribosome during polypeptide biosynthesis. The polypeptide is esterified through its C-terminal carboxyl group to the 3'-hydroxyl of the adenosine residue at the 3' end of a molecule of tRNA. See protein synthesis.

peptize or **peptise** to disperse (an aggregate) to form a colloidally stable suspension or emulsion; especially to convert (a gel) into a sol. —**peptization** or **peptisation** n.

peptolide (sometimes) any naturally occurring cyclodepsipeptide; see depsipeptide.

peptone any soluble mixture of products, 0.6-3 kDa, of the partial enzymic (or acid) hydrolysis of proteinaceous material. It is used as a constituent of many microbiological culture media.

peptonize or peptonise 1 to convert (proteinaceous material) into **peptone**. 2 to combine with peptone; e.g. peptonized iron.—peptonization or peptonisation n.

per+ comb. form denoting 1 through, throughout, beyond; e.g. perennial. 2 (in chemistry) a (of an indicated element) being in a higher than usual state of oxidation; e.g. periodate. See also peracid (def. 1). b containing a higher than normal proportion of (an indicated element); e.g. peroxide. See also peroxoacid, peroxy acid. c (in the trivial names performic, peracetic, and perbenzoic acids) peroxy+. d exhaustive replacement of hydrogen (except any in a characteristic group) in an organic compound by (an indicated halogen); e.g. perfluoropentane, C₅F₁₂. See also perhydro.

peracid or per-acid 1 a common name for any inorganic acid in which the central element of the acid is in its highest state of oxidation. 2 a common name for peroxoacid. 3 a common name for peroxy acid.

per cent or percent symbol: %; containing or consisting of a specified numerical proportion (of some component in relation to a whole) expressed as a number fraction multiplied by 100; bearing a specified numerical relationship (to some quantity) similarly expressed. When the term per cent or the symbol % is applied to a solution, one of the designations w/w, w/v, or v/v may be appended according as the units used are mass per mass, mass per volume, or volume per volume, respectively.

percentage proportionality expressed per cent; it is used especially to qualify a substantive, e.g. percentage error.

perchloric acid abbr.: PCA; chloric(VII) acid, HClO₄; a compound used in chemical analysis as an oxidizing agent.

Percoll the proprietary name for a polydisperse preparation of colloidal silica particles rendered nontoxic to cells by a coating of polyvinylpyrollidone. Aqueous dispersions of the material can be used to generate density gradients for the separation of cells, viruses, or cell organelles by sedimentation.

percutaneous through the skin; used especially of the route of administration of drugs applied to the skin.

the immunosuppresive drug cyclosporin A. Another class of immunophilins that exhibit isomerase activity are the FK506. Ban dang doc mot quyen sach duoc tang boi HUY NGUYEN. Neu ban co nhu cau ve sach sinh hoc, xin hen he:

performic acid

perip

being stored in secretory vesicles and released by local exocytosis. With Ca2+, it polymerizes into transmembrane tubules that form pores in the target-cell membrane and is thus capable of lysing nonspecifically a variety of target cells. Example (precursor) from human: database code PERF_ HUMAN, 555 amino acids (61.31 kDa).

performic acid the trivial name for peroxyformic acid, H-C(=O)-O-OH; a strong oxidizing agent, useful in protein chemistry for cleavage of any disulfide bond, R-S-S-R', to the corresponding pair of sulfonic acid groups, R-SO₃H + R'-SO₃H, e.g. of a cystine residue to two cysteic-acid residues. Tryptophan residues are also oxidized, and methionine residues are converted to methionine S, S-dioxide residues.

perfusate any fluid used for a perfusion.

perfuse to pass fluid through an organ or tissue, especially artificially. —perfusion n.

perhydro+ prefix (in chemical nomenclature) signifying conversion of the indicated unsaturated organic compound to the corresponding fully hydrogenated compound; used especially where the parent compound is markedly unsaturated; e.g. perhydroanthracene, C₁₄H₂₄ (formed from anthracene, C₁₄H₁₀).

peri+ comb. form enclosing, surrounding; near.

pericellular surrounding a cell or cells.

perifusate any fluid used for a perifusion (see perifuse).

perifuse to pass a fluid around isolated cells or cell clusters in suspension. —perifusion n.

peri-fused see ortho- and peri-fused.

perikaryon or cell body the cytoplasm immediately surrounding the nucleus of a neuron.

perilipin a protein found in adipocytes exclusively at the surface of the lipid storage droplets that serves as the major Akinase substrate. It is a major hormonally regulated adipocyte-specific phosphoprotein. Example, perilipin A from Rattus norvegicus: database code A49413, 517 amino acids (55.55 kDa).

perinuclear space the zone, 20-40 nm wide, between the two lipid bilayers of the nuclear envelope of a eukaryotic cell.

period 1 a specified or defined length of time, especially the time occupied by one complete cycle of some regularly recurring phenomenon or event. 2 (in chemistry) any of the horizontal rows of chemical elements in the periodic table.

periodate 1 any anion derived from a periodic acid, especially the anion, IO₄, derived from metaperiodic acid. 2 any salt of a periodic acid, especially of metaperiodic acid or orthoperiodic

periodate oxidation a method for the investigation of the structure of organic molecules, based upon the ability of aqueous periodate (or periodic acid) to cleave specifically and quantitatively any carbon-carbon single bond where one carbon atom carries a hydroxyl group and the other carries an amino, carbonyl, carboxyl, or hydroxyl group, these groups being oxidized and the periodate reduced to iodate. The method is particularly useful in the structural analysis of carbohydrates. See also periodic acid-Schiff reaction.

periodic 1 of, relating to, or resembling a **period** (def. 1 or 2); happening or occurring in periods; intermittent; cyclical. periodically adv. 2 (in chemistry) denoting any of several oxoacids of iodine containing a greater proportion of oxygen than iodic acid. See per+ (def. 2a), periodic acid.

periodic acid any of a number of iodic(VII) acids formed by the combination of iodine heptoxide, I₂O₇, with water in different molecular proportions, especially orthoperiodic acid (formerly known as paraperiodic acid), H₅IO₆; metaperiodic acid, HIO₄, exists mainly as its salts. These acids and their salts are strong oxidizing agents.

periodic acid-Schiff reaction abbr.: PAS reaction; a chromogenic reaction used as a sensitive test for carbohydrate, either histochemically or in chromatography. It is based on the periodate oxidation of vicinal -CHOH- groups to -CHO groups and the subsequent reaction of these with Schiff reagent periodic classification see periodic system.

periodicity the recurrence (of some phenomenon or event) at constant intervals in space or time; a measure of the frequency of such recurrence.

periodic law or Mendeleev's law the principle that the properties of the chemical elements are a periodic function of their atomic numbers (originally, of their atomic weights).

periodic system or periodic classification any classification of the chemical elements on the basis of the periodic law.

periodic table a mode of representing the periodic system; it is a tabular arrangement of the chemical elements in horizontal rows and vertical columns in order of increasing proton number row by row, each row, or period, consisting of those elements from an alkali metal to the rare gas of next highest proton number (except for the last, incomplete, period) and each column, or group, consisting of a family or set of those elements with similar chemical properties. Over the years, numerous versions of such a tabular arrangement have been proposed and used, the three commonest formats having 8, 18, or 32 columns of elements. Of these, the ones most widely adopted latterly have been variations of the so-called long periodic table, in which there are 18 columns. The particular version of the long table illustrated on the endpapers is the one currently recommended by IUPAC and adopted for use elsewhere in this dictionary. In this IUPAC periodic table, as similarly in other versions of the long table, the 15 elements of proton numbers 57 to 71, the lanthanoids, occupy a single position in period 6 of group 3, and those of numbers 89 to 103, the **actinoids**, a single position in period 7 of group 3, practical considerations requiring these elements to be listed separately at the bottom of the table.

In previous versions of the long table it was usual for 14 of the columns to be formed into seven groups, numbered I to VII and each divided into A and B subgroups. However, these subgroup designations were not always applied the same way round, with the consequence that two alternative conventions for the long table have concurrently had widespread support one commonly in Europe (and hitherto followed in principle by IUPAC), the other in North America and elsewhere. Furthermore, the three columns containing the elements iron, cobalt, and nickel, originally designated together as group VIII, and the eighteenth column, containing the noble gases and originally designated as group O, have sometimes been labelled group VIIIA and group VIIIB respectively in the European version of the table, whereas in the North-American version the noble gases have in recent years been assigned usually to group VIIIA. The resultant confusion led IUPAC to recommend in 1990 that the columns of the long periodic table now be serially numbered as groups 1 to 18. The correspondence of the group designations in the new IUPAC periodic table with those of the European and North-American conventions in recent use is also shown in the endpapers.

peripheral (cell-membrane) protein or extrinsic protein an operational term for any protein that can be dissociated unchanged from a cell membrane by a mild treatment such as increase in ionic strength of the medium or addition of a chelating agent to it. Such proteins are presumed to be loosely attached to one or other surface of the cell membrane. Compare integral (cell-membrane) protein.

peripheral nervous system the part of an animal's nervous system other than the central nervous system, and generally located in the peripheral, or outer, parts of the body. It comprises the cranial nerves and spinal nerves and their branches, and includes the autonomic nervous system. It serves to link effector organs and sensory receptors with the central nervous system.

peripherin a glycoprotein, named from 'peripheral vision', that is essential for eye-disk morphogenesis; it is probably an adhesion molecule. Example from human: database code to give a characteristic magenta colour.

RDS HUMAN, 346 amino acids (39.14 kDa).

periplasm

periplasm or periplasmic space the region in a bacterial cell between the cell membrane and the cell wall.

peristalsis a wavelike sequence of involuntary muscular contraction and relaxation that passes along a tubelike structure, such as the intestine, impelling the contents onwards. —peristaltic adi.

peristaltic pump a pump that functions, by analogy with the action of peristalsis, by the repeated compression of a length of elastic tubing in such a way as to cause the contents of the tubing to move in one direction in a pulsating fashion but with an overall flow rate that is constant and regulated by the rate of pulsation and the tubing diameter.

peritoneum the thin translucent membrane, consisting of a single layer of flattened mesothelial cells and fibrous connective tissue, that lines the abdominal cavity and covers most of the viscera. —peritoneal adj.; peritoneally adv.

periecan another name for heparan sulfate proteoglycan core protein. See also syndecan.

permeability 1 the quality or degree of being permeable or porous. 2 or magnetic permeability (of a substance) symbol: μ; the ratio of the magnetic induction, B, to the magnetic field strength, H, at any point within the substance, i.e. $\mu = B/H$. The SI unit is the henry per metre or newton per square metre.

permeability coefficient a measure of the ability of a specified permeant to diffuse across a permeability barrier. It is expressed as the amount of substance of the permeant passing through a unit area of the barrier in a unit time when a unit difference in amount-of-substance concentration is applied across it.

permeability of vacuum symbol: μ_0 ; a fundamental physical constant, of value $4\pi \times 10^{-7}$ H m⁻¹ exactly.

permeabilize or permeabilise to render permeable. In cell biology, agents such as saponin, streptolysin O (see streptolysin), or an applied electric field are used to open holes in the plasma membrane of cells. —permeabilization or permeabilisation n.

permeable capable of being permeated; pervious.

permeant 1 able to permeate or to diffuse into or through. 2 a substance having such properties.

permease (sometimes) any protein or protein system that effects a catalytic, stereospecific transfer of a substrate across a biological membrane.

permeate to pass through, or cause to pass through, by diffusion; to pervade. —permeation n.

permeation chromatography any form of chromatography in which a permeable stationary phase is used and in which separation of the components of a mixture is based mainly upon selective exclusion effects, such as differences in molecular size and/or shape (in molecular-sieve chromatography) or differences in charge (in ion-exclusion chromatography). See also gel-permeation chromatography.

permissible allowable. —permissibility n.; permissibly adv.

permissive 1 allowing; tolerant. 2 (in virology) describing a line or strain of cells that allows replication of a specified infecting virus with consequent cell lysis. 3 (in genetics) describing a condition, e.g. temperature, or set of conditions that permits the growth of a conditional lethal mutant (see conditional lethal mutation). —permissiveness n.; permissively adv.

permissive temperature see temperature-sensitive mutation. **permittivity** see relative permittivity.

permselective selectively permeable to certain (classes of)

permutation 1 the process or act of permuting. 2 any of the possible arrangements of the members of a specified set of conditions, numbers, residues, etc.

permute to change the sequence or arrangement of.

Permutit a proprietary name for ion-exchange materials and equipment utilizing permutites.

permutite any of a class of artificial zeolite ion-exchangers. pernicious anemia or (esp. Brit.) pernicious anaemia a form of anemia characterized by defective production of erythrocytes and the presence of megaloblasts in the bone marrow paroxyformic acid see performic acid.

peroxyformic

deficiency of the vitamin or to a failure of production of intrin-

per os Latin by mouth; used especially to denote the administration of drugs, etc. by the oral route.

peroxidase 1 any oxidoreductase enzyme of the sub-subclass EC 1.11.1. These act on hydrogen peroxide as (electron) acceptor with the formation of water. 2 the recommended name of the enzyme EC 1.11.1.7, a hemoprotein that catalyses the reaction of hydrogen peroxide with a wide variety of donors,

donor + H_2O_2 = oxidized donor + 2 H_2O .

Apart from removing H₂O₂, it participates in the oxidation of toxic reductants and in lignin metabolism. In plants there are isoforms in different tissues. Example, peroxidase C2 precursor from horseradish: database code PER2_ARMRU, 347 amino acids (37.99 kDa); the enzyme consists of the region from amino acid 25 to the end. —peroxidatic adj.

peroxidase-antiperoxidase abbr.: PAP; a soluble complex of horseradish **peroxidase** (def. 2) and an antibody to this peroxidase, used in immunochemical procedures in conjunction with specific primary and bridging second antibodies to give a sensitive method of detecting complementary antigens enzymati-

peroxide 1 (in inorganic chemistry) a the O_2^2 ion. b any member of a class of metallic oxides, such as sodium peroxide, Na₂O₂, that contain the peroxide ion and generate hydrogen peroxide on acidification. The name is sometimes used erroneously for certain higher oxides that do not contain the O₂²⁻ ion; e.g. lead peroxide (lead(IV) oxide, PbO2), manganese peroxide (manganese(IV) oxide, MnO₂), nitrogen peroxide (nitrogen(IV) oxide, NO₂ or N₂O₄). c short for hydrogen peroxide, H₂O₂; an oxidizing agent. 2 (in organic chemistry) a any compound of general formula R'-O-O-R", where the groups R' and R" are two chains, two rings, or a ring and a chain, and including cases when R' = R"; e.g. ethyl phenyl peroxide, benzoyl (strictly, dibenzoyl) peroxide. In hydrogen peroxide, R' =R'' = H. b see hydroperoxide.

peroxisomal bifunctional enzyme a monomeric peroxisomal enzyme (mainly in kidney and liver) with the activities of three steps in the **beta-oxidation system**. Example from human: database code ECHP_HUMAN, 722 amino acids (79.12 kDa). The domain comprising amino acids 1-128 has two enzyme activities: enoyl-CoA hydratase and 3,2-trans-enoyl-CoA isomerase; the domain 280-571 has 3-hydroxyacyl-CoA dehydrogenase activity, and 720-722 is the microbody targeting signal.

peroxisome a type of **microbody** that is rich in enzymes that act on or generate hydrogen peroxide, especially the enzymes catalase, (S)-2-hydroxy-acid oxidase, and D-amino-acid oxidase. Peroxisomes have been found in mammalian kidney and liver, and in yeasts and certain protozoans. They are particularly numerous in leaf photosynthetic cells of plants photosynthesizing via the Calvin (C₃) pathway; in plants they are closely associated with chloroplasts and mitochondria, which is consistent with their function in photorespiration. - peroxisomal adj.

peroxo+ prefix (in inorganic chemical nomenclature) indicating substitution (in the corresponding acid) of an -OH group by peroxomonosulfuric acid, the -O-OH group; e.g. HO-SO₂-O-OH.

peroxoacid (in inorganic chemistry) any acid that contains the -O-OH group. Compare peroxy acid.

peroxy+ prefix or infix (in carboxylic-acid nomenclature) indicating substitution of the -OH group in the carboxyl group by the -O-OH group; e.g. peroxypropionic acid, CH₃-CH₂-CO-O-OH. See also per+ (def. 2c).

peroxy acid (in organic chemistry) any acid that contains the -CO-O-OH group. Compare peroxoacid.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

perpendicular dichroism

perpendicular dichroism see dichroic ratio.

Perrin, Jean Baptiste (1870-1942), French physicist; Nobel Laureate in Physics (1926) 'for his work on the discontinuous structure of matter, and especially for his discovery of sedimentation equilibrium'.

persalt any salt of a peroxoacid or a peroxy acid.

perseitol D-glycero-D-galacto-heptitol; a substance found in avocado and the alligator pear.

perspective formula a type of projection formula in which the bonds of (a part of) a molecule tend to be depicted with increasing boldness according to their nearness to the viewpoint, and vice versa, in order to give an impression of perspective. See Haworth representation, Mills perspective representation.

Perspex a proprietary name for poly(methyl methacrylate).

pertactin other name: outer membrane protein P68; an agglutinogen of Bordetella spp. that binds to eukaryotic cells, and is involved in the pathogenicity in whooping cough. It contains the RGD sequence motif. Example (precursor) from Bordetella bronchiseptica: database code PERT_BORBR, 911 amino acids (93.89 kDa).

perturb to cause a selective and measurable change in the state of equilibrium of a system, or in its associated properties, through the action or influence of a specific external agent; to undergo perturbation. - perturbable adj.

perturbant an agent (capable of) causing perturbation.

perturbation 1 the action or process of perturbing; an instance of this. 2 the condition of being perturbed. 3 a cause or factor of disturbance; perturbant.

pertussis toxin a mixture of proteins produced by Bordetella pertussis, the bacterium responsible for whooping cough in young children. The toxin causes long-lasting activation of Gi protein (see G-protein) through catalysing ADP-ribosylation of the a subunit. It contains the NAD-dependent ADP ribosyltransferase (EC 2.4.2.-). The toxin enzyme contains five chains (S1-S5) organized in two functional subunits, A and B. Subunit A comprises S1, which has the enzymic activity, and irreversibly uncouples the GTP-binding proteins Gi and transducin from their membrane receptors. Subunit B binds to the membrane receptors; it has the composition S2S3S5S42, dimers of S2S4 and S3S4 being held together by S5. The database codes of the five chains, S1-S5, are as follows: TOX1_ BORPE, 269 amino acids (29.94 kDa); TOX2_BORPE, 226 amino acids (24.80 kDa); TOX3_BORPE, 227 amino acids (24.96 kDa); TOX4_BORPE, 152 amino acids (16.52 kDa); TOX5_BORPE, 133 amino acids (14.48 kDa).

Perutz, Max Ferdinand (1914-), Austrian-born British molecular biologist; Nobel Laureate in Chemistry (1962), the prize being shared with J. C. Kendrew 'for their studies on the structures of globular proteins' (actually hemoglobin and myoglobin).

pervaporate to vaporize a liquid from one side of a semipermeable membrane with which it is in contact on the other side, as a means of concentrating a solution or suspension in that liquid. —pervaporation n.

pervious permeable.

PEST hypothesis the hypothesis that the presence of one or more regions rich in proline (P), glutamic acid (E), serine (S), and threonine (T) in the primary structure of a protein confers susceptibility to rapid intracellular proteolysis.

pesticide any substance, natural or artificial, used to kill pests. **PET** abbr. for positron emission tomography; see tomography.

peta+ symbol: P; SI prefix denoting 1015 times.

PETG abbr. for polyethyleneterephthalate glycol; a plastic developed as an alternative to PVC for use in packaging; in contrast to PVC it does not produce chloride fumes when burned, giving off only CO₂ and H₂O. Flexible, clear, robust, and light, it is also suitable for contact with food, since no plasticizers or stabilizers are used in its manufacture.

petite 1 describing a strain of yeast (or other) cells derived from a spontaneous mutant in which certain respiratory engrowth and formation of unusually small colonies. 2 describing such a colony or mutant.

Petri dish or Petri plate a shallow, flat-bottomed, circular dish, usually of glass or transparent plastic and 5-15 cm in diameter, with a loosely fitting, overlapping cover. It is used especially for plate cultures of bacteria and moulds on solid (gelled) media, and for tissue culture. [After Richard Julius Petri (1852–1921), German bacteriologist.]

petroselaidic acid see octadecenoic acids.

petroselenate numerical symbol: 18:1(6); the trivial name for Z-octadec-6-enoate; a component of the fatty-acid hydrolysate of umbelliferous seed oils.

petroselenic acid see octadecenoic acids.

pFc' fragment a protein fragment obtained (together with F(ab')₂ fragment) by pepsin hydrolysis of an immunoglobulin molecule. That from human IgG is a 27 kDa protein, which is a noncovalently bonded dimer consisting of the C-terminal moieties of the heavy chains, and resembles the Fc fragment without the residues containing the linking disulfide bond.

PFP abbr. for pore-forming peptide or pore-forming protein; the term embraces cytotoxic peptides such as staphylococcal δ-toxin, alamethicin, magainins, and cecropins; pore-forming proteins include staphylococcal a-toxin, streptolysin-O, enidarian toxins, perforin, and aerolysin.

PFK abbr. for phosphofructokinase.

pg symbol for picogram (i.e. 10⁻¹² gram).

 $\mathbf{p}\mathbf{G}$ symbol for titration $\mathbf{p}\mathbf{K}$.

PG abbr. for 1 phosphatidylglycerol. 2 prostaglandin. 3 protegrin.

PGA abbr. for 1 phosphoglyceric acid. 2 pteroylglutamic acid. 3 prostaglandin A; see prostaglandin.

PGAH₄ abbr. for tetrahydropteroylglutamic acid.

PGAM abbr. for phosphoglycerate mutase.

PGB abbr. for prostaglandin B; see prostaglandin.

PGD abbr. for 1 phosphogluconate dehydrogenase (EC 1.1.1.43). 2 prostaglandin D (see prostaglandin).

PGE abbr. for prostaglandin E; see prostaglandin.

PGF abbr. for prostaglandin F; see prostaglandin.

PGF synthase abbr. for prostaglandin-F synthase.

PGG abbr. for prostaglandin G (see prostaglandin).

PGH abbr. for prostaglandin H (see prostaglandin).

PGH synthase see prostaglandin-endoperoxide synthase.

PGI abbr. for prostaglandin I (i.e. prostacyclin).

PGK abbr. for phosphoglycerate kinase.

P glycoprotein or MDR protein 1 a glycoprotein associated with drug resistance; it is a transmembrane ATP-dependent transporter that pumps hydrophobic substances out of cells. Drug-resistant cells demonstrate increased expression of the P-glycoprotein gene as one mechanism for their resistance to, e.g., chemotherapeutic anticancer drugs. See also MDR.

PGT (in clinical chemistry) abbr. for phosphoglucomutase. **pH** a dimensionless quantity notionally defined as the negative decadic logarithm of the molal activity of hydrogen ions in a solution. Since the activity of a single species of ion is not measurable, pH is defined operationally according to the equation:

$$pH(X) = pH(S) + (E_s - E_x)F/(RT \ln 10)$$

where pH(S) and pH(X) are the pH values of a standard solution, S, and of the test solution, X, respectively; F is the Faraday constant, R the gas constant, and T the thermodynamic temperature; and E_s and E_x are, respectively, the electromotive forces of the two galvanic cells:

reference electrode | KCl (conc.) | | soln. S | H₂(g) | Pt,

reference electrode | KCl (conc.) | soln. X | H₂(g) | Pt, both cells being at the same temperature, with identical refer-

ence electrodes and bridge solutions, KCl (aq, $m \ge 3.5$ mol zymes are defective or deficient, with consequent very slow kg 1. A pH standard solution. S is chosen from a set of five Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

рН*

covering the range pH 3.5 to pH 9, an assigned value of pH(S) at the required temperature being obtained from published tables. To a good approximation, the hydrogen electrodes in the two cells may be replaced by other hydrogen-ion-responsive electrodes, such as glass or quinhydrone electrodes. Originally pH was considered as the negative decadic logarithm of the molar concentration of hydrogen ions, a practice retained to the present day as representing a convenient approximation.

pH* a notation commonly used to denote the apparent pH of a solution containing ²H₂O (i.e. D₂O), as measured electrometrically using a glass electrode without correction for the isotope effect on the electrode.

Ph symbol for the phenyl group.

PH-30 or PH30 a sperm surface protein with disintegrin and metalloprotease domains. Example from Cavia cobaya consists of two subunits, α and β; α subunit: database code CCPH30ASP, 804 amino acids (86.81 kDa); β subunit: database code CCPH30BSP, 735 amino acids (81.81 kDa).

PHA abbr. for phytohemagglutinin (def. 1).

pH-activity profile or **pH profile** a plot of enzyme activity against pH, over a range in which the activity is reversibly affected by pH.

phaeo+ an alternative spelling (esp. Brit.) of pheo+.

phaeochromocytoma an alternative spelling (esp. Brit.) of pheochromocytoma.

phaeofarnesin an alternative spelling (esp. Brit.) of pheofarnesin.

phaeophorbide an alternative spelling (esp. Brit.) of pheophorbide.

phaeophytin an alternative spelling (esp. Brit.) of pheophytin. phage abbr. for bacteriophage.

phage conversion an alternative name for bacteriophage conversion.

phage display library a special example of a gene library encoding fusion proteins of a foreign polypeptide sequence and a coat protein of phage M13 or (more usually) the closely related phage fd. When cloned, the phage is then said to display the foreign protein (in the coat proteins). There are two common versions of the technique. In one, the library consists of random oligonucleotides (e.g. 7-mers). Clones expressing oligopeptides that react with a specific antibody can then be selected using the antibody. In the other version, the library consists of oligonucleotides encoding a range of single-chain variable-domain antibodies. This approach is used where an antibody is required for an oligopeptide, which can thus be used to detect appropriate clones.

phage immunity the immunity conferred on a **lysogenic bacterium** by the presence of a **prophage** and a consequence of the expression of a gene such as cI in **lambda phage**.

phage induction or **prophage induction** the stimulation of prophage in lysogenic bacteria to enter the vegetative state. It is accomplished by the action of UV light, X-rays, nitrogen mustards, etc.

phage lambda see lambda phage.

phagemid a chimeric phage-plasmid cloning vector containing origins of both double-stranded and single-stranded replication. See also phasmid.

phage T4 an icosahedral DNA-containing bacteriophage that infects *Escherichia coli*. Its single molecule of double-stranded DNA is 174 kb in length. Various enzymes prepared from this phage are commonly used in genetic engineering; these include ligase, polymerase, and polynucleotide kinase.

phage typing a procedure for classifying bacteria according to their susceptibility to various bacteriophages.

phagocyte any cell that characteristically engulfs particles from its surroundings into its cytoplasm by phagocytosis. phagocytic adj.

phagocytosis a type of endocytosis whereby certain cells – phagocytes – can engulf external particulate material by extension and fusion of pseudopods around each particle. The particles are initially contained within phagocytic vacuoles

(phagosomes), which then fuse with primary lysosomes to effect digestion of the particles. Phagocytosis is employed by certain cells of the immune system, notably macrophages and neutrophils, to engulf and destroy target cells, tissue debris, and other particles, and by amoeboid protozoans. Compare pinocytosis

phagolysosome an organelle formed by the fusion of a **phagosome** and a **lysosome**. Immediately after fusion there is a brief rise in the pH of the phagolysosome and neutral proteases and cationic proteins are active. Subsequently the pH falls and acid proteases become active. Indigestible substances remain in the phagolysosomes forming residual bodies.

phagosome an inclusion in a eukaryotic cell that arises from the ingestion of particulate material by phagocytosis. The phagosomes subsequently fuse with lysosomes to form a phagolysosome.

phalloidin see phallotoxin.

phallotoxin any member of a family of closely related bicyclic heptapeptides present in the highly poisonous agaric fungus, Amanita phalloides, commonly called the death-cap fungus or deadly agaric, and in some related species; phalloidin is the best-known member. All phallotoxins but one are toxic, though not as intensely so as the congeneric and much more slowly acting amatoxins; high doses of phalloidin in mice or rats cause death in a few hours. The common elements of the molecular structure of phallotoxins include residues of cis-4hydroxy-L-proline, a D-amino acid (which is either threonine or β -hydroxyaspartic acid), and the bisfunctional amino acid, L-tryptathionine (which forms a thioether bridge across the molecule). The majority of phallotoxins bind specifically to F actin and so prevent its depolymerization to G actin; by this means the turnover of microfilaments is blocked and cell movement thereby inhibited.

pharmaceutic an alternative name for pharmaceutical (def. 2). pharmaceutical 1 of, or pertaining to, drugs or pharmacy. 2 or pharmaceutic any medicinal substance, mixture, or formulation.—pharmaceutically adv.

pharmaceutics an alternative name for pharmacy (def. 1).

pharmaco+ comb. form indicating a drug or drugs.
pharmacodynamics functioning as sing. the branch of pharmacology dealing with the effects of drugs on the body, i.e. with the physiological, therapeutic, and toxicological responses to drugs with particular regard to the extent and time course of such effects. —pharmacodynamic adj.; pharmacodynamically adv.

pharmacogenetics functioning as sing. the branch of pharmacology dealing with the genetic mechanisms underlying individual differences in responses to drugs. —**pharmacogenetic** adj.; **pharmacogenetically** adv.

pharmacognosy the study of crude drugs of natural origins.
—pharmacognostic adj.

pharmacokinetics functioning as sing. the branch of pharmacology dealing quantitatively with the movement of drugs within the body, i.e. with the absorption, distribution, metabolism, and elimination of drugs. —**pharmacokinetic** adj.; **pharmacokinetically** adv.

pharmacological or (esp. US) pharmacologic 1 of, pertaining to, or used in pharmacology. 2 (of an effect of a naturally occurring agonist) caused by an unphysiological concentration; (of a concentration or dose of a naturally occurring agonist) having an unphysiological effect. —pharmacologically adv.

pharmacology the science or study of drugs – their origin, characteristics, identification, biological effects, and modes of action. *Distinguish from* **pharmacy**.

pharmacopoeia or (US, sometimes) pharmacopeia 1 an authoritative book, often an official one, containing descriptions of medicinal drugs with their uses, preparation, methods of assay, formulae, dosages, etc. 2 the whole range of medicinal drugs in use or available. —pharmacopoeial or pharmacopoeic adj.

particles are initially contained within phagocytic vacuoles. **pharmacy** 1 or pharmaceutics the practice of preparing and Ban dang doc một quyển sách được tạng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

dispensing drugs. 2 a dispensary (for drugs). Distinguish from pharmacology.

phase 1 any distinct or characteristic period or stage in a sequence of events, occurrences, or processes, whether cyclical or unidirectional; e.g. the phases in the life cycle of an organism or the phases of the cell-division cycle (see also anaphase, gap phase, metaphase, prophase, telophase). 2 (in physical science) a the totality of those parts of a heterogeneous material system that are identical in chemical composition and physical state, and that are separated by an interface from the rest of the system; e.g. solid, liquid, or vapour phases, or the discrete phases into which immiscible liquids separate after mixing, etc. See also epiphase, hypophase, liquid-crystalline phase, phase transition. b a particular stage in the cycle of a periodic phenomenon, process, or quantity; the fraction of such a cycle that has been completed at a specific reference time, expressed in circular measure (or its equivalent in angular degrees). Two or more waveforms (or two or more similar sequences of events, etc.) that are in corresponding phases at the same time are described as 'in phase', while ones not exhibiting such correspondence are described as 'out of phase'. —phasic adj.

phase-contrast microscopy or phase microscopy a form of light microscopy in which a colourless object having a different refractive index from that of the medium is viewed by converting differences in refractive index into visible differences in light intensity. The technique takes advantage of the quarter-wave retardation of the illuminating light that occurs on its diffraction by the object, imposes a similar change of phase on the undiffracted light, and forms an image by interference between the two beams of light.

phaseolin 1 a crystallizable globulin found in seeds of the kidney bean, or French bean, *Phaseolus vulgaris*, and the lima bean, *Phaseolus lunatus*. It is a major seed-storage protein. α and β types are known. Example, α type precursor from *P. vulgaris*: database code PHSA_PHAVU, 436 amino acids (49.27 kDa). 2 a former name for **phaseollin**. 3 an alternative name for **legumain**.

phaseollin or (formerly) **phaseolin** a fungitoxic **phytoalexin** produced by plants of the kidney (or French) bean, *Phaseolus vulgaris*, and some other species of bean. It is a phenolic fused heterocyclic compound, $C_{20}H_{18}O_4$.

phase rule a generalization, valuable in the study of equilibria between **phases** (def. 2), expressed by the equation:

$$F = C - P + 2$$

where C is the number of chemically distinguishable components present, P is the number of phases in equilibrium, and F is the number of degrees of freedom of the system, i.e. the number of independently variable intensive properties that must be specified in order to describe completely the state of the system.

phaseshift mutation an alternative term for frameshift mutation. phase transition (of lipids) the transition of a lipid between any of the various phases it can adopt. The transition is dependent on factors such as temperature, purity of the lipid, state of hydration, and, if not pure, the composition of the mixture. In the nonhydrated state, a crystalline polar lipid can

on heating, prior to a complete melting, adopt a liquid-crystalline phase, in which the polar groups are still associated in sheets, so that the overall structure consists of lipid bilayers, but the fatty-acyl chains undergo increased thermal vibrations leading to considerable disorder; the temperature at which this transition occurs is known as the phase-transition temperature. In the presence of water, below the phase-transition temperature, phospholipids adopt a gel phase, in which water penetrates between the sheets of polar headgroups, but the fatty-acyl chains are highly ordered. On increasing the temperature through the phase-transition temperature, the lipid adopts a hydrated liquid-crystalline phase with disordered fatty-acyl chains. The term **fluidity** has been used to provide a qualitative description of these changes, the bilayer being said to become more fluid as the temperature increases. See also hexagonal phase.

phase variation (of flagellin) see flagellin.

phasmid 1 a gene-cloning vector consisting of an artificial combination of a plasmid with a phage such that its genome contains functional origins of replication of both; it may thus be propagated either as a plasmid or as a phage in appropriate host strains. A phasmid is formed by insertion of one or more plasmid molecules into a phage genome. Compare cosmid, phagemid. 2 either of a pair of lateral caudal organs characteristic of parasitic nematodes of the class Phasmidia; they are thought to function as chemoreceptors. 3 any plant-eating insect of the order Phasmida, which includes leaf insects and stick insects.

PH domain abbr. for pleckstrin homology domain.

Phe symbol for a residue of the α -amino acid L-phenylalanine (alternative to F).

phenazine methosulfate *abbr*.: PMS; *N*-methylphenazonium methosulfate; 5-methylphenazinium methyl sulfate; $[C_{13}H_{11}N_2]^+$ [CH₃SO₄]⁻; an artificial electron carrier, $E^{o'}$ = +0.080 V, useful in the study of redox enzyme systems.

phencyclidine 1-(1-phenylcyclohexyl)piperidine (abbr.: PCP); a potent psychotomimetic agent, known to drug users as angel dust, with analgesic and anesthetic actions. It acts as a ligand for the sigma receptor and is a blocker of the NMDA-receptor ionophore (see glutamate receptor). A controlled substance in the US Code of Federal Regulations.

phene any phenotypic character under genetic control.

phenelzine β -phenylethylhydrazine, (2-phenethyl)hydrazine; a nonselective monoamine oxidase inhibitor used as an anti-depressant.

phenobarbital 5-ethyl-5-phenylbarbiturate; a major **barbiturate** drug.

phenocopy a nonhereditary modification of the phenotype of an organism, induced by nutritional or other environmental factors, that mimics a phenotype controlled by a specific gene.

phenol 1 the common and trivial name for hydroxybenzene, C₆H₅OH. 2 any compound containing one or more hydroxyl groups directly attached to an aromatic carbocycle. Unlike hydroxyalkyl compounds, phenols are weakly acidic.

phenolase 1 an alternative name for catechol oxidase (EC 1.10.3.1). 2 an alternative name for monophenol monooxidase (EC 1.14.18.1). 3 more loosely, any of various other enzymes of the sub-subclass 1.10.3. Such enzymes cause browning of damaged plant tissues when they come into contact with flavonoids, as catechins are converted into polymerized brown

mixture. În the nonhydrated state, a crystalline polar lipid can products. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

The space of the s

Bur Heart

phenolic 1 of, containing, derived from, or having the character of phenol or a phenol. **2** describing a hydroxyl group linked to an aromatic carbocycle.

phenol 2-monooxygenase see monooxygenase.

phenolphthalein an indicator dye that changes from colourless to red over the pH range 8.3–10.0. The β -D-glucuronide ($\lambda_{\text{max}} = 420 \text{ nm}$) is used as a substrate for the assay of β -glucuronidase, hydrolysis leading to release of phenolphthalein, which can be measured in alkaline solution by its red colour ($\lambda_{\text{max}} = 550 \text{ nm}$).

Phenol Red an indicator dye that changes colour from yellow to red over the pH range 6.8-8.4.

phenome the whole of the phenotypic characteristics of an organism. Compare genome. —phenomic adj.

phenomenology a branch of a science dealing with the description and classification of natural phenomena rather than with their explanation or cause. —**phenomenological** adj.

phenon any set of organisms grouped together by the methods of numerical taxonomy.

phenothiazine 1 a chemical structure that forms the basis, by N-substitution, of a group of **neuroleptics**, such as **chlorpromazine**. 2 any of the group of drugs based on the phenothiazine structure. The neuroleptic effects are those now most commonly exploited, but antiemetic, antihistamine and anthelmintic effects have also been of use.

phenotype 1 the totality of the observable functional and structural characteristics of an organism as determined by interaction of the genotype of the organism with the environment in which it exists. 2 any particular characteristic or set of characteristics of an organism so determined. 3 a group of organisms exhibiting the same set of such characteristics. Compare genotype. —phenotypic adj.

phenoxide 1 the anion, C₆H₅O⁻, derived from phenol by the loss of a proton. 2 any salt of phenol.

phenoxy symbol: OPh or PhO; the C₆H₅O- group, derived from phenol by the loss of a hydrogen atom.

phentolamine an antagonist for both α_1 and α_2 adrenoceptors. It is an antihypertensive agent and vasodilator.

phenyl symbol: Ph; the aromatic carbocyclic group C₆H₅-, derived from benzene.

phenylacetaldehyde dehydrogenase EC 1.2.1.39; an enzyme of the pathway of phenylalanine degradation. It catalyses the oxidation by NAD⁺ of phenylacetaldehyde to phenylacetate with formation of NADH.

phenylalaninate 1 phenylalanine anion; the anion, C₆H₅-CH₂-CH(NH₂)-COO⁻, derived from **phenylalanine**. 2 any salt containing phenylalanine anion. 3 any ester of phenylalanine.

phenylalanine the trivial name for β-phenylalanine; α-aminohydrocinnamic acid; α-amino-β-phenylpropionic acid; 2-amino-3-phenylpropanoic acid; C_6H_5 -CH₂-CH(NH₂)-COOH; a chiral α-amino acid. L-phenylalanine (symbol: F or Phe), (S)-2-amino-3-phenylpropanoic acid, is a coded amino acid found in peptide linkage in proteins; codon: UUC or UUU. In mammals it is an essential dietary amino acid and is both glucogenic and ketogenic. Residues of D-phenylalanine (symbol: D-Phe or DPhe), (R)-2-amino-3-phenylpropanoic acid, occur in a number of peptide antibiotics, e.g. bacitracin A, gramicidin S, polymyxins B_1 and B_2 , and tyrocidins A, B, and C.

L-phenylalanine

L-phenylalanine ammonia-lyase EC 4.3.1.5; systematic name: L-phenylalanine ammonia-lyase; an enzyme, widely distributed in plants, that deaminates L-phenylalanine to transcinnamic acid, which is rapidly converted to **lignin**, a major polymer of the plant cell wall.

phenylalanine hydroxylase see phenylalanine 4-monooxygenase.

phenylalanine 4-monooxygenase EC 1.14.16.1; systematic name: L-phenylalanine, tetrahydrobiopterin: oxygen oxidoreductase (4-hydroxylating); other names: phenylalanine 4-hydroxylase; phenylalaninase. An enzyme that catalyses a reaction between L-phenylalanine, tetrahydrobiopterin, and dioxygen to form L-tyrosine, dihydrobiopterin, and H₂O. It is thus of major importance for the provision of L-tyrosine. Absence of the enzyme in humans leads to phenylketonuria. It is an iron protein. Example from human: database code DHPRHUMAN, 244 amino acids (25.77 kDa).

phenylalaninium phenylalanine cation; the cation, $C_6H_5-CH_2-CH(NH_3^+)-COOH$, derived from phenylalanine.

phenylalanino the alkylamino group, C₆H₅-CH₂-CH(COOH)-NH-, derived from phenylalanine.

phonylalanyl the acyl group, C₆H₅-CH₂-CH(NH₂)-CO-, derived from phenylalanine.

phenylalanyl chain (sometimes) the **B chain** of any of those species of insulin whose amino-acid sequences were the first to be determined. It was so called by virtue of the N-terminal phenylalanine residue occurring in those instances.

phenylephrine (R)-(-)-1-(3-hydroxyphenyl)-2-methylaminoethanol; a highly selective α_1 adrenergic agonist. It is a vasoconstrictor, used in treating hypotension; it also acts as a decongestant.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYỄN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

phenylethanolamine N-methyl transferase abbr.: PNMT; EC 2.1.1.28; an enzyme catalysing N-methylation of norepinephrine in the synthesis of epinephrine. S-adenosyl methionine is the methyl donor.

phenylhydrazone any condensation product of the type R'R"C=N-NHC₆H₅, formed between carbonyl compounds of the general formula R'R"C=O and phenylhydrazine. Phenylhydrazones, in particular 2,4-dinitrophenylhydrazones, are useful in the characterization of aldehydes and ketones. See also phenylosazone.

phenylketonuria (abbr.: PKU) or phenylpyruvic oligophrenia an autosomal recessive inherited disorder of phenylalanine metabolism characterized by the presence of phenylpyruvate in the urine and excessively high levels of phenylalanine and its metabolites in the blood and tissues. It can be treated by restricting the amount of phenylalanine in the diet. If untreated in young children, severe mental retardation occurs. This form, classical phenylketonuria, is due to the absence or deficiency of phenylalanine 4-monooxygenase, an enzyme that uses tetrahydrobiopterin as second donor. Other types of hyperphenylalaninemia have been described due to, e.g., deficiency in dihydropteridine reductase (EC 1.6.99.7) or phenylalanine(histidine) aminotransferase (EC 2.6.1.58).

phenylmethylsulfonyl fluoride or phenylmethanesulfonyl fluoride abbr.: PMSF; a reagent used as an inhibitor of serine proteases; it is highly toxic, but less so than diisopropylphosphofluoridate. PMSF is both insoluble and unstable in aqueous solutions, so is usually added to such solutions by first dissolving it in, e.g., dioxan. It acts as an irreversible inhibitor of trypsin and chymotrypsin, sulfonylating the active-site histidine; it does not inhibit cholinesterase. See also aminoethylbenzenesulfonyl fluoride.

phenylosazone any 1,2-bis(phenylhydrazone); i.e. any condensation product of the type $C_6H_5NH-N=CR'-CR''=N-NH-C_6H_5$ formed between an α -dicarbonyl compound of the general formula R'-CO-CO-R'' and phenylhydrazine; α -hydroxy- and α -amino-carbonyl compounds will also form phenylosazones through oxidation of the corresponding [mono]phenylhydrazones initially formed. Phenylosazones, in particular 2,4-dinitrophenylosazones, are useful in the characterization of aldehydes and ketones, especially monosaccharides. See also **phenylhydrazone**.

phenylpropanoid any of a large and heterogeneous group of substances in plants derived from phenylpropane units variously linked and interlinked to form polymers of high molecular mass, especially **lignins**.

phenylpyruvate decarboxylase EC 4.1.1.43; an enzyme of the pathway of phenylalanine degradation. It catalyses the formation of phenylacetaldehyde from phenylpyruvate with release of CO₂.

phonylpyruvic oligophronia an alternative name for phonylketonuria.

pH 5 enzyme the provisional name given to a protein fraction from rat liver, soluble at pH 7 and isolated by precipitation at pH 5, that was used in early studies of protein biosynthesis in vitro. It is now known to be a mixture of amino acid-tRNA ligases.

pheo+ or (esp. Brit.) phaeo+ comb. form denoting darkcoloured.

pheochromocytoma or (esp. Brit.) phaeochromocytoma a tumour of tissues derived from embryological neuroectoderm, often of the adrenal medulla. It is characterized by its ability to synthesize and secrete catecholamines, often in excessive

amounts. The tumour cells commonly show a strong **chromaffin** (or pheochrome) reaction.

pheofarnesin or (esp. Brit.) **phaeofarnesin** any pigment derived by demetallation of a chlorophyll in which the 17-propionic-acid group is esterified with farnesol.

pheophorbide or (esp. Brit.) **phaeophorbide** any pigment derived by removal of metal from a chlorophyll in which the 17-acrylic-acid or 17-propionic-acid group is unesterified or has been de-esterified.

pheophytin or (esp. Brit.) **phaeophytin** any pigment derived by removal of metal from a chlorophyll in which the 17-propionic-acid group is esterified with phytol.

pheromone a substance, or characteristic mixture of substances, that is secreted and released by an organism and detected by a second organism of the same or a closely related species, in which it causes a specific reaction, such as a definite behavioural reaction or a developmental process; a type of ectocrine. The mating pheromones of fungi and insects are examples. Compare allomone, kairomone.

pheromone-binding protein any of a group of insect proteins that bind to and thus solubilize pheromones, which are typically hydrophobic. Example (precursor) from the moth Antherea polyphemus: database code PBP_ANTPO, 163 amino acids (18.12 kDa) (first 21 amino acids are the signal).

pheromone receptor a fungal transmembrane G-proteinlinked receptor. Example from *Ustilago maydis* (smut fungus), receptor for the A1 mating pheromone: database code PRA2_USTMA, 346 amino acids (38.74 kDa).

phi symbol: φ or φ (lower case) or Φ (upper case); the twenty-first letter of the Greek alphabet. For uses see Appendix A.
 PHI or PHI-27 abbr. for peptide HI.

Philadelphia chromosome (Ph¹) a specific chromosomal abnormality in the blood cells of patients with chronic myeloid leukemia. It usually results from a fusion of BCR on chromosome 22 with c-myc (see MYC) on chromosome 9 leading to expression of the latter. The Philadelphia chromosome is a very small chromosome consisting of the short arm and a small piece of the long arm of chromosome 22 fused to a short piece from the end of the long arm of chromosome 9 (the modified chromosome 9 that results being called 9q¹). It is named after the city in which it was first recorded. See also abl.

pH indicator see indicator (def. 3), mixed indicator.

phi X174 or φX174 a single-stranded DNA bacteriophage that infects *Escherichia coli*.

phloem the main food-conducting tissue of plants, via which nutrients and photosynthate are conveyed between different sites. Phloem comprises two types of cells: sieve-tube elements, which are joined end-to-end to form sieve tubes; and adjacent companion cells. Compare xylem.

phloretin 3-(4-hydroxyphenyl)-1-(2,4,6-trihydroxyphenyl)-1-propanone; the aglycon of **phlorizin**, with which it shares many biochemical and pharmacological properties.

phlorizin or **phlorhizin** or **phloridzin** or **phlorrhizin** phloretin-2'- β -glucoside; a dihydrochalcone glucoside occurring in all parts of the apple tree except the mature fruit. It is an inhibitor of intestinal and renal glucose-Na⁺ cotransporters, of the mediated transport of glucose into erythrocytes and hepatocytes, of the glucose 6-phosphate transporter in hepatocytes, and of photophosphorylation. It is used experimentally to produce glucosuria.

often of the adrenal medulla. It is characterized by its ability
to synthesize and secrete catecholamines, often in excessive

tion of pentoses and pentosans; when these are boiled with a solution of phloroglucinol in hydrochloric acid, a cherry-red colour is produced. Galactose also reacts in this way.

phlorrhizin a variant spelling of phlorizin.

pH meter any instrument for determining pH potentiometrically, usually with a glass electrode plus a calomel reference electrode, or with a combination electrode.

phorbol a complex tetracyclic compound, C₂₀H₂₈O₆, based on a cyclopropabenzazulene skeleton. Various phorbol esters occur in croton oil (from Croton tiglium, of the family Euphorbiaceae, hence the name) and act as potent cocarcinogens.

phorbol ester any esterified form of phorbol. A number of phorbol esters possess activity as tumour promoters and activate the mechanisms associated with cell growth. These actions have been widely attributed to the ability to activate protein kinase C, probably by substituting for diacylglycerol. A muchstudied ester is phorbol 12-myristate 13-acetate (PMA); other active esters include phorbol 12,13-dibutyrate (PDBu) and phorbol 12,13-didecanoate (PDD). Activity depends on the β configuration of the hydroxyl at C-4, and a number of 4α phorbol esters have been utilized in control studies.

+phore noun suffix denoting something, especially a chemical substance or group, that carries or produces; e.g. ionophore, chromophore.

+phoresis noun suffix denoting carriage of molecular entities by some agency; e.g. electrophoresis, ionophoresis.

phosducin a part of a complex with the β and γ subunits of transducin in outer and inner segments of retinal rod cells. Light-induced changes in cyclic nucleotide levels modulate the phosphorylation of phosducin by cyclic AMP kinase. Example (bovine): database code PHOS_BOVIN, 245 amino acids (28.20 kDa).

+phosph+ a variant form of +phospho+ (sometimes before a vowel).

phosphacan a chondroitin sulfate proteoglycan of brain that interacts with neurons and neural cell-adhesion molecules. It is an extracellular variant of a receptor-type protein tyrosine phosphatase. Example from rat: database code RNU04998, 1616 amino acids (175.65 kDa).

phosphagen any of a group of guanidine phosphates that occur in muscle and can be used to regenerate ATP from ADP during muscular contraction by a reaction catalysed by creatine kinase or by an analogous enzyme of sub-subclass EC 2.7.3. Included in the group are phosphoagmatine (see agmatine), phosphoarginine, phosphocreatine, phosphoglycocyamine (see glycocyamine), phospholombricine (see lombricine), phosphooctopine (see octopine), and phosphotaurocyamine (see taurocvamine).

phosphataemia a variant spelling (esp. Brit.) of phosphatemia. phosphatase or phosphomonoesterase any phosphoric monoester hydrolase of sub-subclass EC 3.1.3. Some phosphatases are very specific while others are relatively unspecific with regard to substrate. See also acid phosphatase, acylphosphatase, alkaline phosphatase, fructose-bisphosphatase, glucose-1-phosphatase, glucose-6-phosphatase, inorganic pyrophosphatase, protein phosphatase.

phosphatased a jargon term indicating dephosphorylated by

phosphatase inhibitor protein an inhibitor of protein phosphatase 1 (see protein phosphatase) involved in the regulation of glycolysis; it is itself a phosphoprotein. Example, inhibitor 1 from rat: database code IPP1_RAT, 171 amino acids (18.71 kDa).

phosphate 1 the trivalent anion, PO₄3-, derived from phosphoric acid; orthophosphoric acid; tetraoxophosphoric(v) acid; PO(OH)3. 2 any mixture of [ortho]phosphoric acid and its anions. Once widely used in the laboratory as a buffer in the physiological range of pH values; pK_{a2} (37 °C, 0.05 mol L^{-1}) = 6.84. 3 any (partial or full) salt or ester of [ortho]phosphoric acid. Phosphate salts and esters play key roles in the structure and function of all forms of life. 4 any anion or salt of a mixed anhydride of [ortho]phosphoric acid with another acid; e.g. acetyl phosphate (i.e. acetic phosphoric anhydride). 5 the univalent group -O-P(O)(OH)₂ (irrespective of its state of ionization). See also diphosphate, inorganic phosphate, metaphosphate, pyrophosphate, triphosphate.

phosphate bond 1 an ester linkage in a phospho[mono]ester, phosphodiester, or phosphotriester. 2 an anhydride linkage in a phosphoric anhydride. 3 the connecting phosphoric residue in a phosphodiester.

phosphate bond energy a term formerly and incorrectly used for the bond energy (def. 2) of a phosphate bond (def. 1, 2).

phosphatemia or (esp. Brit.) phosphataemia the level of phosphate (def. 2) in the blood; in human plasma its normal range is 0.8-1.4 mmol L⁻¹. The level is regulated by calcitriol, which stimulates absorption of dietary phosphate as well as calcium, and by parathyrin, which decreases phosphate resorption by the kidney. Calcitriol also stimulates bone resorption, which tends to lower the plasma phosphate level, but in states of hypervitaminosis D the effect on the gut predominates and the plasma level is increased. See also hyperphosphatemia, hypophosphatemia. phosphate potential the concentration of ATP in any system

divided by the product of the concentrations of ADP and inorganic phosphate in that system. Compare adenylate energy

phosphatidal a former term for plasmenyl.

phosphatidate any anion, salt, or ester of a phosphatidic acid.

phosphatidate cytidylyltransferase EC 2.7.7.41; systematic name: CTP:phosphatidate cytidylyl transferase; other names: CDPdiglyceride synthetase; CDPdiglyceride pyrophosphorylase. An enzyme that catalyses a reaction between CTP and phosphatidate to form pyrophosphate and CDPdiacylglycerol. It is an endoplasmic reticulum membrane-bound enzyme of phospholipid biosynthesis; it forms the intermediate involved in the synthesis of, e.g., phosphatidylinositol, by reaction with inositol, or phosphatidylserine, by reaction with serine. Example from Escherichia coli: database code CDSA_ECOLI, 249 amino acids (27.54 kDa).

phosphatidate phosphatase EC 3.1.3.4; systematic name: 3sn-phosphatidate phosphohydrolase; an enzyme that removes phosphate from phosphatidic acid to yield an sn-1,2-diacylglycerol.

phosphatide an old term, no longer recommended for glycerophospholipid.

phosphatidic acid any derivative of glycerol phosphate in which both the remaining hydroxyl groups of the glycerol moiety are esterified with fatty acids; the commonest are derivatives of sn-glycerol 3-phosphate.

phosphatidyl symbol: Ptd; an acyl group derived from a phos-

phosphatidylcholine abbr.: PC; any of a class of glycerophospholipids in which a phosphatidyl group is esterified to the hydroxyl group of choline. They are important constituents of cell membranes and lipoproteins.

phosphatidylcholine desaturase EC 1.3.1.35; other names: oleate desaturase; linoleate synthase; an enzyme in plants that

catalyses the reaction:

phos

1-acyl-2-linoleoyl-sn-glycero-3-phosphocholine + NADH.

phosphatidylcholine-dolichol O-acyltransferase see lecithin-cholesterol acyl transferase.

phosphatidylcholine-sterol O-acyltransferase EC 2.3.1.43; other names: lecithin-cholesterol acyltransferase (abbr.: LCAT); phospholipid-cholesterol acyltransferase; a plasma enzyme that catalyses the transfer of a fatty-acyl group from phosphatidylcholine to a sterol to form a sterol ester and 1-acylglycerophosphocholine. In mammals it is important in plasma lipoprotein metabolism, particularly in esterifying cholesterol, which is then transferred to very-low-density lipoprotein as cholesteryl ester. Example from human: database code LCAT_HUMAN, 440 amino acids (49.52 kDa). Compare sterol O-acyltransferase.

phosphatidylethanolamine *abbr*.: PE; any of a class of glycerophospholipids in which a phosphatidyl group is esterified to the hydroxyl group of **ethanolamine**. They are important constituents of cell membranes.

phosphatidylinositol abbr.: PI; symbol: Ptdlns; 1-(3-sn-phosphatidyl)-1D-myo-inositol; the recommended name for any glycerophospholipid in which its sn-glycerol 3-phosphate residue is esterified to the 1-hydroxyl group of 1D-myo-inositol. The older term phosphoinositide is now used as a generic term for any inositol-containing glycerophospholipid. The corresponding names for the monophosphorylated and diphosphorylated derivatives of phosphatidylinositol are phosphatidylinositol 4-phosphate and phosphatidylinositol 4-bisphosphate, respectively. The older names diphosphoinositide and triphosphoinositide for these derivatives are no longer used.

phosphatidylinositol 4,5-bisphosphate or (formerly) triphosphoinositide abbr.: PIP₂ or PI-4,5-P₂; symbol: PtdIns(4,5)P₂ or PtdIns-4,5-P₂; 1-(3-sn-phosphatidyl)-1D-myoinositol 4,5-bisphosphate; any of a class of glycerophospholipids in which a phosphatidyl group is esterified to the 1-hydroxyl group of 1D-myo-inositol 4,5-bisphosphate.

1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase see phospholipase.

phosphatidylinositol cycle or (formerly) phosphoinositide cycle a metabolic cycle that mediates the actions of various hormones and other effectors at the membranes of mammalian cells. The cycle may be summarized as follows. Binding of an effector to its specific receptor at the cell membrane brings about a G-protein-coupled stimulation of a phospholipase C, of 1-phosphatidylinositol-4,5-bisphosphate phosphodiesterase. This action brings about hydrolysis of phosphatidylinositol 4,5-bisphosphate, I, to produce the two intracellular messengers inositol 1,4,5-trisphosphate, II, which causes release of calcium ions from intracellular stores, and sn-1,2-diacylglycerol, III, which activates protein kinase C. III is then converted via phosphatidate (under the action of diacylglycerolkinase and phosphatidate cytidylyltransferase) to CDPdiacylglycerol, IV, while II is converted via inositol bisphosphate and inositol monophosphate to inositol. Inositol and IV then react together (enzyme is CDPdiacylglycerol-inositol 3phosphatidyltransferase) to form phosphatidylinositol, from which I is regenerated by stepwise phosphorylation by specific kinases to complete the cycle. Alternatively, II may be converted to another messenger, inositol 1,3,4,5-tetrakisphosphate, V, which may be implicated in the influx of extracellular calcium ions; V is then degraded to inositol via inositol 1,3,4-trisphosphate, which is inactive.

phosphatidylinositol glycan protein abbr.: PIG protein; N-acetylglucosaminyl-phosphatidylinositol biosynthetic protein; a protein required for synthesis of N-acetylglucosaminyl-phosphatidylinositol, the very early intermediate in the biosynthesis of the GPI anchor. Example, PIG-A (human): database code PIGA_HUMAN, 484 amino acids (54.06 kDa). Another protein required for this synthesis is PIG-F: database code PIGF_HUMAN, 219 amino acids (24.86 kDa).

name: ATP:1-phosphatidyl-1D-myo-inositol 3-phosphotrans-ferase. An enzyme that catalyses the phosphorylation by ATP of 1-phosphatidyl-1D-myo-inositol to form 1-phosphatidyl-1D-myo-inositol 3-phosphate with release of ADP. It forms part of the complex that associates on activation of certain growth factor (e.g. PDGF) receptors, binding via SH2 domains (see SH domain). The molecule is a heterodimer of a catalytic subunit (p110) and a regulatory subunit (p85: two forms, α and β, in mammals). p85 acts as an adaptor to mediate association of p110 to the plasma membrane. Examples, (bovine) p110: database code P11A_BOVIN, 1068 amino acids (124.18 kDa); p85(β): database code P85B_BOVIN, 724 amino acids (80.97 kDa).

1-phosphatidylinositol 4-kinase EC 2.7.1.67; an enzyme of the pathway for the biosynthesis of membrane phosphoinositides. It catalyses the phosphorylation by ATP of 1-phosphatidyl-1D-myo-inositol to form 1-phosphatidyl-1D-myo-inositol 4-phosphate with release of ADP. Example, α form (human): database code A55404, 854 amino acids (96.87 kDa).

phosphatidylinositol-3-phosphatase EC 3.1.3.64; an enzyme that catalyses the hydrolysis of the 3-phosphate from phosphatidylinositol-3-phosphate, forming phosphatidylinositol and orthophosphate.

phosphatidylinositol 4-phosphate or (formerly) diphosphoinositide abbr.: PIP or PI 4-P; symbol: PtdIns4P or PtdIns-4-P; 1-(3-sn-phosphatidyl)-1D-myo-inositol 4-phosphate; any of a class of glycerophospholipids in which a phosphatidyl group is esterified to the 1-hydroxyl group of 1D-myo-inositol 4-phosphate.

1-phosphatidylinositol-4-phosphate kinase EC 2.7.1.68; other name: diphosphoinositide kinase; an enzyme of the pathway for the biosynthesis of membrane phosphoinositides. It catalyses the phosphorylation by ATP of 1-phosphatidyl-1D-myo-inositol 4-phosphate to form 1-phosphatidyl-1D-myo-inositol 4.5-bisphosphate with release of ADP.

1-phosphatidylinositol phosphodiesterase see phospholipase.

phosphatidylinositol synthase see CDP-diacylglycerol-inositol 3-phosphatidyltransferase.

phosphatidylserine any of a class of glycerophospholipids in which a phosphatidyl group is esterified to the hydroxyl group of L-serine. They are important constituents of cell membranes

phosphatidylserine decarboxylase EC 4.1.1.65; an enzyme that converts phosphatidylserine to phosphatidylethanolamine, of major importance in the synthesis of that phospholipid. It exists as a heterodimer of α and β chains, formed by cleavage of a proenzyme. Example, proenzyme from *Haemophilus influenzae*: database code DPSD_HAEIN, 290 amino acids (33.20 kDa); residues 1–256 form the β chain, 257–290 the α chain.

phosphatidylserine synthase an alternative name for CDP-diacylglycerol-serine 0-phosphatidyltransferase.

phosphite 1 any anionic form of phosphorous acid; trioxophosphoric(III) acid; P(OH)₃. 2 any mixture of phosphorous acid and its ionized forms. 3 any (partial or full) salt or ester of phosphorous acid.

phosphite-triester method a method for the chemical synthesis of oligonucleotides in which a suitably protected phosphite diester of general formula Nuc-3'-O-P(OR)X, where R is a methyl or another alkyl group, X is a reactive group such as chloro, dimethylamino, or morpholino, and Nuc is a residue of an appropriate nucleoside, is first condensed with the 5'-hydroxyl of a protected nucleoside (usually anchored through its 3'-hydroxyl to an insoluble support) to form a phosphite triester. Sequential addition of further nucleoside units is then carried out in the same way, the phosphite triester formed at each stage being oxidized to the corresponding phosphate triester before the next cycle of reactions. Protecting groups are removed by hydrolysis at the completion of the synthesis.

1-phosphatidylinositol 3-kinase EC 2.7.1.137; systematic +phospho+ or (sometimes before a vowel) +phosph+ (in chemi-Bạn dang đọc một quyển sách được tạng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

NET HOUSE

cal nomenclature) prefix or infix denoting a phosphoric residue linked to one, two, or three heteroatoms in an organic compound. See also phosphono+.

phosphoacetylglucosamine mutase EC 5.4.2.3; systematic name: N-acetyl-D-glucosamine 1,6-phosphomutase; other name: acetylglucosamine phosphomutase. An enzyme that catalyses the reaction:

N-acetyl-D-glucosamine 1-phosphate =

N-acetyl-D-glucosamine 6-phosphate.

It participates in the pathway for the formation of UDP-N-acetylglucosamine: glucosamine 6-phosphate $\rightarrow N$ -acetylglucosamine-6-phosphate, thence by reaction with UTP to UDP-N-acetylglucosamine + pyrophosphate, thence also to sialic acid. Example from $Schizosaccharomyces\ pombe$: database code PCM1_SCHPO, 518 amino acids (56.35 kDa).

3'-phosphoadenosine 5'-phosphosulfate an alternative recommended name for adenosine 3'-phosphate 5'-phosphosulfate.

phosphoamino acid any phosphorylated amino acid. The term often refers to O-phosphate esters of residues in proteins, e.g. those of serine, threonine, or tyrosine, that are released as phosphoamino acids on hydrolysis. Phosphohistidine can be formed as part of an enzyme mechanism (e.g. **phosphoglycerate mutase**), and phosphohomoserine is an intermediate in threonine biosynthesis. The guanidine group can also be phosphorylated to form a phosphono derivative (see **phosphagen**).

phosphoarginine the recommended trivial name for N°-phosphonoarginine; the commonest phosphagen in invertebrates. The older name, arginine phosphate, is not recommended.

phosphocreatine abbr.: PC; the recommended trivial name for N^{∞} -phosphonocreatine; the commonest **phosphagen** in vertebrates. The older name, creatine phosphate, is not recommended.

phosphodiester any diester of phosphoric acid; i.e. any phosphoric ester containing the bridging group -PO(OH)- between two oxygen atoms in other groups (which may be the same or different) or at different positions in the same group. Examples include cyclic nucleotides, glycerophospholipids, and nucleic acids.

phosphodiesterase any esterase that catalyses the hydrolysis of either (but not both) of the ester linkages in a phosphodiester, each linkage being hydrolysed only by an enzyme specific for that linkage. Such enzymes are classified in various sub-subclasses within the subclass EC 3.1, hydrolases, especially in the sub-subclass EC 3.1.4, phosphoric diester hydrolases. The term is often applied to nucleases without sugar specificity. See also cyclic AMP phosphodiesterase, phosphodiesterase 1, phospholipase C.—phosphodiesteratic adj.

phosphodiesterase I the recommended name for an enzyme, EC 3.1.4.1, that catalyses the hydrolytic removal of 5'-nucleotides successively from the (nonphosphorylated) 3' end of an oligonucleotide; other name: 5'-exonuclease.

enzyme, now named spleen exonuclease (EC 3.1.16.1; previously EC 3.1.4.18), that catalyses the hydrolytic removal of 3'-nucleotides successively from the (nonphosphorylated) 5' end of a (preferably single-stranded) ribonucleic or deoxyribonucleic acid; other names: 3'-exonuclease; spleen phosphodiesterase.

phosphodiester method a method for the chemical synthesis of oligonucleotides in which, essentially, a 5'-phosphate of an appropriate [mono]nucleotide, after suitable protection of other functional groups, is condensed with the 3'-hydroxyl of a protected nucleoside, [mono]nucleotide, or previously formed oligonucleotide, using dicyclohexylcarbodiimide or an arylsulfonyl chloride as a coupling agent. The reaction sequence is then repeated with another nucleotide 5'-phosphate. This method is being superseded by the phosphite-triester method and phosphotriester method.

phosphoenolpyruvate abbr.: PEP or P-enolpyruvate; 2-hydroxy-2-propenoate phosphate (ester); 2-(phosphonooxy)-2-propenoate; the phosphate ester formed from the hydroxy group of the enol tautomer of pyruvate. It is a so-called high-energy compound, hydrolysis to pyruvate giving a particularly large negative change in standard free energy $(-\Delta G^{\circ} = 62 \text{ kJ mol}^{-1} \text{ at pH 7})$. It is a key intermediate in glycolysis and gluconeogenesis, and in the biosynthesis of aromatic amino acids.

phospho*enol***pyruvate carboxykinase** *abbr.*: PEPCK; any of several enzymes that catalyse the reaction:

X-P + oxaloacetate = X + phosphoenolpyruvate + CO_2 ,

where X-P, depending on source, can be GTP or ITP (in EC 4.1.1.32), ATP (in EC 4.1.1.49), or pyrophosphate (in EC 4.1.1.38). (1) Phosphoenolpyruvate carboxykinase (GTP), EC 4.1.1.32; systematic name: GTP:oxaloacetate carboxy-lyase (transphosphorylating); other names: phosphoenolpyruvate carboxylase; phosphopyruvate carboxylase; the rate-limiting gluconeogenic enzyme in eukaryotes. It has different forms in cytoplasm and mitochondria. It catalyses a reaction between GTP and oxaloacetate to form GDP, phosphoenolpyruvate, and CO₂. Example, mitochondrial precursor from chicken: database code PPCC_CHICK, 622 amino acids (69.45 kDa). (2) Phosphoenolpyruvate carboxykinase (ATP), EC 4.1.1.49; systematic name: ATP:oxaloacetate carboxy-lyase (transphosphorylating); other names: phosphoenolpyruvate carboxylase; phosphopyruvate carboxylase (ATP); it catalyses a similar reaction to (1) but with ATP/ADP not GTP/GDP. In many bacteria it is a Ca²⁺-regulated rate-limiting gluconeogenic enzyme. Example from Escherichia coli: database code PPCK_ECOLI, 464 amino acids (51.25 kDa). See also gluco-

phosphoenolpyruvate carboxylase EC 4.1.1.31; systematic name: orthophosphate:oxaloacetate carboxy-lyase (phosphorylating); an enzyme that catalyses a reaction between orthophosphate and oxaloacetate to form phosphoenolpyruvate, H₂O, and CO₂. It is an allosteric enzyme associated with the tricarboxylic-acid cycle in plants; effectors include fatty acids, acetyl-CoA, and fructose 1,6-bisphosphate. It forms oxaloacetate for metabolism by the tricarboxylic-acid cycle in plants. The protein is a homotetramer. Example from Escherichia coli: database code CAPP_ECOLI, 883 amino acids (98.95 kDa).

tides successively from the (nonphosphorylated) 3' end of an oligonucleotide; other name: 5'-exonuclease.

phosphodiesterase II the former recommended name, for an Ban dang doc một quyển sách duọc tặng bởi HUY NGUYEN. Nếu bạn có nhu câu về sách sinh học, xin liên hệ:

phosphogluconate

protein-NP-phosphohistidine-sugar phosphotransferase phosphoenolpyruvate-protein phosphotransferase. The system functions also as a chemoreceptor monitoring the environment for changes in sugar concentration.

phosphoeno/pyruvate mutase EC 5.4.2.9; systematic name: phosphoenolpyruvate 2,3-phosphonomutase; other name: phosphoenolpyruvate phosphomutase. An enzyme that catalyses the conversion of phosphoenolpyruvate to 3-phosphonopyruvate. Phosphoenolpyruvate mutase is an enzyme of the pathway that synthesizes bialaphos forming the C-P bond in the phosphinothricin moiety. Example from Streptomyces hygroscopicus: database code BCPB_STRHY, 313 amino acids

phosphoenolpyruvate-protein phosphotransferase EC 2.7.3.9; systematic name: phosphoenolpyruvate:protein-L-histidine N^{π} -phosphotransferase; other name enzyme I of the phosphoeno/pyruvate-dependent sugar phosphotransferase system; a soluble bacterial enzyme, part of a system for the transport of hexoses across the cell membrane, that catalyses the phosphorylation by phosphoenolpyruvate of a low- M_r , heat-stable protein, HPr. Example from Escherichia coli: database code PT1A_ECOLI, 711 amino acids (78.30 kDa).

phosphoester any [mono]ester of phosphoric acid; i.e. any phosphoric ester containing the group -PO(OH)2 linked to an oxygen atom in a single other group.

phosphofructokinase 1 abbr.: PFK; EC 2.7.1.11; recommended name: 6-phosphofructokinase; other names: phosphofructokinase 1; phosphohexokinase. An enzyme that catalyses the phosphorylation of D-fructose 6-phosphate to D-fructose 1,6-bisphosphate at the expense of ATP, CTP, ITP, or UTP. Phosphofructokinase 1 is an allosteric glycolytic enzyme; the molecule is a homotetramer. Example from Escherichia coli: database code K6P1_ECOLI, 320 amino acids (34.72 kDa); 3-D structure known; this is isoenzyme I; E. coli has a second entirely unrelated isoenzyme (II), presumably of independent

evolution.

2 or phosphofructokinase 2 EC 2.7.1.105; recommended name: 6-phosphofructo-2-kinase; an enzyme that catalyses the phosphorylation of D-fructose 6-phosphate to D-fructose 2,6-bisphosphate at the expense of ATP. Phosphofructokinase 2 is the same protein as fructose-2,6-bisphosphatase; phosphorylation inhibits the kinase activity. Example from human (liver isoform; homodimer): database code F26L_HUMAN, 471 amino acids (54.64 kDa).

3 or fructose-1-phosphate kinase EC 2.7.1.56; recommended name: 1-phosphofructokinase; an enzyme that catalyses the phosphorylation of D-fructose 1-phosphate to D-fructose 1,6-bisphosphate at the expense of ATP, GTP, ITP, or

phosphoglucoisomerase an alternative name for glucose-6-

phosphoglucomutase abbr. (in clinical chemistry): PGT; EC 5.4.2.2; systematic name: α-D-glucose 1,6-phosphomutase; other name: glucose phosphomutase. A phosphotransferase enzyme that catalyses the interconversion of α -D-glucose 1-phosphate and α -D-glucose 6-phosphate; α -D-glucose 1,6-bisphosphate is an intermediate, formed by phosphoryl transfer from the enzyme. It is a key enzyme linking the metabolism of polysaccharides to glycolysis. Example from Saccharomyces cerevisiae: database code PGMU_YEAST, 570 amino acids (63.04 kDa).

phosphogluconate 6-phospho-D-gluconate; an intermediate in the Entner-Doudoroff pathway and in the pentose phosphate pathway. It is a product of the combined action of glucose-6-phosphate dehydrogenase and 6-phosphogluconolactonase, and is a substrate for phosphogluconate dehydrogenase (decarboxylating). (Illustrated opposite.)

phosphogluconate dehydrogenase (decarboxylating) abbr.: 6PGD; EC 1.1.1.44; systematic name: 6-phospho-D-gluconate:NADP+ 2-oxidoreductase (decarboxylating); other names: phosphogluconic acid dehydrogenase; 6-phosphogluconic dehydrogenase; 6-phosphogluconic carboxylase. An enzyme that catalyses a reaction between 6-phospho-D-gluconate and NADP+ to form D-ribulose 5-phosphate, CO2, and NADPH. It is an important enzyme in the pentose phosphate pathway, and is significant in maintaining NADP+ in the reduced state. Example from Escherichia coli: database code 6PGD ECOLI, 468 amino acids (51.48 kDa).

phosphogluconate (oxidative) pathway an alternative name for pentose phosphate pathway.

6-phosphogluconolactonase EC 3.1.1.31; systematic name: 6-phospho-D-glucono-1,5-lactone lactonohydrolase; an enzyme of the pentose phosphate pathway that accelerates the rate of hydrolysis of 6-phosphogluconolactone to 6-phosphoglu-

phosphoglycerate 1 2-phospho-D-glycerate; D-glycerate 2phosphate; (R)-2,3-dihydroxypropanoate 2-(dihydrogen phosphate). 2 3-phospho-D-glycerate; D-glycerate 3-phosphate; (R)-2,3-dihydroxypropanoate 3-(dihydrogen phosphate). These phosphoglycerates are important intermediates in glycolysis. 3-phosphoglycerate is a precursor in serine biosynthesis. Compare glycerophosphate, phosphoglyceride. See also phosphoglycerate mutase.

phosphoglycerate dehydrogenase EC 1.1.1.95; systematic name: 3-phosphoglycerate:NAD+ 2-oxidoreductase; an enzyme that converts 3-phospho-D-glycerate to 3-phosphohydroxypyruvate in the presence of NAD+. An enzyme in the pathway for the synthesis of serine from 3-phosphoglycerate. Example from Bacillus subtilis: database code SERA_BACSU, 419 amino acids (45.60 kDa).

phosphoglycerate kinase abbr.: PGK; EC 2.7.2.3; systematic name: ATP:3-phospho-D-glycerate 1-phosphotransferase; an enzyme that catalyses the phosphorylation of of 3-phospho-Dglycerate by ATP to 3-phospho-D-glyceroyl phosphate with release of ADP. Phosphoglycerate kinase is important in the glycolytic pathway, and exists in tissue-specific or (in protozoa, etc.) organelle-specific isoforms. Example from wheat chloroplast: database code PGKY_WHEAT, 401 amino acids (42.07 kDa).

phosphoglycerate mutase abbr.: PGAM; EC 5.4.2.1; systematic name: D-phosphoglycerate 2,3-phosphomutase; other names: phosphoglycerate phosphomutase; phosphoglyceromutase. An enzyme of the glycolytic and gluconeogenic pathways that catalyses the reaction:

2-phospho-D-glycerate = 3-phospho-D-glycerate

(the forward direction, as written, being the direction in which the enzyme functions in gluconeogenesis). A phosphotransferase enzyme for which 2,3-bisphospho-D-glycerate acts as a reaction primer. The active enzyme has a phosphoryl group active site (histidine is phosphorylated as part of the mechphosphate isomerase.

anism) and transfers phosphoryl to the substrate. Example

503 phosph from Saccharomyces cerevisiae: database code PMGY_YEAST, enzyme is instrumental in releasing arachidonate for prost-

246 amino acids (27.45 kDa). See also phosphohistidine.

phosphoglycerate phosphomutase another name for phosphoglycerate mutase.

3-phospho-D-glyceric phosphoric monoanhydride see 3phospho-D-glyceroyl phosphate.

phosphoglyceride another (less correct) name for glycerophos-

3-phospho-D-glyceroyl phosphate $abbr.: D-glyceric-1,3-P_2;$ one of the recommended names for (R)-[2,3-dihydroxypropanoyl dihydrogen phosphate 3-(dihydrogen phosphate)], a key intermediate in the glycolytic pathway, commonly but incorrectly known as 1,3-diphosphoglycerate or 1,3-bisphosphoglycerate. Alternative recommended names: 3-phospho-Dglyceric phosphoric monoanhydride; (D-glyceroyl phosphate) 3-phosphate. This compound should be distinguished from 2,3bisphospho-D-glycerate.

phosphohexose isomerase an alternative name for glucose-6phosphate isomerase.

phosphohistidine N^{π} -phosphohistidine; it is formed as a residue in certain proteins; being an intermediate in the phosphoglycerate mutase reaction and the phosphoenolpyruvatedependent sugar phosphotransferase system.

phosphoinositide another old term, no longer recommended, for phosphatidylinositol but now much used to denote all phosphatidylinositol derivatives as a class.

phosphoinositide cycle another term for phosphatidylinositol

phosphoketolase EC 4.1.2.9; a thiamine diphosphate-protein of the phosphoketolase pathway that catalyses phosphorolysis of D-xylulose 5-phosphate and orthophosphate to acetyl phosphate and D-glyceraldehyde 3-phosphate.

phosphoketolase pathway any metabolic pathway, usually in a microorganism, that involves the enzyme phosphoketolase, e.g. in heterolactic fermentation or in the fermentation of glucose by Bifidobacterium spp.

phosphokinase a former term for kinase.

phospholamban a homopentameric sarcoplasmic reticulum membrane protein that regulates the calcium pump of cardiac, slow-twitch skeletal, and smooth muscle. It is phosphorylated by protein kinase A in response to β-adrenergic stimulation. The phosphorylated protein increases the rate of the sarcoplasmic reticulum Ca2+-ATPase. Example from human: database code PPLA_HUMAN, 52 amino acids (6.10 kDa).

phospholemman a 72-residue cell-membrane protein that forms a chloride-selective ion channel. It is a substrate for both protein kinase C and cyclic AMP-dependent protein kinase. It is rapidly phosphorylated after β-adrenergic and αadrenergic stimulation of the heart and in response to insulin in muscle. It has a single transmembrane domain. The structure of a related protein, Mat-8, expressed in human breast tumours, is known: database code A55571, 87 amino acids.

phospholipase any enzyme that is a lipase and that catalyses the hydrolysis of a glycerophospholipid. Phospholipases have been subdivided as follows.

Phospholipase A₁ EC 3.1.1.32; the recommended name for any carboxylic ester hydrolase that removes the acyl residue at C-1 of the glycerol moiety.

Phospholipase A2 the recommended name for any carboxylic ester hydrolase that removes the acyl residue at C-2 of the glycerol moiety; e.g. EC 3.1.1.4; systematic name: phosphatidylcholine 2-acylhydrolase; other names: lecithinase A; phosphatidase; phosphatidolipase. The enzyme requires calcium. Snake-venom enzymes have been much studied and have broad specificity for phosphoglyceride classes. There are two such mammalian enzymes, the pancreatic type and the membrane-bound type. The pancreatic enzyme is released from the exocrine pancreas on stimulation by cholecystokinin, has broad specificity for phosphoglycerides, and hydrolyses phospholipids of digested food in the intestine in conjunction with anoid synthesis, and is in many cases stimulated by activated hormone and growth-factor receptors. Example, precursor from human (pancreatic enzyme): database code PA2M_ HUMAN, 144 amino acids (16.06 kDa), 3-D structure known. Phospholipase B EC 3.1.1.5; recommended name: lysophospholipase; other names: lecithinase B; lysolecithinase. These are enzymes that remove the acyl group from a lysoglycerophospholipid.

Phospholipase C abbr.: PLC; the recommended name for any phosphoric diester hydrolase that splits the bond between the phosphorus atom and the oxygen atom at C-1 of the glycerol moiety; other names: lipophosphodiesterase I; lecithinase C; Clostridium welchii a-toxin. Two major types have been studied; one is a bacterial type, which acts on phosphatidylcholine, releasing diacylglycerol (EC 3.1.4.3); there is also a mammalian enzyme of this type. The other type, 1-phosphatidylinositol phosphodiesterase (EC 3.1.4.10) acts on phosphoinositides; it is found in bacteria and animals, and catalyses the conversion of 1-phosphatidyl-D-myo-inositol to D-myo-inositol 1,2-cyclic phosphate (which is hydrolysed in animals but not bacteria to inositol 1-phosphate) and diacylglycerol; 1phosphatidylinositol-4,5-bisphosphate phosphodiesterase (EC 3.1.4.11; other names: triphosphoinositide phosphodiesterase: phosphoinositide-specific phospholipase C) catalyses the hydrolysis of 1-phosphatidyl-D-myo-inositol 4,5-bisphosphate to D-myo-inositol 1,4,5-trisphosphate and diacylglycerol. These enzymes play a role in signal transduction. There are at least six forms of the latter, which is required for production of the second messenger molecules diacylglycerol and inositol 1,4,5trisphosphate. The activation involves a G_{α} G-protein subunit. Example, PLC β₂ from human: database code PIP2_HUMAN, 1181 amino acids (133.53 kDa).

Phospholipase D EC 3.1.4.4; the recommended name for any phosphoric diester hydrolase that splits the bond between the phosphorus atom of a glycerophospholipid and the oxygen atom of the nitrogenous base; other names: lipophosphodiesterase II; lecithinase D; choline phosphatase.

phospholipid or (formerly) phospholipide any lipid containing phosphoric acid as mono- or diester.

phospholipid-cholesterol acyltransferase see phosphatidylcholine-sterol O-acyltransferase.

phospholipid exchange protein any of a number of cytosolic proteins that bind phospholipids and transport them within the cell. Each type of protein exhibits a degree of specificity for the phospholipid bound, and each protein molecule carries one or two phospholipid molecules. These proteins function to exchange phospholipid classes between different intracellular membrane sites.

phospholipid translocase a type of protein that accelerates the transfer of phospholipid (see flip-flop) between the inner and outer lipid leaflets of the plasma membrane bilayer.

phosphomannomutase EC 5.4.2.8; systematic name: D-mannose 1,6-phosphomutase; an enzyme that catalyses the reaction:

D-mannose 1-phosphate = D-mannose 6-phosphate.

One of its functions is to convert mannose 6-phosphate to mannose 1-phosphate, from which GDPmannose is synthesized; this is a precursor of fucose, and is an intermediate in the synthesis of the mannose core of oligosaccharides. Example from Escherichia coli: database code CPSG_ECOLI, 456 amino acids (50.40 kDa).

phosphomonoester any monoester of phosphoric acid. phosphomonoesterase 1 an alternative name for phosphatase.

2 an alternative name for either acid phosphatase or alkaline phosphatase.

phosphonic acid see phosphono+.

phosphono+ comb. form denoting a phosphonic residue, -PO(OH)₂, derived from phosphonic acid, HPO(OH)₂. In biothe action of bile salts to form migelles. The membrane-bound chemical usage this name is usually reserved for the -PO(OH)₂ Ban dang doc mot quyen sach duoc tang bot HUY NGUYEN. Neu ban có nhu câu về sách sinh học, xin liên hê:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

group attached to a carbon atom, as in phosphonoacetate, (HO)₂OP-CH₂COO⁻; and **2-phosphonoethylamine**, or ciliatine, (HO)₂OP-CH₂CH₂NH₂; the group is commonly termed phospho+ when linked to a heteroatom, as in phosphocreatine and phosphogluconate.

No-phosphonoarginine see phosphoarginine. No phosphonocreatine see phosphocreatine.

phosphonomycin or fosfomycin (1R,2S)-(1,2-epoxypropyl)phosphonate; an antibiotic produced by Streptomyces and Pseudomonas strains. It binds irreversibly to UDP-N-acetylglucosamine 1-carboxyvinyl transferase (EC 2.5.1.7), an enzyme catalysing the first stage in the synthesis of bacterial cell-wall peptidoglycan from UDP-N-acetylglucosamine, which it thereby inhibits. It penetrates the cell by utilizing the L- α -glycerophosphate transport system. Loss of this system is a primary reason that resistant strains emerge.

phosphonopeptide any of a series of oligopeptide derivatives, designed as inhibitors of bacterial cell-wall biosynthesis, that have a C-terminal residue of L-1-aminoethylphosphonic acid (a phosphorus-containing analogue of L-alanine).

phosphopentomutase EC 5.4.2.7; systematic name: D-ribose 1,5-phosphomutase; other name: phosphodeoxyribomutase. An enzyme that catalyses the reaction:

D-ribose 1-phosphate = D-ribose 5-phosphate.

The partial sequence is known from Escherichia coli: database code DEOB_ECOLI.

phosphoprotein any protein containing one or more phosphoric residues directly attached, usually by ester linkage, to amino-acid residues.

phosphoprotein phosphatase 1 EC 3.1.3.16; systematic name: phosphoprotein phosphohydrolase; any enzyme that removes a phosphate group from a protein by hydrolysis. Many different enzymes have been identified with varying specificity with respect to the primary structure of the substrate protein. See protein phosphatase. 2 another name for serine/threonine-specific protein phosphatase.

phosphor any substance (capable of) exhibiting phosphorescence (def. 1).

phosphor+ a variant form of **phosphoro+** (before a vowel).

phosphoramidate or amidophosphate or phosphoric amide 1 any ion, salt, or ester of phosphoramidic acid; amidophosphoric acid; (OH)₂PO-NH₂. 2 any compound containing the group $(OH)_2PO-NH-$ or $(OH)_2PO-N<$.

phosphoramidite any compound having the general structure R₃R₄NP(R₂)-O-R₁. Phosphoramidites are useful in the synthesis of oligonucleotides or for the addition of groups to the 5'-phosphate of nucleotides or oligonucleotides. R₁ is often cyanoethyl-; R₃ and R₄ are often isopropyl with R₂ in 3'-nucleotide linkage.

phosphoramidon N-(α -L-rhamnopyranosyl-oxyphospho)-Lleucyl-L-tryptophan; a specific inhibitor of thermolysin. It is an inhibitor of the metalloendopeptidase, EC 3.4.24.11, that is responsible for cleaving and inactivating natriuretic peptide, with corresponding pharmacological effects.

phosphoresce to exhibit phosphorescence (def. 1).

phosphorescence 1 a type of luminescence consisting of the emission by a substance of electromagnetic radiation, especially visible light, as a result of the absorption of energy derived from exciting radiation of shorter wavelength or from incident subatomic particles (especially electrons or alpha particles), and that persists for more than approximately 10 ns after excitation ceases, the persistence being a consequence of the excited electrons decaying via a **metastable** (def. 2) state. Ban dang doc một quyển sach duộc tăng bởi HUY NGUYỄN. Nếu ban có nhu cầu về sách sinh học, xin liên hê:

the property of emitting such radiation. 2 the radiation so emitted. 3 a common but erroneous term for bioluminescence (which occurs in the absence of exciting radiation). Compare fluorescence. —phosphorescent adj.

phosphorescence spectrophotometry measurement of the wavelengths and the intensities of the light emitted from a phosphorescent sample that is excited by monochromatic (or nearly so) exciting radiation.

phosphori+ a variant form of phosphoro+ (def. 3).

phosphoriboisomerase see ribose-5-phosphate epimerase.

phosphoribosylamine-glycine ligase EC 6.3.4.13; other names: phosphoribosylglycinamide synthetase; glycinamide ribonucleotide synthetase (abbr.: GARS); an enzyme of the pathway for de novo purine biosynthesis that catalyses the reaction between ATP, 5'-phosphoribosylamine, and glycine to form 5'-phosphoribosylglycinamide (glycinamide ribotide, abbr.: GAR) with release of ADP and orthophosphate. Example from Bacillus subtilis: database code PUR2_BACSU, 422 amino acids (45.23 kDa). Example from human: database code PUR2_HUMAN, 1010 amino acids (107.64 kDa). This multifunctional protein has domains for three proteins required for purine biosynthesis (amino-acid numbers in brackets): GARS (1-433), phosphoribosylformylglycinamidine cycloligase (434-809), and phosphoribosylglycinamideformyl-transferase (810-1010), although variations with only one or two of the domains occur through alternative splicing.

phosphoribosylaminoimidazolecarboxamide transferase EC 2.1.2.3; other name: AICAR transformylase; inosinicase; IMP synthetase; an enzyme of the pathway for de novo purine biosynthesis that catalyses the formation of 5'phosphoribosyl-5-formamido-4-imidazolecarboxamide from 10-formyltetrahydrofolate and 5'-phosphoribosyl-5-amino-4-imidazolecarboxamide (5-aminoimidazole-4-carboxamide ribotide; abbr.: AICAR) forming also tetrahydrofolate. Example, multifunctional protein from chicken having activities for AICAR transformylase and IMP cyclohydrolase: database code PUR9_CHICK, 593 amino acids (64.34 kDa). The IMP cyclohydrolase activity resides in the C-terminal region.

phosphoribosylaminoimidazole carboxylase EC 4.1.1.21; other name: AIR carboxylase; an enzyme of the pathway for de novo purine biosynthesis that catalyses the formation of 1-(5'phosphoribosyl)-5-amino-4-imidazolecarboxylate from 1-(5'phosphoribosyl)-5-aminoimidazole (5'-aminoimidazole ribotide, abbr.: AIR) and CO2. The reaction requires neither biotin nor ATP. For an example, see multifunctional protein ade2.

phosphoribosylaminoimidazolesuccinocarboxamide

synthase EC 6.3.2.6; other name: SAICAR synthetase; an enzyme that catalyses the formation of 1-(5'-phosphoribosyl)-4-(N-succinocarboxamide)-5-aminoimidazole (N-succinylo-5aminoimidazole-4-carboxamide ribonucleotide; abbr.: SAICAR) from ATP, 1-(5'-phosphoribosyl)-4-carboxy-5-aminoimidazole and L-aspartate with release of ADP and orthophosphate. The reaction forms part of the pathway for the de novo synthesis of purines. For an example, see multifunctional protein ade2.

(5-)phospho(-α-p-)ribosyl diphosphate symbol: PPRibP or PRibPP; 5-phospho- α -D-ribofuranosyl diphosphate; α -D-ribose 1-diphosphate 5-phosphate; a compound that is essential in the biosynthesis of various nitrogen-containing ring compounds or their derivatives, especially of histidine, and of purines and pyrimidines as their nucleotides. It is commonly but incorrectly known as phosphoribosyl pyrophosphate (abbr. (not recommended): PRPP).

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

phosphoribosylformylglycinamidine cyclo-ligase 6.3.3.1; other name: phosphoribosyliminoamidazole thetase; an enzyme that catalyses the reaction between ATP and 2-formamido- N^1 -(5-phosphoribosyl)acetamidine to form 1-(5-phosphoribosyl)-5-aminoimidazole with release of ADP and orthophosphate. Example from rabbit: database code A53688, 201 amino acids (22.71 kDa).

phosphoribosylformylglycinamidine synthase EC 6.3.5.3; other names: phosphoribosylformylglycinamidine synthetase; FGAM synthase; an enzyme of the pathway for de novo purine biosynthesis that catalyses the formation of 5'phosphoribosylformylglycinamidine from ATP, 5'-phosphoribosylformylglycinamide, L-glutamine, and H₂O with release of ADP, orthophosphate, and L-glutamate. Example from yeast: database code PUR4_YEAST, 1360 amino acids (149.15 kDa).

phosphoribosylglycinamide formyltransferase 2.1.2.2; other names: 5'-phosphoribosylglycinamide transformylase; GAR transformylase (abbr.: GART); an enzyme of the pathway for de novo purine biosynthesis that catalyses the formation of 5'-phosphoribosyl-N-formylglycinamide (formylglycinamide ribotide; abbr.: FGAR) from 10-formyltetrahydrofolate and 5'-phosphoribosylglycinamide (glycinamide ribotide, abbr.: GAR) yielding also tetrahydrofolate. Example, multifunctional protein from chicken for phosphoribosylamine-glycine ligase (GARS)/phosphoribosylformylglycinamidine cyclo-ligase (AIRS)/GART: database code PUR2_CHICK, 1003 amino acids (106.42 kDa).

phosphoribosyl pyrophosphate abbr.: PRPP; a common name for (5-)phospho($-\alpha$ -p-)ribosyl diphosphate.

phosphoribosyl pyrophosphate synthetase (abbr. PRS) see ribose-phosphate pyrophosphokinase.

phosphoribosyltransferase EC 2.4.2.7-2.4.2.12, 2.4.2.17; any of a group of enzymes that catalyse the biosynthesis of a mononucleotide from 5-phospho-α-D-ribosyl diphosphate (PRPP) in an alternative (or salvage) pathway for nucleoside biosynthesis. They catalyse a reaction between a base and 5phospho-α-D-ribosyl diphosphate to form a D-ribonucleotide and pyrophosphate; the base may be (number indicates no. in sub-subclass EC 2.4.2) adenine (7), hypoxanthine (8), uracil (9), orotate (10), nicotinate (11), nicotinamide (12), or ATP (17). Examples: (1) hypoxanthine/guanine phosphoribosyltransferase (HGPRT) from human: database code HPRT_ HUMAN, 217 amino acids (24.42 kDa); (2) ATP phosphoribosyltransferase, involved in histidine biosynthesis, from Escherichia coli: database code HIS1_ECOLI, 299 amino acids (33.33 kDa). Other phosphoribosyltransferases of sub-subclass EC 2.4.2 involve the following (no. in sub-subclass EC 2.4.2): anthranilate (18), dioxotetrahydropyrimidine (20), and xanthine (22).

phosphoric symbol: P or (in the one-letter convention for nucleotides) p; the general name for a residue of [ortho]phosphoric acid - i.e. tetraoxophosphoric(v) acid, PO(OH)₃ - whether singly, doubly, or triply attached to other groups and whether or not any residual hydroxyl groups are deprotonated.

phosphorimetry the measurement of phosphorescence.

phosphoro+ or (before a vowel) phosphor+ comb. form 1 phosphorus. 2 [ortho]phosphoric acid. 3 or phosphori+ phosphores-

phosphoroclastic describing a chemical reaction in which a carbon-carbon bond is split apparently by the action of inorganic phosphate with attachment of a phosphoric group to one of the resulting fragments.

phosphorolysis any reversible lytic process or reaction undergone by an acyl compound (I) or glycosyl compound (II) in which nucleophilic displacement by phosphate (anion) occurs, with formation of the corresponding acyl or sugar phosphate and uptake of a hydron by the other moiety of the original compound, as in the generalized equations:

phosphorylase kinase EC 2.7.1.38; systematic name: ATP-Ban dang doc một quyền sách được tăng bởi HUY NGUYEN. Nếu ban có nhu cấu về sách sinh học, xin liên hệ:

phosphorolytic of, or relating to, phosphorolysis; capable of undergoing phosphorolysis.

(II) $R-O-R' + PO_4H_2^- + H^+ = R-O-PO_3H_2 + HOR'$.

phosphorous 1 of, containing, or resembling phosphorus. 2 a residue of phosphorous acid - i.e. trioxophosphoric(III) acid, P(OH)₃ - whether singly or doubly attached to other groups and whether or not any residual hydroxyl groups are deprotonated.

phosphorus symbol: P; a nonmetallic element of group 15 of the (IUPAC) periodic table; atomic number 15; relative atomic mass 30.974; it exists naturally as a single stable nuclide, phosphorus-31. Phosphorus occurs only in the combined state, almost exclusively as phosphates. Its commonest covalencies are III and v. Phosphorus compounds are vital components of all living materials. See also phosphorus-32, phosphorus-33.

phosphorus-31 the stable nuclide \(\frac{3}{15}P; \) its relative abundance in natural phosphorus is 100 atom percent.

phosphorus-32 the artificial radioactive nuclide ³²P. It emits a relatively high-energy electron or β-particle (1.709 MeV max.) and no gamma radiation. It has a half-life of 14.3 days.

phosphorus-33 the artificial radioactive nuclide 33P. It emits a moderate-energy electron or β - particle (0.249 MeV max.) and no gamma radiation. It has a half-life of 25.4 days.

phosphorus:oxygen ratio abbr.: P:O ratio; the number of atoms of inorganic phosphorus (as phosphate) incorporated into organic compounds (usually ATP) per atom of dioxygen consumed during oxidative phosphorylation. The value observed depends on the nature of the substrate being oxidized and the state of preservation of mitochondrial function. If the latter is high, a P:O ratio near 3 is observed during the oxidation of NADH, near 2 for succinate, fatty acyl CoA, 3-phosphoglycerate. See also chemiosmotic coupling hypothesis, tight coupling.

phosphoryl 1 the trivalent group -P(O)= derived from phosphoric acid. 2 a name used frequently for the univalent group -P(O)(OH)₂; this usage is not recommended; a phosphoric ester may be named, e.g., choline O-(dihydrogenphosphate) or O-phosphonocholine. However, phosphoryl is accepted except in derived terms such as the names of enzymes (e.g. phosphorylase) or processes (e.g. phosphorylation). See also phos-

phosphorylase 1 the name recommended for any of various enzymes, classified together as EC 2.4.1.1, that catalyse the phosphorolytic removal of the nonreducing terminal glucose residue from a glucan according to the general reaction:

 $Glc\alpha 1-[4Glc\alpha 1-]_n 4Glc + orthophosphate =$ Glc α 1-[4Glc α 1-]_{n-1}-4Glc + Glc α 1-phosphate.

These enzymes vary somewhat in regard to their preferred substrate; the name should be qualified in each instance by prefixing to it the name of the natural substrate (e.g. starch phosphorylase). Glycogen phosphorylase exists in two forms: phosphorylase a, the more active, phosphorylated form; and phosphorylase b (or dephosphophosphorylase), the less active, unphosphorylated form. The conversion of b to a is effected with ATP by the enzyme phosphorylase kinase, and the conversion of a to b is brought about by the enzyme phosphorylase phosphatase (EC 3.1.3.17). Example from Rattus norvegicus, glycogen phosphorylase liver form: database code PHS1_ RAT, 850 amino acids (97.48 kDa). 2 a generic name recommended for those glycosyltransferase enzymes within subclass EC 2.4 that utilize orthophosphate as acceptor. Some appear to be specific, e.g. maltose phosphorylase (EC 2.4.1.8) or uridine phosphorylase (EC 2.4.2.3), others less so, e.g. $1,3-\beta$ -oligoglucan phosphorylase (EC 2.4.1.30). See also α -glucan phosphorylase.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

phosphorylase-b phosphotransferase; other name: dephosphophosphorylase kinase. An enzyme that catalyses the reaction:

4 ATP + 2 phosphorylase b = 4 ADP + phosphorylase a.

Its activity is regulated by $Ca^{2+}/calmodulin$ and by covalent modification, as a result of phosphorylation by **cyclic AMP-dependent protein kinase** or dephosphorylation by **protein phosphatase** 1. The enzyme has the subunit structure $\alpha_4\beta_4\gamma_4\delta_4$; of these γ is the catalytic chain, α and β are regulatory, and δ is a synonym for **calmodulin**. Example, γ chain (human): database code KPBH_HUMAN, 406 amino acids (46.39 kDa).

phosphorylase-limit dextrin the polysaccharide produced by the action of starch phosphorylase on the branched polysaccharide amylopectin.

phosphorylase phosphatase EC 3.1.3.17; an enzyme that catalyses the hydrolysis of phosphorylase a to two molecules of phosphorylase b and four of orthophosphate, thereby converting the phosphorylase to a less active form. See also protein phosphatase.

phosphorylate to effect phosphorylation.

phosphorylation the act or process of introducing a phosphoric group into a molecule, usually with the formation of a phosphoric ester, a phosphoric anhydride, or a phosphoric amide. Biochemical phosphorylation reactions are of importance in the trapping of energy and the formation of biosynthetic intermediates during metabolic processes and in the control of the activity of numerous enzymes and other proteins. See also oxidative phosphorylation, photophosphorylation, substrate-level phosphorylation.

phosphorylation state ratio symbol: R_p ; a measure of the phosphorylating power of the adenylate system within cells. It is given by:

$$R_p = [ATP]/[ADP][P_i].$$

Compare (adenylate) energy charge.

 ${\bf phosphorylcholine-glyceride\ transferase}\ see\ {\bf diacylglycerol\ cholinephosphotransferase}.$

phosphorylcholine transferase see cholinephosphate cytidylyltransferase.

phosphorylethanolamine transferase see ethanolamine-phosphate cytidylyltransferase.

phosphoryn the major phosphate-rich protein of **dentine**. It contains about 40 residue % of phosphoserine and 35 residue % of aspartic acid. It is isolated from incisors and is involved in bone mineralization. Soluble forms and a form complexed with collagen in dentine are known.

phosphoserine O-phospho-L-serine; a phosphoamino acid found in peptide linkage in proteins. Phosphorylation of serine and threonine residues is catalysed by protein kinases specific for serine or threonine residues, and phosphorylation and dephosphorylation mechanisms have a regulatory role in the protein function. See also protein kinase, protein phosphatase.

3-phosphoshikimate 1-carboxyvinyltransferase EC 2.5.1.19; systematic name: phosphoenolpyruvate:3-phosphoshikimate 5-O-(1-carboxyvinyl)-transferase; other name: 5-enolpyruvyl shikimate-3-phosphate (EPSP) synthase; an enzyme of the **shikimate pathway** that catalyses the formation of O^5 -(1-carboxyvinyl)-3-phosphoshikimate (5-enolpyruvyl shikimate 5-phosphate) from phosphoenolpyruvate and 3-phosphoshikimate with release of orthophosphate. See **pentafunctional arom polypeptide**.

phosphosphingolipid see sphingolipid.

phosphothreonine O-phospho-L-threonine; a phosphoamino acid found in peptide linkage in proteins. Phosphorylation of serine and threonine residues is catalysed by protein kinases specific for serine or threonine residues, and phosphorylation and dephosphorylation mechanisms have a regulatory role in the protein function. See also protein kinase, protein phosphatase.

phosphotransferase any of the enzymes of sub-subclasses EC 2.7.1 to 2.7.4, and EC 2.7.9; they catalyse transfer of a phosphate group from a donor to an acceptor, and are classified

according to whether the transfer is to an alcohol group (EC 2.7.1), a carboxyl group (EC 2.7.2), a nitrogenous group (EC 2.7.3), a phosphate group (EC 2.7.4) or to paired acceptors (EC 2.7.9 – only two of these are currently classified, transferring phosphate from ATP to both pyruvate and orthophosphate in one case and to pyruvate and water in the other, yielding AMP in both instances). Enzymes of sub-subclass EC 2.7.6 that transfer diphosphate are classified as diphosphotransferases.

phosphotransferase system a system for transferring substrates into bacteria (see phosphoenolpyruvate-dependent sugar phosphotransferase system).

phosphotriester any triester of phosphoric acid.

phosphotriester method (of oligonucleotide synthesis) a method for the chemical synthesis of oligonucleotides in which a suitably protected phosphodiester of general formula Nuc-3'-O-P(O)(OR)OH, where R is an aryl group and Nuc is a residue of an appropriate nucleoside, is first condensed with the 5'-hydroxyl group of another nucleoside (usually anchored through its 3'-hydroxyl group to an insoluble support) to form a phosphotriester. Sequential addition of further nucleoside units is then carried out in the same way, the 5'-protecting group being removed at each stage before the next cycle of reactions. All remaining protecting groups are removed at the completion of the synthesis.

phosphotyrosine O-phospho-L-tyrosine; a phosphoamino acid found in peptide linkage in proteins, especially in proteins involved in effector mechanisms in growth stimulation, including growth-factor factor receptors. See also protein kinase, protein phosphatase.

phosphovitin or phosvitin a phosphoprotein (subunit size 25 kDa) that, together with lipovitellin, constitutes the major part of the mass of the egg-yolk proteins in oviparous vertebrates. It has the highest phosphorus content of all known phosphoproteins (10% P) and approximately half of its amino-acid residues are serine, all of which are O-phosphorylated. Phosphovitin and lipovitellin are derived from a common precursor protein, vitellogenin.

phot the cgs unit of illuminance, equal to one lumen per square centimetre; 1 phot = 10⁴ lux.

phot+ a variant form of **photo+** (sometimes before a vowel).

photagogikon (pl. photagogika) the light-emitting compound of any luminescent system regardless of binding of the compound or of its state of ionization. See also photogen.

photic 1 of, or relating to, light. 2 of, or relating to, the reaction to light of, or the production of light by, living organisms. 3 describing the uppermost zone in a body of water that receives sufficient light to permit photosynthesis.—photically adv.

photo+ or (sometimes before a vowel) phot+ comb. form denoting 1 of, pertaining to, produced by, or responding to light.
2 involving a photographic process.

photoactivate to render active or reactive by means of light.

—photoactivation n; photoactivatable or photoactivable adj.

photoactive (of a substance) capable of giving a physical or chemical response to light or other electromagnetic radiation. **photoaddition** any chemical addition reaction promoted by light or other electromagnetic radiation.

photoaffinity label or photolabel an affinity label carrying a separate photoactivatable group that on illumination reacts with the protein being labelled to form a covalent link.

photoautotroph or photolithotroph any organism that is both an autotroph and a phototroph. —photoautotrophic adj.; photoautotrophy n.

photobiochemistry the photochemistry of biochemical processes. —photobiochemical adj.; photobiochemically adv.; photobiochemist n.

photobiology the study of the effects of radiation, mainly of visible and ultraviolet light, on living organisms. —**photobiologist** n.

phate group from a donor to an acceptor, and are classified logical adj.; photobiologist n. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

photobleaching

photobleaching the loss of colour or fluorescence through the action of incident visible or near-ultraviolet radiation.

photocatalysis 1 the acceleration of a chemical reaction by light. 2 the catalysis of a photochemical reaction. —photocatalytic adj.; photocatalytically adv.

photocathode (in an electronic device) a cathode from which electrons are emitted when exposed to electromagnetic radiation of suitable frequency.

photocell or photoelectric cell any type of transducer capable of converting incident electromagnetic radiation to an electric signal of corresponding magnitude. It may function by generating a potential difference or a current, or by changing its

photochemical action spectrum the relationship between the efficiency of a photochemical reaction and the frequency of the illuminating light.

photochemical reaction any chemical reaction that is initiated or accelerated by the absorption of visible or near-ultra-

photochemistry the branch of chemistry concerned with the effect of electromagnetic, especially visible and ultraviolet, radiation on chemical processes and with the uptake or production of photons during chemical reactions. —photochemical adj.; photochemically adv.

photochromism or phototropy the property possessed by certain substances of changing colour reversibly when exposed to electromagnetic radiation of appropriate frequency. Compare electrochromism, thermochromism. —photochromic adj.

photoconductive describing an electrical device that is capable of changing its conductance on exposure to light or other electromagnetic radiation. —photoconductivity n.

photodamage deleterious chemical change caused by the action of light, especially ultraviolet light.

photodensitometer see densitometer (def. 1).

photodetector a device, e.g. a photocell, that responds to incident light.

photodimerization or photodimerisation the formation of dimers by a photochemical reaction. It is of particular importance in the formation of pyrimidine dimers in DNA. —photodimerize or photodimerise vb.

photodiode any semiconductor diode (def. 1) that generates a potential difference or changes its conductivity when exposed

photodissociation the splitting of a molecule into smaller molecules, radicals, or atoms on absorption of a quantum of electromagnetic radiation.

photodynamic involving, causing, or promoting a deleterious reaction to light, particularly ultraviolet light. Such reactions usually involve oxidation. Damage is caused by singlet oxygen produced, e.g., by illumination of chlorophyll in chloroplasts. Normally the singlet oxygen is quenched by the carotenoid pigments coexisting with the chlorophylls in chloroplasts. Hence, any mutation that deletes carotenoids from chloroplasts is lethal, because the chlorophylls are destroyed by singlet oxygen.

photoelectric of, pertaining to, or concerned with electric or electronic effects caused by electromagnetic radiation, especially light.

photoelectric cell an alternative name for photocell.

photoelectron an electron that is ejected from an atom on interaction of the atom with a photon of sufficient energy.

photoelectron micrograph any photograph of an object taken by photoelectron microscopy.

photoelectron microscopy an electron-microscopic technique in which photoelectrons emitted from a specimen exposed to ultraviolet radiation are accelerated and focused to produce an image. It is the counterpart in the electron microscope of fluorescence microscopy in the light microscope, the resolution being correspondingly enhanced.

photoelectron spectroscopy a technique in which a specimen (a gas sample or the surface of a solid or a liquid) is ex-Ban dang dọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

posed to monochromatic electromagnetic radiation in the ultraviolet or X-ray regions and the energy spectrum of the emitted photoelectrons recorded. This provides information about the atomic composition of the specimen and also about the types of orbitals to which the constituent electrons of its atoms and molecules are assigned.

photon co

photoemission the emission of electrons from a surface as a result of bombardment by photons.

photoexcitation the act or process of raising an atom or molecule to a higher energy state by interaction with a photon.

photogen 1 an older term for photogogikon. 2 a term proposed for the specific biochemical precursor of a photagogikon.

photographic emulsion or emulsion any medium that is sensitive to light or other electromagnetic radiation, used for preparing photographic film, paper, etc., and consisting usually of a suspension of a silver salt (especially the bromide or chloride) in gelatin; a coating of such a suspension applied to a substrate.

photoheterotroph or photoorganotroph any organism that is both a heterotroph and a phototroph. —photoheterotrophic adj.; photoheterotrophy n.

photoinactivation the irreversible abolition of specific biological activity by the action of light.

photoinhibition the reversible abolition of specific biological activity by the action of light.

photoionization or photoionisation the ionization of a molecular entity by the loss of an electron on interaction of the entity with a photon of sufficient energy.

photokinesis any change in the undirected movement of an organism in response to variation in light intensity. —photokinetic adj.

photolabel an alternative term for photoaffinity label.

photolabile (of a substance) unstable in the presence of light. photolithotroph an alternative term for photoautotroph. —photolithotrophic adj; photolithotrophy n.

photoluminescence luminescence as a result of absorption of electromagnetic radiation. The emitted light is always of lower frequency than that of the incident radiation. —photoluminescent adj.; photoluminesce vb.

photolyse or (sometimes, US) photolyze to subject to or to undergo photolysis.

photolysis the cleavage of one or more covalent bonds in a molecular entity resulting from absorption of energy from light or other electromagnetic radiation; any photochemical process in which such a cleavage is an essential part, e.g. laser photolysis; flash photolysis. —photolytic adj.; photolytically

photolyze a US spelling of photolyse.

photometer any instrument used to measure the intensity of light or other electromagnetic radiation; includes spectrophotometer.

photometry the measurement of the intensity of light or other electromagnetic radiation; it includes spectrophotometry (see spectrophotometer). —photometric adj.; photometrically adv.

photomicrograph a photograph taken through a light microscope; it is sometimes, incorrectly, termed a microphotograph. —photomicrographic adj; photomicrographically adv; photomicrography n.

photomultiplier a photocell consisting of a photocathode linked to an electron multiplier. Photons striking the photocathode cause the emission of electrons, which are then amplified by the electron multiplier to give an enhanced signal.

photon symbol (in nuclear reactions, etc.): γ; a quantum of light (or other electromagnetic radiation) considered as a particle with zero rest mass, zero charge, and energy $h\nu$ joule, where h is the Planck constant and ν the frequency of the radiation in hertz.

photon counter a device, consisting of a photomultiplier and an associated scaler, that is capable of responding to and

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

photonicking photosynt

photonicking photolysis of a nucleic-acid molecule with production of a nick.

photoorganotroph an alternative term for photoheterotroph. photoorganotrophic adj.; photoorganotrophy n.

photooxidize or photooxidise to oxidize by the use of, or as a result of, radiation in the visible and ultraviolet wavelengths. -photooxidizable or photooxidisable adj.

photoperiod 1 the length of daylight in a 24-hour period. 2 the duration of daily exposure of an organism to illumination; the length of this period that favours optimum functioning. —photoperiodic adj.; photoperiodically adv.

photoperiodism or **photoperiodicity** the response of an organism to the relative durations of light and dark in a 24-hour

photophore any light-emitting organ of an animal.

photophosphorylation or photosynthetic photophosphorylation the metabolic processes by which photosynthetic organisms use light energy to convert ADP to ATP without the concomitant reduction of dioxygen to water that occurs in oxidative phosphorylation (see photosynthesis). There are two distinct electron transport mechanisms: in noncyclic photophosphorylation, which involves both photosystems I and II, ATP synthesis is linked to the transport of electrons from water to NADP+, with production of NADPH and dioxygen; in cyclic photophosphorylation, which involves only photosystem I, ATP synthesis is driven by a proton gradient generated across the thylakoid membrane.

photopia adjustment of the eye to vision in light of moderate or high intensity, permitting perception of colour; it is considered to involve mainly the cone cells of the retina. Compare scotopia. —photopic adj.

photopigment any pigment whose chemical state depends on the intensity of the light falling on it.

photopolymerize or **photopolymerise** to effect polymerization by the action of light. —photopolymerization or photopolymerisation n.

(6-4)photoproduct a type of pyrimidine dimer.

photoprotein any protein actively concerned in the emission of light by a living organism.

photopsin an opsin that is the apoprotein of an iodopsin.

photoreactivating enzyme see DNA photolyase, photoreactiva-

photoreactivation the process by which genetic damage caused to organisms by ultraviolet radiation can be reversed by subsequent illumination with visible or near-ultraviolet light. The pyrimidine dimers formed in DNA by the action of ultraviolet light bind DNA photolyase, which absorbs light, maximally at 380 nm, and catalyses the restoration of two pyrimidine residues in the DNA.

photoreactive (of a substance or reagent) reactive in a photochemical reaction. —photoreactivity n.

photoreceptor any biological structure that responds to incident electromagnetic radiation, particularly visible light. It especially refers to a cell that, on absorbing light, generates a nerve impulse or impulses.

photoreduction 1 chemical reduction brought about by electromagnetic radiation, especially visible light. 2 a process occurring at low light intensities in certain algae whereby dihydrogen functions in place of water as an electron donor for the reduction of carbon dioxide and oxygen is not evolved; at higher light intensities normal photosynthesis takes place. 3 reduction in size photographically.

photorespiration a light-dependent catabolic process occurring concomitantly with photosynthesis in plants (especially C₃ plants) whereby dioxygen is consumed and carbon dioxide is evolved. The substrate is glycolate formed in large quantities in chloroplasts from 2-phosphoglycolate generated from ribulose 1,5-bisphosphate by the action of ribulose-bisphosphate carboxylase; the glycolate enters the peroxisomes where it is converted by glycolate oxidase to glyoxylate which undergoes dria where it is decarboxylated. C₃ plants may lose 20-40% of photosynthetically fixed carbon by photorespiration, whereas C₄ plants lose relatively little. C₄ plants defeat photorespiration in two ways. First, they recapture released CO₂ in the cytoplasm using phosphoenolpyruvate carboxylase which has a very high affinity for CO₂. Although this does not directly affect photorespiration, it prevents loss of CO2. Second, they concentrate CO₂ near ribulose-biphosphate carboxylase, and this increases the CO₂:O₂ ratio, which has the effect of inhibiting the oxygenase activity. —photorespiratory adj.

photosensitivity 1 the property of being reactive or unusually reactive to incident photons, especially to those of visible light. 2 (in medicine) an abnormal, local or generalized reaction to sunlight, due to the accumulation in the skin of photodynamic substances, either endogenous or exogenous. -photosensitive adj.

photosensitize or photosensitise 1 to render photosensitive; see photosensitivity. 2 to render a target molecule more reactive (e.g. more easily oxidized) by the addition to it of a second type of molecule, often a dye, that absorbs light energy and transfers it to the target molecule. —photosensitization or photosensitisation n.

photosensitizer or photosensitiser any substance that photosensitizes or is photodynamic.

photosuicide inhibitor a type of suicide inhibitor that, after reaction with an enzyme or other appropriate protein, is capable of being selectively photodecomposed to a highly reactive species that can irreversibly modify the protein in the neighbourhood of its active site.

photosynthate any product of the dark reactions of photosyn-

photosynthesis 1 (in biology) the synthesis by organisms of organic chemical compounds, esp. carbohydrates, from carbon dioxide using energy obtained from light rather than from the oxidation of chemical compounds (compare chemosynthesis). In higher plants, green algae, and cyanobacteria, water is the electron donor and dioxygen is evolved; in other photosynthetic bacteria, however, various other simple substances (e.g. H₂S) may act as electron donors, dioxygen is not formed, and the photosynthetic pathway is simpler. Photosynthesis comprises two separate processes: the light reactions and the dark reactions of photosynthesis. The system in higher plants, green algae, and cyanobacteria brings about an overall reaction in which electrons are released from water molecules and are transferred through complexes of chlorophylls, cytochromes, proteins, and small molecules to NADP⁺, reducing it to NADPH. Protons are released from water and form a chemiosmotic gradient that results in the formation of ATP by a process similar to that operating in mitochondria (see chemiosmotic coupling hypothesis). These are the light reactions. The NADPH and ATP formed by these reactions then drive the dark reactions i.e. the reductive pentose phosphate cycle. The electrons and protons are released from water by the oxygenevolving complex (abbr.: OEC), and dioxygen is formed in the process. The sequence of reactions involves the OEC, from which electrons pass to photosystem II (see photosystem), thence to plastoquinone reducing it to a quinol which then reduces the cytochrome b_6 -f complex. This in turn reduces plastocyanin which passes electrons to photosystem I (see photosystem) which then reduces NADP+ to NADPH. In photosynthetic bacteria, a simpler system exists, in which water is not split, dioxygen is not evolved, and NADP+ is not reduced directly. In this system, photons excite molecules of bacteriochlorophyll b in a photosynthetic reaction centre to transfer electrons through a cyclic electron-transfer system.

Cyclic electron flow can also occur under some conditions in plants, and involves only photosystem I, electrons being released by photon activation from photosystem I and returned to it through cytochrome b_6 -f and plastocyanin, with pumping of protons to generate ATP. Under these conditions there is transamination to glycine. This then passes into the mitochon- no reduction of NADP+. 2 (in chemistry) any synthesis by a Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

pH star

photochemical reaction. —photosynthetic adj.; photosynthetically adv

photosynthetic phosphorylation an alternative term for photophosphorylation.

photosynthetic quotient a ratio of the rate of dioxygen evolution by a cell or organism capable of photosynthesis to that of carbon dioxide uptake. It is an index of photosynthetic activity relative to respiration (including photorespiration).

photosynthetic reaction centre the photosynthetic complex in bacteria, consisting essentially of a transmembrane protein of three subunits, denoted L, M, and H. Collectively the three subunits generate 11 transmembrane helices. Although the L and M helices (which have binding sites for the many prosthetic groups) are different, the groups themselves are arranged with near twofold symmetry because of similarities in the folds of the subunits. The L and M subunits bear bacteriochlorophyll, bacteriopheophytin, ubiquinone, and menaquinone molecules. The bacteriochlorophylls will be either a or b types, as will be the bacteriopheophytins. Here we describe a system with b types. Of the four bacteriochlorophyll b molecules, two constitute a 'special pair' with an Mg²⁺-Mg²⁺ distance of 7 Å and in hydrophobic environments; other prosthetic groups are bacteriopheophytin b (two molecules), one nonheme Fe(II), one ubiquinone, and one menaquinone. There is cyclic electron flow through a cytochrome bc_1 complex, cytochrome c, and the bacteriochlorophyll-bacteriopheophytin complex, protons being pumped from the bacterial cytosol to the periplasmic space, and then returning to the cytosol through an ATP synthase with synthesis of ATP. The system differs from that in plants in that there is only one type of reaction centre, no splitting of water, and no direct reduction of NADP⁺. Its essential features are that photons excite electrons in the 'special pair' and these excited electrons then flow through the bacteriochlorophyll-bacteriopheophytin complex, ubiquinone, and menaquinone, dissipating energy in bringing about protein pumping to form the chemiosmotic gradient that results in ATP formation. They then return to the 'special pair' via cytochromes bc_1 and c. Examples from Rhodobacter sphaeroides: L subunit: database code NRL_ 4RCRL, 266 amino acids (29.74 kDa); M subunit: database code NRL_4RCRM, 296 amino acids (33.15 kDa); H subunit: database code NRL_4RCRH, 237 amino acids (25.63 kDa). This (and the complex from Rhodopseudomonas viridis) represents the first transmembrane protein to have its 3-D structure determined in atomic detail by X-ray crystallography (by Deisenhofer, Michel, and Huber). See also P870, P960, photosystem (def. 2).

photosystem 1 either of the two functionally distinct but cooperating systems, designated photosystem I (abbr.: PSI) and photosystem II (abbr.: PSII), between which are distributed the various molecules that effect the light reactions of photosynthesis; photosystems are located in the thylakoid membranes of the chloroplasts of higher plants and green algae or in the free thylakoid membranes of cyanobacteria. Photosystem I consists of a transmembrane multisubunit complex, of about 10 subunits in all, consisting of a heterodimer complex of PsaA and PsaB which binds P700, together with the chlorophyll acceptor A_0 , the phylloquinone acceptor A_1 , and Fx, a 4Fe-4S centre. PsaC, which is bound to this complex, contains two additional 4Fe-4S centres required for ferredoxin reduction. Other subunits are involved in binding soluble ferredoxin, ferredoxin-NADP oxidoreductase and regulation of electron flow. Approximately 100 chlorophyll a molecules are bound to the minimal heterodimer unit. Examples (all from pea), heterodimer of two similar subunits, A₁: database code PSAA_PEA, 761 amino acids (84.01 kDa) and A₂: database code PSAB_PEA, 734 amino acids (83.32 kDa); PsaC: database code PSAC_PEA, 80 amino acids (8.84 kDa) is similar to bacterial-type 4Fe-4S ferredoxins. Photosystem II is formed from a heterodimer of the D1 and D2 proteins which bind

quinone acceptors Q_a and Q_b, and a non-heme iron atom. The minimal purified unit contains about six chlorophyll a molecules. Cytochrome b₅₅₉ is always associated with PSII. A large number of other subunits including light-harvesting chlorophyll-protein complexes, proteins involved in stabilizing the Mn complex, and regulatory subunits are required to form a functional photosystem II. Examples (from pea) of proteins of photosystem II are D₁ precursor: database code PSBA_PEA, 353 amino acids (38.92 kDa); and D₂ precursor: database code PSBC_PEA, 353 amino acids (39.51 kDa). 2 any functionally analogous but simpler single photosystem present in photosynthetic bacteria. That from Rhodopseudomonas viridis contains three hydrophobic subunits, a special pair of bacteriochlorophyll b (the reaction-centre bacteriochlorophyll P960), two molecules of bacteriopheophytin b (see bacteriopheophytin), a bound iron atom and one molecule each of ubiquinone and a **menaquinone.** There are four heme c-type cytochromes in this case (but not in all). The complete structure has been determined by X-ray crystallography. See also photosynthetic reaction centre.

phototaxis the movement of a motile cell or organism towards (positive phototaxis) or away from (negative phototaxis) a source of light. --- phototactic adj.

phototoxic able to cause physiological damage by making the skin abnormally sensitive to light. —phototoxicity n.

phototransistor a type of junction transistor that responds to incident light or other electromagnetic radiation by the generation of an electric current, which is then amplified.

phototroph or phototrophe any organism whose principal or only source of primary energy is sunlight. The great majority of such organisms are photoautotrophs (or photolithotrophs), which use light energy to synthesize their organic requirements solely from inorganic precursors; these include all green plants and algae, cyanobacteria, and green and purple sulfur bacteria. Relatively few phototrophs are photoheterotrophs (or photoorganotrophs), which require a supply of organic precursors to manufacture their own organic components; examples include certain purple nonsulfur bacteria. Compare chemotroph. —phototrophic adj.; phototrophy n.

phototropic 1 involving or showing phototropism. 2 involving or showing phototropy (i.e. photochromism).

phototropism the orientation or growth of a cell or (a part of) an organism in relation to a source of light. The term is used especially of plants or plant organs.

phototropy an alternative term for photochromism.

phototube a type of photocell consisting of a vacuum tube or gas-filled tube in which a photocathode responds to incident light or other electromagnetic radiation by emission of elec-

pH paper absorbent paper, usually in strip form, that is impregnated with a colour-changing pH indicator dye. It is useful for estimating the approximate pH of a solution.

pH profile see pH-activity profile.

phragmoplast a structure formed in the developing plant cell wall from the endoplasmic reticulum and spindle fibres. It is observed during cytokinesis in plant cells as a cylindrical structure, composed of microtubules, between the two sets of daughter chromosomes. The microtubules are those of the two sets of polar microtubules of the spindle. These microtubules transport small Golgi-derived vesicles to the equatorial (or central) region, which fuse there to form the early cell plate, which then grows out to join up with the cell wall.

phrenosin a cerebroside in which the acyl constituent is cerebronate. See lignocerate, of which cerebronate is the 2-hydroxy derivative.

pH standard any of a set of six standard solutions which may be used as primary pH standards; they are: potassium hydrogen tartrate, saturated at 25 °C, pH 3.557 at 25 °C; 0.1 mol/kg potassium dihydrogen citrate, pH 3.776 at 25 °C; 0.025 mol/kg P680, together with the pheophytin acceptor, two plasto- KH2PO4 + 0.025 mol/kg Na2HPO4, pH 6.865 at 25 °C; Ban dang dọc một quyển sách được tặng bởi HUY NGUYÊN. nur restrect

0.008695 mol/kg KH₂PO₄ + 0.03043 mol/kg Na₂HPO₄, pH 7.413 at 25 °C; 0.01 mol/kg disodium tetraborate, pH 9.180 at 25 °C; 0.025 mol/kg NaHCO₃ + 0.025 mol/kg Na₂CO₃, pH 10.012 at 24 °C.

pH-stat an instrument for maintaining a constant pH in an aqueous liquid mixture in which hydrogen ions are being liberated or taken up. It is frequently arranged to measure the amount of reagent, as a function of time, that has to be added to maintain a predetermined pH.

Pht< or -Pht- symbol for the (divalent) phthaloyl group.

Pht-symbol for the (univalent) phthalyl group.

phthalate 1 the trivial name for 1,2-benzene dicarboxylate, the dianion of phthalic acid. 2 any mixture of phthalic acid and its mono- and dianions. 3 any salt or ester of phthalic acid.

phthaloyl symbol: Pht< or -Pht-; the divalent acyl group, -OC-C₆H₄-CO-, derived from phthalic acid.

phthalyi symbol: Pht-, the univalent acyl group, HOOC-C₆H₄-CO-, derived from phthalic acid.

pH unit the difference between any two successive integral values of pH.

phyco+ comb. form denoting seaweed or other algae.

phycobilin any bilin found in phycobiliproteins. The two most common are phycocyanobilin and phycoerythrobilin. They are linear tetrapyrroles or open tetrapyrroles, i.e. chains of four pyrroles, the terminal pyrroles not being linked to each other to form the cyclic tetrapyrrole structure. The structure of phycocyanobilin is shown; phycoerythrobilin is similar except that the ethyl group on ring A is -CH=CH₂ and the methyne group between rings A and B is a methylene group.

phycocyanobilin

phycobiliprotein or biliprotein any phycobilin-protein conjugate found in the algae of the phyla Cryptophyta and Rhodophyta, and in cyanobacteria. Phycobiliproteins are intensely coloured and fluorescent water-soluble globular proteins. The two most common types, phycocyanin and phycoerythrin, are composed of two kinds of subunits, α (10-20) kDa) and β (14-30 kDa), each of which carries about three molecules of covalently bound phycobilin (phycocyanobilin in phycocyanin, phycoerythrobilin in phycoerythrin) and is present in vivo most commonly as aggregates of formula $(\alpha, \beta)_n$ where n is 3 or 6. Phycocyanin (blue: A_{max} at 618 nm) predominates in Cyanophyta, and phycoerythrin (red: Amax at 545 nm) predominates in Rhodophyta. A third type, allophycocyanin (pale blue: A_{max} at 650 nm), present in small amounts in both Cyanophyta and Rhodophyta, has only one type of protein subunit (~15.5 kDa), carries one molecule of covalently bound phycocyanobilin, and is present in vivo as aggregates of six subunits. It is a heterodimer of α and β chains. Example from Mastigocladus laminosus (B chain only available): database code PHBB_MASLA, 169 amino acids (18.84 kDa). See

phycobilisome any of the granules, approximately $32 \text{ nm} \times 48$ nm and consisting of highly aggregated **phycobiliproteins**, that are attached in arrays to the external face of a **thylakoid** membrane in algae of the phyla Cyanophyta and Rhodophyta, where they function as light-harvesting devices in photosynthesis. Excitation energy in the phycobilisome flows in the sequence:

phycoerythrin → phycocyanin → allophycocyanin,

whence it passes to the antenna chlorophyll of photosystem II. In Cyanophyta it is also known as a cyanosome.

phycocyanin a blue phycobilin; see phycobiliprotein.

phycocyanobilin a type of phycobilin; see also phycobiliprotein. phycoerythrin a red phycobilin; see phycobiliprotein.

phycoerythrobilin a type of phycobilin; see also phycobiliprotein.

phycofluor any artificial conjugate of a **phycobiliprotein** with a molecule conferring biological specificity (e.g. avidin, immunoglobulin, protein A). Such conjugates are useful in fluorescence immunoassay and fluorescence-activated cell sorting by virtue of the distinctive and intense fluorescence of the phycobiliprotein moiety.

phycotoxin any poisonous substance produced by algae.

phyl+ a variant form of **phylo+** (sometimes before a vowel). **phyla** the plural of **phylum**.

PHYLIP a suite of computer programs used for determining phylogeny and/or cladistic relationships from protein and/or nucleic-acid sequences, using, in part, parsimony.

phylio+ or (before a vowel) **phyll+** comb. form denoting leaf.

phyllocerulein or (esp. Brit.) phyllocaerulein see cerulein. phylloquinone abbr.: K; the recommended name for vitamin K₁; 2-methyl-3-phytyl-1,4-naphthoquinone. See vitamin K.

phylo+ or (sometimes before a vowel) **phyl+** comb. form denoting race or tribe.

phylogenetic tree a graphical representation of the (putative) evolutionary relationships of a group of organisms.

phylogeny the evolutionary history of an organism or group of related organisms. In biochemistry, such evolutionary relationships are based on similarities and differences in nucleic acid or protein sequences. —phylogenetic or phylogenic adj.

phylum (pl. phyla) a primary taxon of animals or plants (in plants also termed division). It consists of a number of classes (or sometimes a single class).

physalaemin Glp-Ala-Asp-Pro-Asn-Lys-Phe-Tyr-Gly-Leu-Met-NH₂; an 11-residue peptide amide tachykinin from the skin of the amphibian *Physalaemus fuscumaculatus*. It is more potent than eledoisin and substance P in some assay systems, and is useful in the study of receptors for substance P.

physeteric acid see tetradecenoic acid.

physical 1 of, or pertaining to, matter and energy; of material things. 2 of, or relating to, natural science, especially of non-living systems. Compare biological. 3 having reference to or used in physics.—physically adv.

physical adsorption an alternative term for physisorption.

physical biochemistry the application of physical chemistry to biochemical substances, structures, and systems. Often used synonymously with biophysical chemistry.

physical chemistry the branch of chemistry concerned with the relationship between the physical properties of substances and their chemical properties, reactions, and structures.

physical map a map which identifies the physical location of genes on a chromosome in contrast to a linkage map which is generated by measuring recombination frequencies. Physical length may be measured in base pairs, kilobases, or megabases. Such maps are obtained, e.g. in pulsed field gel electrophoresis, fluorescence in situ hybridization, and contig mapping.

physico+ comb. form denoting physical or of physics.

physicochemical of, pertaining to, or using the methods of physical chemistry. —physicochemically adv.

also phycobilisome. Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

with the properties of matter and of energy, and with the interactions and interconversions between matter and energy.

physiological 1 of, pertaining to, or used in physiology. 2 normal (def. 4); not pathological (def. 2) or pharmacological (def. 2). -physiologically adv.

physiological antagonist a drug that produces the opposite effect to a specified agonist by an action that is unrelated to that of the agonist.

physiological chemistry an older term for biochemistry (especially that of humans and higher animals).

physiological conditions environmental conditions simulating those under which the (normal) functions of a cell, organ, or tissue can be expressed.

physiological saline or (sometimes) normal saline a (sterile) solution of 0.9% w/v (0.154 mol L⁻¹) sodium chloride in water. It is approximately isotonic with mammalian blood and lymph, and is useful in the temporary maintenance of living cells and tissues, and as a vehicle for injections.

physiology the science dealing with the functioning of cells, tissues, organs, and organisms, and with the chemical and physical phenomena concerned.

physisorption or physical adsorption or van der Waals adsorption the type of adsorption (def. 1) in which only van der Waals forces are involved and hence in which no significant changes occur in the electronic orbital patterns of the interacting substances. Compare chemisorption.

physostigmine or eserine a toxic alkaloid extracted from Calabar beans (Physostigma venenosum). It inhibits cholinesterase by binding to the anionic site of the enzyme, forming a carbamoyl ester of the serine hydroxyl, which is only slowly hydrolysed. It has been used in West Africa in witch ordeals.

phyt+ a variant form of **phyto+** (before a vowel).

phytanic acid 3,7,11,15-tetramethylhexadecoanoic acid; a branched chain fatty acid that is formed metabolically from phytol, a constituent of chlorophyll, by bacteria in the ruminant stomach. Its oxidation in animals depends on the alpha oxidation pathway, since the methyl group on C-3 (the beta carbon) blocks beta oxidation. After alpha oxidation this methyl group is on C-2 of the product, so that beta oxidation can occur, releasing propionyl-CoA as a product...

phytase either of the two enzymes, designated 3-phytase (EC 3.1.3.8) and 6-phytase (EC 3.1.3.26), that catalyse the hydrolytic removal of a phosphoric residue from phytate at the 3-position or the 6-position, respectively; most commonly it signifies 6-phytase.

phytate any anion of phytic acid, any mixture of free phytic acid and its ionized forms, or any salt of phytic acid. It is the major phosphorus compound in plants and is important for phosphate storage in cereal grains, especially as its calcium-magnesium salt, **phytin**. In higher animals phytin binds dietary Ca^{2+} and Mg^{2+} , making them less available.

+phyte noun suffix denoting 1 plant (of the habitat or type specified). 2 pathological outgrowth. -+phytic adj.

phytic acid the trivial name for myo-inositol hexakis(dihydrogen phosphate). See phytate.

phytin see phytate.

phyto+ or (before a vowel) **phyt+** comb. form denoting plant. phytoagglutinin or (rarely) phytohemagglutinin any plant lectin. The majority are glycoproteins, although some, e.g. concanavalin A, contain no carbohydrate. They accumulate mainly in seeds, in cytoplasm of cotyledons and embryonic cells, although they are synthesized in leaves.

Bạn đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

phytoalexin any substance with antibiotic activity that is produced by plant tissues in response to infection, especially with a fungus. A variety of different types of substance are regarded as phytoalexins. They include compounds as divergent as phaseollin, some sesquiterpenes and long-chain acetylenic alcohols.

phytochelatin any of a group of peptides that bind heavy metals (Cd, Zn, Cu, Pb, Hg) in thiolate coordination complexes, and can be isolated from plant cell suspension cultures. The structure is of the type (γ-glutamyl-cysteinyl)_n-glycine, where n is 2 to 11.

phytochemistry the branch of chemistry concerned with plants, especially with secondary metabolites.

phytochrome a chromoprotein present in trace amounts in all higher plants and involved in regulating light-dependent processes such as leaf development and flowering. It consists of a phycobilin-related chromophore covalently linked to a polypeptide of ≈124 kDa. Phytochrome exists in two forms, P_R (A_{max} at 666 nm) and P_{FR} (A_{max} at 730 nm), which are indefinitely interconvertible on absorption of light in the red and far-red regions of the spectrum, respectively. The spectral changes are due to cis-trans isomerization in the phycobilin. The active form, P_{FR}, plays a central role in light-promoted modulation of gene expression, which is of importance in plant growth and development in every phase of the life cycle; conversion of PFR to PR cancels these responses. The phytochromes are homodimeric proteins with a linear tetrapyrrole chromophore covalently linked to a polypeptide. Examples, phytochrome A (vegetable marrow): database code PHYA_ CUCPE, 1124 amino acids (124.94 kDa); phytochrome B (tobacco): database code PHYB_TOBAC, 1132 amino acids (125.67 kDa).

phytoecdysone (sometimes) any member of the group of ecdysteroids found in plants.

phytoglycogen plant glycogen; a highly branched polymer of D-glucose, with a structure similar to that of animal glycogen, found in fungi, corn (maize), and rice. A similar substance is found in bacteria and cyanobacteria. In contrast to the major branched chain glucan, amylopectin, which is found only as a component of starch, plant glycogen is found as an independent molecule.

phytohemagglutinin or (esp. Brit.) phytohaemagglutinin 1 abbr.: PHA; or phytomitogen the lectin from the red kidney bean, Phaseolus vulgaris; a potent mitogen. Example, leukoagglutinating phytohemagglutinin precursor: database code PHAL_PHAVU, 272 amino acids (29.56 kDa). 2 a rare alternative name for phytoagglutinin.

phytohormone or plant hormone any plant growth factor or similar substance that regulates plant development. The group is diverse and includes abscisic acid, auxins, ethylene, cytokinins, and gibberellins.

phytokinin an alternative term for cytokinin.

phytol a trivial name for trans- (or E-) (7R,11R)-3,7,11,15tetramethyl-2-hexadecen-1-ol; the pure substance is a colourless oily liquid. Phytol occurs in combined form in chlorophyll and vitamin K_1 . See also phytyl.

phytolysosome a lysosome of plant cells.

phytomitogen an alternative name for phytohemagglutinin (def. 1).

phytoplankton plant plankton; consisting of diatoms, dinoflagellates, and other microscopic algae.

phytoporphyrin any plant porphyrin.

phytosphingosine 2S,3S,4R-2-amino-1,3,4-octadecanetriol; a constituent of many plant sphingolipids.

phytosterol any sterol occurring in higher plants; they differ from animal sterols in having C₁ or C₂ residues at C-24 and/or a double bond at C-22.

phytotoxic toxic to a plant.

phytotoxin 1 any toxin produced by a plant. 2 any substance

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyenltd.com.

phytotron

phytotron a laboratory where plants can be grown and studied under a variety of controlled conditions.

phytyl the alkyl group, $(CH_3)_2$ –CH– $[CH_2]_3$ – $CH(CH_3)$ – $[CH_2]_3$ – $CH(CH_3)$ – $[CH_2]_3$ – $CH(CH_3)$ – $[CH_2]_3$ – $CH(CH_3)$ – $[CH_2]_3$ –

pi 1 symbol: π (lower case) or Π (upper case); the sixteenth letter of the Greek alphabet. For uses see Appendix A. 2 (in mathematics) symbol: π ; a transcendental number that is the ratio of the circumference of a circle to its diameter. It has the approximate value 3.141 592 653 59.

pi symbol for isoelectric point.

Pl abbr. for phosphatidylinositol.

pi adduct or π adduct any adduct formed by coordination and involving donation of an electron pair from a pi orbital into a sigma orbital, from a sigma orbital into a pi orbital, or from a pi orbital into a pi orbital. It is also known, less correctly, as a pi complex.

pi bond or π bond the type of covalent bond formed between atoms by electrons occupying a **pi orbital**.

picein (wax) an unreactive thermoplastic material, composed of a mixture of hydrocarbons of very low vapour pressure, that adheres well to glass and metal. It is useful as a sealing substance in the assembly of vacuum systems.

Pichia see methylotrophic yeasts.

picket-fence (porphyrin) complex any synthetic iron-porphyrin complex in which the porphyrin has been derivatized with four large groups attached to one side of the porphyrin ring, to each of the inter-pyrrole carbon atoms, so as to form a protective enclosure for the binding of a dioxygen molecule as in myoglobin or hemoglobin.

pico+ symbol: p; SI prefix denoting 10^{-12} times.

picogram symbol: pg; a unit of mass equal to 10^{-15} kilogram or 10^{-12} gram.

picometre or (US) **picometer** symbol: pm; a unit of length equal to 10^{-12} metre.

picomolar symbol: pM or pM; describing a solution containing one picomole of solute per litre of solution, or a specified multiple or fraction thereof; used also of a substance concentration similarly expressed.

picomole symbol: pmol; a unit of amount of substance equal to 10^{-12} mole.

pi complex or π complex a less suitable name for pi adduct.

picoplankton plankton having cell dimensions of between 0.2 and 2 μm and including bacteria, cyanobacteria, some algae, and certain microscopic protozoans. Picoplankton appears to be ubiquitous in open waters of lakes and seas and probably exceeds in total biomass any other group of pelagic organisms.

picornavirus any of a group of RNA animal viruses consisting of naked, icosahedral 27 nm capsids with single-stranded infectious RNA (plus strand) of 2.7 MDa. The group includes human poliovirus, some common-cold viruses, and foot-and-mouth disease virus (of cattle and other cloven-footed mammals)

picosecond symbol: ps; a unit of time equal to 10^{-12} second.

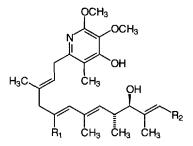

4-pi counter any type of radiation counter that detects radiation emitted through a solid angle of 4π steradians, i.e. in all directions from a source.

picrotoxin or cocculin a preparation containing an equimolar mixture of **picrotoxinin** (C₁₅H₁₆O₆) and **picrotin** (C₁₅H₁₈O₇) obtained from the seeds of Anamirta cocculus (fishberries). It contains a potent ligand for the chloride ionophore of the GABA_A receptor, binding to the channel protein and inhibiting Cl⁻ transport without displacing GABA; this endows it with potent convulsant activity. It can thus also act as an antidote to barbiturates, which enhance GABA binding. It is displaced from its binding site by anticonvulsants.

pi electron or π electron an electron in a pi orbital.

plericidin A an antibiotic that is a structural analogue of ubiquinone. It is a classical inhibitor of mitochondrial electron transport similar in action to rotenone. It is a potent inhibitor

of NADH: ubiquinone oxidoreductase (see NADH dehydrogenase), acting at or near the ubiquinone catalytic site.

pig 1 any nonruminant, omnivorous ungulate mammal of the family Suidae, especially the domestic pig, Sus scrofa. 2 informal short for guinea pig.

PI-G abbr. for phosphatidylinositolglycan.

PIG-A abbr. for phosphatidylinositol glycan protein class A.

pigeon any stout-bodied bird of the family Columbidae, especially the domesticated or feral pigeon, *Columba livia*. Pigeon-breast muscle has been extensively used as a convenient tissue for the study of oxidative metabolism.

pigment 1 any general or particular colouring matter in living organisms. 2 any natural or artificial substance used to impart colour. 3 to colour with pigment.

pigment 680 see P680.

pigment 700 see P700.

pigmentation 1 natural coloration of organisms. 2 an increase in such coloration.

pigment system an alternative name for photosystem.

Pi-G-tailed proteins proteins that are anchored to the membrane through linkage to phosphatidylinositol-glycan.

pili the plural of pilus.

pilin any protein subunit of a bacterial pilus.

pilocarpine an alkaloid extracted from *Pilocarpus jaborandi*; it has muscarinic cholinomimetic activity.

pilot plant a prototype apparatus set up to develop and scale up a new manufacturing process.

pilus (pl. pili) a hairlike appendage, about 25 nm in diameter and 10-12 µm long, present sometimes on cells of certain Gram-negative bacteria, especially members of the Enterobacteriaceae and Pseudomonas spp., in addition to any flagella. The two main types, distinguishable morphologically and antigenically, are common pilus and sex pilus, both of which may be present on the same cell. Up to several hundred common pili per cell may be present, either distributed over the entire surface or concentrated at a pole; their function is not known. Only one or two sex pili commonly are present; they appear to be required for bacterial conjugation. Both types of pili are thought to be tubes or tubelike structures formed from one or two helically wound strands, each of which consists of a linear arrangement of molecules of the protein pilin. The term pilus is often used interchangeably with fimbria, but may be used specifically to mean sex pilus (in which case fimbria then denotes common pilus).

transport similar in action to **rotenone**. It is a potent inhibitor **PIM** a gene family encoding serine/threonine kinases of un-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

pl marker known function named from proviral integration site MuLVinduced murine T-cell lymphomas. They are highly conserved between human and mouse, and are expressed at high levels in hemopoietic tissues, testes and ovaries, and embryonic stem cells. Example of gene product from mouse: database code

KPIM_MOUSE, 313 amino acids (35.54 kDa). pl marker an isoelectric point marker; see isoelectric point.

pineal body or pineal gland a small, pine-cone-shaped structure situated deep between the cerebral hemispheres of the mammalian brain. It elaborates and secretes melatonin.

pineal hormone an older name for melatonin.

ping-pong mechanism an alternative name for doubledisplacement (enzyme) mechanism.

pinocytic an alternative term for pinocytotic (see pinocytosis). pinocytic vesicle an alternative term for pinocytotic vesicle.

pinocytosis the process whereby cells take in liquid material from their external environment; literally 'cell drinking'. Liquid is enclosed in vesicles, formed by invagination of the plasma membrane. These vesicles then move into the cell and pass their contents to endosomes. Pinocytosis is the type of endocytosis occurring in most types of cells; hence the term is often applied interchangeably with endocytosis to such cells (compare phagocytosis). —pinocytotic or pinocytic adj.

pinocytotic vesicle or pinocytic vesicle a cellular vesicle serving pinocytosis; an alternative term to endocytotic vesicle when containing nonparticulate material.

pinosome an alternative name for endosome (def. 1) (when containing nonparticulate material).

pi orbital or π orbital a bonding molecular orbital formed by the in-phase, sideways-on overlap of parallel p atomic orbitals, one from each of two atoms, to produce a charge-density distribution that is mainly between the atomic nuclei but maximal in two zones, one on either side of and parallel to the internuclear axis. When occupied by two electrons of opposed spins it becomes the second bond in a double covalent bond (two such occupied orbitals, mutually orthogonal, providing the second and third bonds of a triple bond).

PIP or PI 4-P abbr. for phosphatidylinositol 4-phosphate. PIP₂ or PI 4.5-P₂ abbr. for phosphatidylinositol 4.5-bisphosphate.

Pipes or **PIPES** abbr. for 1.4-piperazinediethanesulfonic acid; a Good buffer substance; pK_a (20 °C) = 6.8.

pipette or (US) pipet 1 any device for transferring or delivering (usually measured) volumes of liquid and commonly consisting of a slender, calibrated glass or plastic tube with a finely drawn-out delivery tip and (for larger volumes) a centrally placed bulb. It may be filled by applied suction or by capillarity (according to its bore), and emptied by drainage or by applied pressure. 2 to transfer or deliver a (usually measured) volume of liquid with a pipette (def. 1). —pipettable adj.

pipettor any device for the rapid, repetitive dispensing of a predetermined volume of a liquid.

pipsyl symbol: Ips; p-iodophenylsulfonyl; I-C₆H₄-SO₂; a chemical group with which free amino groups may be derivatized by reaction with pipsyl chloride, p-iodophenylsulfonyl chloride. Compare tosyl.

pipsylate to convert (an amino compound) to a pipsyl derivative. —pipsylation n.

Pirani gauge an electric gauge for low gas pressures that functions over the range 10^{-2} to 10^{-5} mm Hg. It depends on the principle that an electrically heated wire loses heat by conductivity, and thus varies in electric resistance, to an extent empirically dependent on the pressure of the surrounding gas.

piscine of, relating to, or being a fish.

along the axis of a helix corresponding to one complete turn of

PIT a gene encoding the pituitary-specific positive transcription factors, Pit. It activates the genes for somatotropin and prolactin, binding specifically to the consensus sequence 5'-TAAAT-3'. It contains a POU domain and contributes to the naming of the domain. Example Pit-1 from human: database code HMP1_HUMAN, 291 amino acids (32.91 kDa).

Pitocin a proprietary name for (a solution of) oxytocin.

Pitressin a proprietary name for (a solution of) vasopressin.

pituitary 1 pertaining to or produced by the pituitary gland. 2 the pituitary gland.

pituitary function see combined test of pituitary function.

pituitary gland or hypophysis (cerebri) the most important endocrine gland of vertebrates. It is situated below the brain, to which it is attached by a stalk, and measures about 8 mm by 12 mm in an adult human. It consists of two parts: the anterior lobe, or adenohypophysis, and the posterior lobe, or neuro**hypophysis**; both lobes secrete a range of hormones.

Pituitrin a proprietary name for an aqueous extract of bovine neurohypophysis; it contains both oxytocin and vasopressin.

PIVKA abbr. for protein induced by vitamin K absence; examples of such substances are the abnormal proteins produced in vitamin K-deficient animals, corresponding to coagulation factors II, VII, IX, and X (see blood coagulation) in which some glutamate residues have not been carboxylated to γ -carboxyglutamate residues.

pixel one of the very small units that make up the image on a cathode-ray tube. [From 'pix' (i.e. pictures) + el(ement).]

pK symbol for the decadic logarithm of the reciprocal of a (thermodynamic) dissociation constant, K; i.e.

$$pK = \log 1/K = -\log_{10}K.$$

The type of constant may be indicated by a subscript: e.g. pK_a , a dissociation constant of an acid; pK_b , a dissociation constant of a base; pK_2 , a second dissociation constant. For the dissociation of an acid, HA, to its ions, H⁺ and A⁻,

$$K = [H^+][A^-]/[HA].$$

Thus when $[A^-] = [HA]$, i.e. when the acid is half-dissociated, $K = [H^+]$, and hence pK is then equal to pH. Formerly symbolized as p_K. See also group pK, Henderson-Hasselbalch equation, molecular pK, titration pK.

pK symbol for the decadic logarithm of the reciprocal of an apparent (concentration) dissociation constant, K'.

 pK_2 see pK.

pK_a see pK.

pKb see pK.

pK symbol for the decadic logarithm of the reciprocal of the ion product of water, Kw.

PK (in clinical chemistry) abbr. for pyruvate kinase.

PKC abbr. for protein kinase C.

PKU abbr. for phenylketonuria.

PL abbr. for 1 placental lactogen (i.e. choriomammotropin). 2 pyridoxai.

placebo (pl. placebos or placeboes) a tablet, capsule, or liquid medicine devoid of any specific pharmacological activity, but appearing identical to a preparation containing a biologically active substance. Placebos are used in human medicine for their psychological effects, and as controls in experimental therapeutics for elucidating the clinical actions of a drug.

placenta (pl. placentas or placentae) a highly vascularized organ within the uterus of a pregnant animal by which the embryo is attached to the uterine wall and through which the embryo can exchange solutes with the maternal circulation. The placenta also functions as an endocrine gland, secreting inter alia choriogonadotropin, choriomammotropin, and certain steroid hormones. —placental adj.

placental lactogen abbr.: PL; an alternative name for choriomammotropin.

pitch height (of a helix) symbol; p; the linear displacement plakoglobin or desmoplakin III a protein of cell junctions. It is Ban dang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

plakog

isn hortegye

thought to play a central role in the function of desmosomes and intermediate junctions. Example from human: database PLAK HUMAN, 743 amino acids (81.40 kDa).

planar 1 of, or pertaining to, a plane. 2 lying in one plane; flat. planchet or planchette a small, shallow dish used to contain a specimen for determination of its radioactivity with an end-window or windowless counter.

Planck, Max Karl Ernst Ludwig (1858–1947), German physicist; Nobel Laureate in Physics (1918) 'in recognition of the services he rendered to the advancement of Physics by his discovery of energy quanta'.

Planck constant symbol: h; a fundamental constant of proportionality between the frequency, ν , of electromagnetic radiation and the energy, E, of a quantum of the radiation; i.e. $h = E/\nu$. It has a value of 6.626 075 5(40) × 10⁻³⁴ J s.

plane 1 a surface in which a straight line joining any two contained points lies entirely within the surface; a flat surface.
2 an imaginary surface of such a kind within a real structure or lying conceptually in space.
3 lying wholly in one plane; flat or level; planar.

plane of polarization or plane of polarisation (of linearly polarized light or other electromagnetic radiation) the plane containing the electric vectors of the vibrations.

plane of symmetry a plane through a three-dimensional structure, e.g. a crystal or molecule, that divides the object into two parts that are mirror images of each other.

plane-polarized or plane-polarised an alternative term for linearly polarized. See polarized light.

planimeter a mechanical integrating instrument for measuring the area of an irregular plane figure. It consists of a moveable tracing arm, which is made to follow the boundary of the figure, and a dial on which the arm's motion is recorded. — planimetry n.

plankton the collective term for the small or microscopic plants (phytoplankton) and animals (zooplankton), that drift freely in the surface waters of lakes, seas, and oceans.

plant any organism of the kingdom Plantae. Plants are characterized by their ability to effect photosynthesis and the possession of rigid cell walls that contain cellulose.

planteobiose the disaccharide, 6-O-α-D-galactopyranosyl-D-fructose; a unit of the trisaccharide **planteose**.

planteose $O-\alpha$ -D-galactopyranosyl- $(1\rightarrow 6)$ -O-β-D-fructofuranosyl- $(2\rightarrow 1)$ - α -D-glucopyranoside; a trisaccharide isolated from defatted seeds of *Plantago ovata*.

plant hormone an alternative term for phytohormone.

plantibody a human antibody produced by genetically engineered tobacco plants.

plaque 1 any small disk-like object, patch, or zone. 2 a macroscopic or microscopic rounded clear zone in a layer of cells or bacterial lawn that results from the killing or lysis of adjacent cells by the action of a virus or other agent. 3 a (a patch of) fibrous or lipid material on the inner surface of an artery. b an area of tissue degeneration with distinctive histological features characteristic of certain (especially neurological) diseases, e.g. kuru, multiple sclerosis. 4 (a patch of) deposit closely adherent to the surface of a tooth that contains a mixed mixed.

crobial flora and is composed largely of extracellular bacterial polysaccharide.

plaque-lift a technique used in recombinant DNA technology for screening actively expressing clones. Candidate clones for expression of a particular protein are plated out onto a dish. After incubation a nitrocellulose (or other) membrane is pressed against the surface of the plate, thereby adsorbing any protein 'plaques' formed by actively expressing clones. The membrane can then be screened, and the active clones identified.

+plasia or +plasy comb. form indicating development or growth. —+plastic adj.

plasm+ a variant form of plasmo+ (before a vowel).

+plasm comb. form denoting the colloidal material of which living cells are composed. —**+plasmic** adj.

plasma 1 the proteinaceous fluid in which the cells of blood or lymph are suspended; the meaning is sometimes extended to include also the analogous fluid in which the fat droplets of milk are suspended. See also blood plasma. 2 a less common word for protoplasm. 3 (in physics) any region of highly ionized gas (as in a gas-discharge tube, a hot flame, or a thermonuclear reaction) containing approximately equal numbers of electrons and positively charged ions. It differs from ordinary gas in being a good conductor of electricity and being affected by a magnetic field. —plasmatic or plasmic adj.

plasma albumin an alternative name for serum albumin.

plasma cell or plasmacyte or plasmocyte a fully mature antibody-secreting B lymphocyte, found in lymphoid tissue and in connective tissue liable to encounter foreign material. It has an eccentrically placed nucleus, basophilic cytoplasm, and an unusually large amount of rough endoplasmic reticulum.

plasma cholesterol (in medical biochemistry) the concentration of cholesterol in blood plasma. In human blood, cholesterol occurs as a component of all plasma lipoproteins, but especially very-low-density lipoprotein, low-density lipoprotein, and high-density lipoprotein. A correlation exists between the level of plasma cholesterol and the occurrence of atheroma and heart attacks; this concept is associated with the role of low-density lipoprotein, which has the highest concentration of cholesterol and is thought to be the lipoprotein that distributes cholesterol to the tissues. However, the ratio of high-density lipoprotein cholesterol to low-density lipoprotein cholesterol must be taken into account, as high-density lipoprotein is thought to have a protective function in cycling cholesterol from peripheral tissues back to the liver. The circulating level of cholesterol may be altered by disturbances in carbohydrate and endocrine metabolism (e.g. diabetes or thyroid hormone imbalance), diet, and drugs. It is thought that the level of circulating total cholesterol should desirably be maintained below about 5 mmol L⁻¹.

plasma clearance see clearance (def. 2).

plasmacyte an alternative name for plasma cell.

plasmacytoma a tumour of plasma cells; most such tumours secrete myeloma proteins belonging to the same category as monoclonal antibodies

plasma kallikrein see kallikrein.

plasmalemma an alternative term for cell membrane.

plasmalogen any glycerophospholipid in which the glycerol moiety bears an O-(1-alkenyl) group at position 1. The term embraces **plasmenic acid**.

plasmalogen synthase EC 2.3.1.25; an enzyme that catalyses the formation of plasmenylcholine from acyl-CoA and 1-O-alk-1-enyl-sn-glycero-3-phosphocholine with release of CoA.

plasma membrane an alternative term for cell membrane.

plasmanic acid a derivative of *sn*-glycerol 3-phosphate in which the glycerol moiety is etherified with an alkyl (or alkenyl other than 1-alkenyl) group at position 1 and esterified with an acyl group at position 2; i.e. any 2-acyl-1-O-R-sn-glycerol 3-phosphate where R = alkyl or n-alkenyl when n > 1. Compare plasmenic acid.

adherent to the surface of a tooth that contains a mixed mi-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

plasmapheresis

nur search

rived from a **plasmanic acid**. The term is useful for naming phosphoric diesters of plasmanic acid, e.g. plasmanylethanolamine, 2-acyl-1-O-alkyl-sn-glycerol 3-phosphoethanolamine. Compare **plasmenyl**.

plasmapheresis or plasmaphoresis or plasmapharesis or plasmapharesis or plasmapharesis or plasmapharesis a technique for decreasing the protein content of blood plasma circulating in the body by withdrawing blood, separating the cells by centrifugation, and then returning them to the circulation as a suspension in a suitable protein-free medium

plasma protein 1 any of the numerous proteins present in or derived from blood plasma. 2 such proteins collectively. In mammalian plasma the concentration of plasma protein is 60-80 g L⁻¹; of this, $\approx 60\%$ is serum albumin, $\approx 18\%$ is immunoglobulin G, $\approx 9\%$ is β_1 -lipoprotein, and $\approx 4\%$ is fibrinogen.

plasma thromboplastin antecedent an alternative name for factor XI; see blood coagulation.

plasmenic acid a derivative of *sn*-glycerol 3-phosphate in which the glycerol moiety is etherified with a 1-alkenyl group at position 1 and esterified with an acyl group at position 2; i.e. any 2-acyl-1-O-(1-alkenyl)-sn-glycerol 3-phosphate. *Compare* plasmanic acid, plasmalogen. [Contraction of plasmalogenic acid.]

plasmenyl or (formerly) phosphatidal the trivial name for any phosphoric acyl group derived from a plasmenic acid. The term is useful for naming phosphoric diesters of plasmenic acid, e.g. plasmenylethanolamine, 2-acyl-1-O-(1-alkenyl)-sn-glycerol 3-phosphoethanolamine. Compare plasmanyl.

plasmid strictly any extrachromosomal genetic element; however, mitochondrial and chloroplast DNA, yeast killer, and other cases are commonly excluded, hence the term plasmid generally refers to an extrachromosomal covalently continuous double-stranded DNA molecule that occurs in bacteria and (rarely) other microorganisms. Natural plasmids vary from ≈5 kb to over 90 kb in size. They are classified in a number of different ways: the copy number (between 1 and 50) describes the ratio of plasmid/chromosome molecules; the host range describes the variety of species that can act as host (see also incompatibility). Plasmids capable of transfer are said to be conjugal; wide host-range, conjugal plasmids are described as promiscuous. Plasmid genes include drug resistance (resistance plasmids), genes for catabolic enzymes (catabolic plasmids), genes for antibiotic synthesis, and genes for toxin production. Plasmids are popular choices for cloning vectors.

plasmid chimera a hybrid DNA molecule that has been constructed *in vitro* by joining fragments of separate plasmids and that forms a new, biologically functional replicon when inserted into a cell.

plasmid curing the elimination of a plasmid from a cell culture by treatment with **Acridine Orange** at a concentration insufficient to inhibit chromosome replication but sufficient to inhibit plasmid replication.

plasmid engineering genetic engineering when a plasmid is used as a cloning vector.

plasmid incompatibility see incompatibility.

plasmid segregation see segregation (def. 3).

plasmid transconjugant see transconjugant.

plasmid vector see cloning vector.

plasmin or fibrinolysin or fibrinase EC 3.4.21.7; a serine proteinase that converts the insoluble fibrin of a blood clot into soluble products. It is formed from plasminogen by proteolysis, which results in a two-chain protein linked by a single disulfide bond; the heavier A chain is derived from the N-terminal part of plasminogen and the lighter B chain contains the enzymically active site. It exhibits preferential cleavage at Lys-Xaa > Arg-|-Xaa bonds, with a higher selectivity than trypsin. See also blood coagulation.

plasminogen or profibrinolysin a ≈90 kDa, single-polypeptide glycoprotein found in blood plasma. It is the inactive precursor of plasmin, into which it may be converted by hydrolysis one peptide band (Arg⁵⁶⁰-l-Val⁵⁶¹) brought about a get by the Ban dang age một quyển sach duộc tạng bời HUY NGUYÊN. Nếu ban có nhu cầu về sách sinh học, xin liên hệ:

action of plasminogen activator or streptokinase. Example from Mus musculus (precursor): database code PLMN_MOUSE, 812 amino acids (90.35 kDa). 3-D structure for plasminogen Kringle 4 chain a: database code NRL_1PMKA, 78 amino acids (8.90 kDa); chain b: database code NRL_1PMKB, 78 amino acids (8.90 kDa). See also blood coagulation.

plasminogen activator any serine proteinase that converts plasminogen into plasmin. Numerous variants occur in different tissues; they may be classified immunologically into urokinase-type and tissue-type plasminogen activators (abbr.: UPA and TPA respectively). Example 1, urokinase-type (EC 3.4.21.73); this catalyses specific cleavage of the Arg⁵⁶⁰-|-Val⁵⁶¹ bond in plasminogen to form plasmin. It is found in urine, and is used clinically for therapy of thrombotic disorders. Example from human: database code UROK_HUMAN, 431 amino acids (48.47 kDa). Example 2, tissue-type (EC 3.4.21.68); this catalyses specific cleavage of the Arg⁵⁶⁰-|-Val⁵⁶¹ bond in plasminogen to form plasmin. Cleavage after Arg310 by plasmin or trypsin results in a two-chain form of the molecule; the two halves are held together by one or more disulfide bonds. TPA is active in tissue remodelling and destruction, and particularly also in fibrinolysis, and in cell migration. Example from human: database code UROT_ HUMAN, 562 amino acids (62.85 kDa). Example 3, found in certain pathogens, is the activator EC 3.4.21.-, also known as coagulase/fibrinolysin precursor; it is a homopentamer occurring in the outer membrane. Example from Yersinia pestis, the plague bacterium, in which it is involved in transmission by the insect vector (flea): database code COLY_YERPE, 312 amino acids (34.57 kDa). See also urokinase.

plasmo+ or (before a vowel) **plasm+** comb. form denoting of, pertaining to, related to, or derived from plasma.

plasmocyte an alternative name for plasma cell.

plasmodesma (pl. plasmodesmata or plasmodesmas) a fine cytoplasmic channel, found in all higher plants, that connects the cytoplasm of one cell to that of an adjacent cell. It is a roughly cylindrical, membrane-lined channel of diameter 20-40 nm, through the centre of which runs a narrower cylindrical **desmotubule**; the latter appears to be continuous with elements of the endoplasmic reticulum membrane of each of the connected cells. The function of plasmodesmata appears to be similar to that of **gap junctions** between animal cells. They permit passage of molecules of M_r less than about 800.

plasmodium (pl. plasmodia) 1 any member of the protozoan genus Plasmodium. Certain species parasitize humans causing malaria, while others parasitize other mammals. Their life cycle is complex, requiring, at different stages, an insect host and a mammalian host. 2 the motile multinucleate mass of protoplasm formed by the true slime moulds (Myxomycetes).

plasmolysis temporary shrinkage of the protoplasm of a plant or bacterial cell away from the cell wall, caused by the withdrawal of water from the cell. —**plasmolyse** vb.

plasmon the sum total of the extrachromosomal hereditary determinants in a cell.

plasmoptysis the localized extrusion of cytoplasm through the cell wall of a bacterium.

plasmosome an alternative name for nucleolus.

+plast comb. form denoting an organized subcellular particle from a living organism.

plastein a gel that may be formed on treating a partial hydrolysate of a protein with an endopeptidase. It was once thought to be a demonstration of the synthetic capability of proteinases.

plastic 1 any of a large and diverse group of polymeric materials, either synthetic or semisynthetic, that may be obtained following moulding, extrusion, etc. at a stage in their manufacture when soft or liquid. 2 made of or containing plastic; of the nature of plastic. 3 (of a material) capable of being formed or moulded. 4 (in biology) of or pertaining to an ability to adapt to the environment; able to change, develop, or grow.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

+plastic see +plasia.

plasticizer or plasticiser any substance added to another to render the latter less brittle and/or more mouldable and flex-

plastid any member of a family of organelles found in the cytoplasm of eukaryotic plants, all of which contain DNA, are bounded by a double membrane, and develop from a common type, the proplastid. Plastids also contain pigments and/or storage materials. They include aleuroplasts, amyloplasts, chloroplasts, chromoplasts, elaioplasts, and etioplasts.

plastidome the total complement of plastids of a cell.

plastocyanin a soluble protein of eukaryotic plants that contains one atom of copper per molecule and is blue in its oxidized form. It occurs in the chloroplast at a molar concentration equal to that of P700, where it functions as a one-electron carrier (E'_{o} = +0.43 V) between the cytochrome b_{6} -f and P700 of photosystem I. It is loosely bound to the inner thylakoid membrane surface. Example from pea: database code PLAS_PEA, 168 amino acids (17.14 kDa).

plastogene any of the hereditary determinants of plastids.

plastoglobuli droplets, 50-220 nm in diameter and without a bounding membrane, that occur close to thylakoid membranes in chloroplasts. Rich in lipids, particularly plastoquinone, they are particularly numerous when thylakoids are disrupting, and appear to be liberated therefrom.

plastome or plastom the total complement of the plastogenes of a cell.

plastoquinol abbr.: PQH₂; any hydroquinone derived from the corresponding plastoquinone by a two-electron reduction.

plastoquinone abbr.: PQ; any 2,3-dimethyl-5-multiprenylbenzoquinone; plastoquinones occur mainly in plants; the number of intact prenyl units in the side chain (commonly nine in the plastoquinone of higher plants) may be designated by a suffixed numeral, e.g. plastoquinone-9 (abbr.: PQ-9). The plastoquinone-plastoquinol redox system $(E'_{o} \approx +0.1 \text{ V})$ functions in the electron-transport system, transferring electrons from photosystem II to the cytochrome b_6 -f complex.

plate 1 (in biology) a Petri dish or other shallow vessel containing so-called solid or semisolid culture medium; a culture grown on this. 2 (in chemistry) any one of the horizontal perforated plates that comprise the fractionating component of a plate column for fractional distillation, or the theoretical equivalent of such a plate. See also theoretical plate. 3 (in biology) or plate out to inoculate a plate (def. 1) with microbial or other cells, or with material (suspected of) containing such cells. 4 to coat (a metal or other substrate) with a thin layer of (other) metal.

plateau (pl. plateaux or plateaus) 1 a part of a graph in which the value of the ordinate shows little or no change with increasing value of the abscissa. 2 a period of (relative) stability in the course of a progression. 3 to reach or pass through a

plate column see plate (def. 2).

plate height see height equivalent to a theoretical plate.

platelet or thrombocyte the smallest of the blood cells. It is an anucleate biconvex disk, 2-3 µm in diameter, formed by division of the cytoplasm of a megakaryocyte and having an exterior coat rich in glycoprotein, a normal cell membrane, and a well-developed system of microtubules some of which are arranged as an equatorial ring. The main functions of platelets are in hemostasis, by (1) adhering to damaged blood vessels and aggregating to form a plug; (2) releasing various vasoconstrictive agonists, e.g. epinephrine, serotonin, and thromboxane A₂; (3) activating or binding certain coagulation factors; and (4) releasing factor XIII, platelet-derived growth factor, and platelet factor IV; blood clotting then occurs around the aggregated platelets. See blood coagulation.

platelet-activating factor abbr.: PAF or PAF-acether; 1-Oalkyl-2-acetyl-sn-glycerol 3-phosphocholine, where 'alkyl' may be hexadecyl or octadecyl; a potent general inflammatory M. It is released from a variety of cells in response to a number of stimuli, e.g. by IgE-mediated release from basophils and by the interaction of tissue-bound IgG, complement, and neutrophils. It is so named because of its high activity in causing aggregation of platelets; other effects of PAF include activation of polymorphonuclear leukocytes, monocytes, and macrophages, mediation of increased vascular permeation, hypotension, decreased cardiac output, and stimulation of uterine contraction. It is synthesized in the cell in either of two ways: (1) from 1-O-alkyl-sn-glycerol-3-phosphate by addition of an acetyl group and release of phosphate, forming 1-alkyl-2-acetyl-sn-glycerol, which then reacts with CDPcholine to form PAF and CMP; or (2) by an alternative remodelling pathway, in which the 2-fatty acyl group is removed from a phosphatidylcholine by phospholipase A₂ and replaced with acetyl. A number of analogues act as PAF agonists, e.g. the stable analogues in which the 2-acetyl group is replaced by an ethyl, methyl, or benzyl ether group; replacement of the choline moiety by (N-methylpyrrolidino)-ethanolamine greatly increases its effect. PAF antagonists include gossypol, hexanolamino-PAF, bis(methylthio)gliotoxin, and bis(3,4,5-trimethoxyphenyl)-1,3-dioxolane.

platelet basic protein precursor abbr.: PBP; the precursor of several peptides generated by alternative processing. Example from human: database code PF4L HUMAN, 128 amino acids (13.88 kDa); this contains a signal (residues 1-34), platelet basic protein (35-128), LA-PF4 (44-128), B-thromboglobulin (48-128), and NAP-2 (59-128).

platelet-derived endothelial cell growth factor abbr.: PD-ECGF; a cytokine produced by platelets, fibroblasts, and smooth muscle cells. It is a monomer of 471 amino acids. A related protein, gliostatin, which also exists as a dimer, is produced by astrocytes. Both proteins stimulate growth of endothelial cells in vitro and angiogenesis in vivo, and promote survival and differentiation of CNS neurons; they inhibit the growth of astrocytes and glial cells. These proteins may be identical with thymidine phosphorylase.

platelet-derived growth factor abbr.: PDGF; a cytokine, of ≈30 kDa, composed of two disulfide-bonded polypeptide chains denoted A and B, which are nonidentical but homologous. It is believed that human PDGF is an AB heterodimer but pig PDGF is a homodimer of B chains. PDGF is a potent mitogen for cells of mesenchymal origin (endothelial cells, epithelial cells, some fibroblasts, smooth muscle cells) and for glial cells; it has chemotactic properties. It is released by platelets on wounding and stimulates nearby cells to grow and repair the wound; it is also produced by endothelial cells, fibroblasts, monocytes, macrophages, smooth muscle cells, and neurons. PDGF-like proteins are produced by numerous human tumour cell lines and the B chain is almost identical to part of the transforming protein produced by simian sarcoma virus (see sis). Homodimers of A and B chains (both can bind to the receptor) are implicated in transformation processes. Examples from human (precursors); A chain (two forms, derived by alternative splicing; data refer to long form): database code PDGA_HUMAN, 211 amino acids (24.01 kDa); B chain: database code PDGB_HUMAN, 241 amino acids (27.25 kDa). See also platelet-derived growth factor receptor.

platelet-derived growth factor receptor or PDGF receptor a tyrosine kinase dimer, of $\alpha\alpha$, $\beta\beta$, or $\alpha\beta$ subunits, belonging to the immunoglobulin superfamily. It is a transmembrane cell surface receptor; the binding of platelet-derived growth factor (PDGF) stimulates tyrosine-kinase activity, which leads to phosphorylation of tyrosine residues in the receptor and in some cytoplasmic proteins. It belongs to a class of receptor tyrosine kinases, subclass III, that have a non-kinase insert in the cytoplasmic kinase region. Example from human (precursor); α subunit: database code PGDS_HUMAN, 1089 amino acids (122.53 kDa); \(\beta \) subunit: database code PGDR_ mediator, active at concentrations in the range 10⁻¹² to 10⁻⁹ HUMAN, 1106 amino acids (123.83 kDa).

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

platelet endothelial cell adhesion molecule see PECAM. platelet factor IV a 70-residue polypeptide secreted by platelets when they adhere at a site of injury. It is a chemokine that binds heparin strongly and is a powerful attractant for neutrophils and monocytes. Example from Bos taurus: database code PLF4_BOVIN, 88 amino acids (9.52 kDa).

plating see plate (def. 3, 4).

platysome (sometimes) the core particle of a nucleosome.

PLC abbr. for 1 preparative-layer chromatography. 2 phospholipase C; see phospholipase.

pleated sheet see beta-pleated sheet.

pleckstrin other name: platelet p47 protein; a platelet protein that is the major substrate for Ser/Thr phosphorylation by protein kinase C. Its function is not known. Example from human: database code P47_HUMAN, 350 amino acids (40.08) kDa). See also pleckstrin homology domain.

pleckstrin homology domain abbr.: PH domain; a domain first noted in the platelet protein pleckstrin, consisting of about 100 residues. Its function is unknown, but it has since been found in many (more than 60) proteins, especially those associated with intracellular signal transduction downstream of cell-surface receptors. It binds inositol-1,4,5-triphosphate. The 3-D solution structure of the domain from dynamin is known.

plectonemic coiling a type of coiling of a double-stranded helix in which the two strands are intertwined, i.e. they may not be separated without uncoiling.

pleiotropin or pleiotrophin other name: heparin-binding growth factor 8; a heparin-binding mitogenic protein with neurite extension activity for osteoblasts and brain cells. Example (precursor) from human: database code PTN_ HUMAN, 168 amino acids (18.92 kDa).

pleiotropism or pleiotropy the phenomenon in which a single gene is responsible for producing multiple, distinct, apparently unrelated phenotypic effects; an instance of such a phenomenon. The meaning is sometimes extended to include multiple, distinct, unrelated actions or effects of a single polypeptide agonist. - pleiotropic adj.

pleiotypic relating to the process by which a single stimulus to a living cell elicits multiple, unrelated responses.

pleomorphism or pleomorphy the quality of occurring in, or exhibiting more than one distinct form. Compare polymorphism. -pleomorphic adj.

pleuropneumonia-like organism abbr.: PPLO; an obsolete name for mycoplasma or mollicute.

Plexiglas or Plexiglass a proprietary name for poly(methyl

PLI abbr. for pulsed laser interferometry.

+ploid adj. and n. comb. form indicating the specific multiple of homologous sets of chromosomes in cell. --+ ploidy n.

ploidy the number of homologous sets of chromosomes in a cell, or in each cell of an organism.

plot 1 a diagram showing the relationship between two or more variables. 2 to construct such a plot.

plotter an instrument for automatically making a plot (def. 1). PLP abbr. for 1 pyridoxal phosphate. 2 proteolipid protein; see myelin proteins.

plug flow a type of flow of fluids in which there is no mixing in the direction of flow.

plumper a disposable, nonscratching plastic device for adding a small volume (5-50 µL) of a reagent to, and mixing it with, a liquid in a small container such as a spectrophotometer cuvette.

pluripoietin granulocyte colony stimulating factor (G-CSF) precursor. Pluripoietin a is a second human hemopoietic colony stimulating factor produced by the human bladder carcinoma cell line 5637. See colony stimulating factor.

pluripotent 1 (of a biomolecule) capable of being converted (biologically) into more than one active product. 2 (of a cell) capable of differentiating into more than one alternative type of matur Beell dang đọc một quyển sách được tặng bởi HUY NG THÝN THE THE GA FIQUE SING NG THU PRINCE SING Học SING NG LIÊN HỘC. XIN liên hê:

plus and minus screening a technique for isolating genes for gene products that are present in one type of cell and absent in another. It involves comparing the results of colony hybridization of a cDNA clone library from the first cell type with cDNAs derived from the mRNAs of both cell types and then picking off the desired colonies from the reference plate.

plus end the end of a microtubule or actin filament at which addition of monomers occurs most readily; the 'fast-growing' end of a microtubule or actin filament. The plus end of an actin filament is also known as the barbed end.

plus strand 1 the parental polynucleotide strand in bacteriophages whose genomes consist of duplex RNA. It is the template used for the production of the complementary minus strand. 2 virus-specified messenger RNA, or any given strand of nucleic acid (RNA or DNA) whose base sequence is equivalent to that of virus-specified mRNA. Any strand having a base sequence complementary to virus-specified mRNA is described as a minus strand, 3 (sometimes) an alternative term for coding strand (of genomic duplex DNA). Compare minus strand.

pM or pM symbol for picomolar.

Pm symbol for promethium.

PMA abbr. for phorbol 12-myristate 13-acetate; see phorbol

PMF abbr. for protonmotive force, or sometimes (facetiously), after its discoverer, Peter Mitchell force.

PMN abbr. for 1 pyridine mononucleotide. 2 polymorphonuclear (leukocyte).

pmol symbol for picomole.

PMR or pmr abbr. for proton magnetic resonance; see nuclear magnetic resonance spectroscopy.

PMS abbr. for 1 phenazine methosulfate. 2 pregnant mares'

PMSF abbr. for phenylmethylsulfonyl fluoride.

PMSG abbr. for pregnant mares' serum gonadotropin.

PN-1 see nexin 1.

PNA abbr. for pentose nucleic acid (i.e. ribonucleic acid).

PNAD abbr. for protein NH₂-terminal arginine deamidase; an enzyme, discovered in the pig, that catalyses deamidation of N-terminal arginine residues in peptides.

pneumo+ or pneumono+ or (before a vowel) pneum+ or pneumon+ comb. form of or pertaining to a lung or lungs; respiratory.

pneumococcus (pl. pneumococci) any strain of bacterium belonging to the species Streptococcus pneumoniae. —pneumococcal adi.

pneumococcus capsule swelling reaction an alternative name for Quellung reaction.

p[NH]ppA symbol for adenosine 5'- $[\beta, \gamma$ -imido]triphosphate (alternative to AdoPP[NH]P).

PNK abbr. for polynucleotide kinase.

PNMT abbr. for phenylethanolamine N-methyltransferase.

PNP abbr. for 1 para-nitrophenol. 2 purine-nucleoside phos-

Po symbol for polonium.

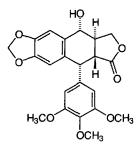

pocket (in molecular biology) a cavity or hollow in a three-dimensional structure, e.g. a substrate pocket of an en-

podocalyxin a sialated glycoprotein of the kidney glomerulus. It is the major sialoprotein of the podocyte foot process glycocalyx. It is prominently expressed on renal glomerular epithelial cells and found in patients with glomerulonephritis.

podophyllotoxin a lignan found in the May apple, or American mandrake (Podophyllum peltatum). It is known in folk medicine as a cathartic and poison, and is useful in topical treatment of warts, including venereal warts; it may have antiviral action. In mammalian cells it inhibits assembly of tubulin into microtubules, and also nucleoside transport. It is used in

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

+poiesis

podophyllotoxin

+poiesis noun comb. form indicating an act or process of making (something specified), e.g. erythropoiesis, hemopoiesis. +poietic adj.

poikilo+ comb. form indicating various, variable.

poikilocyte an erythrocyte that is distorted in shape and usually larger than normal, found in the blood of persons with pernicious anemia and some other anemias.

poikilosmotic describing an organism whose internal osmotic pressure varies with that of its environment. Compare homoios-

poikilothermic or poikilothermal describing an organism whose body temperature varies with that of the environment. Compare homoiothermic. —poikilotherm n.

point 1 (in mathematics) a any dimensionless geometric element whose position in space is defined by its coordinates. b a location or position, especially on a diagram, graph, etc. 2 a decimal point. 3 a point of inflection.

point group 1 a notation used in describing the geometrical arrangement of the symmetry of globular oligomeric proteins. Such molecules may belong to any of the three point groups having cyclic symmetry, dihedral symmetry, or cubic symmetry. 2 (in crystallography) a group of symmetry operations that leave unmoved at least one point within the object to which they apply. It can describe single molecules or actual crystals.

point ligand any of two or more individual atoms or groups linked covalently to a specified carbon atom in an organic compound. Point ligands may be identical or nonidentical, but they may not occupy the same position in space.

point mutation any mutation (def. 1) involving a single base change. See also transition, transversion.

point of inflection any point on a graph where the direction of curvature changes.

poise symbol: P; the cgs unit of dynamic viscosity; it has the dimensions of $g s^{-1} cm^{-1}$; $1 P = 0.1 N s m^{-2}$. [After Jean-Louis Marie Poiseuille (1799-1869), French physician and physicist.]

Poiseuille's equation an equation describing the behaviour of a liquid flowing under pressure through a capillary tube of length l and radius r. The volume flowing per second, dV/dt, is given by:

$dV/dt = \pi P r^4 / 8\eta l,$

where η is the viscosity of the liquid and P is the pressure difference of the liquid along the tube over a distance l. [After Jean-Louis Marie Poiseuille (see poise).]

poison 1 (in toxicology) any substance that, in relatively small amounts, can impair the functioning of, or cause structural damage to a cell or organism. 2 (in chemistry) any substance that, at relatively low concentrations, inhibits a chemical reaction or inactivates a catalyst. 3 to add or administer poison to (a cell, organism, catalyst, etc.).

pokeweed mitogen abbr.: PWM; a plant lectin (phytoagglutinin) extractable from the roots of pokeweed, Phytolacca americana, a North American plant. It is one of the lectins most commonly used in immunology and cell biology. It has an affinity for N-acetyl-1-15-5 glucosamine oligomers bard ngy NOVYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

polarizai

glutinates leukocytes and erythrocytes (of all ABO blood groups). It also has mitogenic properties, which appear to reside in five (or more) separable components; one of these activates both T and B lymphocytes, and the others are specific for T lymphocytes.

poky mutant a mutant strain of Neurospora with a lower rate of growth than that of wild-type strains, due to absence or deficiency of certain components of the respiratory chain. The poky gene appears to occur in mitochondrial DNA and is transmitted to sexually derived progeny only when the female parent exhibits the poky phenotype.

pol 1 a retroviral gene that encodes a polyprotein containing retropepsin, reverse transcriptase, and ribonuclease H (see ribonuclease). 2 as polA, polB, polC, genes that encode DNA polymerases I to III.

Pol the gene product of polA.

polA the structural gene in Escherichia coli for DNA polymerase I (Pol or Pol I; see DNA polymerase), which serves in vivo as a repair polymerase and as an exonuclease in the generation of Okazaki fragments. The enzyme belongs to family A of DNA polymerases and has three characteristic domains: 5'-exonuclease (amino acids 1-323), 3'-exonuclease (amino acids 324-517), and polymerase (amino acids 521-928). Klenow polymerase (amino acids 324-928) contains the latter two domains. See Klenow enzyme.

polar 1 pertaining to, or possessing, a pole or poles. 2 (in chemistry) (of a group or a molecular entity) having an uneven distribution of electrons and hence a permanent dipole moment. See also polarity.

polar body (in biology) either of the two small cells that form as a result of the division of a primary oocyte during its development to a mature ovum. One is formed in the first division of meiosis and the other in the second division of meiosis. At each division, the cytoplasm divides unequally, the polar body being of much smaller size than the developing oocyte. At the second division in which a polar body is formed, the polar body and the developing oocyte each contains a haploid set of chromosomes. The polar bodies eventually degenerate.

polar bond 1 a covalent bond in which the electron pair(s) of the bond are held with greater force by one of the two bonded atoms leading to the existence of a permanent dipole moment in the group or molecular entity in question. 2 an ionizable bond between two oppositely charged ions of a salt.

polar coordinate (in mathematics) either of two numbers that locate a point in a plane, one being the distance along a line to the point from the origin and the other being the angle this line makes with a fixed line passing through the origin.

polar group see polar (def. 2).

polarimeter 1 an instrument for measuring the degree of polarization of light. 2 an instrument for measuring the rotation of the plane of vibration of linearly polarized light as a result of passing through a given length of optically active material. –polarimetric adj.; polarimetry n.

polarity 1 the state, or condition, of having poles. 2 having a differential distribution of a property or properties along an axis; see polar. 3 having opposing physical properties at different points, e.g. north and south magnetic poles, positive and negative electric charges, hydrophobic and hydrophilic regions. 4 the state of being electrically either positive or negative. 5 (of a solvent) ionizing power. 6 (of an organism) the tendency to develop differentially along an axis; e.g. plants exhibit polarity in developing roots downwards and stems up-

polarity gradient (in genetics) the quantitative effect of a polar mutation in one gene on the expression of later genes in the operon.

polarity mutant a mutant gene formed by a polar mutation. polarizability or polarisability the quality of being able to be

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

polarization or polarisation 1 inducing polarity. 2 the quality of being or becoming polarized.

polarization microscope or polarisation microscope an alternative name for polarizing microscope.

polarize or polarise 1 to acquire or cause to acquire polarity. 2 to cause the polarization of light or other electromagnetic radiation; see polarized light. 3 to cause the electrical resistance of an electric cell to increase through the accumulation of electrolysis products at an electrode.

polarized light or polarised light light (or other electromagnetic radiation) in which the angular orientations of the electric vectors of its transverse vibrations are nonrandom. In linearly (or plane-) polarized light the electric vectors all lie in a given plane containing the light beam; to an observer looking along the light beam the vectors appear as a straight line through the axis of propagation. In circularly polarized light the angular orientations of the electric vectors are such that a given point on the vectors generates a (left-handed or righthanded) helix whose axis is the direction of the beam; to an observer looking along the light beam this point appears to describe the circumference of a circle, the light being defined as right or left circularly polarized depending on whether the point appears to the observer looking towards the source to be rotating clockwise or anticlockwise, respectively. Circularly polarized light may be considered to consist of two superimposed linearly polarized waves of equal amplitude but differing in phase by an odd number of quarter-wavelengths and having their electric vectors mutually at right angles; conversely, if right and left circularly polarized waves of equal amplitude are superimposed the resultant is a linearly polarized wave. In elliptically polarized light the angular orientations of the electric vectors are such that a given point on the vectors generates a (left-handed or right-handed) flattened helix whose axis is the direction of the beam; to an observer looking along the light beam this point appears to describe the perimeter of an ellipse, the degree of such polarization being characterized by the ellipticity and by the angular orientation of the major axis of the ellipse. Elliptically polarized light may be considered to result from the superimposition of two linearly polarized waves of equal amplitude and having their electric vectors mutually at right angles but where the phase difference is neither zero nor exactly an even or odd number of quarter-wavelengths; alternatively, it may be considered to result from the superimposition of right and left circularly polarized waves of differing amplitude.

polarizer or polariser an optical device for producing linearly polarized light, e.g. a Nicol prism or a sheet of Polaroid (def. 1). polarizing microscope or polarization microscope a microscope that is useful for examining the birefringence properties of small objects, or for visualizing objects by virtue of their birefringence properties. Also: polarising microscope, polar-

polar microtubule see mitotic spindle, prometaphase.

isation microscope.

polar molecule a molecule in which there is a polarized distribution of positive and negative charges due to an uneven distribution of electrons. Polar molecules are likely to be soluble in water.

polar mutation a mutation in one gene that reduces the expression of genes further from the promoter in the same operon.

polarogram the current-voltage diagram obtained by polarography.

polarograph 1 an instrument used for polarography. 2 to subject (a sample) to analysis by polarography.

polarography a method for quantitative or qualitative determination of small concentrations of reducible or oxidizable substances based on the nature of the current-voltage curve obtained when a test solution is subjected to electrolysis with a steadily increasing voltage between, e.g., a dropping mercury cathode and a pool of mercury serving as anode. The cursigmoidal; the potential at the midpoint (called the half-wave potential) is characteristic of the substance being oxidized or reduced and the limiting current is related to its concentration. - polarographic adj.

Polaroid a proprietary name for 1 a thin, transparent material that linearly polarizes light transmitted by it (see polarized **light**). It consists of oriented, doubly refracting microcrystals of herapathite (quinine iodosulfate) in a matrix of cellulose acetate. 2 a photographic process or camera producing a nearly instantaneous, permanent photograph.

polar solvent any solvent of relatively high ionizing power.

polar zipper a motif in proteins that is considered to promote binding between protein subunits or between proteins as a result of interactions between polar residues, which are aligned in the form of a 'zip fastener'. The polar groups may consist of repeats of glutamines, Asp-Arg or Glu-Arg repeats, or repeats of glutamates and either lysines or histidines. The concept derives from the previously coined term leucine zipper.

pole 1 either end of an axis of rotation of a sphere or spheroid body, especially of the Earth. 2 (in biology) a either of the differentiated zones at opposite ends of an axis in a cell, organ, or organism. b (in mitosis or meiosis) either of the opposite ends of the spindle. 3 (in physics) a any of the zones in a magnetized body, commonly two in number and near its extremities, where the lines of magnetic flux appear to originate (north pole) or end (south pole). b either of the (positively or negatively charged) terminals of an electric battery, or of the corresponding terminals of a d.c. electric generator; either of two points, positions, or regions carrying opposite electric charges in a piece of material, system, or (polar or polarized) molecular entity. Compare dipole. See also polar.

policeman a device used for detaching adherent particles of precipitate, cells, etc. from the wall of a vessel and consisting commonly of a glass stirring-rod with a short piece of rubber tubing fitting tightly over one end, but sometimes of a small snipe feather cemented into the end of a capillary tube.

poly+ comb. form 1 denoting more than one; many or much; more than the usual number or amount; often used interchangeably with multi+. 2 indicating heterogeneity of a physical attribute e.g. polychromatic, polydisperse. Compare mono+ (def. 2). 3 (in chemistry and biochemistry) a denoting more than one of a specified component or substituent, e.g. polyamine, polyene, polyester; in names of large molecules, usually denoting more than 10-20 of the component specified, especially in contrast to oligo+ (def. 2), e.g. polynucleotide, polypeptide, polysaccharide. Compare mono+ (def. 3). b denoting polymer of a specified substance, e.g. polyglycine, polystyrene. c indicating more than one function of the kind specified, e.g. polyacidic, polybasic, polydentate, polyhydric. Compare mono+ (def. 5).

poly(A) abbr. for polyadenylate.

polyacidic (of a base (def. 1)) able to accept more than one proton per molecule in solution.

polyacrylamide (gel) a common name for any hydrogel containing a three-dimensional matrix of randomly cross-linked polymers of acrylamide (2-propenamide; $CH_2=CH-CO-NH_2$). The cross-linking agent commonly used is N,N'-methylene $(CH_2=CH-CO-NH)_2CH_2$, polymerization being initiated by various alternative methods for generating free radicals. The pore size and rigidity of the gel depend on the concentration of acrylamide and the proportion of crosslinking agent used.

polyacrylamide gel electrophoresis abbr.: PAGE; a technique of zone electrophoresis that uses polyacrylamide gel as supporting medium. It is especially useful for the separation of biopolymers and fragments thereof. A two-dimensional electrophoresis has been used to resolve as many as 1000 proteins: in the first step the polypeptides are separated by isoelectric focusing electrophoresis and in the second step by SDS (polyacrylamide) gel electrophoresis. The 2-D process was devised by rent-volt**ber**n ehing obtained (falled sa **orlange exhi**g wa volty NGUYER. Retella after nihoua it vector namedoc, xin liên hê:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

polyacrylamide gradient gel electrophoresis an alternative name for gradient gel electrophoresis.

polyadenylate 1 abbr.: poly(A); any homopolymer of adenylate (i.e. adenosine 5'-monophosphate). Most eukaryotic mRNAs are terminated at the 3' end by a tract of poly(A) 40-200 residues long (see poly(A) tail). 2 to add a stretch of polyadenylate to a molecule. —polyadenylation n.

poly(ADP-ribosyl) a structure found attached to histones H1 and H2B, to other eukaryotic chromosomal proteins, and to some mitochondrial proteins. It consists of a polymer of 20-50 ADP-D-ribosyl units linked by glycosidic bonds; linkage is formed by transfer of the ADP-ribosyl unit of NAD+, linking its ribosyl C-1 position to the C-2' position of the ribosyl of the terminal ADP-ribose of the growing chain. The attachment to protein appears, at least in some instances, to be through an ester linkage between the terminal ribose group and certain free carboxyl groups in the protein. See also ADPribosylation; NAD(P)+-arginine ADP-ribosyltransferase.

poly(ADP)-ribosyl transferase EC 2.4.2.30; recommended name: NAD+ ADP-ribosyltransferase; systematic name: NAD+:poly(adenine-diphosphate-D-ribosyl)-acceptor ADP-Dribosyl-transferase; other names: poly(ADP) polymerase; poly(adenosine diphosphate ribose) polymerase; ADP-ribosyltransferase (polymerizing); poly(ADP-ribose) synthetase. An enzyme responsible for ADP-ribosylation of acceptors; it catalyses a reaction between NAD+ and (ADP-D-ribosyl),-acceptor to form nicotinamide and $(ADP-D-ribosyl)_{n+1}$ -acceptor. It often has zinc as cofactor (as in example); the acceptor is a histone or the enzyme itself. The modification is dependent on DNA and is involved in the regulation of cellular processes such as differentiation, proliferation, and tumour transformation and also in the regulation of the molecular events involved in the recovery of a cell from DNA damage. Example from human: database code PPOL_HUMAN, 1013 amino acids (112.82 kDa). See also NAD(P)+-arginine ADP-ribosyltransferase. Compare ADP-ribosylation.

polyamide any polymer in which the constitutional units are joined by amide or thioamide links. Compare nylon, polypep-

polyamine any organic compound containing two or more amino groups. Putrescine, spermine, and spermidine are important animal polyamines. Polyamines are synthesized by various routes. In animals, putrescine is the decarboxylation product of ornithine. Decarboxylated S-adenosylmethionine (see S-adenosylmethionine decarboxylase) is a substrate in a reaction in which propylamine is transferred to putrescine to form spermidine, and again to spermidine to form spermine. See also ornithine decarboxylase.

poly(amino acid) any homopolymer, or mixture of homopolymers, of a particular (specified) amino acid.

polyampholyte any amphoteric polyelectrolyte.

polyanion any macromolecular ion that carries multiple negative charges.

poly(A) polymerase abbr.: PAP; the recommended name for polynucleotide adenylyltransferase.

poly(A) tail a sequence of adenylyl residues at the 3' end of eukaryotic mRNA. Almost all mature eukaryotic mRNAs have 3'-poly(A) tails of 40-200 nucleotides, those of histones being a notable exception. The poly(A) tail is added enzymically to the primary transcript, which is first cleaved 10-30 nucleotides past a highly conserved AAUAAA sequence. The poly(A) tail is then generated from ATP through the action of polynucleotide adenylyltransferase. In practical terms the poly(A) tail on mRNA has facilitated its ready isolation from total cellular RNA by affinity chromatography on oligo(dT)-cellulose.

polyatomic (of a molecular entity) composed of two or more

polybasic (of an acid (def. 1)) able to give up more than one proton per molecule in solution.

poly(C) abbr. for polycytidylate.

linked by carbonate ester groups, usually formed by the polymerization of diphenylols with phosgene (i.e. carbonyl chloride). Such polymers are tough thermoplastic resins.

polycation any macromolecular ion that carries multiple positive charges.

polychromatic 1 relating to, or possessing, various or varying colours; consisting of, relating to, or emitting light (or other electromagnetic radiation) of two or more frequencies or wavelengths. 2 of, relating to, or showing polychromatophilia.

polychromatophilia the quality of being stainable by more than one type of dye, especially by both acid and basic dyes.

polycistronic messenger RNA or multicistronic messenger RNA or polygenic messenger RNA any messenger RNA molecule that carries more than one initiation site and encodes the synthesis of two or more (usually related) gene products. It is formed by transcription of a single operon and is characteristic of prokaryotes.

polyclonal of, pertaining to, being formed by, or derived from two or more clones (def. 1).

polyclonal antibody an antibody that arises from the immune response to an immunogen. Each epitope on the immunogen has the potential for causing the formation of a clone of B lymphocytes each capable of synthesizing an antibody specific to the particular epitope.

polycyclic having more than one ring of atoms in the molecule; used especially of molecules with condensed ring sys-

polydentate an alternative term for multidentate.

polydeoxynucleotide or polydeoxyribonucleotide any polynucleatide composed solely of deoxynucleatide residues.

polydisperse describing a colloidal system whose disperse phase consists of particles of many different sizes. -polydispersity n.

polyelectrolyte any macromolecular substance that, on dissolution in water or another ionizing solvent, dissociates to give polyanions or polycations together with an equivalent of oppositely charged ions, which may be simple ions or themselves polyions.

polyene any unsaturated organic compound containing two or more carbon-carbon double bonds.

polyene antibiotic any member of a group of structurally related antibiotics produced by Streptomyces spp. They possess a large lactone ring containing 4-7 conjugated double bonds (generally all-trans) and substituted by aliphatic groups, by a residue of mycosamine or another amino sugar, and by numerous hydroxyl groups. The polyene antibiotics include amphotericin B and nystatin; they interact with sterols in cell membranes and hence have antifungal but not antibacterial activity and tend to be toxic to mammals. Compare macrolide.

polyenoic acid any alkenyl carboxylic acid containing two or more double bonds per molecule.

polyester any synthetic polymer in which the constitutional units are joined by ester bonds; proprietary materials include Dacron and Mylar. Polyesters are extensively used in textiles, ropes, etc.

polyethylene an alternative name (esp. US) for polythene. See also polyethylene glycol.

polyethylene glycol abbr.: PEG; any polymer of general formula $H(OCH_2CH_2)_nOH$, where $n \ge 4$; a suffixed number may be used as a guide to the average relative molecular mass, e.g. polyethylene glycol 4000. Polyethylene glycols are clear viscous liquids or white solids, useful as embedding media for microscopy, as bases for ointments, and in radioimmunoassays.

poly(ethyleneimine) a water-soluble synthetic linear polymer of ethyleneimine (i.e. aziridine) of 30-40 kDa. It is useful for the selective precipitation of proteins and nucleic acids. It is also used as a substituent in hydroxylated chromatographic support matrices, as in PEI-cellulose, to form anion exchangers. Proprietary name: Polymin P.

polyfructosan former term for fructan.

polycarbonate any polymer in which the structural units are Neuvilla ban do mot quyen sach duoc tang boi HUY Neuvilla ban co mid duyen sach duoc tang boi HUY Neuvilla ban co mid cau vè sách sinh hoc, xin liên hê: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

polygalactan polyr

polygalactan former term for galactan.

polygalacturonase EC 3.2.1.15; other name: pectinase; an enzyme that hydrolyses 1,4-α-D-galactosiduronate linkages in pectin and other galacturonans in a random fashion. It participates in cell-wall degradation in plants. Example, polygalacturonase I precursor from Aspergillus niger: database code PGL1_ASPNG, 368 amino acids (38.11 kDa).

polygene any one of a group of genes, each of which individually exerts a small effect on the phenotype but that together control a quantitative character such as stature.

polygenic describing a character or trait that is controlled by polygenes. *Compare* multigenic.

polyglucosan a former term for glucan.

polygon any closed plane figure bounded by three or more (nonintersecting) straight lines. —polygonal adj.

polyhedron (pl. polyhedrons or polyhedra) any solid figure bounded by four or more plane faces, each of which is a polygon. —polyhedral adj.

polyhydric describing any chemical compound containing two or more hydroxyl groups per molecule; used especially of alcohols

poly(hydroxybutyrate) a linear polymer of approximately 1500 (R)-3-hydroxybutyrate residues held together in ester linkage. It is found in the cells of a number of prokaryotic genera where it occurs in membrane-bound granules and acts as a storage material.

poly(1) abbr. for polyinosinate.

polyion any macromolecular ion that carries multiple charges. **polykaryocyte** a multinucleate cell. —**polykaryotic** adj.

polyketide or (sometimes) acetogenin any of a diverse group of natural products synthesized via linear poly- β -ketones, which are themselves formed by repetitive head-to-tail addition of acetyl (or substituted acetyl) units indirectly derived from acetate (or a substituted acetate) by a mechanism similar to that for fatty-acid biosynthesis but without the intermediate reductive steps. In many cases, acetyl-CoA functions as the starter unit and malonyl-CoA as the extending unit. Various molecules other than acetyl-CoA may be used as starter, often with methylmalonyl-CoA as the extending unit. The poly-βketones so formed may undergo a variety of further types of reaction, which include alkylation, cyclization, glycosylation, oxidation, and reduction. The classes of product formed - and their corresponding starter substances - comprise inter alia: coniine (of hemlock) and orsellinate (of lichens) - acetyl-CoA; flavanoids and stilbenes - cinnamoyl-CoA; tetracyclines amide of malonyl-CoA; urushiols (of poison-ivy) - palmitoleoyl-CoA; erythronolides - propionyl-CoA and methylmalonyl-CoA as extender.

polylabelling labelling where more than one atom of a molecule has been isotopically substituted.

polylinker any linker containing multiple restriction sites.

polymannan a former term for mannan.

polymer 1 (in chemistry and biochemistry) any substance that is composed of molecules containing a large number of constitutional units (or 'mers') that are in repetitive covalent linkage and that may be of one or more than one species. Polymers are generally considered to comprise at least ten mers, although sometimes the term is taken to imply simply 'more than one' mer. Hence 'polymer' may or may not embrace oligomer, depending on the branch of chemistry or biochemistry concerned. 2 (in molecular biology and enzymology) (sometimes) an alternative term for multimer. See also heteropolymer, homopolymer.—polymeric adj.; polymerize or polymerise vb.; polymerization or polymerisation n.

polymerase a general name for any of various enzymes (transferases) catalysing the formation of biological **polymers** (def. 1), especially of polynucleotides. See **DNA polymerase**, **RNA polymerase**.

polymerase accessory protein any of a group of proteins that are associated with DNA polymerases. Examples (1) DNA polymerases

CTF4_YEAST, 926 amino acids (104.18 kDa); (2) phage T4 accessory proteins: protein 44, database code DPA4_BPT4, 319 amino acids (35.74 kDa); protein 45, database code DPA5_BPT4, 227 amino acids (24.80 kDa); protein 62, database code DPA6_BPT4, 187 amino acids (21.34 kDa).

polymerase chain reaction abbr.: PCR; a method whereby a specific sequence of nucleotides within a double-stranded DNA is amplified. The sequence is identified by the use of short synthetic oligonucleotides that are complementary to the two terminal regions of the DNA sequence to be amplified; these oligonucleotides are extended by the thermostable Tag DNA polymerase on the DNA template. The effect is that the new chains span the region delimited by the two chosen termini. The nascent chains are heat denatured and the process is repeated. Up to 100 000-fold amplification of the DNA stretch required may be obtained. The method was first described by Kary B. Mullis in 1984. The use of the thermostable Tag polymerase from a thermophilic bacterium avoids the need to add more polymerase at each cycle because the enzyme is not inactivated at the temperature of denaturation of the DNA. PCR amplification has become an indispensable tool in a great variety of applications. Clinically it may be used for the rapid diagnosis of infectious diseases and the detection of rare mutations associated with cancer. Forensically, the DNA from even a single hair or sperm can be used to identify the donor. RNA may be amplified by first converting it to cDNA through the use of reverse transcriptase.

polymetaphosphate (sometimes) an alternative name for polyphosphate.

poly(methyl methacrylate) a clear, easily worked, relatively nontoxic thermoplastic, useful as a substitute for glass and in the construction of many pieces of scientific apparatus. *Proprietary names*: Lucite, Perspex, Plexiglass, etc.

Polymin P a proprietary name for poly(ethyleneimine).

polymorph see polymorphonuclear leukocyte.

polymorphic or **polymorphous** having, assuming, or passing through various different forms or styles; exhibiting or undergoing **polymorphism**.

polymorphism 1 (in biology) a the occurrence of two or more distinct kinds of individual (morphs) belonging to the same species within a population that is interbreeding freely. b genetic polymorphism. 2 (in chemistry) the existence of the same substance in two or more different crystalline forms. See also enantiomorph.

polymorphonuclear 1 describing a cell whose nucleus is multipartite or **polymorphic**. 2 a **polymorphonuclear leukocyte**.

polymorphonuclear leukocyte or polymorphonuclear or polymorph abbr.: PMN; any white blood cell of the myeloid series that in its mature form has a lobed and variably shaped nucleus and granular cytoplasm; included are basophil leukocyte, eosinophil leukocyte, and neutrophil leukocyte. The term is often used erroneously for neutrophil leukocyte solely.

polymorphous a variant form of polymorphic.

polymyxin any of a group of related antibiotics isolated from cultures of *Bacillus polymyxa* and active against most Gramnegative bacteria. Individual polymyxins are designated by suffixed letters, e.g. polymyxin B. All are decapeptides containing five or six residues of L-2,4-diaminobutyric acid. Their biosynthesis does not involve ribosomes (see protein and peptide biosynthesis). The sequence of seven residues at the C-terminal end is formed into a heterodetic ring through an isopeptide link to one of the diaminobutyric acid residues, while the N-terminal residue is acylated with a 6-methylheptanoyl or 6-methyloctanoyl group. Polymyxins bind to the cytoplasmic membrane of sensitive organisms, causing leakage of cytoplasmic components; however, they also attack the cell membranes of eukaryotic cells and therefore have limited clinical usefulness; they are used in antibiotic ointments. Polymyxin B inhibits protein kinese C. Shayba calieties

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

polymyxin B1
DAB = diaminobutyric acid

polynucleate or **polynuclear** (of a cell) containing several or many nuclei; **multinucleate**.

polynucleotidase an alternative name for polynucleotide phosphatase.

polynucleotide any one-stranded homo- or heteropolymer of at least about ten nucleotide units connected by phosphodiester linkages between (usually) the 3' position on the glycose moiety of one nucleotide unit and the 5' position on the glycose moiety of the adjacent one, or any two-stranded molecule comprised of two such one-stranded molecules held together by hydrogen bonds. Comprehends the term nucleic acid.

polynucleotide adenylyltransferase EC 2.7.7.19; other names: NTP polymerase; RNA adenylating enzyme; poly(A) polymerase; an enzyme that adds the poly(A) tail to mRNA. It catalyses a reaction of the type:

$$n \text{ ATP} + (\text{nucleotide})_m =$$

n pyrophosphate + (nucleotide)_{m+n}.

PAP I and II are long forms of the enzyme that contain four functional domains: a ribonucleoprotein-type RNA-binding domain, a catalytic region, two nuclear localization signals, and a C-terminal serine/threonine-rich region. Clones of a number of truncated forms have been obtained, some of which are expressed in tissues. Examples from vaccinia virus subunits PAP1 (VP55) and PAP2 (VP39): database codes PAP1_VACCC, 479 amino acids (55.52 kDa), and PAP2_VACCC, 333 amino acids (38.87 kDa). Example from yeast: database code PAP_YEAST, 568 amino acids (64.48 kDa). The enzyme from Escherichia coli (also known as plasmid copy number protein): database code PCNB_ECOLI, 468 amino acids (53.81 kDa). See also polyadenylate.

polynucleotide kinase abbr.: PNK; any of a number of enzymes belonging to subclass EC.2.7 that phosphorylate the 5' end of nucleic acids. The reaction is between ATP and the 5'-OH of RNA or DNA to form ADP and RNA or DNA-5'-phosphate. Example, phage T4 enzyme: database code KIPN_BPT4, 301 amino acids (34.58 kDa).

polynucleotide ligase an alternative name for DNA ligase (ATP); see DNA ligase.

polynucleotide ligase (NAD+) an alternative name for DNA ligase (NAD+); see DNA ligase.

polynucleotide phosphatase or polynucleotidase either of the enzymes polynucleotide 3'-phosphatase (EC 3.1.3.32) or polynucleotide 5'-phosphatase (EC 3.1.3.33).

polynucleotide phosphorylase an alternative name for polyribonucleotide nucleotidyltransferase (EC 2.7.7.8).

polyol any polyhydric alcohol.

polyol (metabolic) pathway (sometimes) a metabolic pathway by which nonphosphorylated sugars and sugar alcohols are interconverted.

polyomavirus any member of a genus (*Polyomavirus*) of mouse viruses of the Papovaviridae family. They are widely distributed and may be oncogenic under appropriate condi-

polyose an obsolete term for any polymer consisting of an unknown or unspecified number of covalently linked monose residues.

polypeptide 1 any peptide comprising more than about 10-20 amino-acid residues connected by peptide linkages. Unlike a protein it usually lacks appreciable tertiary structure in solution and is not liable to irreversible denaturation. 2 (loosely) an alternative term for protein. 3 describing another entity of a polypeptide nature, e.g. polypeptide chain, polypeptide hormone

polypeptide hormone an alternative term for peptide hormone. polyphase or polyphasic 1 (of matter) consisting of two or more phases. 2 or multiphase (of an electrical system or device) having, generating, or using two or more alternating electric voltages of the same frequency but differing from each other in phase. 3 (of a process) consisting of or occurring in a number of separate stages.

polyphenol oxidase EC 1.10.3.1; recommended name catechol oxidase; any of a family of copper-containing oxidoreductases that catalyse the oxidation of mono and o-diphenols to o-diquinones. These enzymes are found in plants, localized in membranes of plastids, but their normal function is unknown. However, they are responsible for brown discoloration ('browning') in fruit and vegetables on storage, as their products give rise, probably nonenzymatically, to polyphenolic melanin-like compounds. Sequences of polyphenol oxidase genes from different plants are very similar, but when compared with related bacterial, fungal, or animal enzymes (see monophenol monooxygenase) only the putative copper-binding sites are conserved. Example from Lycopersicon esculentum (tomato), polyphenol oxidase B precursor: database code PPOB_LYCES, 596 amino acids (67.23 kDa).

polyphosphate or (sometimes) polymetaphosphate 1 any ionic form of polyphosphoric acid, $H_{n+2}P_nO_{3n+1}$ (where n is an unknown or unspecified integer greater than 1), or any mixture of polyphosphoric acid and its ionized forms. Polyphosphate occurs in the volutin granules observed in many microorganisms, where it is synthesized by the action of the enzyme polyphosphate kinase and is believed to serve as a phosphate store. 2 any (partial or full) salt or ester of polyphosphoric acid. See also metaphosphate.

polyphosphate kinase EC 2.7.4.1; a microbial enzyme that catalyses the synthesis of polyphosphate by transfer of the terminal phosphoric residue of ATP to diphosphate (i.e. pyrophosphate) or to a polyphosphate one residue smaller than the product. Example from *Klebsiella aerogenes*: database code PPK_KLEAE, 684 amino acids (80.03 kDa).

polyphosphoinositide or polyphosphatidylinositide a former inappropriate general name for any [mono]phosphate, bisphosphate, trisphosphate, or tetrakisphosphate of phosphatidylinositol; use not recommended.

polyploid describing a cell (or organism) that has three, four, five, or more times the haploid number of chromosomes in its nucleus. —**polyploidy** n.

polyprenol a recommended term for any prenol in which there are more than four isoprene residues; the isoprene units may be all-trans or a mixture of cis and trans. The number of such units in a particular polyprenol may be indicated by a multiplicative prefix, e.g. undecaprenol. Polyprenols and their derivatives are widely distributed in living organisms. See also dolichol.

polyprenyl the univalent alkyl group derived from a polyprenol by loss of its hydroxyl group. The number of isoprene residues in a particular polyprenyl derivative may be indicated by a multiplicative prefix, e.g. undecaprenyl diphosphate.

polyprotein any polypeptide that on cleavage gives rise to two or more biologically active proteins, e.g. **proopiomelanocortin**.

polyribonucleotide any polynucleotide composed solely of ribonucleotide residues.

ed and may be oncogenic under appropriate condi- **polyribonucleotide nucleotidyltransferase** EC 2.7.7.8; Bạn đang đọc một quyển sách được tặng bởi HUY NCƯ PẾN MếT DẠT UCLEOTIDE THO SE NATYLEST NA CONTROL THE HELE.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

involved in the degradation of mRNA, hydrolysing single nucleotides successively from the 3' end of the RNA, to yield a nucleoside diphosphate and a shortened mRNA. Example from Escherichia coli: database code PNP_ECOLI, 711 amino acids (77.10 kDa).

polyribonucleotide synthase (ATP) see RNA ligase (ATP). polyribosome an alternative name for polysome.

polysaccharide an alternative name for glycan; i.e. any linear or branched polymer consisting of monosaccharide residues. Important polysaccharides include glycogen, starch, hyaluronic acid, and cellulose.

polysome or ergosome or polyribosome any structure consisting of two or more ribosomes attached to different points on the same strand of messenger RNA. Hence, a polysome is a complex involved in the cellular synthesis of the polypeptide specified in the message. Polysomes effect the synthesis of all proteins, but in the case of secretory proteins they become attached to the rough endoplasmic reticulum.

polysomic 1 describing a cell or organism that has one or more normal chromosomes in excess of the usual diploid or polyploid complement; being such a chromosome. 2 a polysomic organism. -polysomy n.

polystyrene phenylethene homopolymer; a clear, brittle, rigid thermoplastic with high electrical resistivity. A proportion of divinylbenzene may be added as a cross-linking agent during polymerization in order to produce polystyrene resins of various porosities for use in the preparation of polystyrene ion-exchange resins.

polysubstituted having more than one chemical substituent. -polvsubstitution n.

poly(T) abbr. for polythymidylate.

polytene chromosome a type of chromosome in a polyploid cell, formed when multiple copies of homologous chromosomes are aligned side by side to give a giant chromosome in which distinct chromosome bands are readily visible.

polyteny an alternative name for endomitosis. —polytene adj. polytetrafluoroethylene abbr.: PTFE; tetrafluoroethene homopolymer; a polymer consisting of chains of (~2000) linked -CF₂- units prepared by polymerization of tetrafluoroethylene, F₂C=CF₂. It is a nonflammable thermoplastic, extremely chemically resistant, of high electrical resistivity, and with an extremely low coefficient of friction. It is useful as tubing and sheeting in chemical laboratory work, as a lining to reaction vessels, as gasket material, and as packing for pumps and bearings. Proprietary names: Fluon, Teflon, etc.

polythene or (esp. US) polyethylene ethene homopolymer; a versatile thermoplastic polymer of ≈1.5-100 kDa, prepared by polymerization of ethylene. High-density polyethylene, a linear polymer, is fairly rigid and crystalline, while low-density polyethylene, a branched polymer, is softer and more flexible; both forms are chemically resistant and have high electrical resistiv-

polytopic describing an integral membrane protein that completely traverses the membrane two or more times.

polytrioxophosphate(v) the recommended name for metaphos-

poly(U) abbr. for polyuridylate.

polyubiquitin the form in which ubiquitin (def. 1) is synthesized, a precursor with a number of head-to-tail repeats.

polyunsaturated describing a substance containing more than one carbon-carbon multiple bond per molecular entity or residue; applied especially to a fatty acid containing more than one multiple bond in the hydrocarbon chain of its molecular structure, and to a fat or oil derived from one or more such fatty acids. See also polyunsaturated fatty acid. -polyunsat-

polyunsaturated fatty acid abbr.: PUFA; any fatty acid that is polyunsaturated; the multiple bonds are most frequently all ethylenic and usually methylene-interrupted, the configuration of their substituents generally being Z (i.e. cis); more polyunsaturated fatty acids belong to families denoted by the position of the double bond nearest to the methyl group and often also by the name of the fatty acid from which the remainder can be derived; hence linoleic family, linolenic family, oleic family, and palmitoleic family. In recent years, emphasis has been placed on a role of some polyunsaturated fatty acids in lowering plasma cholesterol, and potentially reducing the risk of heart disease. Foremost among these have been those of the n-6 family such as linoleic acid. A recommendation has been made that the diet should contain these polyunsaturated fats in a ratio of 2:1 to saturated fats. See also essential fatty acid, fatty-acid nomenclature, fish oil.

polyuria the passing of large volumes of urine.

polyuronide an old term for glycuronan.

polyvalent or multivalent 1 (in chemistry) a having a numerical valency greater than unity. b capable of exhibiting more than one valency value. 2 (in immunology) a (of an antibody molecule or fragment) having at least two combining sites. b (of an antiserum or other antibody preparation) capable of combining with two or more different antigens. c (of a vaccine) capable of eliciting immunity to more than one (strain of) microorganism, toxin, or other antigenic agent.

polyvinyl acetate abbr. PVA; ethenoic acid homopolymer; a synthetic polymer obtained from ethyne and acetic acid, used in adhesives and paints and in the manufacture of polyvinyl alcohol

polyvinyl alcohol abbr.: PVA; ethenol homopolymer; a polymer prepared from polyvinyl acetates by replacement of the acetate groups by hydroxyl groups; the commercial products have differing contents of residual acetyl groups and hence differing physical characteristics. Polyvinyl alcohols are used in adhesives and can also be compounded into elastomers, which are useful in the manufacture of artificial sponges, hydrocarbon-resistant tubing, etc.

polyvinyl chloride abbr.: PVC; chloroethene homopolymer; a plastic solid, soluble in many organic solvents, that discolours on exposure to light or heat unless containing stabilizers. It is useful for the manufacture of rubber substitutes and electric wire coverings.

polyvinyl pyrollidone abbr.: PVP; 1-ethenyl-2-pyrridinone homopolymer; commercial preparations are ≈10 kDa to ≈700 kDa; it is soluble in water to give colloidal solutions. PVP is used in the preparation of enzymes from plants; it removes phenolic compounds that can destroy enzyme activity.

polyxenic see synxenic.

rarely is Banagahylanic hand appears in aliveral metahylivy nguyên. Nếu ban có nhu cappa sách sinh học, xin liên hê: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

pomace the pulpy residue remaining after extraction of juice from fruits such as apples, or after extraction of oil from seeds, nuts, or similar materials.

POMC abbr. for proopiomelanocortin.

Pompe's disease an alternative name for type II glycogen (storage) disease; see glycogen disease.

Ponceau S or Fast Ponceau 2B a dye used for staining protein, especially on cellulose acetate strips. (Illustrated on p. 523.) pontal (of an atom or group) bridging.

ponticulin an F-actin-binding transmembrane glycoprotein of plasma membranes of the cellular slime mould Dictyostelium discoideum. It is a major membrane protein of this organism and a protein of the major high-affinity actin-membrane link. It is directly involved in actin polymerization. Example: database code A54793, 143 amino acids (14.75 kDa).

pool see metabolic pool.

POPOP 1,4-bis(5-phenyloxazol-2-yl)benzene; a secondary fluor used in liquid scintillation counting, originally as a wavelength shifter and more recently to decrease sensitivity to the action of quenching agents.

population 1 (in biology) any group of individual organisms of the same species inhabiting a given area; the number of such individual organisms. 2 (in statistics) or universe any finite or infinite collection of individuals or items from which a sample has been drawn.

population standard deviation see standard deviation.

P:O ratio abbr. for phosphorus:oxygen ratio.

porcine abbr. (in compound abbrs.) p or (formerly) P; of, characteristic of, or relating to a pig or pigs; resembling a pig.

pore any very small opening, e.g. in a (cell) membrane or in the integument of an organism, that allows the passage of gases and/or liquids.

porin 1 any member of a class of similar proteins of ≈15 kDa (monomer) that can be isolated from the outer membranes of certain Gram-negative bacteria. Trimers of these proteins are thought to make these membranes porous to hydrophilic substances of ≤600 Da by forming in them water-filled channels that allow transmembrane diffusion of uncharged small solutes. The proteins are usually homotrimers with several characteristic motifs; they are typically beta barrels with short a-helical domains. Examples: (1) from Rhodobacter capsulatus: database code NRL_2POR, 301 amino acids (31.50 kDa); 3-D structure known; (2) from Escherichia coli (Neisseria protein is similar): database code PHOE_ECOLI, 351 amino acids (38.88 kDa). 2 any of the transmembrane proteins typically of the mitochondrial outer membrane in eukaryotes that form aqueous channels through the lipid bilayer, allowing passage of small molecules. These constitute a structural family, characterized by four motifs and much β structure. Human mitochondrial membrane porin (voltage-dependent anionselective channel protein) allows diffusion of small hydrophilic molecules; the channel adopts an open conformation at low or zero membrane potential and a closed conformation at potentials above 30-40 mV. Example: database code PORI_ HUMAN, 282 amino acids (30.61 kDa).

porosity 1 the state or quality of being porous. 2 the degree to which a material or substance is porous.

porosome nuclear pore complex.

porous having pores; allowing the passage or uptake of gases and/or liquids, especially by diffusion rather than by bulk

porphin or porphine an alternative name for porphyrin (def. 1).

methyl)-1H-pyrrole-3-propanoic acid; the biosynthetic precursor of all porphyrins. It is excreted in relatively large amounts in the urine in some porphyrias.

porphobilinogen deaminase see hydroxymethylbilane synthase. porphobilinogen synthase EC 4.2.1.24; systematic name: 5aminolevulinate hydro-lyase (adding 5-aminolevulinate and cyclizing); other names: δ -aminolevulinic acid dehydratase; aminolevulinate dehydratase. An enzyme that catalyses the conversion of two moles of 5-aminolevulinate to one mole of porphobilinogen + 2 H₂O in the pathway for the synthesis of **porphyrins**; zinc is a cofactor. Example from *Escherichia coli*: database code HEM2_ECOLI, 323 amino acids (35.45 kDa).

porphyr+ a variant form of porphyro+ (before a vowel). porphyria any of a group of metabolic disorders characterized by the excretion of abnormally large amounts of various porphyrins and/or their biosynthetic precursors. Porphyrias are currently classified as primary (if inherited) or secondary (if acquired). The primary disorders may be further classified into two broad categories: (a) the neurological/psychiatric forms and (b) the forms associated with cutaneous photosensitivity, though these two types of symptoms may in some cases overlap. The acquired disorders are much more common than the inherited conditions. There is no clear-cut association of enzyme defects with specific porphyrias. Elevated blood levels of intermediates in porphyrin biosynthesis are normally present during attacks. Elevated intermediates that are found, together with (in parentheses) associated enzymes and conditions are (1) aminolevulinic acid (or ALA) (porphobilinogen (or PBG) synthase; PBG synthase deficiency porphyria); (2) ALA and PBG (PBG deaminase; acute intermittent porphyria, variegate porphyria); (3) uroporphyrin (uroporphyrinogen decarboxylase; porphyria cutanea tarda, acute intermittent porphyria) (4) coproporphyrin (coproporphyrinogen oxidase; variegate porphyria, hereditary coproporphyria). Acquired porphyria may be due to lead exposure, some malignancies, and chronic ethanol exposure among other causes. It has been suggested that the British king, George III, suffered from a form of porphyria leading to psychiatric symptoms.

porphyrin 1 the systematic name for the fundamental skeleton, C₂₀H₁₄N₄, of the macrocyclic tetrapyrroles; often known also as porphin or porphine. It consists of a ring of four pyrrole nuclei linked each to the next at their a positions (i.e. those adjacent to their nitrogen atoms) through a methine group, -CH= (compare corrin).

The structure is aromatic and tautomeric, two hydrogen atoms being associated with any two of its four nitrogen atoms (though for the purposes of nomenclature the name 'porphyrin' implies that the saturated nitrogen atoms are at positions 21 and 23 in the molecule unless there is a specific indication otherwise). Many di- or trivalent metal ions are porphobilinggan, 48%: nBG in selevier welly lade bottory norbylied in keupsanlys in the buse from here tal nelogen porphyrinogen post-translat

atoms. [Note: It was recommended in 1986 that the widely used Fischer system of (incomplete) numeration for the porphyrin ring be discontinued in favour of one in which all the atoms are numbered, the C atoms 1 to 20 and the N atoms 21 to 24.1 The systems for numbering tetrapyrrole carbons are shown at hacteriochlorophyll. Porphyrin itself is a synthetic substance, deep purple in colour. 2 any member of a large group of naturally occurring or synthetic derivatives or analogues of porphyrin (def. 1), of which protoporphyrin IX and its derivatives, especially the chlorophylls and hemes, are the most important.

porphyrinogen 1 5,10,15,20,22,24-hexahydroporphyrin; see porphyrin. 2 a general name for the corresponding hexahydro derivative of any porphyrin (def. 2).

porphyrinuria the excretion of abnormally large amounts of porphyrins in the urine. See also porphyria.

porphyro+ or (before a vowel) porphyr+ comb. form denoting

porphyropsin a purple, light-sensitive, visual pigment in the rod cells of the retinas of freshwater and migratory fishes and some amphibians, consisting of a rod-type opsin combined (as a Schiff's base) with 3,4-didehydro-11-cis-retinal. It has an absorption maximum at ≈522 nm and is analogous in function to rhodopsin in other vertebrates.

portable (in molecular biology) describing DNA sequences that can be inserted into recombinant molecules for the purposes of gene expression; e.g. portable promoter, portable Shine-Dalgarno sequence, etc.

portal 1 relating to a blood vessel, or system of blood vessels, that carries blood from one capillary bed to another, especially the hepatic portal vein. 2 relating to a porta, such as the hepatic porta (porta hepatis). 3 the route of entry into the body of a drug, microorganism, beam of radiation, etc. (or sometimes of its exit therefrom).

porter any transporter of solutes between aqueous phases on either side of a lipid membrane. The term includes antiporter, symporter, and uniporter (see uniport).

Porter 1 George, Baron Porter of Luddenham (1920-British physical chemist; Nobel Laureate in Chemistry (1967) jointly with R. G. W. Norrish, the prize being shared with M. Eigen 'for their studies of extremely fast chemical reactions, effected by disturbing the equilibrium by means of very short pulses of energy'. 2 Rodney Robert (1917-85), British biochemist and immunochemist noted particularly for his isolation of the constituent polypeptide chains of antibody molecules and for formulating the four-chain structure of such molecules; Nobel Laureate in Physiology or Medicine (1972) jointly with G. M. Edelman 'for their discoveries concerning the chemical structure of antibodies'.

positional cloning a strategy for the identification of a gene of unknown function responsible for a genetic disease. The phenotype is correlated with a chromosomal site, the DNA of that region is cloned and compared with that in normal individuals. If a single gene is involved, it is sequenced, and the protein structure deduced. An example is the discovery of the genetic basis of cystic fibrosis and the identification of the cystic fibrosis transmembrane conductance regulator (CFTR).

positional information information supplied to or possessed by cells according to their position in a multicellular organ-

positional isomer any of two or more constitutional isomers that differ in the position of a particular substituent or group. **positive 1** having a value greater than zero. 2 (in mathematics) of the same value but of opposite sense to that regarded as negative. 3 (of the results of a test) indicating the presence of the material or condition tested for. 4 (of an electric charge) having the opposite polarity to the charge of an electron. 5 (of a molecular entity) having a positive electric charge; having a deficiency of electrons. 6 (of a point in an electric circuit) having a higher potential than some other point to which a potenmovement towards a (specified) stimulus. 8 (in photography) an exposed and developed photographic film, plate, or print showing an image in colours or tones corresponding to those of the object photographed. Compare negative. -positiveness n.; positivity n.

positive chromatography (sometimes) any method of purification of substances by affinity chromatography in which a substance of interest in a sample interacts with and is selectively retained by the adsorbent, especially as opposed to negative chromatography.

positive control the initiation or enhancement of some biological activity by the presence of a specific molecular entity.

positive cooperativity cooperative ligand binding in which binding of one ligand to one site on a macromolecule increases the affinity at other sites for the subsequent binding of the same or ligands.

positive correlation see correlation (def. 2).

positive effector see effector.

positive electron an alternative name for positron.

positive feedback see feedback (def. 1).

positive staining a technique used for preparing specimens for electron microscopic examination in which charged biological macromolecules or structures are rendered electrondense by allowing heavy-metal ions of opposite charge to bind to them. Compare negative-contrast technique.

positron or positive electron symbol: β^+ ; an elementary particle that is the antiparticle of the electron. It has the same mass as an electron and a numerically equal but positive electric charge.

positron emission tomography see tomography.

post+ or (sometimes) post- prefix denoting after in time or sequence; behind, posterior to.

postabsorptive describing the period immediately after absorption of food.

posterior after in position, sequence, or time; behind; following.

posterior lobe the posterior lobe of the pituitary gland; i.e. the neurohypophysis.

postlysosome a degenerate telolysosome that has lost its enzymes.

postmitochondrial fraction or postmitochondrial supernatant or supernatant fraction an operational term for the part of a homogenate of eukaryotic cells or tissue remaining after sedimentation of the mitochondrial fraction by centrifugation. It consists essentially of the microsomal fraction and the cytosol.

post-mortem 1 occurring after death. 2 a post-mortem examination; necropsy, or autopsy.

postnatal describing the period after birth or giving birth.

postpartum describing the period immediately after birth or giving birth.

postprandial describing the period immediately after intake of food.

postreplication repair see recombinational repair, mismatch re-

postreplicative describing the period following replication of

a cell or of a nucleic-acid molecule. postribosomal fraction or postribosomal supernatant or supernatant fraction an operational term for the part of a homo-

genate of eukaryotic cells or tissue remaining after sedimentation of the ribosomal (microsomal) fraction by centrifugation. It consists essentially of the cell sap.

postsynaptic 1 describing a neuron or a neuronal membrane that is on the efferent side of a synapse. 2 describing the membrane of a muscle cell at a motor end-plate.

postsynaptic membrane see synapse.

post-transcriptional describing any phenomenon or process occurring after completion of transcription of genomic nucleic acid. —post-transcriptionally adv.

post-translational describing any phenomenon or process occurring after completion of translation of messenger RNA tial of zeraninassience motiquich sach signifying growth of notiven lymptican cost shut the tive spect stanslationally individe

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Potter-Elvehjem homoge

post-translational modification or post-translational processing any enzyme-catalysed change to a protein made after it is synthesized by the translation of messenger RNA. Examples are proteolytic cleavage, glycosylation, methylation, phosphorylation, and prenylation.

potash 1 the common name for potassium hydroxide or potassium carbonate. 2 the name for potassium in the common names of certain of its salts.

potassium or (in scientific and medical Latin) kalium symbol: K; a soft, silvery white, highly reactive, metallic element of group 1 of the (IUPAC) periodic table; atomic number 19; relative atomic mass 39.0983. Natural potassium is a mixture of stable nuclides of mass numbers 39 (93.2 atom percent) and 41 (6.7 atom percent) together with a minute proportion of the radionuclide of mass number 40 (0.012 atom percent). Potassium is widely distributed in all living organisms, besides occurring in various minerals; it is one of the most abundant elements of the Earth's crust. It forms a monovalent cation, K⁺. Several artificial radioactive isotopes are known. In the body, potassium is a major intracellular cation, with little in the extracellular compartment; the range in normal human plasma is 3.6-5.0 mmol L⁻¹, with serum 0.2-0.3 mmol L⁻¹ higher due to release from platelets on clotting. The cellular uptake of potassium is stimulated by insulin, and its excretion by the kidney is indirectly controlled by aldosterone, which stimulates sodium reabsorption in the distal tubules, potassium being excreted by passive transfer due to the electrochemical gradient thereby created. It is actively pumped into cells by sodium/potassium-ATPase. See also hyperkalemia, hypokalemia.

potassium-40 the naturally occurring radioactive nuclide $^{40}_{19}$ K. It has a half-life of 1.28×10^9 years, emitting beta particles (i.e. electrons) of 1.34 MeV max. and gamma radiation of 1.46 MeV.

potassium-42 the artificial radioactive nuclide ⁴²₁₅K. It has a half-life of 12.36 h, emitting high-energy beta particles (i.e. electrons) of 3.52 MeV max. (82%) and 1.97 MeV max. (18%), together with gamma radiation of 1.52 MeV (18%) and 0.31 MeV (0.15%).

potassium channel or K+ channel any one of a number of types of structure that permit controlled (gated) passage of potassium ions, predominantly efflux, through membranes; these channels exhibit considerable diversity, but in excitable cells their role is to set the resting potential, participate in restoring it after depolarization, and attenuate and regulate potentials generated by other excitatory inputs. The main subdivisions of potassium ion channel are: (1) those primarily responding to membrane polarization, termed voltagedependent, voltage-gated, or delayed rectifier (see rectification) K⁺ channels; transmembrane (typically six transmembrane domains, designated S1 to S6) proteins; example, channel protein KV1.3 (human): database code CIK3_HUMAN, 523 amino acids (58.18 kDa); there are six motifs; (2) Ca²⁺-activated K+ channels, which are activated by increase of intracellular Ca2+ concentration; (3) receptor-coupled channels, which may be activated or inhibited by receptor occupancy; these themselves fall into two classes - those which have an intrinsic ion channel as part of the receptor, and those which act through a G-protein that activates an independent channel; example of the latter from human: database code IRK7_HUMAN, 423 amino acids (48.51 kDa); and (4) ATPsensitive K+ channels that close in response to increased intracellular ATP/ADP ratios generated by increased metabolic flux; example, heart K_{ATP} channel from human: database code IRK5_HUMAN, 419 amino acids (47.67 kDa). Types 3 and 4 are known as inward rectifier channels, in that they favour inward movement of K+. Inward rectifier channels have two transmembrane domains rather than the six of voltage-gated channels. However, all K+ channels have a loop known as the H5 or P region, which is thought to line the conducting pore.

S6, and in inward rectifier channels between the two transmembrane domains.

potency (in pharmacology) an expression of the activity of a drug or other agent, in terms of either the concentration or the amount needed to produce a defined effect. It is an imprecise term that should always be further defined. Compare EC50, IC50.

potential (in physics) 1 the work done in bringing unit positive charge, unit positive pole, or unit mass from infinity to a specified point in an electric, magnetic, or gravitational field, respectively. 2 electric potential. 3 electric potential difference.

potential difference abbr.: p.d.; 1 generally, the difference in **potential** (def. 1) between any two points. 2 see **electric potential** difference.

potential divider a chain of resistors (or inductors or capacitors) connected in series, across which an electric potential may be applied and from which a desired fraction of the potential may then be obtained from a contact suitably placed in the chain. See also **potentiometer** (def. 3).

potential energy abbr.: PE; symbol: E_p or V or Φ ; the energy of a body or system consequent upon its physical state or its position in an electric, magnetic, or gravitational field. It is expressed as the work necessary to bring it to its present state or position from a reference state or position, to which a potential energy value of zero is assigned.

potential energy barrier or energy barrier 1 the difference between the bond energy at which a molecule dissociates and the energy of that molecule in the ground state. 2 the difference between the energy of the ground state of an enzymically activated reaction complex and the sum of the energies of the ground states of the reactants forming the activated complex.

potential gradient the potential difference per unit distance between a point of higher and one of lower (electric) potential; the algebraic differential of this at a particular point.

potentiate to cause to be (more) potent, especially to increase the potency of a drug or other agent. —potentiation n.

potentiometer 1 a precision instrument for measuring an electric potential difference of constant polarity without drawing current from the circuit being examined. In its simplest form, it consists of a length of wire of uniform resistance and across which a constant potential is applied. By means of a sliding contact the proportion of this applied potential is found that will balance the potential being measured as determined by a null reading on a galvanometer. 2 a direct-reading electronic device for measuring electric potential difference or electromotive force without drawing appreciable current. 3 or (informal) pot a development of a potential divider consisting of a resistor with a movable contact and used, especially in electronics, either as a potential divider or as a variable resistor.—potentiometry n.; potentiometric adj.; potentiometrically adv.

potentiometric titration or (sometimes) electrometric titration titration in which an electrode reversible to one of the ionic components of the analyte or titrant is immersed in the analyte solution and the electric potential of the electrode (relative to that of an inert reference electrode) is measured during addition of titrant. Because the potential of an electrode is a logarithmic function of the activity of the ion to which the electrode is reversible, an abrupt change in its potential is observable as an equivalence point is approached.

potocytosis a mechanism for small molecule transport across eukaryotic cell membranes that uses **caveolae** rather than clathrin-coated pits.

For Pregion, which is thought to line the conducting pore.

Potter-Elvehjem homogenizer a device for preparing small quantities of cell or tissue homogenates. It consists of a cylindrical pestle (of glass, Perspex, or Teflon) that fits closely into a hard-glass test tube. Cells or small pieces of tissue in a suspending medium are placed in the tube and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in voltage-gated and and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in voltage-gated college and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in voltage-gated college and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in voltage-gated college and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in voltage-gated and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in voltage-gated and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in voltage-gated and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in the tube is slowly moved up and down by hand, a shear thereby being imparted in the tube and the pestle is rotated by means of an electric motor while the tube is slowly moved up and down by hand, a shear thereby being imparted in the tube and the pestle is rotated by means of an electric motor while the tube and the pestle is rotated by means of an electric motor while the tube and the pestle is rotated by means of an electric m

POU domain

(1911-), US biochemist, and Conrad Arnold Elvehjem (1901-62).1

POU domain a feature found in many transcription factors. Its name derives from the fact that it was first recognized after comparison of cDNAs encoding three families of transcriptional regulators, Pit (see PIT), Oct, and Unc (see, e.g., unc-86). POU domain genes now also include the Brn family and others. The POU domain is a bipartite DNA-binding domain, i.e. it has two prominent protein domains that confer sequencespecific DNA binding. One of these domains is homologous to the domain found in other transcription factors and is called the POU homeodomain, whereas the other is specific to these factors and is called the POU-specific domain. The recognition sequences are A/T-rich, including the highly conserved octamer sequence 5'-ATGCAAAT-3'. The domain can also confer special protein-protein binding properties. Example i-POU (Pou inhibitory) protein of Drosophila melanogaster: database code IPOU_DROME, 367 amino acids (39.83 kDa).

pound symbol: lb; the avoirdupois unit of mass, now defined as 0.453 592 338 kg exactly.

powder pattern or powder diagram a diffraction pattern obtained from a specimen of a crystalline material in finely divided form. The specimen is rotated in a parallel beam of monochromatic X-rays, electrons, neutrons, etc. so that all planes of the crystals assume all possible orientations with respect to the incident beam.

power 1 symbol: P; a measure of the rate of doing work, expressed as energy divided by time. The derived SI unit of power is the watt. 2 (in optics) a measure of the ability of a lens or mirror to magnify, expressed as the reciprocal of the focal length of the lens or mirror in metres. 3 (in mathematics) a an alternative name for exponent or index; e.g. 2 to the power $3 = 2^3$). b one more than the cardinal number of times that a number or expression has to be multiplied by itself to give a required number; e.g. 2 to the power $3 = 2 \times 2 \times 2$. c one more than the ordinal number of times that a particular number has to be multipled by itself to give a required number; e.g. the third power of 2 is $8 = 2 \times 2 \times 2$.

poxvirus any member of the Poxviridae, a family of large, double-stranded DNA viruses, in class I of the Baltimore classification. They consist of a single molecule of DNA of 130-240 MDa together with 30 or more structural proteins, a number of viral enzymes, and lipid. Their hosts range from insects to mammals; examples include the viruses of variola (smallpox) and vaccinia (cowpox) - but not of varicella (chickenpox) - in humans, and the virus of myxomatosis in rabbits.

Pp symbol for the propionyl group.

PP abbr. for pancreatic polypeptide.

PP: symbol for inorganic pyrophosphate.

P particle a liberated, mature kappa particle.

ppb or p.p.b. abbr. for parts per billion, i.e. parts per 109.

PP cell or (formerly) F cell a type of cell containing granules that store pancreatic polypeptide (pancreatic hormone). In adult humans such cells are located exclusively in the pancreas (79% in the islets, 19% in the acini, and 2% in the ducts).

pp[CH₂]pA symbol for adenosine 5'- $[\alpha,\beta$ -methylene]triphosphate; an analogue of ATP in which the α,β -bridging oxygen atom has been replaced by a methylene group.

PPF or PP factor abbr. for pellagra-preventative factor; an early name for nicotinic acid or nicotinamide.

ppGpp symbol for guanosine 3'-diphosphate 5'-diphosphate (also known as magic spot I). See relA, spoT.

PPlase abbr. for peptidylprolyl isomerase.

PPLO abbr. for pleuropneumonia-like organism (i.e. myco-

ppm or **p.p.m.** abbr. for parts per million, i.e. parts per 10⁶.

PPO abbr. for 2,5-diphenyloxazole; a substance useful as a primary fluor in liquid scintillation counting.

pppGpp symbol for guanosine 3'-diphosphate 5'-triphosphate

(also known as magic spot II). See relA. *PPRibP spahodվո*ց(մշթիդորկանի ենի թական արև միջական անանական հայարան հայարան հայարան հայարան հայարան հայարան հա

PPS (in clinical chemistry) abbr. for pepsin A.

ppt 1 or ppt.; abbr. for precipitate. 2 or p.p.t. abbr. for parts per trillion, i.e. parts per 10¹².

prednise

PPT abbr. for preprotachykinin (see protachykinin β precursor, tachykinin).

PQ abbr. for plastoquinone.

PQH₂ abbr. for dihydroplastoquinone (i.e. plastoquinol).

PQQ abbr. for pyrroloquinoline quinone (i.e. methoxatin).

Pr symbol for 1 praseodymium. 2 the propyl group.

Pr symbol for the isopropyl group, $(CH_3)_2CH_{-}$.

prazosin or furazosin a quinazoline antagonist of α_1 adrenoceptors; it has anti-hypertensive properties.

pre+ or **pre-** prefix 1 before in time, position, sequence, rank, etc.; compare pro+ (def. 1). 2 denoting a substance that moves faster (or further) than a specified substance in a separative procedure (e.g. prealbumin). Usage in this sense for naming proteins is now deprecated in order to avoid confusion with def. 3. 3 denoting a (usually metabolic) precursor, whether endogenous (e.g. prehormone, prekallikrein, pre-messenger RNA, preprotein, pretyrosine) or exogenous (e.g. precarcinogen), of the (class of) substance specified; Compare pro+ (def. 3); see also prepro+.

PRE abbr. for proton relaxation enhancement.

prealbumin an operational (and confusing) term for either of two protein-containing zones observed to migrate more rapidly towards the anode than does serum albumin on zone electrophoresis of serum at pH 8.6 by some techniques. The faster-moving of these zones is now known to be transthyretin and the other to be acidic α_1 -glycoprotein (i.e. **orosomucoid**).

prebiotic of or relating to the period before the appearance of living organisms on Earth.

precancerous describing a tissue or condition that is not yet malignant but is expected to form a cancer.

precarcingen (sometimes) a chemical carcingen that can be converted by metabolism into another of no less potency. Compare proximate carcinogen.

precarcinomatous describing a tissue that is expected to form a carcinoma.

P receptor see purinoceptor.

precerebellin a cerebellum-specific protein containing a 16residue peptide known as cerebellin, flanked by Val-Arg and Glu-Pro. Precerebellin is the precursor of cerebellin, which is a protein of the postsynaptic structures of Purkinje cells. Concentrations of cerebellin are low at birth and (in humans) peak at days 5-15. It has a conserved sequence in mammals and birds. Example from human: database code CERB_HUMAN, 193 amino acids (21.07 kDa).

precess to undergo, or cause to undergo, precession.

precession (slow) gyration of the axis of rotation of a spinning body caused by application of a torque such that the axis of rotation generates a cone.

precipitant an agent or a reagent that induces the formation of a precipitate.

precipitate 1 to (cause to) come out of solution or suspension. 2 substance or material that is precipitated. —precipitation n. precipitating antibody an alternative name for precipitin.

precipitin or precipitating antibody an antibody that is capable of reacting with a soluble antigen with the formation of an insoluble antigen-antibody complex.

precipitin reaction the reaction together of antigen and antibody near their equivalence point to form a cross-linked precipitate. Quantitative analysis of this interaction gives both the antibody content of an immune serum and an indication of the valency of the antigen. If the reaction occurs in a gel then the reactants form precipitin arcs.

precision-bore (of tubing or a tubular object) having a lumen whose diameter varies only within extremely narrow limits.

prednisolone 1,4-pregnadiene- 11β , 17α ,21-triol-3,20-dione; a semisynthetic steroid with glucocorticoid action. Compare

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

prednisolone

prednisone 1,4-pregnadiene- 17α ,21-diol-3,11,20-trione; a synthetic steroid with glucocorticoid action. *Compare* **prednisolone**.

preelectrophoresis a preliminary treatment of an electrophoresis gel in which a potential difference is applied in order to remove undesirable substances such as excess polymerization reagents.

preflashing the hypersensitization of photographic emulsion by a preliminary exposure to a brief (≈1 ms) flash of light in order to increase its sensitivity to low levels of radiation and to render its response more nearly linear. It is useful especially in fluorography and (auto)radiography.

Pregl, Fritz (1869–1930), Austrian chemist; Nobel Laureate in Chemistry (1923) 'for his invention of the method of microanalysis of organic substances'.

pregnancy-associated α 2-glycoprotein see pregnancy zone protein.

pregnancy zone protein abbr.: PZP; other names: pregnancy-associated α_2 -glycoprotein; α_2 -pregnoglobulin; a homotetrameric disulfide-linked proteinase inhibitor of the α_2 -macroglobulin family that inhibits all four classes of proteinase by a 'bait-and-trapping' mechanism (see bait region). One of the major human pregnancy-associated plasma proteins, it may reach levels of 1.0-1.4 g L⁻¹ just before term. It has extensive homology with human α_2 -macroglobulin. In the sequence (example below) amino acids 1-24 form the signal, 26-1482 are the pregnancy zone protein, and 685-735 the bait region. Example (precursor) from human: database code PZP_HUMAN, 1482 amino acids (163.65 kDa).

pregnane a C₂₁ steroid to which pregnanediol is related.

5β-pregnane

 $3\alpha,20\alpha$ -diol; (20S)- 5β -pregnane- $3\alpha,20$ -diol; the principal urinary metabolite of progesterone, occurring mainly as its 3-glucuronide. Its level in the urine increases during the luteal phase of the menstrual cycle and especially in the latter part of pregnancy, the excretion rate being a convenient (if approximate) index of the functional state of the corpus luteum and placenta.

pregnant mares' serum gonadotropin abbr.: PMSG; a clinically useful impure gonadotropin preparation extracted from the serum of pregnant mares – such serum has high activities of both follicle-stimulating hormone and luteinizing hormone. Compare urogonadotropin.

pregnenolone a common name for the steroid Δ^5 -pregnen-3 β -ol-20-one; 3β -hydroxypregn-5-en-20-one; a key intermediate on the biosynthetic route from cholesterol to progesterone. It has glucocorticoid activity and has been used in the treatment of rheumatoid arthritis. It is the product of **cholesterol mono-oxygenase (side-chain-cleaving)**.

 α 2-pregnoglobulin see pregnancy zone protein.

preincubate to bring a reaction mixture or a cell or tissue preparation to (chemical, metabolic, thermal, etc.) equilibrium before starting the reaction to be investigated. —**preincubation** n.

prekallikrein a plasma glycoprotein of 88 kDa (bovine), and a blood coagulation factor. It is the precursor of the proteinase kallikrein, to which it is converted by the action of factor XIIa. The protein contains four apple domains. The active site contains His, Asp, and Ser residues characteristic of a charge-relay system. Example from human (precursor): database code KAL_HUMAN, 638 amino acids (71.37 kDa).

Prolog, Vladimir (1906–98), Bosnian-born Swiss organic chemist and stereochemist; Nobel Laureate in Chemistry (1975) 'for his research into the stereochemistry of organic molecules and reactions' [prize shared with J. W. Cornforth].

prelysosomal vacuole or prelysosome a former name for **endo-** some (def. 1).

pre-messenger RNA abbr.: pre-mRNA; the class of primary gene transcripts from which the corresponding messenger RNA molecules are subsequently formed by post-transcriptional processing; any member of this class. It comprises a substantial part of heterogeneous nuclear RNA.

pre-mRNA abbr. for pre-messenger RNA.

pre-mRNA processing protein (abbr.: PRP protein) or pre-mRNA splicing factor any of the proteins involved in processing the primary transcript RNA. Many of them function as components of a spliceosome. Most are components of snRNP

pregnanediol gargming manguler the statoid ish pregnancy nouviews, which are numbered Versich etch these proteins here

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

usually numbered PRP2, etc.; the examples given are from yeast (Saccharomyces cerevisiae) unless stated to the contrary. PRP2 is an ATP-binding RNA helicase required for the first cleavage ligation reaction: database code PR02_YEAST, 876 amino acids (99.70 kDa). PRP5 is an ATP-binding RNA helicase required for unwinding of pre-mRNA and is part of the spliceosome, a so-called **DEAD-box** helicase: database code PR05_YEAST, 849 amino acids (96.25 kDa). PRP6: database code PRP6_YEAST, 899 amino acids (104.11 kDa). PRP8 is a U5 snRNP protein: database code PR08_YEAST, 2413 amino acids (279.18 kDa). PRP9 is required for U2 snRNP to bind to pre-mRNA: database code PR09_YEAST, 530 amino acids (62.96 kDa). PRP15 is an RNA-dependent ATPase required for branch-point recognition. PRP16 is an RNA helicase (another DEAD-box helicase): database code PR16_YEAST, 1071 amino acids (121.51 kDa). PRP18 is a component of the U4/U5/U6 snRNP; a homodimer: database code PR18_ YEAST, 251 amino acids (28.35 kDa). PRP19 is a U2-binding protein of unknown function: database code PR19_YEAST, 502 amino acids (56.41 kDa). PRP21 is probably involved in retention of pre-mRNA in the nucleus: database code PR21_YEAST, 280 amino acids (33.02 kDa); PRP21 is a DEAD-box helicase involved in release of spliced mRNA from the spliceosome: database code PR22_YEAST, 1145 amino acids (129.86 kDa). PRP28 is a DEAD-box helicase involved in U4/U5/U6 SNRP; database code PR28_YEAST, 588 amino acids (66.62 kDa). PRP38 is involved in maintenance of U6 snRNA: database code PR38_YEAST, 242 amino acids (27.94) kDa). PRP39 facilitates interaction between U1 snRNP and the 5'-splice site: database code PR39_YEAST, 629 amino acids (74.55 kDa).

premurein-leader peptidase EC 3.4.99.35; other names: prolipoprotein-signal peptidase; signal peptidase II; SPase II. An enzyme that cleaves a single bond between Gly²⁰ and alkylated Cys²¹ in a bacterial lipoprotein, detaching the leader peptide. Example from Escherichia coli: database code LSPA_ECOLI, 164 amino acids (18.14 kDa).

prenol the recommended name for any **isoprenoid** of general formula H-[CH₂-C(CH₃)=CH-CH₂-]_n-OH; i.e. any primary monohydroxy alcohol whose carbon skeleton consists of two or more isoprene residues linked head to tail. See also **polyprenol**.

prenyl the univalent alkyl group derived from a prenol by loss of its hydroxyl group. See also polyprenyl. Compare isopentenyl. **prenylation** the enzymic addition of prenyl moieties to proteins as a post-translational modification; geranyl, farnesyl, or geranylgeranyl groups may be added. The process involves reaction of a prenyl diphosphate with a cysteinyl sulfhydryl group near the C terminus of the protein, to give a prenyl-S-Cys moiety. Characteristically a Cys-ali-ali-Xaa sequence is recognized by the transferase that mediates the reaction, where Cys is cysteine, ali is an aliphatic amino acid, and Xaa is any amino acid. When Xaa is serine, alanine, or methionine the protein is farnesylated; when Xaa is leucine it is geranylgeranylated, but this is variable; for example, in the case of Rab 3A (see RAB), the Cys-Xaa-Cys motif leads to geranylgeranylation on both cysteine residues and methyl esterification of the terminal carboxyl, while in other members of the Rab family Cys-Cys directs geranylgeranylation without esterification. The function of the process appears often to be regulation of protein-protein and protein-membrane interaction.

prenyltransferase see dimethylallyltranstransferase.

PR-enzyme an old name for 1 phosphorylase phosphatase (EC 3.1.3.17). [PR stood originally for prosthetic-group removing, later for phosphorylase rupturing, and later still for phosphate removing.] 2 deoxyribodipyrimidine photo-lyase (EC 4.1.99.3). [PR stood for photoreactivating.]

preparative ultracentrifuge any ultracentrifuge designed for preparation or purification of tangible quantities of macromolecular substances, subcellular fractions, etc.

prephenate a trivial name for 2-oxo-3(1-carboxylato-4-hydroxy-2,5-cyclohexadiene-1)-propanoate; a nonaromatic intermediate in the branched biosynthetic pathway (the **prephenate pathway**) from chorismate to phenylalanine or tyrosine in most autotrophic organisms. See also **arogenate**.

prephenate dehydratase EC 4.2.1.51; systematic name: prephenate hydro-lyase (decarboxylating); an enzyme that catalyses the formation of phenylpyruvate from prephenate with release of H₂O and CO₂. This is a reaction in one of the pathways for the biosynthesis of phenylalanine. Example from Bacillus subtilis: database code PHEA_BACSU, 285 amino acids (31.86 kDa). In other cases (e.g. Escherichia coli) the activity is one domain of a bifunctional enzyme that also contains chorismate mutase (another enzyme of the phenylalanine biosynthetic pathway). Example from E. coli: database code PHEA_ECOLI, 386 amino acids (43.06 kDa). The mutase domain is in the N-terminal part of the database code, the dehydratase in the C-terminal part. See also arogenate.

prephenate dehydrogenase any of several enzymes that convert prephenate to 4-hydroxyphenylpyruvate with release of CO₂ and reduction of either NAD⁺ or NADP⁺. They function at a branch point in the pathway for the biosynthesis of aromatic amino acids, at which they initiate the branch of the pathway leading to tyrosine biosynthesis. They include prephenate dehydrogenase, EC 1.3.1.12; systematic name: prephenate:NAD+ oxidoreductase (decarboxylating); other name: hydroxyphenylpyruvate synthase; an enzyme that also has chorismate mutase activity, so can convert chorismate to hydroxyphenylpyruvate. Example from Escherichia coli: database code TYRA_ECOLI, 373 amino acids (42.04 kDa). There is also prephenate dehydrogenase (NADP+), EC 1.3.1.13; systematic name: prephenate: NADP+ oxidoreductase (decarboxylating). Example from Saccharomyces cerevisiae: TYR1_ YEAST, 452 amino acids (50.92 kDa).

prephenate pathway a pathway for the synthesis of phenylalanine and tyrosine from chorismate, utilizing prephenate as an intermediate. Prephenate is formed from chorismate by chorismate mutase. It is converted by prephenate dehydrogenase to 4-hydroxyphenylpyruvate, from which tyrosine is formed by transamination with glutamate as the amino-group donor. For the synthesis of phenylalanine, phenylpyruvate is formed by prephenate dehydratase, and is then converted to phenylalanine by transamination, glutamate again acting as amino-group donor. See also arogenate.

pre-piece an alternative name for signal peptide.

prepolypeptide or presecretory polypeptide the transient, primary translation product of a eukaryotic messenger RNA for any polypeptide destined to be secreted by a cell, irrespective of whether or not an intermediary propolypeptide is formed; the polypeptide counterpart of preprotein. See also prepropolypeptide.

prepro+ or **prepro-** compound prefix denoting preprotein of the proprotein of a specified protein, or prepolypeptide of the propolypeptide of a polypeptide.

preprocessing a fanciful name for enzymic conversion of a preproprotein (or prepropolypeptide) to a proprotein (or propolypeptide).

preprohormone the prehormone of any prohormone of a protein or (poly)peptide hormone. Examples are: preproglucagon, preproinsulin, preproparathyrin, prepro-VIP.

preprophase band a dense band of microtubules, 1-3 μm wide, that appears just beneath the cell membrane before the start of cell division in the cells of higher plants. It precedes the onset of prophase and then disappears as mitosis begins, yet it somehow determines the plane of orientation of the new cell plate forming in late telophase and marks the zone of the parental cell wall where fusion with the growing cell plate ultimately occurs.

prepropolypeptide the prepolypeptide of any propolypeptide. Examples are: preproenkephalin and prepromelittin.

pre-part ob pre-partide an abstraction for signal peptide of the properties of the community of sach sprantice, and sprantice in the properties of the community of sach sprantice, and sprantice of the community of sach sprantice, and the community of sach sprantice, and

are: preproalbumin (serum) and prepro-von Willebrand factor. Note that preprolactin is not a preproprotein since prolactin is not a proprotein.

preprotachykinin abbr.: PPT; see protachykinin β precursor.

preprotein the transient, primary translation product of a eukaryotic messenger RNA for any protein destined to be secreted by a cell, irrespective of whether or not an intermediary proprotein is formed. It is detectable only in a cell-free proteinsynthesis system since in an intact cell its N-terminal presequence (i.e. signal peptide) is cleaved off before translation has been completed. See also prepolypeptide, preproprotein.

presecretory polypeptide an alternative name for prepolypeptide

presequence an alternative name for 1 signal peptide. 2 transport sequence (of a protein imported into mitochondria), especially in those instances where the sequence is not removed by proteolytic cleavage prior to translocation through the membrane but is removed at its final destination.

pressor (in physiology) 1 of, relating to, or bringing about an increase in arterial blood pressure. 2 any drug or other agent that has a pressor effect.

pressure symbol: p or P; the force per unit area acting on a surface; i.e. p = F/A. The pressure at a point in a fluid is equal to the force per unit area on an infinitesimal plane situated at that point, and in a fluid at rest it is the same in all directions. The SI derived unit of pressure is the **pascal**; the **bar** is also acceptable (see **standard atmosphere**). See also **millimetre of mercury**, there

pressure dialysis dialysis in which a hydrostatic pressure is applied to the material being dialysed in order to minimize its initial dilution by solvent entering by osmosis.

pressure homogenization or nitrogen cavitation a method of disrupting cells that depends on equilibrating a cell suspension with a gas, e.g. nitrogen, at high pressure (up to 7 MPa) and then suddenly reducing the pressure, whereupon the gas dissolved in the cytoplasm is explosively released.

pressure-jump method a relaxation technique in which change of pressure is the disturbing factor. See relaxation kinetics.

pre-steady-state kinetics or transient-phase kinetics the kinetics of a catalysed reaction during the phase in which the concentration of the catalyst-reactant complex rises from zero to its steady-state value. For an enzyme-catalysed reaction this phase usually occupies a very brief period of time (from a second to a microsecond or less) and special techniques are required for its study. See also rapid reaction kinetics.

pre-swollen describing a commercial gel preparation that has already been equilibrated with water or another liquid phase.

presynaptic 1 (in anatomy) a designating a neuron that transmits an impulse directly to a synapse. b of or pertaining to that part of such a neuron close to the synapse. 2 (in cytology) prior to meiotic synapsis.

presynaptic membrane see synapse.

presynaptic nerve ending see synapse.

pre-transfer RNA abbr.: pre-tRNA; the class of primary gene transcripts from which the corresponding transfer RNA molecules are subsequently formed by post-transcriptional processing; any member of this class.

pretransition temperature the specific temperature at which a lipid bilayer being heated shows the first signs of melting (def. 2), before it reaches its transition temperature. Special techniques (e.g. employing spin-labelled or fluorescent probes) are required for its detection and study.

pretyrosine an obsolete name for arogenate.

previtamin a less common word for provitamin.

Pribnow box a promoter site in *Escherichia coli* and phage genes that specifically binds **RNA polymerase**. The Pribnow box has the consensus sequence TATAAT and is centred at -10 (ten nucleotides on the 5' side of the first nucleotide transcribed, which is designated +1).

primaeval soup a variant spelling of primeval soup; see **primor**-dial soup.

primaquine one of several 8-aminoquinoline antimalarial drugs. It is active against the exo-erythrocytic form of the parasite, and can effect radical cures as well as serving as a preventive medicine.

primary (in chemistry) 1 a describing an alkyl compound (e.g. an alkanol) in which the functional group (e.g. a hydroxyl group) is attached to a carbon atom linked to only one other. b describing the carbon atom bearing the functional group in such a compound. 2 describing an amide or an amine in which a single appropriate group is attached to a nitrogen atom. 3 describing a salt formed by replacing only one of the ionizable hydrogen atoms of a tribasic acid by another cation. Compare secondary, tertiary.

primary cell wall the outer layer of the wall of a plant cell. It is produced by deposition of cellulose microfibrils against the cell plate separating two daughter cells newly formed by division. When cell extension is complete, it is supplemented by deposition of the secondary cell wall (see secondary cell wall deposition).

primary culture a culture of cells (or tissue) that have been obtained directly from their place of origin.

primary electron an electron incident on a surface that causes **secondary electrons** to be emitted.

primary F'-containing strain see F' plasmid.

primary fluor or **primary scintillator** or **primary solute** (in liquid scintillation counting) the fluorescent substance to which radiation energy is directly transferred from excited molecules of the solvent. Compare **secondary fluor**.

primary granule an alternative name for azurophil granule.

primary hormone a term proposed to embrace any hormone that acts rapidly and uses a cyclic nucleotide as second messenger.

primary immune response the response produced in an animal when it is first exposed to an antigen. It consists characteristically of a slow production of antibody molecules and the priming of lymphoid tissue in readiness for the production of a secondary immune response on subsequent challenge with the same antigen.

primary kinetic isotope effect an isotope effect on a reaction rate that is attributable to isotopic substitution of an atom to which a bond is made or broken in the rate-limiting step or in a pre-equilibrium step of a specified reaction.

primary lysosome or protolysosome a lysosome containing newly synthesized acid hydrolases that have not as yet reacted with their ultimate substrates. A primary lysosome may be considered as a vesicle for transport between the site of enzyme synthesis and the digestive body or secondary lysosome.

primary metabolism the ensemble of metabolic activities that are common to most if not all living cells and are necessary for growth, maintenance, and survival. Compare secondary metabolism.

primary metabolite any intermediate in, or product of, primary metabolism.

primary response see primary immune response.
primary scintillator an alternative name for primary fluor.

PRibPP symbol for (5-)phospho(-α-p-)ribosyl diphosphate primary solute an alternative name for primary fluor. Ban dang doc một quyển sách duọc tạng bởi HUY NGUYEN. Neu bạn có như câu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

primary solvent

Bur Hoge of

primary solvent (in liquid scintillation counting using mixed solvents) the solvent to which energy of the radiation emitted by the specimen is first transferred as excitation energy.

primary standard 1 any standard of measurement of nationally or internationally agreed and specified value that is used as the basis of a unit of measurement. 2 a specimen of a particular substance that is of extremely high purity and stability and that serves as an ultimate reference to which may be compared the purity of any secondary standard used in analysis.

primary structure the first order of complexity of structural organization exhibited by polypeptide and protein molecules and by polynucleotide and nucleic-acid molecules. When applied to a segment of a polypeptide chain or to a polypeptide or protein molecule, it refers to the linear sequence of the amino-acid residues of the polypeptide chain(s) without regard to spatial arrangement apart from configuration at the α -carbon atoms (and excluding the positions of any disulfide bonds). When applied to a segment of a polynucleotide chain or to a polynucleotide or nucleic-acid molecule, it refers to the linear sequence of the nucleotide residues of the polynucleotide chain(s) without regard to spatial arrangement. Compare secondary structure, tertiary structure, quaternary structure.

primary transcript the RNA as synthesized by RNA polymerase directly from a gene, unaltered by any further modification, such as **splicing**, that it may undergo.

primase 1 any RNA polymerase that synthesizes an RNA primer needed for the initiation of DNA synthesis. Such enzymes vary greatly in structure, specificity, and mode of regulation. 2 or DNA primase the DNA-directed RNA polymerase (EC 2.7.7.—) of the bacterial primosome. In Escherichia coli, primase is the product of the dnaG gene while in T4 phage the primase is the product of gene 61. In either case, the primase is only active in the presence of other proteins which create a complex called a primosome. The complex participates in the unwinding of parental DNA strands ahead of the replication fork, and synthesizes short RNA primers for the Okazaki fragments. Example from E. coli: database code PRIM_ECOLI, 581 amino acids (65.49 kDa).

primate any member of the Primates, an order of placental mammals. Primates are characterized by flexible pentadactyl limbs, opposable first digits, good stereoscopic vision, and, in the higher apes, highly developed brains. Included are lemurs, tarsiers, monkeys, apes, and humans.

prime 1 the printer's character, ', used (singly, doubly, etc.) as a mark to discriminate between characters or symbols representing things that are or would otherwise be indistinguishable. In chemical nomenclature it is used to distinguish between (1) identical locants referring to different moieties of the same molecule; or (2) two or more unspecified but differing univalent groups represented by the same symbol R. In physical chemistry it is used to differentiate the symbol for a quantity measured under arbitrary conditions from that for the corresponding quantity referred to the (thermodynamic) standard state; e.g. K', apparent equilibrium constant, from K, thermodynamic equilibrium constant; Eo', standard redox potential at a specified pH, from E_0 , standard redox potential at a hydron activity of unity. 2 (in biochemistry) to provide a metabolic reaction with a primer; to bring about activation of a process or substrate. 3 (in immunology) to induce a primary immune response in an animal; to activate a cell specifically with respect to a given antigen. 4 (in mathematics) a having no other integral factor than itself and one. b prime number.

prime number any integer that possesses no integral factors and hence is divisible only by itself and 1.

primer 1 something used to prime (def. 2, 3). 2 an oligonucleotide required as the starting point for the stepwise synthesis of a polynucleotide from mononucleotides by the action of a nucleotidyltransferase. 3 a short-chain fatty acyl-CoA, e.g. acetyl-CoA or butynyl-CoA, required for the initiation of the

stepwise enzymic synthesis, from two-carbon units, of longchain fatty acids as their CoA derivatives. See also glycogenin. primeval soup or (esp. Brit.) primaeval soup an alternative name for primordial soup.

primeverose 6-O- β -D-xylosyl-D-glucose; a disaccharide occurring in madder.

primordia the plural of primordium.

primordial existing at or from the beginning, primeval; earliest formed, primitive.

primordial soup or primordial slime or primeval soup or (esp. Brit.) primaeval soup the aqueous solution of organic compounds that is considered to have been the environment in which the synthesis of macromolecules first occurred and cellular life originated. See also coacevate droplet.

primordium (pl. primordia) an organ or part at the earliest stage of its development; a rudiment.

primosome a protein complex that is essential for the activity of the **primase** responsible for the synthesis of RNA primers in the replication of DNA in *Escherichia coli*. See replication complex, replication of DNA.

PRINTS a computer database of protein sequence motifs (signatures) used in the compilation of this dictionary and elsewhere to identify amino-acid sequences (typically sequences of about 10 residues) defining structural and functional features of protein sequences. See also Appendix E.

prion a term originally introduced to emphasize the proteinaceous and infective nature of the pathogen responsible for transmissible encephalopathies. These include scrapie, kuru, bovine spongiform encephalopathy, Creutzfeld—Jakob disease, fatal familial insomnia, and Gerstmann—Sträussler syndrome. The agent is now widely accepted to be a variant of the normal prion protein; it is believed that the variant folds abnormally and induces the normal protein also to fold abnormally, typically into beta configurations, which form aggregates. A similar phenomenon has been observed in yeast, hence the term 'yeast prion'. See also virino.

prion protein abbr.: PrPC; a membrane protein of 33-35 kDa that is encoded in the mammalian genome; it contains, in humans, 253 amino-acid residues (near the same number in other species) and has a glycosylinositol phospholipid anchor. A variant, termed PrPSc, with the same amino-acid sequence, is found in the brains of sheep and other mammals affected by spongiform encephalopathy. PrPC is rich in a helix but devoid of β sheet, while PrPSc contains much β sheet. PrPSc associates to form aggregates ('rods') in the central nervous system; these aggregates are seen in many manifestations of susceptibility to spongiform encephalopathy. Such mutations appear to be important in respect of the susceptibility of spongiform encephalopathy. Polymorphism, e.g. at position 171, occurs in several species and in subgroups in one species. Example: database code PRIO_SHEEP, 256 amino acids (27.88 kDa); eight motifs.

prism 1 any polyhedron of which two faces are polygons in parallel planes and the other faces are parallelograms. 2 a crystal form of which three or more faces are parallel to one axis. 3 a solid, bounded in part by two nonparallel plane faces and made of material transparent in the relevant region of the spectrum, that is used in optics to invert an image or to disperse or deviate a beam of light.

acetyl-CoA or butylyl-CoA required for the initiation of the NGUYEN. New prolacting the sach sinh hoc, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

pro+ or **pro-** prefix 1 before in time or position; anterior; projecting; compare pre+ (def. 1). 2 for, on behalf of, substituting for, favouring, encouraging, etc. 3 (in biochemistry) denoting (inactive or less active) biosynthetic precursor of the (class of) proteinaceous agent specified, to which it is convertible by proteolytic cleavage in a specific manner. Examples are: proalbumin, prohormone, proinsulin, proprotein, and prothrombin (but not prolactin!). Compare pre+ (def. 3). See also +gen.

Pro symbol for a residue of the α -amino (strictly, cyclic α -alkylamino) acid L-proline (alternative to P).

pro- prefix in symbols designating prochirality; see pro-R/pro-S

proaccelerin an alternative name for factor V; see blood coagulation.

probability (in statistics) symbol: p or P; a measure of the likelihood of the occurrence of a given event, expressed as the ratio of the number of times it occurs in a series of observations to the total number of observations, or as its decimal equivalent.

probable error an older measure of sampling variability such that one-half of the events, observations, etc. in a normal distribution lie between the mean value minus the probable error and the mean value plus the probable error. The probable error is equal to the standard error multiplied by 0.6745.

proband an alternative term for propositus.

probe 1 something that searches into, examines, or tests; e.g. an instrument or tube used for exploring a cavity or sampling a fluid, or an electric conductor introduced into an electric circuit or a cavity resonator to provide electric coupling to an external circuit. 2 (in biochemistry) a chemical species, or a chemical group attached to a carrier molecule, used to investigate the chemical nature of some other particular chemical species or the physical nature of a particular environment, especially within an intact cell; a reporter group. Typically some measurable physical property of the probe (e.g. fluorescence, electron spin resonance) alters in a way that can be correlated with changes in the environment or in the macromolecule. Examples are a group having paramagnetic properties, for detection using electron spin resonance (see, e.g., TEMPO), and a fluorescent lipid molecule used to report membrane fluidity (see, e.g., parinaric acid). 3 (in molecular biology) or gene probe or hybridization probe an oligo- or polynucleotide that is complementary to an oligonucleotide or nucleic-acid sequence under investigation. The probe is normally labelled in a way that permits its ready detection, e.g. with a radioactive isotope or a fluorescent constituent. Hybridization of the probe to the oligonucleotide sequence under investigation allows that sequence to be detected. The technique finds much use in screening gene libraries, detecting oligonucleotides on blots of electrophoresis gels, and in other associated technologies. 4 to examine with or as with a probe.

procainamide a local anaesthetic similar in action to procaine but having a less easily hydrolysed amide linkage, which gives it longer duration of action.

procainamide azide a local anaesthetic; it binds the 43 kDa postsynaptic protein (µ chain or rapsyn) of the nicotinic cholinoceptor and is useful as a photoaffinity label.

procaine or novocaine the prototype injectable local anaes-

lipid bilayer towards a more fluid state, decreasing ordering of the fatty-acyl side chains.

procapsid a precursor of the virion of certain viruses, consisting of a viral capsid without its specific nucleic acid.

procarboxypeptidase component III a protein, resembling elastase but without enzyme activity, found in the pancreatic juice of ruminants in noncovalent association with zymogens, carboxypeptidse A, etc. It probably prevents denaturation of the latter in the acid of the duodenum. Example (bovine): database code CAC3_BOVIN, 240 amino acids (25.83 kDa).

procaryon a variant spelling of prokaryon.

procaryote a variant spelling of prokaryote.

process (in anatomy) a thin prominence or protuberance of a structure, or an extension or outgrowth of a cell.

processed gene a pseudogene that lacks the intervening sequence or sequences of the homologous functional gene. It usually contains a short segment consisting entirely or almost entirely of adenine nucleotides, attached near the 3' end, and is thought to originate by reverse transcription of an mRNA template with incorporation of the cDNA so formed into genomic DNA. A processed gene is sometimes called a retrogene.

processing (in molecular biology) covalent modification either of the primary transcription product (i.e. RNA) of a DNA or of the primary translation product (i.e. polypeptide) of a messenger RNA. See also post-translational modification.

processive (in molecular biology) or nondistributive describing (the action of) any enzyme or catalytic complex that progressively synthesizes or degrades a biopolymer by effecting several or many cycles of the same type of reaction or reaction sequence without dissociating from the template or intermediate product (as appropriate) between catalytic events. Compare distributive.

processivity (of a nucleic acid polymerase) the average number of nucleotides inserted before the enzyme dissociates from its template. In the case of DNA polymerases, repair enzymes (such as Pol I in Escherichia coli) have low processivity replication enzymes (such as Pol II and its associated proteins in E. coli) have high processivity.

processosome a hypothetical ribonucleoprotein associated with processing of pre-RNA in the nucleolus.

prochiral describing a molecule, or a centre or axis in a molecule, that in itself is achiral but is capable of becoming chiral by a replacement reaction. In general, a prochiral molecule has a structure Caabc, where the 'a' groups (or atoms) are identical. Replacement of one 'a' by another group or atom, 'd', leads to a chiral molecule. Thus, in ethanol, replacement of one ¹H of the methylene group by ²H leads to a chiral structure which can be shown to be optically active. In a prochiral molecule Caabc, the chemically like 'a' groups may be differentiated one from another in a reaction with a chiral molecule, especially an enzyme. An achiral molecule containing a double bond or a planar cyclic ring system is also prochiral if separate addition of an achiral reagent to each face leads to two enantiomeric products. See also meso-carbon atom, pro-R/pro-S convention. —prochirality n.

procholecystokinin precursor a member of the gastrin/ cholecystokinin family, and a precursor for five different cholecystokinins. Example from human: database code CCKN_ HUMAN, 115 amino acids (12.65 kDa).

Procion the proprietary name for a range of reactive dyes that thetic. It brings about changes in the physical properties of the North Properties of the North Real Bandang doc might quyen sach duck tang bot Huly North Real Rection Blue H-B. Properties of the Real Rection Blue H-B. Properties and Help Real Rection Re procoagulant

progeste

number of other dyes useful in biochemistry, especially in dyeligand chromatography.

procoagulant (sometimes) any of factor V, factor VII, or factor VIII, each of which acts to accelerate the conversion of prothrombin to thrombin during **blood coagulation**.

procollagen a ≈150 kDa triple-helical protein that is an intermediate in the biosynthesis of tropocollagen, into which it is converted proteolytically by removal of the additional sequences at both the N and the C termini of each of the three peptide chains. Example, procollagen α1 (human): database code CA11_HUMAN, 1464 amino acids (138.73 kDa). Compare protocollagen.

procollagen N-endopeptidase EC 3.4.24.14; other name: procollagen N-proteinase; an enzyme that catalyses the cleavage of the N-propeptide of collagen chain α -1(I) at Pro-|-Gln and of chain α -2(II) at Ala-|-Gln.

procollagen-lysine 5-dioxygenase EC 1.14.11.4; other names: procollagen-lysine,2-oxoglutarate 5-dioxygenase; lysine hydroxylase; lysine,2-oxoglutarate 5-dioxygenase; an enzyme that catalyses the formation of hydroxylysine residues in collagen. The reaction is between dioxygen, procollagen L-lysine, and 2-oxoglutarate to form procollagen 5-hydroxy-L-lysine, succinate, and CO₂. Iron and ascorbic acid are cofactors. Example (precursor) from human: database code LYSH_HUMAN, 727 amino acids (83.49 kDa). See also procollagen-proline dioxygenase.

procollagen-proline dioxygenase EC 1.14.11.2; systematic name: procollagen-L-proline,2-oxoglutarate:oxygen oxidoreductase (4-hydroxylating); other names: proline,2-oxoglutarate-4-dioxygenase; protocollagen hydroxylase; proline hydroxylase; prolyl 4-hydroxylase. An enzyme converting Lproline into 4-hydroxy-L-proline; it catalyses a reaction between dioxygen, procollagen L-proline, and 2-oxoglutarate to form procollagen trans-4-hydroxy-L-proline, succinate and CO₂. Hydroxylation only occurs when proline is present in a polypeptide chain elongating on a ribosome. Ascorbic acid and Fe³⁺ are also required as cofactors, and the reaction is one of the few well-defined roles for ascorbic acid; it seems likely that scurvy, as a result of vitamin C deficiency, is due to defective activity of this enzyme, which plays a key role in collagen synthesis. The enzyme is a tetramer of two α chains and two β chains; the β chain is the multifunctional protein disulfide isomerase and hence has microsomal triacylglycerol transfer protein activity. Subcellular location is the endoplasmic reticulum lumen. There are two forms of a subunit, which are produced by alternative splicing of the same gene. Example from human (α precursor): database code P4HA_HUMAN, 534 amino acids (60.84 kDa). See also procollagen-lysine 5-dioxygenase.

proconvertin an alternative name for factor VII; see blood coagulation.

procorticotropin or procortin an alternative name for proopiomelanocortin.

procyclin or PARP a major surface antigen of procyclic forms of trypanosomes. It is GPI-anchored. Example B1-α precursor from Trypanosoma brucei brucei: database code PAR1_TRYBB, 143 amino acids (14.88 kDa).

prodrug a drug molecule that is itself inert but has pharmacological effects after **bioactivation**. An example is **ganciclovir**.

produce (in mathematics) to extend a line or a plane.

product 1 (in biochemistry and chemistry) something formed in a reaction. 2 (in mathematics) the result of multiplying together two or more numbers, quantities, or expressions.

product inhibition the inhibition of an enzymic reaction caused by increased concentration of one or more products of that reaction.

productive (capable of) yielding a product, result, or benefit. **productive binding** or eutopic binding the binding of a substrate in a reactive mode at the active site of an enzyme. Compare nonproductive binding.

productive complex any enzyme-substrate complex in which which it is secreted during the latter half of the estrous cycle, the substrate is bound to the enzyme in a manner that renders acting upon the endometrium to prepare it for embryo imBan dang doc mot quyen sach duoc tang boi HUY NGUYEN. Neu ban co nhu cau ve sach sinh hoc, xin lien he:

catalysis possible so that products can be formed. Compare abortive complex.

productivity (in biotechnology) symbol: r; the mass of product formed per unit reactor volume per unit time; often per unit of enzyme or biomass. It is measured typically in kg m⁻³ h⁻¹.

proenkephalin a protein precursor for several neuropeptides including various enkephalins formed in brain and adrenal medulla. For example, in the human, proenkephalin A precursor yields four copies of [Met]enkephalin (100–104; 107–111; 136–140, 210–214) and single copies of each of [Leu]enkephalin (230–234), [Met]enkephalin—Arg—Gly—Leu (octapeptide) (186–193) and [Met]enkephalin—Arg—Phe (heptapeptide) (261–267), which arise by enzymatic cleavage of the gene product by cleavage at paired basic amino acids: database code PENK_HUMAN, 267 amino acids (30.79 kDa). Another human protein, proenkephalin B precursor (other name: β-neoendorphin—dynorphin precursor) yields single copies of α-neoendorphin, dynorphin, [Leu]enkephalin, rimorphin, and leumorphin, also by cleavage at paired basic amino acids: database code NDDB_HUMAN, 254 amino acids (28.38 kDa).

proenzyme an alternative name for zymogen.

pro-Elpro-Z convention if the two chemically-like hydrogen atoms of $abC=CH_2$ are separately replaced by the achiral, d, an achirotopic stereogenic element is generated and two (diastereoisomeric) alkenes, abC=CHd are formed that are E and Z stereoisomers (see **E/Z** convention). The replacement has converted a prostereogenic element into which one which is stereogenic; the situation is comparable to the change, prochiral -> chiral, although a chiral element is not involved. The two chemically-like hydrogen atoms are designated as pro-E and pro-Z, and are abbreviated as H_E and H_Z . Replacement of a pro-E hydrogen with ²H yields an E diastereoisomer and the similar replacement of a pro-Z hydrogen yields the Z form. Example: the two hydrogen atoms of phosphoenolpyruvate; that on the same side of the double bond as the COOH group is H_E, that on the same side as the OPO₃H₂ group is H_Z. Replacement of ${}^{1}H_{E}$ by ${}^{2}H$ yields (E)-[3- ${}^{2}H_{1}]$ phosphoenolpyruvate; the Z diastereoisomer results if ¹H_Z is replaced by ²H. A similar situation is found in the side chain of chorismic acid.

proestrus see estrous cycle.

profibrinolysin an alternative name for plasminogen.

profilin a protein that in vitro prevents the polymerization of actin. In many cells it occurs as a 1:1 complex with monomeric actin, that appears to act as an intracellular storage form of actin. Profilin binds $PtdInsP_2$ and inhibits the γ isoform of phospholipase C (see **phospholipase**), an inhibition that is overcome when the enzyme is activated as a result of receptor kinase-dependent tyrosine phosphorylation. This activation appears in some way to recruit profilin-actin to the site of filament assembly which occurs when cells are stimulated e.g. by nitrogen. Example, profilin I (human): database code $PROl_HOMAN$, 139 amino acids (14.91 kDa).

proflavin 3,6-diaminoacridine; an acridine dye, molecules of which are capable of intercalating between adjacent base pairs in duplex DNA. It is useful as an antibacterial agent, by virtue of its ability to inhibit the biosynthesis of both DNA and RNA, possibly through intercalation into preexisting DNA, and as a frameshift mutagen for bacteriophages.

progesterone the common name for pregn-4-ene-3,20-dione; the principal steroid hormone of the corpus luteum, from which it is secreted during the latter half of the estrous cycle, acting upon the and matrium to prepare it for embryo im-

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

progestin

plantation. During pregnancy, secretion occurs also from the placenta, the rate of production increasing markedly as pregnancy proceeds, when it acts to maintain the uterus, inhibit further release of ova, and promote proliferation of acini within the mammary gland. Progesterone occurs also in the adrenal cortex and testis. It is synthesized from **pregnenolone** by 3β -hydroxy- Δ^3 -steroid dehydrogenase, EC 1.1.1.145, and is an intermediate in the formation of androgens, estrogens, glucocorticoids, and mineralocorticoids. It also occurs in some plants, e.g. Hollatrhena floribunda.

progestin 1 an alternative name for progestogen. 2 natural progesterone, especially in unpurified form.

progestogen or progestagen or progestin any natural or synthetic compound with the hormonal activity of progesterone. In oral contraception regimes, a progestogen is normally combined with an estrogen. The effect is to inhibit ovulation. A preferred method is to use a gestagen, which acts by an effect on the endometrium; these have fewer side effects than progestogens.

proglucagon the putative prohormone of glucagon and enteroglucagon. In mammals it appears to be an 18 kDa single-chain polypeptide of some 170 residues that contains the entire 29-residue sequence of glucagon within its N-terminal moiety and in addition the sequences of two glucagon-like peptides, designated GLP-1 and GLP-2, of 37 and 35 residues respectively, within its C-terminal moiety. The 69-residue N-terminal portion of the molecule, containing the glucagon sequence, is identical with glicentin, and thus in mammals proglucagon appears to be the common biogenetic precursor both of pancreatic glucagon and of enteroglucagon and other nonpancreatic forms of glucagon. Angler-fish proglucagon is similar but smaller, and apparently exists in two forms: a 14 kDa form (lacking GLP-2 and a 13-residue connecting peptide) and a 12 kDa form (of unknown sequence).

program 1 a sequence of coded instructions for controlling a computer or other electrical or electromechanical device, especially for enabling a computer to manipulate data in a predetermined way; an equivalent of this in an electronic or magnetic storage medium. 2 to constrain to function or operate in a particular way, especially by providing with a program or other (set of) instructions. 3 to write (and test) a computer program for a specific application. —programmable or sometimes (esp. US) programable adj.

programmable messenger a term proposed for a cytosolic protein messenger molecule in a hypothesis advanced to explain the multiple actions on their target cells of hormones whose cellular receptors are linked to oligomeric GTP-regulatory proteins in cell membranes. According to this concept, the activation of GTP-regulatory proteins (by GTP and the respective hormones) causes release of their a subunits from the membranes as cytosolic proteins, which become the primary messengers of hormone action and which thereupon are transformed by various protein-modifying enzymes (e.g. kinases and proteases) to yield new structures with selective affinities for different effectors, each responsive to its specific activating system. A variety of responses of the target cells thus may be elicited: accordingly, these messengers are considered programmable.

whereby different proteins may result from a single mRNA molecule, due to the presence of alternative sites within the mRNA that are recognized for initiation and termination of

prolactin reco

translation.

progress curve a graph showing the change with time in the concentration or amount of an analyte as a chemical reaction proceeds.

prohormone a natural precursor of a hormone, especially for the proprotein of a (poly)peptide or protein hormone.

prohormone convertase an enzyme activity that cleaves prohormones at dibasic cleavage sites to form active polypeptides. As EC 3.4.23.17 its recommended name is proopiomelanocortin converting enzyme. However, no sequence has been reported. An example of a convertase enzyme is given in kexin. See also neuroendocrine convertase.

prohormone converting enzyme see pro-opiomelanocortin converting enzyme.

proinsulin or (formerly) pro-insuline the prohormone of insulin; it is a single-chain polypeptide of ≈9 kDa with three intrachain disulfide bridges, the number of amino-acid residues varying somewhat with species (78 in dog, 81 in cattle and sheep, 84 in cod and pig, 86 in horse, human, and rat). Proinsulin is synthesized in the pancreatic B cell, where it is normally present at about 5% of the concentration of insulin, and from where it is secreted in small amounts into the blood.

projection formula any two-dimensional diagrammatic representation of the (three-dimensional) structural formula of a molecule (or part thereof) as if seen by projection onto a plane surface from a particular viewpoint in space. Bonds with different spatial orientations relative to the observer may be depicted distinctively. The term includes conformational formula, Fischer projection, Newman projection, and perspective formula.

prokaryon or procaryon (pl. prokarya or procarya) a primitive nucleus; i.e. genomic DNA in a defined structure, but lacking a nuclear membrane or other nuclear inclusions. Such an arrangement is found in bacteria (including actinomycetes) and cyanobacteria. See also nucleoid (def. 2). —prokaryous or procaryous adj.; prokaryosis or procaryosis n.

prokaryosis the condition of possessing a prokaryon or prokarya.

prokaryote or procaryote any organism in which the genomic DNA is not enclosed by a nuclear membrane within the cells; i.e. any organism whose cells possess a prokaryon. The prokaryotes comprise the bacteria, cyanobacteria, and archaea and are classified in their own kingdom, variously named Monera or Procaryotae. Compare eukaryote. —prokaryotic or procaryotic adj.

prolactin abbr.: PRL; a hormone secreted by the anterior pituitary that stimulates lactation. Human prolactin (hPRL) is a 199-residue protein, 23 kDa in its monomeric form (little prolactin), although dimeric (big prolactin, 48-56 kDa) and polymeric (>100 kDa) forms circulate in blood. The prolactin gene belongs to a family of genes, along with those encoding placental lactogen and human growth hormone (see somatotropin). Secretion is episodic; it is inhibited by dopamine, which binds to lactotrope D₂ receptor (see dopamine receptor) to inhibit adenylate cyclase, and is probably stimulated by thyrotropinreleasing hormone and vasoactive intestinal peptide. Prolactin synthesis is positively regulated by estrogen acting at the level of the prolactin gene. Receptors for prolactin are located in breast, liver, ovary, testis, and prostate, but its main site of action is the mammary gland, which is stimulated to develop by estrogen, progesterone, prolactin, and placental mammotropic hormones. Lactation is stimulated by prolactin but is prevented during pregnancy by the inhibitory action of estrogen and progesterone, the levels of which fall after parturition, allowing prolactin to initiate lactation. Example (precursor) from Gallus gallus: database code PRL_CHICK, 229 amino acids (25.81 kDa). See also prolactin receptor, proliferin.

prolactin receptor a membrane protein of the cytokine receptorampad daho domaio traves sifting of a message with the cytokine receptorampad daho domaio traves sifting of a message with the common data with t

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

code PLR2_HUMAN, 622 amino acids (69.43 kDa). The prolactin receptor is associated with a small protein calcyclin.

prolamin or (formerly) prolamine any of a group of simple proline-rich proteins, found especially in the seeds of cereal plants, that are insoluble in water, neutral salt solutions, and absolute ethanol, but soluble in dilute acid or alkali and in 70-80% aqueous ethanol. The group includes the gliadins of wheat and rye, hordein of barley, and zein of maize. Compare alutelin.

prolate 1 having a polar diameter longer than the equatorial diameter. 2 describing an ellipsoid of rotation generated by the rotation of an ellipse about its major axis. Compare oblate.

prolidase another name for X-Pro dipeptidase. Distinguish from prolinase.

proliferin or mitogen-regulated protein a prolactin-related protein, the mRNA of which appears in several murine cell lines during growth. One of several proteins of the somatotropin/ prolactin family that provide a growth stimulus to target cells in maternal and fetal tissues during the development of the embryo. The mRNA occurs in placenta, which secretes proliferin as a glycoprotein distinct from placental lactogen. Examples: three proliferin precursors from mouse: database code PRO1_MOUSE, 224 amino acids (25.34 kDa); database code PRO2_MOUSE, 224 amino acids (25.28 kDa); and database code PRO3_MOUSE, 224 amino acids (25.31 kDa).

prolinase the recommended name for Pro-X dipeptidase. Distinguish from prolidase.

prolinate 1 proline anion; the anion, (C₄H₇NH)-COO⁻, derived from proline. 2 any salt containing proline anion. 3 any ester of proline.

proline the trivial name for pyrrolidine-2-carboxylic acid, (C_4H_7NH) -COOH; a chiral cyclic N-alkylated α -amino acid. L-proline (symbol: P or Pro), (S)-pyrrolidine-2-carboxylic acid, is a coded amino acid found in peptide linkage in proteins; codon: CCA, CCC, CCG, or CCU; by virtue of its more constrained molecular structure relative to most other α amino acids it cannot participate in α-helix formation. In mammals it is a nonessential dietary amino acid and is glucogenic. It is formed from glutamate 5-semialdehyde by reduction by NADPH. D-Proline (symbol: D-Pro or DPro), (R)-pyrrolidine-2-carboxylic acid, is not known to occur naturally. See also hydroxyproline.

proline/arginine-rich protein abbr.: PARP; a 24 kDa proline- and arginine-rich protein from bovine cartilage, closely related to the N-terminal domain of collagen al (XI).

proline dehydrogenase EC 1.5.99.8; a flavoprotein enzyme that catalyses the reaction:

L-proline + acceptor + H_2O =

(S)-1-pyrroline-5-carboxylate + reduced acceptor.

The flavin is FAD. Example, from Escherichia coli, a bifunctional enzyme, having the activities of both proline dehydrogenase and 1-pyrroline-5-carboxylate dehydrogenase: database code PUTA_ECOLI, 1320 amino acids (143.66 kDa).

proline dipeptidase see X-Pro dipeptidase.

proline hydroxylase see procollagen-proline dioxygenase.

prolinium proline cation; the cation, (C₄H₇NH₂⁺)-COOH, derived from proline.

prolino the pyrrolidino group, HOOC-(C₄H₇N)-, derived from

prolyl dipeptidase see Pro-X dipeptidase. L-prolylglycine dipeptidase see Pro-X dipeptidase. prolyl hydroxylase see procollagen-proline dioxygenase.

prolyl oligopeptidase EC 3.4.21.26; other names: prolyl endopeptidase; post-proline cleaving enzyme; post-proline endopeptidase. An enzyme that catalyses the hydrolysis of Pro-|-Xaa >> Ala-|-Xaa in oligopeptides. It is a cytoplasmic (in eukaryotes) serine endopeptidase, also found in some bacteria. Example from pig: database code PPCE_PIG, 710 amino acids (80.68 kDa).

prometaphase the stage in mitosis or meiosis, following prophase, during which the nuclear envelope is disrupted and breaks into membrane vesicles, and the spindle microtubules enter the nuclear region. Kinetochores mature on each centromere and attach to some of the spindle microtubules; these are then called kinetochore microtubules while those to which kinetochores do not attach are called polar microtubules; microtubules outside the spindle are called astral microtubules. Kinetochore microtubules begin the process of aligning chromosomes in one plane halfway between the poles.

promoter symbol: P; a DNA sequence located 5' to a gene that indicates the site for the initiation of transcription. It may influence the amount of mRNA produced and the tissue specificity. Examples include the TATA box. The symbol may be subscripted to indicate particular promoters, e.g. P_{RM}, a promoter for the cI gene, RM standing for repressor maintenance.

promoter ligand an additional ligand that is included in the loading buffer in affinity chromatography, to promote specific binding to the immobilized ligand.

promutagen any substance that, when acted upon by the cell's metabolism, becomes a mutagen.

Pronase a proprietary name for a mixture of various exo- and endo-peptidases, obtained from Streptomyces griseus, that is able to hydrolyse virtually any protein almost completely to free amino acids. It is used for hydrolysis of many proteins, for digestion of mucins, in isolation of intact DNA or RNA from cells or viruses, and in dispersal of certain types of mammalian tissue cells, e.g. chondrocytes.

pronucleus (pl. pronuclei) the nucleus of either the ovum or the spermatozoon following fertilization. Thus, in the fertilized ovum, there are two pronuclei, one originating from the ovum, the other from the spermatozoon that brought about fertilization; they approach each other, but do not fuse until just before the first cleavage, when each pronucleus loses its membrane to release its contents. —pronuclear adj.

proof a standard by which the strength of distilled alcoholic solutions (or vinegars) is judged. In the UK it is the strength of a mixture of alcohol and water having a specific gravity of 0.91984, and containing 0.495 of its weight or 0.5727 of its volume of absolute alcohol. Degrees of proof express the percentage of proof spirit present; hence 70° proof spirit contains $0.7 \times 57.27\%$ alcohol. In the US, proof is a number that is twice the percentage (by volume) of alcohol present; hence 70° proof spirit contains $0.5 \times 70\%$ alcohol.

proofreading (in genetics) verification of the exact nature of a sequence of bases in DNA or amino-acid residues in a protein. Proofreading of DNA sequence occurs in transcription, during the action of DNA polymerase, when incorporation of an incorrect nucleotide causes mismatch in pairing with the complementary base on the template strand; this leads to immediate excision of the incorrect nucleotide, retreat of the enzyme to the previous position, and another attempt to insert the correct nucleotide. During translation, charging of the tRNA with its aminoacyl group is verified by its fit in the binding site; if incorrect, the aminoacyl-tRNA is hydrolysed to tRNA and amino acid and the whole process is repeated until successful. Examples of such proofreading during translation include rejection of threonine by valine-tRNA ligase, and of valine by isoleucine-tRNA ligase. See also mismatch repair.

Pro(3-OH) symbol for a residue of the α -amino acid (trans-)3prolyl the acri group (C4H NH) = CO = derived from proline in the Ban Gang do Literative to 3Hyp) inh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Pro(4-OH) propra

Pro(4-OH) symbol for a residue of the α -amino acid (trans-)4-hydroxy-L-proline (alternative to 4Hyp).

proopiomelanocortin abbr.: POMC; a 241-residue prohormone protein, also called corticotropin-lipotropin precursor, synthesized in the intermediate and anterior lobes of the pituitary as the primary gene product of the POMC gene; in humans this is located on chromosome 2. POMC is enzymically cleaved in the anterior pituitary by a prohormone convertase, PC1 to yield an N-terminal peptide (residues 1-80), corticotropin (residues 110-148) and β lipotropin (β -LPH, residues 148-241). The segment 83-107, which is thus released, is known as joining peptide. Prohormone convertase, PC2, then cleaves corticotropin to yield a-melanocyte-stimulating hormone (α -MSH; residues 110-122), and cleaves β -LPH to yield γ -LPH (residues 151-208) and β endorphin (residues 211-241). Example from human: database code COLI_HUMAN, 267 amino acids (29.39 kDa) residues 1-26 being the signal peptide. Derived hormones (cleavage points and some sizes differ from porcine above): corticotropin, 39 amino acids; corticotropin-like intermediate lobe peptide, 21 amino acids; β endorphin, 31 amino acids; lipotropins β-LPH (89 amino acids) and γ-LPH (56 amino acids); melanocyte-stimulating hormones α-MSH (13 amino acids), β -MSH (18 amino acids), and γ -MSH (11 amino acids); [Met]enkephalin (see enkephalin), 5 amino acids. In the intermediate lobe, POMC synthesis is regulated mainly by dopamine and serotonin; in the anterior lobe by glucocorticoids and corticotropin-releasing hormone. The prohormone convertases are related to furin and kexin.

proopiomelanocortin converting enzyme EC 3.4.23.17; the recommended name for prohormone convertase.

propargylamine see monoamine oxidase inhibitors.

propellant or **propellent** any substance that through pressure or combustion or other means causes propulsion, as, e.g., the use of compressed gases in spray cans.

propertide that part of a peptide chain that follows the signal sequence, and which is cleaved off in formation of the mature protein.

properdin see complement.

prophage a form of the genome of a bacteriophage in which the nucleic acid is integrated into the genome of the phage's bacterial host, a state known as **lysogeny**. Activation to produce mature phage can occur, with accompanying lysis of the bacterium. For example, in **lambda phage**, transcription of the prophage is repressed by a gene, cl, that codes for a repressor protein that binds to the operator (O) genes to prevent use of the promoter (P) genes. The product of the cII gene, CII, is critical in determining the switch between lysogeny and lysis; if CII is not active (e.g. due to breakdown by host proteases) lysogenization is favoured, since CII competes with the repressor product of cI and prevents it binding to O.

prophage induction see phage induction.

prophage-mediated conversion another name for bacteriophage conversion.

prophage reactivation the phenomenon in which the survival of UV-irradiated lambda phage is higher in a host carrying a homologous heteroimmune prophage than in a host that is nonlysogenic or is lysogenic with a nonhomologous prophage.

prophase the initial stage of mitosis or meiosis in which the chromosomes are condensed, becoming apparent within the nucleus, but are not yet attached to a mitotic spindle. By early prophase, the single centrosome contains two centriole pairs; at late prophase, the centrosome divides and the two asters move apart. In meiosis, the chromosomes come together in homologous pairs, and undergo crossing-over. This occurs during the first of the two meiotic cell divisions, and is divided into several stages. In the first, zygotene, a complex structure develops between the two sister chromatids of each pair, which may play a part in recombination. They remain in the complex during a stage known as pachytene, then separate at the diplotene stage.

with specificity towards paired basic residues (-Lys-Arg-, -Arg-Arg-, or -Arg-Lys-) and no activity towards single basic residues.

propionate the anion, CH₃-CH₂-COO⁻, derived from propionic acid, in any salt; designation for the **propionyl** radical in naming an ester.

propionibacteria bacteria belonging to the genus *Propionibacterium*. They are characterized by their activity in fermenting glucose or lactic acid to propionic acid; acetic acid is also a major product. See also propionic-acid fermentation.

propionic acid propanoic acid; CH₃-CH₂-COOH; a carboxylic acid, important in the energy metabolism of ruminants, in which it is formed by rumen bacteria. It is the basis of a series of nonsteroidal anti-inflammatory agents, known as substituted propionic acids; see ibuprofen.

propionic-acid fermentation fermentation of glucose or lactate by Propionibacterium spp. (see propionibacteria) to either propionate or acetate; pyruvate is a common intermediate for both transformations, the pathway then branching to form either propionate or acetate. In propionate formation, pyruvate first reacts with methylmalonyl-CoA to form propionyl-CoA and oxaloacetate. The latter is converted by reactions of the tricarboxylic-acid cycle to succinate, which then reacts with the propionyl-CoA to form propionate and succinyl-CoA. The succinyl-CoA is converted to methylmalonyl-CoA, which is then available to react with a further molecule of pyruvate. Conversion of pyruvate to acetic acid involves oxidative decarboxylation to acetyl-CoA, reaction of this with orthophosphate to form acetyl phosphate, and reaction of the latter with ADP to form ATP and acetic acid. When lactate is the initial substrate, this is first converted to pyruvate by lactate dehydrogenase. This enzyme is a flavoprotein, that is oxidized by a cytochrome b.

propionyl symbol: Pp; the trivial name for propanoyl, CH₃-CH₂-CO-, the univalent acyl group derived from propionic (i.e. propanoic) acid.

propionyl-CoA carboxylase abbr.: PCCase; EC 6.4.1.3; an enzyme that catalyses a reaction between ATP, propanoyl-CoA, and HCO₃⁻ to form (S)-methylmalonyl-CoA, ADP, and orthophosphate; biotin is a coenzyme. It is an enzyme in the catabolic pathways of odd-chain fatty acids and isoleucine, occurring in the mitochondrial matrix. Defects cause propionic acidemia, which is inherited as a recessive trait. Example from human (precursor); six α chains (biotin binding): database code PCCA_HUMAN, 702 amino acids (77.01 kDa); and six β chains: database code PCCB_HUMAN, 155 amino acids (16.99 kDa).

proplastid the precursor of a plastid.

propolypeptide the inactive form in which some polypeptide hormones or other agonists are produced; it is then activated by removal of part of the sequence by a proteinase.

proportional counter any device for measuring radioactive disintegrations by means of a gas-filled ionization chamber, e.g. Geiger counter, operating in the **proportional region**.

proportional region a range of voltages applied to a gas-filled ionization chamber (e.g. Geiger counter) over which the gas amplification is greater than unity. In radioactive counters of this type, measurement depends on ionization of the gas in the ionization chamber by emitted radiation. Up to a certain applied voltage, ion production and thus the current through the chamber depends solely on collisions between emitted radiation and gas molecules; at higher voltages, the current is enhanced by additional collisions, so that sensitivity is increased, but the current remains proportional (hence the name proportional region) to the rate of emission of radiation. Compare Geiger region.

propositus or (fem.) **proposita** (pl. **propositi**) or **proband** the first individual to present as a patient, in a series of cases related (usually) to a heritable disorder, and from whom the line of descent is traced.

propheromana convertase dy a proteasch strict sent his 1934 Nordprens Ne an himportant badden sechtschantagoniatiehe 1699

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

form is the active structure. It is used therapeutically as an antihypertensive, anti-anginal, and anti-arrhythmic. *One proprietary name*: Inderal (as hydrochloride).

propressophysin the polypeptide precursor of vasopressin and neurophysin (see vasopressin-neurophysin 2-copeptin precursor).
 A clinical name for the product of the gene associated with familial neurogenic diabetes insipidus.

proprotein an inactive form of a protein, having an additional sequence that is removed by a proteinase to yield the active protein; a classic example is **proinsulin**. A **zymogen** is a form of proprotein, sometimes referred to as a proenzyme.

propyl symbol: Pr; n-propyl; the alkyl group, CH₃-CH₂-CH₂-, derived from propane. Compare isopropyl.

pro-R/pro-S convention stereochemical descriptors for paired, chemically-like ligands at a prochiral centre; they derive from an extension of the **sequence rule** used to assign R,S descriptors to a chiral centre. In the prochiral (but achiral) structure, Caabc, the chemically-like ligands are the two atoms (or groups of atoms), a. For the sake of example assume that the sequence rule gives the priority sequence, a > b > c. In the molecular model (or projection formula) arbitrarily label the a groups as a' and a'' and arbitrarily assign higher priority to one of them, e.g., a' > a''. The modified priority sequence, a' > a''a'' > b > c, is then considered with the model viewed from the side remote from c. If this gives a right-handed ordering for a' $\rightarrow a'' \rightarrow b$, thus leading to R chirality for the arbitrarily created chiral element, the promoted a' is designated the pro-R group; conversely, if the arbitrarily created chiral element reveals an S ordering, the promoted group is pro-S. Example: glycerol, HOCH2-CHOH-CH2OH, contains two chemicallylike CH₂OH groups, and the normal priority sequence is OH > CH₂OH > H. In the Fischer projection formula with the central carbon atom having the OH group to the right and H to the left, arbitrarily assign the top C'H2OH group priority over that at the bottom, C"H2OH, giving the modified sequence, OH > C'H₂OH (top) > C"H₂OH (bottom) > H. When the model is viewed from the side remote from the lowest priority atom (H) the ordering, OH \rightarrow C'H₂OH (top) \rightarrow CH₂OH (bottom) is right-handed so that the arbitrarily created chiral element has R chirality; hence the top $C'H_2OH$ is the pro-R group. Subscript letters R and S can be used to indicate whether an atom or group of atoms is pro-R or pro-S. This is most commonly done for the two hydrogens of a methylene group, with H_R indicating the pro-R hydrogen and H_S the pro-S hydrogen. For a methylene group, replacement of ¹H_R by ²H or ³H gives a centre with R chirality; similar replacement of ¹H_S gives a centre with S chirality. See also enantiotopic.

pros a designator of position of a nitrogen in the histidine imidazole ring, being that nitrogen nearest to the side chain; often abbreviated to π , as in N^{π} . Compare **tele**.

PROSITE a database of all documented protein motifs. prosolin see stathmin.

prosome another name for proteasome.

prostacyclin or prostaglandin I (abbr.: PGI) any of a group of prostanoids synthesized by prostaglandin-I synthase (EC 5.3.99.4) from prostaglandin H – which itself is the product of prostaglandin-endoperoxide synthase – as prostaglandin I₂, I₁, or I₃, depending on whether the substrate for the enzyme is arachido Bate dang the months of the synthase and prostaglandin or whether the substrate for the enzyme is arachido Bate dang the months of the synthase and prostaglandin or whether the substrate for the enzyme is arachido Bate dang the months of the synthase (BC 5.3.99.4) For prostaglandin I₂, I₁, or dioate. The structures of prostanoic acid, with its carbon numbering, and of PGG₂, PGH₂, PGD₂, PGE₂ and PGF_{2α} are arachido Bate dang the months of the synthase (EC 5.3.99.4) from prostaglandin I (abbr.: PGI) and 5,7-dihydroxy-11-oxotetranor prostane-1,16 dioate. The structures of prostanoic acid, with its carbon numbering, and of PGG₂, PGH₂, PGD₂, PGE₂ and PGF_{2α} are arachido Bate dang the synthase (EC 5.3.99.4) from prostaglandin I (abbr.: PGI) and 5,7-dihydroxy-11-oxotetranor prostane-1,16 dioate. The structures of prostanoic acid, with its carbon numbering, and of PGG₂, PGH₂, PGD₂, PGE₂ and PGF_{2α} are arachido Bate dang the synthase (EC 5.3.99.4) from prostaglandin I (abbr.: PGI) and bate danged the synthase (FC 5.3.99.4) from prostaglandin I (abbr.: PGI) and bate danged the synthase (FC 5.3.99.4) from prostaglandin I (abbr.: PGI) and bate danged the synthase (FC 5.3.99.4) from prostaglandin I (abbr.: PGI) and bate danged the synthase (FC 5.3.99.4) from prostaglandin I (abbr.: PGI) and bate danged the synthase (FC 5.3.99.4) from prostaglandin I (abbr.: PGI) and bate danged the synthase (FC 5.3.99.4) from PGE₂ and bate oxidation and omega oxidation to urinary metabolite such as 7α-hydroxy-5,11-dioxotetranor prostane-1,16 dioate. The structures of prostaglandin I (abbr.: PGI) and prostaglandin I (abbr.: PGI) and prostaglandin I (abbr.: PGI) and prostaglandin I (abbr.: PGI)

5,8,11,14,17-pentaenoate respectively. PGI₂ is the major product in vivo; it is produced by endothelial cells of blood-vessel walls, has potent platelet anti-aggregatory properties resulting from stimulation of adenylate cyclase, and induces vasodilation. It has a normal half-life of 2 min, being degraded by hydrolysis to 6-oxo-prostaglandin $F_{1\alpha}$; this is then converted to the 6,15-dioxo-13,14-dihydro-PGF $_{1\alpha}$, and follows a similar degradative path to other prostaglandins. More stable but still active analogues have been synthesized, e.g. carbacyclin. (S)-15-hydroperoxyeicosatetraenoate inhibits prostaglandin-I synthase. See also **prostaglandin**.

prostaglandin I2

prostacyclin synthase see prostaglandin-l synthase.

prostaglandin abbr.: PG; any of a group of biologically active metabolites of arachidonate (PG₂ series), dihomo-y-linolenate (PG₁ series), or eicosa-5,8,11,14,17-pentaenoate (PG₃ series). They characteristically contain a cyclopentane ring due to formation of a bond between C-18 and C-12 of the fatty acid; hydroxy or oxo substitution at positions 9 and 11 is a major distinguishing feature between prostaglandin classes. They were originally discovered as a uterus-contracting activity in seminal plasma, and are now known to possess a protean array of highly potent biological activities that defy simplification. However, to give an indication of these roles, their pharmacological effects include: vasodilation (PGE2 and prostacyclin) which is short-acting, and vasoconstriction $(PGF_{2\alpha} \text{ and thromboxane } A_2)$; oxytocic activity $(PGF_{2\alpha} \text{ can be})$ used to terminate pregnancy in the second trimester and PGE₂ induces labour at term); bronchodilation (PGE series) and constriction (PGF series). They are involved in inflammatory reactions, and the enzymes that are involved in their synthesis are targets for antiinflammatory agents such as aspirin and non-steroidal antiinflammatory drugs such as ibuprofen. They are also involved in the regulation of cell proliferation in normal and neoplastically transformed cells. Prostaglandins are formed from the precursors prostaglandin G1, G2, or G3, the intermediate products of prostaglandin-endoperoxide synthase, depending on the substrate fatty acid; the same enzyme converts these to prostaglandins H, from which other enzymes form prostaglandins D, E, and F, and also prostacyclins (or prostaglandins I). These are, from the bioactive aspect, the end products of the system, but they have a half-life of minutes, being rapidly converted to metabolites with much weaker, or often inhibitory properties. The initial metabolites are the 15-oxo-13,14-dihydroprostaglandins, produced by the sequential actions of 15-hydroxyprostaglandin dehydrogenases (e.g. EC 1.1.1.196 and 1.1.1.197) and 15-oxoprostaglandin 13-reductase (EC 1.3.1.48); these are further degraded by beta oxidation and omega oxidation to urinary metabolites such as 7α -hydroxy-5,11-dioxotetranorprostane-1,16-dioate (from PGE₂) and 5,7-dihydroxy-11-oxotetranorprostane-1,16dioate. The structures of prostanoic acid, with its carbon numbering, and of PGG₂, PGH₂, PGD₂, PGE₂ and PGF_{2a} are

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

prostaglandin E2

prostaglandin H₂

prostanoic acid

prostaglandin-D synthase abbr.: PGD synthase; EC 5.3.99.2; other name: prostaglandin- H_2 D-isomerase; an enzyme that catalyses the conversion of (5Z,13E)-(15S)- 9α , 11α -epidioxy-15-hydroxyprosta-5,13-dienoate to (5Z,13E)-(15S)- 9α ,15-dihydroxy-11-oxoprosta-5,13-dienoate (prostaglandin D). Gluta-

human, PGD₂ synthase (glutathione-independent PGD synthetase or β-trace protein): database code PGHD_HUMAN, 190 amino acids (21.00 kDa).

prostaglandin-endoperoxide synthase EC 1.14.99.1; other names: prostaglandin synthase; prostaglandin G/H synthase. An enzyme whose reaction embraces the activity formerly referred to as cyclooxygenase; it catalyses a reaction between dioxygen, arachidonate and two molecules of reduced glutathione (GSH) to form prostaglandin H2, oxidized glutathione (GSSG), and H₂O. The enzyme acts as both a dioxygenase and as a peroxidase. It catalyses the formation of the precursor, prostaglandin G₂ (PGG₂), for the biosynthesis of all prostanoid compounds, by forming an endoperoxide bridge between C-9 and C-11, simultaneously bonding C-8 and C-12 to form the cyclopentane ring, and also forming the hydroperoxide at C-15. The latter is reduced by a reduced glutathione (GSH)dependent peroxidase activity of the enzyme to a hydroxyl group to form prostaglandin H2; these, and their further metabolites, prostaglandins D, E and F, are highly potent bioactive compounds with a great diversity of actions (see prostaglandin). The enzyme can also act on dihomo-(6,9,12)linolenic acid, to form a series of prostaglandins (denoted by a subscript 1, e.g. PGE₁) lacking the C-5 double bond, and on eicosa-5.8.11,14.17-pentaenoic acid, to form the 3 series of prostaglandins (e.g. PGE₃), with the additional double bond at C-17. Two isoenzymes, COX-1, constitutively expressed, and COX-2, inducible in inflammation by cytokines, are highly homologous membrane proteins, but selective inhibition of COX-2 is possible due to its larger inhibitor-binding site. Aspirin acetylates an active-site serine residue in both, the IC₅₀ being 10 to 100 times lower for COX-1 than for COX-2. Its inhibiton of COX-1 is the basis of its antithrombotic effects. Examples, both from human, COX-1 (precursor): database code PGH1_HUMAN, 599 amino acids (68.58 kDa); COX-2 (precursor): database code PGH2_HUMAN, 604 amino acids (68.98 kDa). See also prostacyclin, thromboxane.

prostaglandin- E_2 9-reductase EC 1.1.1.189; an enzyme that catalyses the reduction by NADPH of (5Z,13E)-(15S)- 11α ,15-dihydroxy-9-oxoprosta-5,13-dienoate (PGE_2) to (5Z,13E)-(15S)- 9α ,11 α ,15-trihydroxyprosta-5,13-dienoate $(PGF_{2\alpha})$ with formation of NADP⁺. The monomeric cytoplasmic human enzyme catalyses reduction of many carbonyl compounds. In addition to the activity of prostaglandin- E_2 9-reductase (also termed prostaglandin 9-ketoreductase) described here two other activities are present. They are that of carbonyl reductase (NADPH) EC 1.1.1.184, and 15-hydroxyprostaglandin dehydrogenase (NADP⁺), EC 1.1.1.197: database code DHCA HUMAN 276 amino acids (30.21 kDa)

DHCA_HUMAN, 276 amino acids (30.21 kDa). **prostaglandin-E synthase** EC 5.3.99.3; other names: prostaglandin-H₂ E-isomerase; endoperoxide isomerase; an enzyme that catalyses the conversion of (5Z,13E)-(15S)- 9α , 11α -epidioxy-15-hydroxyprosta-5,13-dienoate to (5Z,13E)-(15S)- 11α ,15-dihydroxy-9-oxoprosta-5,13-dienoate (PGE₂). Glutathione is a cofactor.

prostaglandin-F synthase EC 1.1.1.188; other name: prostaglandin-D₂ 11-reductase; an enzyme that catalyses the formation of (5Z,13E)-(15S)- 9α , 11α ,15-trihydroxyprosta-5,13-dienoate and NADP+ from (5Z,13E)-(15S)- 9α ,15-dihydroxy-11-oxoprosta-5,13-dienoate and NADPH. It is a monomeric protein of the prostaglandin biosynthetic pathway. Example of bovine enzyme (precursor): database code PGFS_BOVIN, 322 amino acids (36.55 kDa).

prostaglandin-l synthase EC 5.3.99.4; other name: prostacyclin synthase; an enzyme that catalyses the conversion of (5Z,13E)-(15S)- 9α , 11α -epidioxy-15-hydroxyprosta-5,13-dienoate to (5Z,13E)-(15S)-6, 9α -epoxy- 11α , 15-dihydroxyprosta-5,13-dienoate (PGI₂, prostacyclin). This is a hemethiolate protein. Example from human: database code JC2231, 500 amino acids (57.04 kDa).

thione is a cofactor in some cases. Example (precursor) from Nordethnoise the anion of prostanoic acid. 2-octylevelopent-Ban dang doc mot quyen sach duoc tang bot HUY NOVEN. Neu ban co như cau ve sach sinh học, xin liên hệ: Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, prostanoid

aneheptanoic acid; the 8S,12S form is the parent compound for prostanoid nomenclature. For structure, see prostaglandin.

prostanoid any compound based on or derived from the prostanoate structure, including the prostaglandins, prostacyclins, and thromboxanes.

prostasin a serine protease with trypsin-like activity, found in human seminal fluid.

prostate-specific antigen abbr.: PSA; a proteinase which is virtually prostate specific. Levels may be elevated in prostate hypertrophy but the release into the serum from cancer is higher than from normal tissue. It is a much better marker than acid phosphatase, being elevated at an earlier stage of the tumour. PSA is a serine endopeptidase belonging to the family of glandular kallikreins with a His-Asp-Ser charge-relay system. Its physiological substrate is the predominant protein of the seminal vesicle coagulum. It can be isolated from prostate epithelial cells and seminal plasma. Example from human (precursor): database code PROS_HUMAN, 261 amino acids (28.74 kDa); residues 1-18 are a signal sequence, 19-24 a propeptide, and 25-261 PSA.

prostatic of, pertaining to, or related to the prostate gland. **prosthetic group** a nonprotein group that is combined specifically with a protein, in stoichiometric proportion.

protachykinin β precursor a preproprotein from which certain polypeptide hormones are cleaved, not all by the same processing pathway. Example from human: database code TKNB_HUMAN, 129 amino acids (14.99 kDa). Derived peptides: substance P, residues 58–68; neurokinin A, residues 98–107; neuropeptide K, residues 72–107; residues 68 and 107 are C-amidated in the derived peptides. See also tachykinin.

protamine any of a group of small peptides, containing arginine, alanine, and serine, that are isolated from the sperm of fish (e.g. salmon, herring, sturgeon, trout, and mackerel), but present in the sperm of all animals. They have a histone-like function in the chromatin of sperm, compacting sperm DNA into a condensed complex. Example, sperm protamine P1 from Alouatta seniculus (howler monkey): database code HSP1_ALOSE, 51 amino acids (6.82 kDa).

protamine sulfate a sulfated derivative of a **protamine**. Protamine sulfates combine with, and inactivate, **heparin**, and are used to prevent bleeding in heparin overdose.

protease a former name for any enzyme that catalyses the hydrolysis of peptide bonds in a protein or polypeptide. The specific names **endopeptidase**, **aminopeptidase**, and **carboxypeptidase** are now recommended. See also **proteinase**.

protease inhibitor 4 see kallistatin.

protease nexin I see nexin 1.

proteasome or proteosome EC 3.4.99.46 recommended name: multicatalytic endopeptidase complex; other names: multicatalytic proteinase (complex); ingensin; macropain; prosome; lens neutral proteinase. Proteasomes are large multi-subunit protease complexes that selectively degrade intracellular proteins. Most of the proteins removed by these proteases are tagged for destruction by ubiquitination. Proteasomes play a role in controlling cellular processes, such as metabolism and the cell cycle, through signal-mediated proteolysis of key enzymes and regulatory proteins. They also operate in the stress response, by removing abnormal proteins, and in the immune response, by generating antigenic peptides. The proteolytic activity is due to a 26S protease, which is a 2 MDa complex. The ability of this 26S protease to degrade proteins generally depends on both the ubiquitination of the substrate and the presence of ATP. The core of the 26S protease is a 20S particle that carries the catalytic activity. It is this 20S particle that was first isolated, and was called 'multicatalytic proteinase' because it possessed trypsin-like, chymotrypsin-like and peptidyl-glutamyl activities, with the ability to cleave peptide bonds carboxy-terminal to basic, hydrophobic, and acidic residues. The 20S particle does not require ATP for activity. Following the determination of the crystal structure of this

ture has been clarified. The proteasome itself is inactive and requires two specific subunits of a 19S particle to mediate recognition of ubiquitin-protein conjugates. The proteasome subunits are arranged in four heptameric rings which are stacked together to form a hollow cylinder with the protease activity on the inside. The active site nucleophile is threonine. The size of the channel in the cylinder is such that the protein substrate first must be unfolded and the disulfide bonds reduced. In Thermoplasma, the two outer rings of the 20S proteasome are composed of seven a subunits, and each inner ring contains seven \(\beta \) subunits, an organization that is likely also to apply in eukaryotic 20S proteasomes. The enzyme catalyses the cleavage at Xaa-|- bonds in which Xaa carries a hydrophobic, basic, or acidic side chain. Components (all examples are human): c2 (other names: macropain subunit c2; proteasome v chain; multicatalytic endopeptidase complex subunit c2; 30 kDa proteasomal protein): database code PRC2_HUMAN, 263 amino acids (29.52 kDa); c3 (EC 3.4.99.46; other names: macropain subunit c3; multicatalytic endopeptidase complex subunit c3): database code PRC3_ HUMAN, 233 amino acids (25.74 kDa); c5 (other names: macropain subunit c5; proteasome y chain): database code PRC5_HUMAN, 241 amino acids (26.46 kDa); proteasome chain 7 (other names: macropain chain 7; multicatalytic endopeptidase complex chain 7; ring 12 protein): database code PRC7_HUMAN, 219 amino acids (23.24 kDa); proteasome component c8 (other names: macropain subunit c8; multicatalytic endopeptidase complex subunit c8): database code PRC8_HUMAN, 254 amino acids (28.27 kDa); proteasome component c9 (other names: macropain subunit c9; multicatalytic endopeptidase complex subunit c9): database code PRC9_HUMAN, 261 amino acids (29.45 kDa); proteasome \(\beta \) chain (other names: macropain β chain; multicatalytic endopeptidase complex β chain (fragment)): database code PRCB_HUMAN, 28 amino acids (2.79 kDa); component c13 (other names: macropain subunit c13; multicatalytic endopeptidase complex subunit c13): database code PRCC_HUMAN, 208 amino acids (23.03 kDa); δ chain (other names: macropain δ chain; multicatalytic δ endopeptidase complex chain): database PRCD_HUMAN, 205 amino acids (21.68 kDa); & chain (other names: macropain & chain; multicatalytic endopeptidase complexe chain; proteasome chain 6 (fragment)): database code PRCE_HUMAN, 26 amino acids (2.32 kDa); component mecl-1 (other names: macropain subunit mecl-1; multicatalytic endopeptidase complex subunit mecl-1): database code PRCF_HUMAN, 273 amino acids (28.90 kDa); t chain (other names: macropain \u03c4 chain; multicatalytic endopeptidase complex τ chain; 27 kDa proteasomal protein (also in rat)): database code PRCI_HUMAN, 246 amino acids (27.37 kDa); \(\zeta \) chain (other names: macropain ζ chain; multicatalytic endopeptidase complex ζ chain): database code PRCZ_HUMAN, 241 amino acids (26.44 kDa).

protectin see CD59.

protecting group or protective group or blocking group any chemical group added to a reactive centre of a molecule to prevent it from reacting during chemical treatments in which it is not intended to participate. Such groups are commonly used during chemical synthesis of macromolecules or shorter polymers of amino acids or nucleotides. Reagents contributing protecting groups should react readily under mild conditions, with high specificity, and lead to addition of a group that can be removed highly specifically under mild conditions. For protein or amino-acid protecting groups see aminoethyl, Boc, citraconylation, DABITC, dabsyl, dansyl, Fmoc, maleylation, pipsyl, silylation, succinylation, tosyl, triphenylmethyl group.

because it possessed trypsin-like, chymotrypsin-like and peptidyl-glutamyl activities, with the ability to cleave peptide bonds carboxy-terminal to basic, hydrophobic, and acidic residues. The 20S particle does not require ATP for activity. Following the determination of the crystal structure of this core from the Archaeon Thermoplasma acidophilum, the structure of Ban dang doc mot quiven sach duoc tang boi Huy NGUYEN. protein and peptide biosynt

PG1_PIG, 149 amino acids (16.67 kDa); protegrin 1 is residues 131-148.

protein any of a large group of organic compounds found as major macromolecular constituents of living organisms. All enzymes are proteins, although catalytic activity is shown by some nucleic-acid molecules (see ribozyme). A protein is a linear polymer of amino acids linked by peptide bonds in a specific sequence. In the biosynthesis of the polypeptide chain, any of 20 different amino acids may be incorporated, according to the genetic instructions of the cell (see protein and peptide biosynthesis). The amino-acid residues may be modified subsequently so that the chains may contain a much wider variety of residues, amounting to nearly 200. The modifications may involve the covalent attachment of various groups such as carbohydrates and phosphate; these are the simple proteins. Other substances may be more loosely associated with the polypeptide chains, such as heme or lipid, giving rise to the conjugated proteins. Four hierarchies of structure may be detected in the polypeptide chains: primary structure is the order of the specific amino-acid residues; secondary structure is the way the aminoacid residues interact within a chain to form structures such as the alpha helix and the beta strand; tertiary structure signifies the way in which an entire single polypeptide chain (or chains linked by disulfide bonds) folds to form a three-dimensional structure; and quaternary structure is the interaction between intact chains to form multi-subunit proteins. The various ways in which the polypeptide chains fold have been elucidated, in particular with regard to the presence of alpha helices and betapleated sheets. Four types of proteins may be classified: allalpha; all-beta; alpha/beta; and alpha + beta. Some important protein types are listed separately in this dictionary and many others are listed individually: contractile proteins (actin, myosin, tropomyosin, tubulin), heat-shock proteins, hemoproteins (cytochromes, hemoglobin, myoglobin), lipoproteins, membrane proteins (ATPases, ion channels, rhodopsin), nonheme proteins (blood coagulation factors, serum albumin, serum globulin), nuclear proteins (histones), plasma proteins, and structural proteins (collagen, crystallin, keratin). Nutritional aspects of protein metabolism include the fact that higher animals cannot synthesize certain of the amino acids required for protein synthesis; such amino acids are referred to as essential amino acids. Plants and most microorganisms can synthesize all of the amino acids required for protein synthesis and many others. The nutritional value of different proteins depends on their composition. Some proteins are of poor nutritional value due to lack of essential amino acids, e.g. gliadin, which lacks lysine, and zein, which lacks lysine and tryptophan. —proteinaceous adj.

14-3-3 protein any of a highly conserved family of proteins, widespread in higher eukaryotes, that seem to act as regulators in signal transduction or phosphorylation. The name derives from the migration position on DEAE-cellulose columns, and on starch-gel electrophoresis, of certain brain proteins that were the first members of the family to be studied. Members of this family have been implicated in regulation of protein kinase C, transcriptional regulation in plants, exocytosis, cell-cycle regulation, and interaction with Raf in the MAP **kinase** cascade. For example, 14-3-3 protein β (other name: protein kinase C inhibitor protein-1) from sheep activates tyrosine and tryptophan hydroxylases in the presence of Ca²⁺/calmodulin-dependent protein kinase II. The bovine equivalent has an identical sequence: it is a homodimer: database code 143B_BOVIN, 244 amino acids (27.82 kDa).

protein A a bacterial cell-wall protein, found in many strains of Staphylococcus aureus, that can bind, without masking the antigen-binding site, to the Fc region of IgG. It binds weakly to human IgA, IgE, and IgM but fails to bind to human IgG3 and IgD; it does not bind to cell Fc receptors. The purified protein or a preparation of cells of S. aureus that carry protein A is widely used as an immunochemical reagent, often in an immobilized form on affinity columns, for isolation and puriplexes, of antigens and immune complexes. It is also used as a binding reagent in enzyme-linked immunoassay, in histochemistry, and in blotting techniques.

protein and peptide biosynthesis the biochemical synthesis of proteins. Biochemists became actively concerned with the elucidation of the mechanism of protein synthesis from about 1950. The classical pathway was expected to involve the utilization of enzymes to synthesize peptide intermediates, which would sequentially be linked together, but it soon became apparent that the number of enzymes involved would be horrendous and, moreover, there was no evidence that such peptide intermediates existed in living cells. Although there was a suggestion that peptide bonds were synthesized by transpeptidation using proteolytic enzymes, on theoretical grounds there was increasing support for the concept that the amino acids would first be aligned on a template and then be sequentially linked by peptide bonds. Following the elucidation of one structure for DNA in 1953 it was confidently predicted that the template would be nucleic acid. Shortly after, in 1955, P. C. Zamecnik and his group in Boston demonstrated the synthesis of a polypeptide by the isolated microsome fraction from rat liver. This involved the presence of particles (ribosomes), a soluble extract of the cell, and ATP and

As will be described, the synthesis of most peptides in living cells depends on the presence of ribosomes. This includes the small peptide hormones, such as oxytocin and vasopressin, which are synthesized as polyproteins. Other peptides are not synthesized by means of ribosomes. Thus glutathione is synthesized by soluble enzymes in two steps. Many biologically active peptides, especially cyclic structures, are products of microorganisms. These include such antibiotic peptides as gramicidin S, the tyrocidines, and the polymyxins. The systems responsible for their synthesis consist of interacting multienzymes in which activated aminoacyl groups are transferred onto -SH groups to form intermediate thioesters. The multienzymes are unusual in size, ranging from 120 to 1700 kDa. The respective genes consist of repeating modules, each encoding the incorporation of one amino-acid residue. The genes are arranged in clusters associated with genes encoding auxiliary proteins for the synthesis of precursors, modifying enzymes, exporting proteins, and regulatory systems. In addition to the amino acids and ATP, S-adenosylmethionine is required as methyl group donor if N-methylated bonds are involved. Due to their complexity (cyclosporin synthase for example, integrates 40 reactions on one polypeptide chain), the multienzyme systems have low turnover numbers. It has been possible to set up cell-free systems for the production of various peptides and their analogues.

With respect to the synthesis involving ribosomes it was shown that the first step was the activation of the amino acids to form amino-acid adenylates. The amino acids were then transferred to an RNA present in the soluble extract of the cell, and so named soluble RNA but later termed transfer RNA (tRNA) to which the amino acids became attached by an ester linkage. The template was then found to be messenger RNA (mRNA), which associates with the ribosomes themselves. Although the ribosomes themselves contain much RNA it came as a surprise that this did not serve as a template. The translation of the triplet codons in mRNA to provide a polypeptide involves three steps: chain initiation, chain elongation (see elongation factor), and chain termination (see release factor). Chain initiation normally starts with the codon for methionine, AUG. For this purpose a unique initiator tRNA is involved. Many protein factors play a part in the three processes and five molecules of ATP and GTP participate. The ribosomes participate in a cycle during which they subdivide into their two subunits only to reassemble. Hence the synthesis of a peptide bond is a surprisingly expensive process in terms of cell physiology. The targeting of the newly synthefication of immunoglobulins and, by forming ternary com-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

protein-glutamine y-glutamyltransfe

esis. The mechanism of ribosomal protein synthesis is very similar in all types of cell but there are subtle differences between prokaryotes and eukaryotes, which account for the differential action of antibiotics such as chloramphenicol and cycloheximide. Apart from differences in the number and properties of the soluble factors the main difference involves chain initiation: in prokaryotes this is by way of formylmethionine while in eukaryotes, apart from mitochondria, this involves methionine.

proteinase name introduced in 1928 to distinguish a sub-class of proteases that catalyse the hydrolysis of peptide bonds more readily in an intact protein than in small peptides. It is still widely used. **Endopeptidase** is now recommended.

proteinase K EC 3.4.21.64; recommended name: endopeptidase K; other name: Tritirachium alkaline proteinase. A serine proteinase enzyme that catalyses the hydrolysis of keratin, and of other proteins with subtilisin-like specificity. Example from the fungus Tritirachium album: database code NRL_2PRK, 279 amino acids (28.88 kDa); 3-D structure of this, and with inhibitor bound, is known.

proteinase V8 see glutamyl endopeptidase.

protein B a cell-surface protein of group B Streptococcus species that binds specifically to the Fc region of human IgA, without affecting its antigen-binding capacity, but not to other immunoglobulins or serum proteins. It is used in enzyme-linked immunoassay and blotting techniques.

protein biosynthesis see protein and peptide biosynthesis.

protein-bound iodine abbr.: PBI; that fraction of iodinated molecules bound to protein in serum. It is due largely to thyroxine (T₄), 99.97% of which in human serum is present bound to the binding proteins T₄-binding globulin, T₄-binding prealbumin and albumin, but also to T₃, 99.7% of which is bound to the same proteins. Determination of PBI (now replaced by immunoassay) was used for estimation of blood thyroid hormones as a basis for assessment of thyroid function.

protein C a vitamin K-dependent glycoprotein that is the zymogen of a serine endopeptidase in normal blood plasma; M_r 62 000 (human), 54 300 (bovine). It is formed from a precursor, autoprothrombin IIA, which is cleaved into a light chain and a heavy chain held together by a disulfide bond to form protein C. Thrombin cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin; protein C then becomes the enzyme protein C (activated), EC 3.4.21.69. This activated form specifically hydrolyses factors Va and VIIIa to inactive forms (in a reaction requiring phospholipid, calcium, and protein S), thereby acting as a potent anticoagulation factor; it contains 10-12 y-carboxyglutamyl residues in the N-terminal 40 residues. Example (precursor) from human: database code PRTC_ HUMAN, 461 amino acids (52.01 kDa). A congenital deficiency of protein C (usually autosomal dominant) is often not compatible with survival, or leads to hemorrhagic disease of the newborn. Protein C is so named because it eluated from columns as the third of four peaks labelled A, B, C, and D.

protein C23 see nucleolin.

protein C-binding protein see apolipoprotein H.

protein disulfide-isomerase EC 5.3.4.1; other name: disulfide rearrangase; an enzyme that enhances the rate of interchange in the groups attached to two or more intrachain or interchain disulfide bonds in a protein. It was originally described by Anfinsen in 1966 concerning the reversible denaturation of ribonuclease and then called 'rearrangase'. It has since been shown to be a luminal protein of the endoplasmic reticulum. It is a homodimer; two of its domains are homologous to thioredoxin of Escherichia coli. It is also the triacylglycerol transfer protein (MTP) that facilitates the incorporation of lipids into newly synthesized core lipoproteins within the endoplasmic reticulum. It serves as the β subunit of procollagenproline dioxygenase. Examples: probable protein disulfidekDa microsomal protein): database code ER60_HUMAN, 505 amino acids (56.64 kDa); precursor (human) of this and also prolyl 4-hydroxylase β subunit (EC 1.14.11.2) and cellular thyroid hormone binding protein (p55): database code PDI_HUMAN, 508 amino acids (57.04 kDa).

protein engineering the process whereby a protein of any desired primary structure can (in principle) be created by the use of recombinant DNA technology. The ability to express DNA in a bacterium such as Escherichia coli creates the potential to synthesize a protein with the desired primary structure. Bacteria cannot effect post-translational modifications so if these also are required a eukaryotic host cell such as yeast must be employed. In principle there are no problems with the proteins of bacterial cells but introns present in the genome of eukaryotic cells present a potential problem. This can be overcome by preparing complementary DNA, cDNA, which is synthesized by the use of the mRNA as template and the enzyme reverse transcriptase. There are several ways whereby the DNA for the required protein may be prepared by modification of the base sequence of the natural DNA. DNA may be used that contains inserts of synthetic oligonucleotides, or stretches replaced by these. Oligonucleotide-directed mutagenesis may be used to modify a single base to produce a protein with a single amino-acid replacement. This is done by preparing an oligonucleotide primer with the modified sequence which will base pair with the natural DNA around the site to be altered; a single base substitution still permits satisfactory pairing. The primer is elongated by DNA polymerase and the doublestranded circle closed by DNA ligase. A specific deletion can be obtained by cleaving a plasmid at two sites with a restriction enzyme and religating to form a smaller circle. A smaller deletion can be obtained by cutting a plasmid at a single site. The ends of the linear DNA are then digested with an exonuclease that removes nucleotides from both strands and the shortened piece of DNA is religated.

protein folding disease any disease that results from the abnormal folding of a protein. Prion diseases are examples of such diseases that can be inherited or acquired; Alzheimer's disease is a different type of disease, caused by alternative folding of proteins derived from the amyloid precursor.

protein G a bacterial cell-wall protein isolated from group G streptococci. Its properties and uses are similar to those of protein A, but it does not bind to IgM, IgD, or IgA; it does bind to all subclasses of human IgG, and animal immunoglobulins with which protein A does not react well.

protein gene product any one of the proteins or protein subunits synthesized biochemically on the basis of information encoded in a genome, whether generated at translation or by post-translational modification; the pattern of protein gene products formed or capable of being formed by an organism is unique to any one genotype. Individual proteins are often referred to using the symbol p followed by the relative molecular mass, e.g. p53. The protein may be further identified by adding an indication of its origin as a superscript, e.g. p21^{ras}. A protein gene product may also be referred to by the name of the gene that encodes it, but normal font is used instead of italics, with a capital initial followed by lower case characters, e.g. Src protein encoded by SRC gene.

protein-glutamate methylesterase a chemotaxis protein encoded by cheB (see che).

protein-glutamine y-glutamyltransferase EC 2.3.2.13; systematic name: protein-glutamine:amine y-glutamyltransferase; other names: transglutaminase, factor XIIIa; the enzyme activity of blood coagulation factor XIIIa. It forms inter- and intramolecular links between a γ-carboxyl group of a glutamine residue of a protein and the ε -amino group of a lysine residue, releasing ammonium ion. Its natural substrate is the fibrin monomer, and its function is to link these into polymers. The isomerase er-60 precursor from human (other names: erp60: 58 Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có như cấu về sách sinh học, xin liên hệ:

protein intron prot

the A chain bearing the catalytic activity. Examples from human, A chain: database code F13A_HUMAN, 731 amino acids (83.14 kDa); residues 1-37 are a propeptide that is cleaved from the A chain by thrombin in the conversion of factor XIII to XIIIa; B chain (precursor): database code F13B_HUMAN, 661 amino acids (75.49 kDa); residues 1-20 are the signal peptide; the molecule contains ten Sushi domains.

protein intron see intein; splicing (def. 3). protein kinase any of a number of enzymes that phosphorylate one or more hydroxyl or phenolic groups in proteins, ATP being the phosphoryl-group donor. Two classes are recognized: those that phosphorylate seryl or threonyl hydroxyls, and those that phosphorylate tyrosyl phenolic groups. The first class contains enzymes that were classically identified as regulating pathways of intermediary metabolism (e.g. glycogen phosphorylase kinase); subsequently, protein kinase A (cyclic-AMP-dependent protein kinase) and protein kinase C were recognized in this class. Enzyme activity of the second class is found in some cytokine receptors such as platelet-derived growth factor receptor and epidermal growth factor receptor and in oncogene products such as that of SRC. Over 110 unique gene products are known to make up the protein kinase superfamily; important motifs include GXGXXG...AHK and APE...DXWSXG, which are common to both serine/threonine- and tyrosine-specific activities. The tyrosine-specific kinase activity associated with the cytoplasmic domains of certain cytokine receptors forms part of an important signaltransduction mechanism implicated in cell growth (see tyrosine kinase)

protein kinase A an alternative name for cyclic-AMP-dependent protein kinase.

protein kinase C abbr.: PKC; any of a family of protein kinase enzymes identified following discovery of a protein kinase requiring anionic phospholipid for activity, and regulated by diacylglycerol and Ca²⁺. They phosphorylate hydroxyl groups in substrate serine and threonine residues. Several isoforms have now been characterized: α , β_1 , β_2 , γ , δ , ϵ , ζ , θ , η , ι , and μ . Four conserved regions are recognized, C₁, C₂, C₃, and C₄; C₃ and C₄ comprise the C-terminal half of the molecule and bear the active site, including the ATP-binding sequence GXGXXG...K. PKC- ϵ is Ca²⁺-independent, and δ , ϵ , and ζ lack the homologous C2 region. Activation of PKC occurs when plasma membrane receptors coupled to phospholipase C are themselves activated, releasing diacylglycerol. Phorbol ester tumour promoters can substitute for diacylglycerol in enzyme activation, which may indicate their mechanism of action, and much evidence points to PKC activation being involved in cell-growth stimulation. Inhibitors of PKC attract considerable interest, and include bisindolylmaleimide, 1-Ohexadecyl-2-O-methylglycerol, melittin, phloretin, polymyxin B, and staurosporine. Examples: a from Bos taurus: database code KPCA_BOVIN, 672 amino acids (76.84 kDa); β₂ from Oryctolagus cuniculus: database code KPC2_RABIT, 673 amino acids (76.97 kDa); δ from Mus musculus: database code KPCD_MOUSE, 674 amino acids (77.59 kDa).

protein kinesis the directed movement of proteins from their site of synthesis to specific targets within cells and the modulation by proteins of interactions among intracellular organelles. It is a factor in generating subcellular compartments and determining the way in which reactions are compartmentalized to control metabolic processes. It embraces the mechanisms for ensuring that proteins reach their site of action and that the amounts and locations of particular proteins are controlled during development, during the cell-division cycle, in combating pathological states of the cell, and during apoptosis.

protein mapping the resolution of a mixture of proteins into a two-dimensional pattern (i.e. map) by successive use of two differing separative procedures, as in isoelectric focusing followed by gradient gel electrophoresis, the pattern being rendered visible by an appropriate detection method.

groups from proteins. Together with protein kinases, these enzymes control the state of phosphorylation of cell proteins and thereby provide an important mechanism for regulating cellular activity. Protein phosphatases are classified into several groups. Class I enzymes are mainly specific for seryl- or threonyl-phosphate. Within this class, phosphatase 1 is ATP,Mg²⁺-dependent (AMD phosphatase); it consists of a catalytic subunit of 38 kDa and a modulator subunit of 23 kDa, which is subject to phosphorylation, thus activating the phosphatase. Phosphatase 2A is polycation-stimulated (PCS), being directly stimulated by protamine, polylysine, or histone H1; it constitutes a subclass of several enzymes activated by different histones and polylysine. These have a very high affinity for the tumour promoter okadaic acid. Phosphatase 2B (or calcineurin) is a heterodimer; one of the subunits, of 61 kDa, contains the catalytic site, a high-affinity calmodulin-binding site, and a binding site for the other subunit, a 19 kDa, Ca²⁺binding protein. Phosphatase 2C is a Mg²⁺-dependent monomeric 43 kDa protein; it has been purified as myosin light chain phosphatase, but is active against the phosphorylated forms of glycogen synthase, 6-phosphofructo-1-kinase, pyruvate kinase, fructose 1,6-bisphosphatase, and 6-phosphofructo-2-kinase. Class II enzymes hydrolyse tyrosylphosphates, and are generally designated 'phosphatase 3'. They are subdivided into those that are cytoplasmic, and others that are membrane-bound and may have receptor properties. Example of phosphatase 2A from human: database code P2AA_ HUMAN, catalytic subunit 309 amino acids (35.55 kDa); same in rabbit. This enzyme can modulate the activities of phosphorylase kinase b, casein kinase 2, mitogen-stimulated S6 kinase, and MAP-2 kinase. It is a cytoplasmic enzyme that exists in several oligomeric forms, all of which contain a catalytic (C) subunit (36-38 kDa) associated with one or both of two putatively regulatory subunits, the A subunit (61-65 kDa) and the B subunit (51-55 kDa). Example of protein tyrosine phosphatase, leukocyte antigen-related PTPase precursor from human: database code LAR_HUMAN, 1897 amino acids (211.60 kDa).

protein-N'-phosphohistidine-sugar phosphotransferase EC 2.7.1.69; systematic name: protein- N^{κ} -phosphohistidine:sugar N^{κ} -phosphotransferase; other name enzyme II; any of a group of related membrane-bound bacterial enzymes, part of the phosphoenolyyruvate-dependent sugar phosphotransferase system for the transport of hexoses across the cell membrane. It involves phosphorylation of a protein substrate (9.5 kDa), a phosphocarrier known as HPr. Individual enzymes are specific for a range of sugars. They catalyse the reaction:

protein N^{π} -phosphohistidine (HPr) + sugar = protein histidine + sugar phosphate;

example from Escherichia coli: database code PT2G_ECOLI, 477 amino acids (50.62 kDa).

protein S a single-chain glycoprotein occurring in blood, M_r 69 000. It is a vitamin K-dependent protein (not a proteinase) that promotes the binding of **protein C** to platelets, and functions as a cofactor for the anticoagulant activity of activated protein C. It is named after Seattle, where it was discovered. **protein splicing** see splicing.

protein synthesis 1 (in cell biology) see protein and peptide biosynthesis. 2 (in chemistry) see peptide synthesis (def. 2).

protein thiotemplate mechanism see thiotemplate mechanism. proteinuria the presence of protein in urine. Normal excretion of protein in human urine is less than 0.1 mg every 24 h, about half of which is Tamm-Horsfall glycoprotein, and about 20% is albumin. Protein may appear in urine due to extrarenal factors such as fever, strenuous exercise, or burns; direct involvement of the kidney occurs in the nephrotic syndrome, which may arise from several causes, such as diabetic nephropathy, cancer of the kidney, or various forms of glomerulonephritis of unknown etiology.

protein phosphatase and epzymethat hydrolyses phosphate protein znemająt protein of badey endosperm albumin. Heis

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

structurally similar to a **serpin**, but its main role is as a storage protein, being especially rich in lysine. Database code PRTZ_HORVU, 399 amino acids (22 lysine), 43.23 kDa.

proteoclastic an obsolete term for proteolytic.

proteoglycan any glycoprotein in which the carbohydrate units are glycosaminoglycans.

proteolipid a term variously applied to describe certain hydrophobic membrane proteins, or any other protein, that has a lipid moiety covalently bound to one or more of its constituent amino acids. Many such proteins are soluble in chloroform-methanol, a property that was significant in their first identification.

proteoliposome a **liposome** into which a specific protein, or group of proteins, has been incorporated.

proteolysis degradation of a protein, usually by hydrolysis at one or more of its peptide bonds. —proteolytic adj.

proteolytic enzyme see peptidase.

proteome the complete expression profile of the proteins of an organism. See also **proteomics**.

proteomics the study of the **proteome** by the analysis of protein structure and composition.

proteosome a variant spelling of proteasome.

 $\begin{array}{c} \textbf{prothrombin} \ an \ alternative \ name \ for \ factor \ II; \ see \ \textbf{blood coagulation}. \end{array}$

protide 1 symbol: ¹H⁻; a hydride (def. 1) ion derived from an atom of protium. 2 any hydride (def. 2) formed from protium. 3 or protid a generic name embracing protein, peptide, or amino acid, suggested by analogy with glucide and lipid(e). Its use in English is largely restricted to translations or abstracts from French. —protidic adj.

protio+ comb. form indicating that one or more atoms of hydrogen in a hydrogen-containing chemical compound consists exclusively of **protium**.

Protista a taxonomic grouping of eukaryotic organisms that are unicellular, coenocytic, or multicellular but that are not classified as fungi, animals, or embryophytes.

protium symbol: ¹H; hydrogen-1, the nuclide of hydrogen, ¹H, of relative atomic mass 1.008. It is a stable isotope, having a relative abundance in natural hydrogen of 99.98 atom percent. The name is used especially when distinction from deuterium or tritium is required.

protoalkaloid an alkaloid that does not contain a heterocyclic ring, e.g. damascenine in *Nigella* spp.

protobiont one of the postulated first precursors of cells, supposed to have arisen when a boundary or membrane formed around one or more macromolecules possessing catalytic properties. Compare coacervate droplet.

protochlorophyllide Mg²⁺-vinylpheoporphyrin A₅ methyl ether; an intermediate in the synthesis of chlorophyll, it is formed from Mg²⁺-protoprophyrin, and converted to **chloro**-

phyllide by NADPH:protochlorophyllide oxidoreductase (EC 1.3.1.33). Protochlorophyllides may be suffixed with the letter of the related chlorophyll, e.g. protochlorophyllide a.

protochlorophyllide holochrome a pigment protein complex that carries out a light-catalysed reduction of **protochlorophyllide** to **chlorophyllide** with an external hydrogen donor, which is probably strongly bound NADPH. The enzyme involved in regenerating NADPH is NADPH-photochlorophyllide oxidoreductase; it is a single polypeptide, M_r 36 000, and is only one component of the complex protein entity of the holochrome.

protocollagen collagen chains in which proline and lysine residues have not been hydroxylated. Protocollagens may be produced by experimental inhibition of the relevant hydroxylases either by use of a chelating agent or by imposed anaerobiosis. Compare procollagen.

protoheme or (esp. Brit.) protohaem the iron-porphyrin prosthetic group of the cytochromes b.

protohemin see hemin.

protokaryon an obsolete term for prokaryon.

protokaryote an obsolete term for prokaryote.

protolysosome see primary lysosome.

protomer any of the subunits of an oligomeric protein that are identical. See also monomer, oligomer. —protomeric adj.

proton 1 symbol: ¹H⁺; the cation derived from an atom of protium; a hydrogen ion of nucleon number unity; used in this sense especially when distinction between ¹H⁺, ²H⁺ (i.e. deuteron), and ³H⁺ (i.e. triton) is needed; any solvated species is included. 2 symbol: H⁺; commonly used term for the cation derived from any atom of natural hydrogen (of which a small proportion is deuterium) by loss of its orbital electron; any solvated species is included. See also hydrogen ion, hydron. 3 symbol: p; a nuclear particle of nucleon number unity, having a charge equal and opposite to that of an electron and having a mass of 1.007 276 470 (12) Da.—protonic adj..

proton magnetic resonance abbr: PMR or pmr; see nuclear magnetic resonance spectroscopy.

proton magnetogyric ratio symbol: γ_p ; a fundamental physical constant, of value 2.675 221 28(81) \times 10⁸ s⁻¹ T⁻¹. See also gyromagnetic ratio.

protonmotive indicating, or related to an ability to transport protons (i.e. hydrons).

protonmotive Q cycle a hypothetical mechanism put forward to explain the protonmotive and redox properties of certain components of the respiratory chain in the coupling membrane of bacteria, mitochondria, and chloroplasts. The Q cycle applies to the part of the respiratory chain involving passage of electrons through cytochrome b. Essentially, the cycle accepts two hydride ions from a reduced flavoprotein (e.g. of complex I or complex II of the respiratory chain; see complex I, II, III, IV) passes electrons singly to cytochrome c_1 and releases the two hydrons to the intermembrane space. Ubiquinone is the molecule that accepts the hydride ions, and releases the electrons and hydrons. Cytochromes b_{566} and b_{562} are involved in shuttling electrons between different oxidation states of ubiquinone during the cycle. The property of ubiquinone that it can exist as a semiquinone is important in the switch from twoelectron to one-electron transfer.

proton number or atomic number symbol: Z; a dimensionless physical quantity, with a unique integral value for each chemical element, that is equal to the number of protons contained in the nucleus of each atom of the element irrespective of the mass of any particular atom. It also is equal to the number of unit positive charges on the nucleus of each atom of a given chemical element, to the number of orbital electrons surrounding the nucleus of an un-ionized atom of that element, and, for a specific nuclide of that element, to the arithmetical difference between the nuclide's nucleon number, A, and its neutron number, N; i.e. Z = N - A. The proton number of an element described the specific section of the section of th

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC, Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

Dut to gray

table. It may be attached to the symbol for the element as a left subscript, e.g. $_6\mathrm{C}$.

proton pump another term (esp. in pharmacology) for hydrogenion pump.

proton relaxation enhancement abbr.: PRE; a technique that yields information concerning (macro)molecular motion. It depends on the enhancement of the solvent water-proton relaxation rates on addition of a macromolecule.

protooncogene a normal gene, usually concerned with the regulation of cell proliferation, that can be converted into a cancer-promoting oncogene by mutation. For example, in the case of the Rous sarcoma virus the viral oncogene is v-src (see src). This is closely related to a normal gene, c-src. The appearance of v-src is believed to have followed the acquisition of a copy of c-src by an ancestor of the Rous sarcoma virus. Through many generations this ancestral gene was mutated and became dominant. Protooncogenes encode proteins involved in all aspects of controlling cell proliferation, including growth factors, growth-factor receptors, nuclear factors regulating gene expression proteins that generate second messengers, and protein kinases.

protoplasm the living contents of a cell; i.e. the matter contained within (and including) the plasma membrane, usually taken to exclude large vacuoles and masses of secretory or ingested material. In eukaryotes it includes the nucleus and cytoplasm.

protoplast a spherical, osmotically sensitive plant cell without its cell wall but retaining an intact cell membrane. The cell wall is degraded by digestion with different hydrolytic enzymes, as a mixture or sequentially, e.g. cellulase, hemicellulase. Protoplasts are used to create hybrid cells via protoplast fusion. In some cases they are totipotent, and are thus capable of yielding plants. Such protoplasts can be used in plant transformation.

protoporphyrin IX the specific substrate for the enzyme ferrochelatase, which catalyses the insertion of iron to form protoheme. It is also probably the substrate for the insertion of magnesium in the formation of chlorophylls in plants.

prototroph any strain of a microorganism (alga, bacterium, or fungus) that does not require any substances in its nutrition additional to those required by the wild type. *Compare* auxotroph. —prototrophic adj.

Protozoa a phylum or subkingdom comprising single-celled eukaryotic microscopic organisms, usually classified as animals. Compare Metazoa, Parazoa.

provirus a virus, e.g. a **retrovirus**, that is integrated into the chromosome of its host cell and can be transmitted through the generations without causing lysis of the host cell.

provitamin a compound which is converted to an active vitamin in the body. In practice the term is only applied to **carotenes**.

Pro-X dipeptidase EC 3.4.13.8; recommended name: prolinase; other names: prolyl dipeptidase; iminodipeptidase; prolinase; L-prolylglycine dipeptidase; an enzyme that catalyses the hydrolysis of Pro-|-Xaa dipeptides. It also acts on hydroxyprolyl analogues.

proximal protein any protein that binds early in the assembly of complex structures, such as ribosomes. Their presence in the partially assembled structure is required for the binding of **distal proteins**.

proximate carcinogen or proximate carcinogenic metabolite any metabolite of a **chemical carcinogen** that is itself carcinogenic; the term may embrace **ultimate carcinogen**.

Prozac see fluoxetine.

PrP abbr. for prion protein.

PRP protein abbr. for pre-mRNA processing protein.

PRPP abbr. (not recommended) for phosphoribosyl pyrophosphate (see (5-)phospho(-\alpha-0-)ribosyl diphosphate).

PRPP synthetase another name for ribose-phosphate pyrophosphokinase.

prunasin (-)-(R)-mandelonitrile β-D-glucoside; a cyanogenic clear. When peudouridine occurs in the anticodon of transfer glycoside

HOCH₂
OH
OH
OH

prunasin

ps symbol for picosecond.

P-selectin see selectin.

pseudoalkaloid any **alkaloid** in which the skeleton is partly derived from a terpene.

pseudoallele any of two (or more) mutations that are allelic functionally but not structurally. See allele.

pseudoaxial (in chemistry) abbr.: a'; see conformation.

pseudocholinesterase EC 3.1.1.8; recommended name: cholinesterase; other name: choline esterase II. An enzyme, found in blood and other tissues, that catalyses the hydrolysis of a variety of choline esters and a few other compounds. Compare acetylcholinesterase.

pseudoequatorial (in chemistry) abbr.: e'; see conformation. **pseudoexon** a portion of an **exon** that is duplicated in an adjacent intron.

pseudogene symbol: ψ ; a sequence in DNA that is related to a functional gene but cannot be transcribed. This may be due to mutational changes that preclude it from being expressed in the form of functional products or the lack of some flanking control region in the promoter. Pseudogenes may or may not contain the introns of the functional gene. Examples include pseudogenes for α , β , and ζ globulins in several species, V_{κ} chains of immunoglobulins, actin, and tubulin. Processed pseudogenes, or LINES (see LINE), occur in a genome somewhere other than the normal position of the corresponding functional gene and so cannot be expressed because of alterations in regulatory DNA sequences, or coding sequences, or both.

pseudoglobulin a globulin that is soluble in solutions of low ionic strength or in pure water. *Compare* euglobulin.

pseudointron an **intron** that contains 5' and 3' splice sites that are appropriate but not utilized in the excision of the intron.

pseudoisoenzyme any one of the epigenetically derived multiple forms of an enzyme.

pseudo-operator a functional **operator** element within a structural protein-coding region of DNA.

pseudopepsin see pepsinogen.

pseudoplasmodium see Dictyostelium discoideum.

pseudopodium (pl. **pseudopodia**) a temporary protrusion or retractile process of a cell, associated with flowing movements of the protoplasm and serving for locomotion and feeding. — **pseudopodial** adj.

pseudouridine symbol: Ψ ; 5- β -D-ribofuranosyluracil; a component of transfer RNA (tRNA) containing a C-C bond between the ribose (C-1) and uracil (C-5). Typical of the minor nucleosides present in tRNA, it is formed by modification of uridine in the original transcript; the chemistry of this process is unclear. When peudouridine occurs in the anticodon of transfer

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

Phone/Fax: (84-8) 9509938, 8551478, 8574867 Handphone: 0918190535, email: huynguyen@huynguyenltd.com.

psi 1 symbol: ψ (lower case) or Ψ (upper case); the twenty-third letter of the Greek alphabet. For uses see Appendix A. 2 or p.s.i. abbr. for pounds per square inch (a unit of pressure in the Imperial and US systems of units).

pseudouridine

PSI abbr. for photosystem I (see photosystem).

psicofuranine 6-amino-9-D-psicofuranosylpurine; an antibiotic produced by *Streptomyces hygroscopicus*, found to have antitumour activity. *See also* **D-psicose**.

D-psicose a nonsystematic name for the keto-hexose D-ribo-2-hexulose. The hydroxyl at C-3 has the opposite configuration to that of D-fructose. It is a component of **psicofuranine**.

α-p-pyranose form

PSII abbr. for photosystem II (see photosystem).

psilocin 3-[2-(dimethylamino)ethyl]-1*H*-indol-4-ol; a hallucinogenic alkaloid extracted from the mushroom *Psilocybe mexicana*.

P-site abbr. for a peptidyl-tRNA binding site of ribosome; in bacteria this involves the ribosomal proteins L2, L14, L18, L24, L27, and L33, and a region close to the 3' end of 16S rRNA.

psoralon 6-hydroxy-5-benzofuranacrylic acid δ -lactone; a furocoumarin present as a **phytoalexin** in many plants. It has photosensitizing and phototoxic effects in humans and animals, and is used in photochemistry, intercalating into DNA and forming cross-links on irradiation. See also **methoxy-psoralen**.

PSP abbr. for pancreatic stone protein (see pancreatic thread protein).

UDPgalactose and sphingosine by sphingosine β -galactosyltransferase, EC 2.4.1.23. It is acylated to a cerebroside by reaction with a long-chain acyl-CoA.

psychrometer or wet-and-dry bulb hygrometer a type of hygrometer consisting of two thermometers, one with a wet bulb and one with a dry bulb. The cooling effect of evaporation from the wet bulb creates a temperature difference between the two thermometers, from which the relative humidity can be calculated.

psychrophile an organism that grows best at low temperatures (below about 20 °C). —**psychrophilic** adj.

P system a system of blood groups in which the antigenic determinants are oligosaccharides. The antigens are detected on erythrocytes, erythroblasts, platelets, megakaryocytes, fibroblasts, and endothelial cells; they are designated P^k, P, and P₁. The common phenotypes are P₁ (antigens P₁ and P positive) and P₂ (P antigen positive); P^k phenotypes are rare. Individuals with the p phenotype lack all of the above determinants, having only the core structure lactosylceramide, and have anti-P and anti-P^k antibodies. The determinants are:

 P^k (Gb₃Cer): Gal(α 1-4)Gal(β 1-4)GlcCer

P (Gb₄Cer): GalNAc(β 1-3)Gal(α 1-4)Gal(β 1-4)GlcCer P₁: Gal(α 1-4)Gal(β 1-4)GlcNAc(β 1-3) Gal(β 1-4)GlcCer.

Pt symbol for platinum.

PTA abbr. for plasma thromboplastin antecedent (i.e. factor XI); see blood coagulation.

PTC abbr. for 1 plasma thromboplastin component (i.e. factor IX); see blood congulation. 2 phenylthiocarbamoyl.

Ptd symbol for the phosphatidyl group.

Ptdlns symbol for phosphatidylinositol.

Ptdlns4P or Ptdlns-4-P symbol for phosphatidylinositol 4-phosphate.

Ptdlns(4,5)P₂ or **PtdIns-4,5-**P₂ symbol for phosphatidylinositol 4,5-bisphosphate.

pteridine pyrazino[2,3-d]pyrimidine; the parent structure of pterins and the **pteroyl** group. See also **xanthopterin**.

ptercyl 4-[[(2-amino-1,4-dihydro-4-oxo-6-pteridinyl)methyl]-amino]benzoyl; the acyl group of pteroic acid, and the structural basis of **folate** and its derivatives.

PTFE abbr. for polytetrafluoroethylene.

PTH abbr. for 1 parathyroid hormone (i.e. parathyrin). 2 phenylthiohydantoin; as in PTH-amino acid (i.e. the phenylhydantoin derivative of an amino acid).

PTI abbr. for pancreatic trypsin inhibitor.

PTM abbr. for post-translational modification.

PTS abbr. for phosphoenolpyruvate-dependent sugar phosphotransferase system.

ptyalin a substance in saliva, identified as α -amylase.

Pu symbol for plutonium.

psychosing il-Qarigorise action distribution again duite in a far model from NOAC Tactor and Ut a series of the said coming actors having an

purinoc

ampicillin resistance gene and part of the lacZ gene containing multiple cloning sites (MCSs). Different members of the series (e.g. pUC18, pUC19) vary in the restriction enzyme recognition sites included in the MCS. They are high copy number plasmids and so can be purified by rapid, small-scale methods of isolation. A related series of bacteriophage M13 vectors, the M13mp vectors, contain the same MCS and are useful for DNA sequencing. See also Messing vector.

PUFA abbr. for polyunsaturated fatty acid.

puff any discrete, localized expansion occurring at specific sites in polytene chromosomes, e.g. the giant salivary gland chromosomes in Diptera. Typically a few micrometres long, they are believed to be a gene or group of genes that are actively synthesizing RNA, which accounts for a considerable part of the mass of the puff. See also Balbiani ring.

'pull' model a nickname for the Monod-Wyman-Changeux model (for ligand-induced changes in protein conformation) because, in this model, ligands influence the equilibrium between enzyme states by sequestering the enzyme in ligand-bound forms. Compare 'push' model.

pullulan an extracellular glucan elaborated by Aureobasidium pullulans (yeast form) and formed by other fungi. It is a linear structure with both $(1\rightarrow 4)-\alpha$ -D- and $(1\rightarrow 6)-\alpha$ -D-linkages. Pullülan is used as a non-caloric material, a water-retention agent, and as a film and fibre former.

pullulanase 1 isopullulanase EC 3.2.1.57; an enzyme that catalyses the hydrolysis of pullulan to isopanose (i.e. $6-\alpha$ -maltosylglucose). 2 neopullulanase EC 3.2.1.135; an enzyme that catalyses the hydrolysis of pullulan to panose (i.e. $6-\alpha$ -D-glucosylmaltose). 3 see α -dextrin endo-1,6- α -glucosidase.

pulsed field gel electrophoresis abbr.: PFGE; a type of gel electrophoresis in which large fragments of DNA can be separated by continuously altering the angle at which the electric current is applied.

pulse radiolysis a technique whereby reactive chemical species are generated by pulses of high-energy radiation and the subsequent reactions of these species are followed spectrophotometrically as a function of time.

pump (in cell biology) any transmembrane protein that drives the active transport of ions and small molecules across the lipid bilayer. See also hydrogen-lon pump, sodium pump.

PUMP-1 see matrilysin.

pump-1 protease see matrilysin.

Purcell, Edward Mills (1912-97), US electrical engineer, physicist, and radioastronomer notable for his discovery (independently of F. Bloch) of the phenomenon of nuclear magnetic resonance of certain atomic nuclei and for being the first to report detection of the emission of 1420-Hz microwave radiation by interstellar dihydrogen; Nobel Laureate in Physics (1952) jointly with F. Bloch 'for their development of new methods for nuclear magnetic precision measurements and discoveries in connection therewith'.

purine 1 1*H*-purine; 7*H*-imidazo[4,5-*d*]pyrimidine; an organic nitrogenous base, sparingly soluble in water. 2 any of a class of derivatives of 1H-purine; these form one of the two classes of nitrogen-containing ring compounds found in DNA and RNA, which include adenine and guanine. See also purine biosyn-

purine biosynthesis the biosynthesis of purine ribonucleotides. The pathway for the synthesis of purine ribonucleotides begins with the formation of 5-phospho-α-D-ribosyl diphosphate (5-phosphoribosyl-α-D-pyrophosphate, common 2.7.6.1. This is converted to β -5-phosphoribosylamine (I) by reaction with glutamine, catalysed by amidophosphoribosyltransferase, EC 2.4.2.14; reaction of I with glycine, with hydrolysis of ATP to ADP and Pi, catalysed by phosphoribosylamine-glycine ligase, EC 6.3.4.13 (glycinamide ribonucleotide synthetase, common abbr.: GAR synthetase), brings about the formation of N¹-(5-phospho-D-ribosyl)glycinamide (II, glycinamide ribotide, common abbr.: GAR); II reacts with 10-formyltetrahydrofolate to form 5'-phosphoribosyl-Nformylglycinamide (III, common abbr.: FGAR), the enzyme being phosphoribosylglycinamide formyltransferase, EC 2.1.2.2 (GAR transformylase); III is converted to 5'-phosphoribosylformylglycinamidine (IV, formylglycinamidine ribotide, common abbr.: FGAM) by phosphoribosylformylglycinamidine synthase, EC 6.3.5.3 (common abbr.: FGAM synthetase) by reaction with glutamine with ATP hydrolysis to ADP and Pi. IV is converted to 1-(5-phosphoribosyl)-5-aminoimidazole (V, 5-aminoimidazole ribotide, common abbr.: AIR), with hydrolysis of ATP to ADP and Pi, by phosphoribosylformylglycinamidine cyclo-ligase, EC 6.3.3.1 (common abbr.: AIR synthetase); V is carboxylated to 1-(5-phosphoribosyl)-5-amino-4-imidazolecarboxylate (VI, carboxyaminoimidazole carboxamide, common abbr.: CAIR), by phosphoribosylaminoimidazole carboxylase, EC 4.1.1.21 (common abbr.: AIR carboxylase); VI reacts with L-aspartate, with hydrolysis of ATP to ADP and Pi, to form 1-(5-phosphoribosyl)-5-amino-4-(N-succinocarboxamide)-imidazole (VII, 4-(N-succinylocarboxamide)-aminoimidazole ribotide, common abbr.: SACAIR) catalysed by phosphoribosylaminoimidazolesuccinocarboxamide synthase, EC 6.3.2.6 (common abbr.: SACAIR synthetase); VII is converted, with loss of fumarate, to 1-(5-phosphoribosyl)-4-carboxamide-5-aminoimidazole (VIII. aminoimidazolecarboxamide ribotide. common abbr.: AICAR) by adenylosuccinate lyase, EC 4.3.2.2 (VII is an alternative substrate for this enzyme); VIII reacts with 10formyltetrahydrofolate to form 5'-phosphoribosyl-5-formamido-4-imidazolecarboxamide (IX, formaminoimidazolecarboxamide ribotide, common abbr.: FAICAR), catalysed by phosphoribosylaminoimidazolecarboxamide formyltransferase, EC 2.1.2.3 (common abbr.: AICAR transformylase); IX undergoes ring closure catalysed by IMP cyclohydrolase, EC 3.5.4.10, to form inosine monophosphate (IMP), from which other purine nucleoside monophosphates are formed. Thus it is converted to AMP via adenylosuccinate, in steps catalysed by adenylosuccinate synthase, EC 6.3.4.4, and adenylosuccinate lyase, EC 4.3.2.2. It is converted to GMP via xanthosine monophosphate, in steps catalysed by IMP dehydrogenase, EC 1.1.1.203, and GMP synthase, EC 6.3.4.1. A salvage pathway also exists, that reconverts purine bases released during nucleic-acid degradation to nucleoside monophosphates. The enzymes adenine phosphoribosyltransferase and hypoxanthine-guanine phosphoribosyltransferase are responsible for these reac-

purine-nucleoside phosphorylase abbr.: PNP; EC 2.4.2.1; systematic name: purine-nucleoside:orthophosphate ribosyltransferase; other name: inosine phosphorylase. An enzyme that catalyses the phosphorylysis of a purine nucleoside to a purine and α -D-ribose 1-phosphate. It functions in the degradation of purines; decreased activity leads to accumulation of dGTP, which affects DNA replication. Enzyme deficiency is associated with moderate immunodeficiency. Example from Escherichia coli, homohexamer: database code DEOD_ ECOLI, 238 amino acids (25.79 kDa).

purinergic describing a type of nerve in which synaptic transmission is brought about by purine-like transmitter substances. See purinoceptor. Compare adrenergic, cholinergic.

purinoceptor or purinergic receptor a family of receptors (P₁, P_{2X}, P_{2Y}, P_{2Z}, P_{2T}, and P_{2U}) classified according to the relative potency of purine nucleotides - ATP, ADP, AMP, and UTP in stimulating them and by their response to either adenosine (P₁) or ATP (P₂). P_{2Y} and P_{2U} have seven transmembrane doabbr.: PRPP) by ribose-phosphate pyrophosphokinase FEC NGUYEN. Neuroan conhucau ve sach sinh học, xin liên hệ: puromycin

P_{2U} from Rattus norvegicus: database code P2UR_RAT, 374 amino acids (42.26 kDa). P2x, P2z, and P2T modulate the opening of an intrinsic cation channel but P2T also stimulates release of intracellular Ca2+ and reduces synthesis of cyclic AMP. Example of P2X from R. norvegicus: database code P2X1_RAT, 472 amino acids (52.62 kDa).

puromycin a nucleoside antibiotic produced by the soil actinomycete Streptomyces alboniger. It interrupts protein synthesis by virtue of its structural similarity to the 3' end of aminoacyltRNA: it enters the A-site (see aminoacyl site) on the ribosome, and is incorporated into the growing polypeptide chain, thereby causing premature release of the puromycinyl polypeptide from the ribosome.

purothionin any of a group of basic peptides, isolated from grain and of $M_r \approx 5000$, that contain a large number of cysteine residues and are toxic to bacteria and fungi by inhibiting DNA transcription and RNA translation. Example purothionin γ -1 from Triticum aestivum: database code THG1_WHEAT, 47 amino acids (5.24 kDa).

purple membrane part of the cell membrane of Halobacterium halobium containing bacteriorhodopsin.

'push' model a nickname for the Koshland model (for ligandinduced changes in protein conformation) because, in this model, binding of the ligands results in a conformational change and does not simply select a pre-existing state. Compare 'pull model'.

putidaredoxin a ferredoxin, isolated from Pseudomonas putida, that is an electron carrier in a hydroxylase system acting on camphor and closely related monoterpenes. Compare adrenodoxin.

putrescine 1,4-diaminobutane; the polyamine formed by decarboxylation of ornithine and the metabolic precursor of spermidine and spermine.

PVA abbr. for 1 polyvinyl alcohol. 2 polyvinyl acetate.

PVC abbr. for polyvinyl chloride.

PVP abbr. for polyvinyl pyrrolidone.

PWM abbr. for pokeweed mitogen.

pycnometer an apparatus for measuring the density of liquids, and also sometimes of solids. It consists of a container whose volume can be accurately measured, and that can be filled with great precision, so that when filled with the liquid in question it can be weighed to determine the density. —pycnometric adj.

Pyd symbol for a residue of an unspecified pyrimidine nucleoside (alternative to Y).

pyr-1 the symbol for the pyrimidine 1 gene, which encodes CAD protein in several eukaryotes.

pyran the trivial name for either of the hypothetical isomers α pyran, 2H-pyran, oxacyclohexa-3,5-diene, or γ-pyran, 4Hpyran, oxacyclohexa-2,5-diene, C₅H₆O. These pyrans are not known as such, but are the parent structures of various known pyranoid compounds such as dihydropyran, α - and γ -pyrones,

pyranoid pyran-like, i.e. describing a molecular structure that consists of or contains a ring of five carbon atoms and one oxygen atom (as in pyran).

pyrimidine c

pyranose symbol: p; any monosaccharide or monosaccharide derivative whose molecule contains a pyranoid ring. Compare

pyridine-nucleotide coenzyme any of a group of coenzymes containing a nicotinamide nucleotide residue, e.g. nicotinamide-adenine dinucleotide (NAD+); now known as nicotinamide-nucleotide coenzymes.

pyridoxal abbr.: PL; 3-hydroxy-5-(hydroxymethyl)-2-methyl-4-pyridine carboxaldehyde; a compound with vitamin B₆ activ-

pyridoxal kinase EC 2.7.1.35; an enzyme that catalyses the formation of pyridoxal 5'-phosphate from ATP and pyridoxal with release of ADP. Example (fragment) from sheep: database code A61483, 11 amino acids (1.24 kDa).

pyrimidine 1 1,3-diazine; an organic nitrogenous base, sparingly soluble in water. 2 any of a class of derivatives of pyrimidine (def. 1); these form one of the two categories of nitrogen-containing ring compounds found in DNA and RNA, which include cytosine, thymine, and uracil. See also pyrimidine biosynthesis.

pyrimidine biosynthesis or pyrimidine ribonucleotide biosynthesis pyrimidines are formed from carbamoyl phosphate (see carbamoyl-phosphate synthase) after conversion to carbamoyl aspartate in a reaction with L-aspartate catalysed by aspartate transcarbamylase, EC 2.1.3.2. Carbamoyl aspartate is converted to orotate via dihydroorotate, in steps catalysed by dihydroorotase, EC 3.5.2.3, and dihydroorotate dehydrogenase, EC 1.3.99.11. Orotate is phosphorylated to orotidine monophosphate (OMP) in a reaction with 5-phospho-α-D-ribosyl diphosphate catalysed by orotate phosphoribosyltransferase, EC 2.4.2.10. OMP is converted to uridine monophosphate by orotidine 5'-phosphate decarboxylase, EC 4.1.1.23.

pyrimidine dimer any structure formed within a strand of DNA from two neighbouring pyrimidine residues through covalent cross-linking induced by ultraviolet irradiation. Two types are known. (1) Addition of one pyrimidine ring to the other at each end of their respective 5,6-double bonds generates a cyclobutadipyrimidine, a fully substituted cyclobutane. Such a dimer is formed most readily from two thymine residues (see thymine dimer), but may be formed also from two cytosine residues, or from one cytosine and one thymine residue. For each of these varieties there are four possible configurational isomers: if the pyrimidine rings have become linked in a parallel manner, i.e. by 5-5' and 6-6' bonds, the configuration is designated by the prefix syn-, but if they are linked in an antiparallel manner, i.e. by 5-6' and 6-5' bonds, it is designated by anti-; further, if the pyrimidine rings are both on the same side of the plane of the cyclobutane ring, the dimer is described as being in the 'doghouse configuration', designated by the prefix cis-, but if the rings are on opposite sides of the cyclobutane plane, the dimer is said to be in the and pyranoses. [pyruvate kinase]-phospha

cyclobutadipyrimidine in a DNA strand causes a local distortion of the DNA duplex and blocks the action of DNA polymerase, thus preventing replication; cell death may ensue unless repair is effected by photoreactivation. (2) Alternatively, addition may take place between position 6 of one pyrimidine residue and position 4 of an adjacent one, with creation of a single covalent link and generation of a (6-4)photoproduct. Such a dimer is usually formed between position 6 of a cytosine or thymine residue on the 5' side of a dinucleotide segment and position 4 of a cytosine residue on its 3' side. The (6-4)photoproduct is thought to be the main type of lesion in DNA responsible for mutations; it is not susceptible to photoreactivation, but can be eliminated by other DNA-repair mechanisms, e.g. excision repair.

pyrimidine-nucleoside phosphorylase any of several enzymes that function in the catabolism of pyrimidines; examples are: (1) Uridine phosphorylase, EC 2.4.2.3; it catalyses the phosphorolysis of uridine to uracil and α -D-ribose 1-phosphate. Example from Escherichia coli, homohexamer showing 4-, 6-, and 8-fold symmetry: database code UDP_ECOLI, 252 amino acids (27.00 kDa). (2) Thymidine phosphorylase, EC 2.4.2.4; it catalyses the phosphorylysis of thymidine to thymine and 2-deoxy-D-ribose 1-phosphate. Example from E. coli, homodimer: database code DEOA_ECOLI, 441 amino acids (47.28 kDa).

pyro+ or (before a vowel) pyr+ comb. form 1 of, relating to, caused, or produced by fire. 2 (in chemistry) indicating material derived by the action of heat; it often indicates an acid formed by loss of a molecule of water in a heating process, and hence also some anhydrides, e.g. pyrophosphate.

pyrocatechol or pyrocatechin or (formerly) catechol 1,2-benzenediol; o-dihydroxybenzene. Compare catecholamine, obenzoquinone, hydroquinone.

pyrolysis the decomposition or dissociation of a chemical compound by the application of heat. See also thermolysis. - pyrolytic adj.; pyrolyse or (sometimes, US) pyrolyze vb.

pyrophosphatase 1 an imprecise name for inorganic pyrophosphatase. 2 the generic name for any of a number of the enzymes within sub-subclass EC 3.6.1 (enzymes acting on diphosphate bonds); e.g. ATP pyrophosphatase (EC 3.6.1.8).

pyrophosphate an older name for diphosphate (def. 1-5) (use no longer recommended although it is still used as an alternative in such terms as inorganic pyrophosphate, pyrophosphatase, etc.). See also inorganic diphosphate.

pyrophosphokinase the general name for any enzyme belonging to the sub-subclass EC 2.7.6, diphosphotransferases, which transfer a diphosphate group from ATP to a named substrate; e.g. GTP pyrophosphokinase (EC 2.7.6.5), which converts guanosine 5'-triphosphate, GTP to guanosine 3'phosphate 5'-triphosphate, pppGpp.

pyrrolidonecarboxylic acid symbol: <Glp; pyroglutamic acid; 5-oxoproline; pyrrolid-2-one-5-carboxylic acid.

1-pyrroline-5-carboxylate dehydrogenase EC 1.5.1.12; an enzyme that catalyses a reaction between 1-pyrroline-5-carboxylate (abbr.: P5C), NAD+, and H2O to form L-glutamate and NADH. P5C is an intermediate in the conversion of glutamate, proline, and ornithine. Example from Escherichia coli, a bifunctional protein that also has proline dehydrogenase activity: database code PUTA_ECOLI, 1320 amino acids (143.66 kDa).

pyrroloquinoline-quinone abbr.: PQQ; an alternative name

pyruvate trivial name for 2-oxopropanoate, CH₃COCOO⁻; it is found in virtually every type of cell and species, being an important intermediate in many pathways including the catabolism of glucose, and the biosynthesis of amino acids and carbohydrates.

pyruvate carboxylase abbr.: PCB; EC 6.4.1.1; systematic name: pyruvate:carbon dioxide ligase (ADP-forming); other name: pyruvic carboxylase; an enzyme that catalyses a reaction between ATP, pyruvate, and HCO₃- to form oxaloacetate, ADP, and orthophosphate; biotin and manganese or zinc are cofactors. Example from yeast (PCB1) homotetramer: database code PYC1_YEAST, 1178 amino acids (129.95 kDa).

pyruvate decarboxylase EC 4.1.1.1; systematic name: 2-oxoacid carboxy-lyase; other names: α-carboxylase, pyruvic decaboxylase; α -ketoacid carboxylase. An enzyme that catalyses the decarboxylation of a 2-oxo acid to an aldehyde and CO₂, thiamine diphosphate is a coenzyme. Example from yeast (there are three related isozymes), homotetramers, isozyme 1: database code DCP1_YEAST, 563 amino acids (61.44 kDa).

pyruvate decarboxylase kinase or pyruvate dehydrogenase kinase a subunit of the mammalian pyruvate dehydrogenase complex. It phosphorylates three serine residues on pyruvate dehydrogenase (lipoamide) resulting in loss of activity, and is stimulated by elevated levels of acetyl-CoA and NADH.

pyruvate dehydrogenase complex an enzyme complex that catalyses the overall reaction between pyruvate, NAD+, and coenzyme A to form acetyl-CoA, NADH, and CO2. The complex consists of three activities: (1) pyruvate dehydrogenase (lipoamide), designated E₁, catalysing a reaction between pyruvate and lipoamide to form S-acetyldihydrolipoamide and CO_2 ; (2) dihydrolipoamide S-acetyltransferase, designated E_2 , catalysing a reaction between S-acetyldihydrolipoamide and coenzyme A to form acetyl-CoA and dihydrolipoamide; and (3) dihydrolipoamide dehydrogenase, designated E₃, which oxidizes dihydrolipoamide to lipoamide. The complex is regulated by the phosphorylation and dephosphorylation of the pyruvate dehydrogenase (lipoamide) component, phosphorylation being catalysed by pyruvate decarboxylase kinase and removal of phosphate being catalysed by [pyruvate dehydrogenase (lipoamide)] phosphatase (or pyruvate decarboxylase phosphatase), EC 3.1.3.43. Elevated levels of NADH and acetyl-CoA inhibit the complex by stimulating the kinase.

pyruvate dehydrogenase (lipoamide) EC 1.2.4.1; systematic name: pyruvate:lipoamide 2-oxidoreductase (decarboxylating and acceptor-acetylating); other names: pyruvate decarboxylase; pyruvate dehydrogenase; pyruvic dehydrogenase. A component enzyme of the pyruvate dehydrogenase complex. It catalyses a reaction between pyruvate and lipoamide to form S-acetyldihydrolipoamide and CO2; thiamine diphosphate is a coenzyme. Example, pyruvate dehydrogenase E₁ component from Escherichia coli, homodimer, flavoprotein: database code ODP1_ECOLI, 886 amino acids (99.50 kDa).

[pyruvate dehydrogenase (lipoamide)]-phosphatase EC 3.1.3.43; an enzyme that catalyses the hydrolysis of phosphate from [pyruvate dehydrogenase (lipoamide)] phosphate. This hydrolysis activates the enzyme activity. Example (precursor) from Bos taurus, catalytic subunit: database code PDP_ BOVIN, 538 amino acids (61.12 kDa).

pyruvate kinase EC 2.7.1.40; systematic name: ATP:pyruvate 2-O-phosphotransferase; other names: phosphoenolpyruvate kinase; phosphoenol transphosphorylase. An enzyme that catalyses the formation of pyruvate and ATP from phosphoenolpyruvate and ADP; it requires Mg2+ and K+. In the glycolytic pathway, it effects the phosphorylation of ADP to ATP. In many cases the enzyme is a homotetramer. Example from yeast: database code KPYK_YEAST, 500 amino acids (54.48 kDa).

for methoxatin.

pyruvate-malate cycle

catalyses the hydrolysis of phosphate from [pyruvate kinase] phosphate in order to activate pyruvate kinase.

pyruvate-malate cycle a metabolic cycle involving malate dehydrogenase (oxaloacetate-decarboxylating) (the malic enzyme) that occurs during fatty-acid biosynthesis. In this situation, acetyl-CoA is transported into the cytoplasm as citrate, formed by mitochondrial citrate synthase; the citrate is cleaved in the cytoplasmic compartment to acetyl-CoA, which participates in fatty-acid synthesis, and oxaloacetate. No transport system exists for taking this oxaloacetate back into the mitochondrion; however, it can be reduced to malate by

cytoplasmic NAD⁺-linked malate dehydrogenase, and the malate so formed can be converted to pyruvate by malic enzyme, EC 1.1.1.38; the pyruvate can then be transported into the mitochondrion, to be carboxylated to oxaloacetate by pyruvate carboxylase.

pyruvic-malic carboxylase an alternative name for malic enzyme.

PYY abbr. for peptide YY.
PZ abbr. for pancreozymin.

Qq

- **q** symbol for quartet (in nuclear magnetic resonance spectroscopy).
- **q** symbol for 1 heat (alternative to Q). 2 partition function (individual entity). 3 specific humidity.
- **Q** symbol for 1 a residue of the α -amino acid L-glutamine (alternative to Gln). 2 a residue of the ribonucleoside **pseudouridine** (replacing Ψ for computer work). 3 coenzyme Q (i.e. **ubiquinone**); not recommended. The number of prenyl residues may be indicated by a suffixed arabic number, e.g. Q-10. 4 queuosine.
- **Q** symbol for 1 heat (alternative to q). 2 electric charge. 3 radiant energy (alternative to W). 4 or Q_v quantity of light. 5 partition function (whole system).

Q₁₀ symbol for temperature coefficient of a reaction.

Q_{CO2} symbol for metabolic quotient in respect of discharge of carbon dioxide; it is expressed in terms of microlitres CO₂ evolved per milligram dry mass of material per hour.

Q₀₂ symbol for metabolic quotient in respect of uptake of dioxygen; it is expressed in terms of microlitres O₂ absorbed per milligram dry mass of material per hour.

 $\mathbf{Q_s}$ symbol for a measure of the activity of an enzyme, especially a respiratory enzyme, defined as the number of microlitres (at stp) of gaseous substrate S used up per hour per milligram enzyme. It could be extended to nongaseous substrates by taking 1 μ mol as equivalent to 22.4 μ L.

QAE abbr. for the quaternized aminoethyl; denoting the group diethyl-(2-hydroxypropyl)aminoethyl; $(C_2H_5)_2(CH_3-CHOH-CH_2)N^+-CH_2-CH_2-$; a strongly basic substituent sometimes used in hydroxylated chromatographic support matrices, as in QAE-Sephadex, to form anion exchangers. Compare **DEAE**.

Q cycle an alternative name for protonmotive Q cycle.

Q enzyme an alternative name for amylopectin branching enzyme; see branching enzyme.

Q gas a mixture of 98.7% helium and 1.3% butane, used as filling for gas-flow Geiger counters.

QH· symbol for ubisemiquinone.

QH2 symbol for ubiquinol.

quad denoting four kinetically important substrates or products in an enzyme mechanism. See reactancy of enzymes.

quadri+ or (sometimes) quadru+ or (before a vowel) quadr+ comb. form four; fourth or one-fourth; square:

quadruplex DNA another name for tetraplex DNA.

quality factor or (formerly) relative biological effectiveness an index of the ability of a given type of ionizing radiation to cause biological damage, depending on the density of the ionization produced relative to that produced by gamma radiation. For all X- (and gamma) radiation and beta particles (+ or -) likely to be encountered in the use of radioisotopes it is assigned a value of unity, for thermal neutrons usually a value of 3, and for all alpha particles a value of 10. See also dose equivalent.

quanta the plural of quantum.

quantal 1 of, pertaining to, or being a **quantum** or something that is quantized; of or pertaining to the quantum theory. 2 of a biological effect or response in which there are only two categories, conditions, or states (e.g. all or none, alive or dead).

—quantally adv.

quantitative electrophoresis (sometimes) an alternative name for crossed immunoelectrophoresis.

quantity or physical quantity (in systems of measurement) any property whose value can be expressed as the product of a numerical value and a unit. In the International System of Units (see SI) there are seven base quantities, physical quantities regarded as being dimensionally independent; these are: length mass, time, electric current, thermodynamic temperature, amount of substance, and luminous intensity: all are arbitrare.

ily defined. **Derived units** are expressed algebraically in terms of the base units. Symbols for physical quantities are printed in italic type; they are generally single Roman or Greek letters, and may be lower case or capital.

quantity of electricity an alternative name for electric charge. quantize or quantise to restrict (a physical quantity) to a set of discrete values, characterized by quantum numbers. A quantized physical quantity cannot vary continuously but must

change in steps. —quantization or quantisation n.

quantum (pl. quanta) 1 a (specific) quantity or amount of something. 2 a unit amount of a physical quantity, especially of electromagnetic energy, such that all other amounts are integral multiples of it. According to the quantum theory, a quantum of energy released during radiation emission or taken up during radiation absorption is equal to $h\nu$, where h is the Planck constant and ν the frequency of the radiation in hertz. A quantum of light (or other electromagnetic energy) is termed a photon.

quantum efficiency 1 (in a luminescent system) the fraction of the molecules in a particular excited state that emit luminescence. 2 (in biochemistry) an alternative term for quantum vield (def. 1).

quantum mechanics a mathematical theory developed from the quantum theory (see quantum) as a replacement for classical mechanics in order to explain satisfactorily the behaviour of atoms, molecules, and elementary particles in terms of observable quantities such as the intensities and frequencies of spectral lines.

quantum number any of a set of small integral or half-integral numbers that give the various possible values of a quantized property of a system. Quantum numbers are used especially in describing the properties of elementary particles, such as their charge (values of 0, +1, or -1) or spin (values of $+\frac{1}{2}$, or $-\frac{1}{2}$), and in specifying the energy states of electrons in atomic orbitals (each of which is characterized by a unique set of four quantum numbers).

quantum requirement (in photosynthesis) the inverse of quantum yield (def. 2); i.e. the number of quanta of light energy required to bring about the release of one molecule of dioxygen. The theoretical value is eight, but the value observed in an experimental system is generally somewhat higher, depending on conditions.

quantum theory see quantum.

quantum yield 1 abbr.: Q; (in a luminescent system) the probability of luminescence occurring in given conditions, expressed by the ratio of the number of photons, i.e. quanta of light, emitted by the luminescing species to the number absorbed. Compare quantum efficiency. The measurement of Q requires the counting of photons, because

Q = photons emitted/photons absorbed.

It requires highly specialized instrumentation, but a less rigorous method may be employed in which the fluorescence of a fluor is compared with that of a fluor of known Q. Then

$$Q_{\rm x} = [I_{\rm x}Q_{\rm s}A_{\rm s}]/[I_{\rm s}A_{\rm x}]$$

where Q_s is the quantum yield of the standard, I_s and I_x are the fluorescence intensities of the sample and standard and A_s and A_x are the percentage of absorption of each solution at the exciting wavelength. 2 (in photosynthesis) the inverse of quantum requirement; i.e. the fractional number of molecules of carbon dioxide reduced per photon absorbed.

garded as being dimensionally independent; these are: length, mass, time, electric current, thermodynamic temperature, amount of subtance and individual fair abilitary NOTIFEN. Referentiation of the mast immension of the subtance and individual fair abilitary NOTIFEN. Referentiated and evidence for more individual fair abilitary notices.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

the right- and left-handed forms rotating the plane of polarized light in opposite directions.

quaternary 1 consisting of four (items, parts, etc.); by or in fours. 2 (in chemistry) consisting of or containing an atom bound to four atoms or groups. 3 of the fourth order; fourth in a series or hierarchy.

quaternary ammonium compound any compound that can be regarded as derived from ammonium hydroxide or an ammonium salt by replacement of all four hydrogen atoms of the NH₄⁺ ion by organic groups. Certain compounds of this class - ones in which one of the organic groups is a long-chain (C₈-C₁₈) alkyl group and the other three are shorter-chain alkyl or other groups - have the properties of cationic detergents and are powerful antimicrobial agents. They are bacteriostatic at low concentrations and bactericidal at higher concentrations, being generally more active against Grampositive than Gram-negative organisms. They display relatively low toxicity to higher animals and humans, and hence are widely used as antiseptics and disinfectants.

quaternary structure the fourth order of complexity of structural organization exhibited by protein, nucleic acid, and nucleoprotein molecules. It refers to the arrangement in space of the subunits of a multimeric macromolecule and the ensemble of its intersubunit contacts and interactions without regard to the internal geometry of the subunits. Hence it is possessed only when the molecule in question is made up of at least two (identical or nonidentical) subunits that are (at least potentially) separable, i.e. are not linked by covalent bonds.

Quellung reaction or Neufeld Quellung reaction or pneumococcus capsule swelling reaction the swelling of the capsule observed when specific antibody is mixed with suitable bacterial cells (e.g. pneumococci). It is probably due to deposition of antibody on the outside of the capsule, making the latter clearly visible. [From the German, Quellung, swelling; described by Ferdinand Neufeld (1869-1945), German bacteriologist, in 1902.]

quench correction (in liquid-scintillation counting) a correction to be applied to an observed count rate to allow for losses resulting from quenching (def. 2).

quenched flow see rapid-reaction kinetics.

quencher a substance capable of reducing or destroying luminescence through deactivation of an excited chemical species. In biological systems this usually occurs by chemical reaction (e.g. complex formation), by exchange of energy on collision, or by resonance energy transfer.

quenching 1 the reduction or destruction of luminescence, especially fluorescence, of a sample by addition or inclusion of a quencher. Fluorescence quenching is the basis of a useful technique for studying the binding of small molecules to proteins or other macromolecules. 2 the reduction by whatever means of the efficiency of energy transfer from beta particles to the photomultiplier(s) in a liquid-scintillation counter. Such means include: (1) dilution quenching - reduction of the probability of scintillation occurring through dilution of the scintillator by the sample; (2) chemical (or impurity) quenching absorption by a component of the sample of some of the energy of the beta particles without emitting photons, or (without fluorescing and in competition with the primary fluor) of some of the photons emitted by excited solvent molecules; and (3) colour quenching – absorption by a coloured component of the sample of some of the photons emitted by the secondary fluor. 3 the termination of a chemical or enzymic reaction by addition of another reagent or sudden change of the condi-

quercetin 3,3',4',5,7-pentahydroxyflavone; a member of the flavonoids, or flavones, widely distributed in plants, often as glycosides; it is the aglycon of quercitrin, rutin, and other materials. Known in folk medicine for its anti-inflammatory properties. it inhibits the lipoxygenase pathway, has some antiplatelet and antithrombotic activity in vivo, inhibits mast-cell degranulation, and possesses anti-asthmatic activity. It inhibits many its value as a DNA-labelling agent. Ban dang độc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

enzymes, including protein kinases, and also inhibits DNA, RNA, and protein synthesis. A number of its actions may reflect its property as a nucleoside antagonist.

quercitrin quercetin-3-L-rhamnoside. See also quercetin.

query language very high level computer language used in interrogating databases.

queuosine symbol: Q; any one of a series of nucleosides found in tRNA and having an additional pentenyl ring added via an NH group to the methyl group of 7-methylguanosine. The pentenyl ring may carry other substituents.

Qui symbol for a residue (or sometimes a molecule) of the deoxyaldohexose quinovose.

Quin-2 abbr. for 2-[(2-amino-5-methylphenoxy)methyl]-6methoxy-8-aminoquinoline-N,N,N',N'-tetraacetic acid; a molecule functionally related to the Ca2+-chelating agent EGTA, but containing fluorescent groups. The quantum yield of fluorescence is greatly enhanced on binding Ca2+, leading to its use as a quantitative indicator of Ca2+ concentration. It is normally used as its tetraacetoxy ester, which readily crosses the plasma membrane and is then hydrolysed within the cell by esterases to Quin-2, the polar nature of which causes it to be retained as an intracellular indicator. See also Fura-2, INDO-1.

quinacrine or mepacrine or atebrine 6-chloro-9-(4-diethylamino-1-methylbutylamino)-2-methoxyacridine; a derivative of acridine, formerly used as an antimalarial and anthelmintic. It fluoresces powerfully in UV light and can be used as a fluorochrome to label DNA in chromosomes.

quinacrine mustard a compound derived by chloro-substitution of the terminal methyls of quinacrine ethylamino groups, and possessing properties of an alkylating agent; this enhances

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

quinhydrone an addition compound of one mole each of hydroquinone and p-benzoquinone. It is a reddish-brown crystalline substance with a dark-green lustre, useful as an antioxidant, in photography, and as a redox system in the **quinhydrone electrode**.

quinhydrone electrode a half-cell consisting of a bright platinum (or sometimes gold) electrode immersed in a test solution to which has been added a little quinhydrone. It has an electric potential related to the pH value of the solution and thus is useful as a secondary hydrogen electrode for the electrometric measurement of pH.

quinic acid the D enantiomer $(1\alpha, 3\alpha, 4\alpha, 5\beta)$ -1,3,4,5-tetrahydroxycyclohexanecarboxylic acid occurs commonly in plants, either free or as esters (e.g. **chlorogenic acid**), and may make up as much as 2-10% of the dry weight of leaves. It may be formed by the **shikimate pathway**. Its catabolism to protocatechuic acid has been extensively studied in *Aspergillus nidulans* and *Neurospora crassa*.

quinidine $\hat{\beta}$ -quinine; 6'-methoxycinchonan-9-ol; a stereoisomer of **quinine** noted for its cardiac anti-arrhythmic effects.

quinine 6'-methoxycinchonan-9-ol; a bitter-tasting alkaloid obtained especially from the bark of cinchona, any of a number of trees or shrubs of the tropical genus *Cinchona* (especially the Javan species *C. lidgeriana* and various South

American species). It was formerly much used (and sometimes is still needed) for the prevention and treatment of malaria; it

binds to the DNA of the malarial parasite, *Plasmodium* spp., and is thought thereby to inhibit biosynthesis of the parasite's nucleic acids. Quinine and drinks containing it (e.g. tonic water) help to prevent cramp. *Compare* quinidine.

quinoid or **quinonoid** of, derived from, or resembling a **quinone** (def. 2).

quinol an alternative name for hydroquinone.

4-quinolone antibiotic a generic term for any of a wide range of synthetic antibacterial compounds whose molecular structures contain a 4-oxo-1,4-dihydroquinoline or a 4-oxo-1,4-dihydrocinnoline nucleus; e.g. cinoxacin, ciprofloxacin, nalidixic acid, oxolinic acid. Their antibiotic activity derives from interaction with the A subunit of bacterial DNA gyrase (see type II DNA topoisomerase); this results in trapping of bacterial DNA in the complex it forms with the A sububit. Rejoining of the DNA strands broken by the enzyme is thereby arrested.

quinone 1 a common name for p-benzoquinone. 2 any member of a class of diketones derivable from aromatic compounds by conversion of two CH groups into CO groups with any necessary rearrangement of double bonds. Simple quinones are usually p-quinones, i.e. derivatives of p-benzoquinone (compare hydroquinone (def. 2)), but they may also be o-quinones, i.e. derivatives of o-benzoquinone (compare catechol (def. 2)). Naturally occurring quinones form a large, varied, and widespread group of compounds; they include numerous pigments, various electron carriers (e.g. plastoquinone, ubiquinone), and vitamins K. See also semiquinone.

+quinone comb. form denoting a quinone (def. 2); e.g. benzo-quinone, anthroquinone, naphthoquinone.

quinonoid an alternative term for quinoid.

quinoprotein a proposed name for any of a number of bacterial oxidoreductase enzymes within the sub-subclass EC 1.1.99 that have pyrroloquinoline-quinone (see methoxatin) as coenzyme or prosthetic group. The category includes alcohol dehydrogenase (acceptor) (EC 1.1.99.8) of methylotrophic bacteria, glucose dehydrogenase (pyrroloquinoline-quinone) (EC 1.1.99.17), and a number of dehydrogenases acting on other specified (types of) alcohols or polyols.

quinovosamine 2-amino-2,6-dideoxy-p-glucose; an amino derivative of quinovose present in bacterial polysaccharides.

quinovose symbol: Qui; a trivial name for 6-deoxy-D-glucose. α -Quinovose occurs, e.g., as its 6-sulfo derivative (6-deoxy- α -D-glucopyranosyl 6-C-sulfate) in the sulfoquinovosyl diacylglycerols, which form one of the two major groups of the glycerolipids of chloroplasts. The sulfoquinovosyl derivative also occurs in some **cardiac glycosides**.

quisqualate receptor $see~\alpha$ -amino-3-hydroxy-5-methyl-isoxazole-propionic acid receptor.

Rr

r 1 symbol for ribo+ (def. 1); it is used as a prefix in (one- or three-letter) symbols for ribonucleosides for emphasis or clarity, especially to distinguish from 2'-deoxyribonucleosides. 2 symbol for reaction. 3 abbr. for rat (as a prefix to an abbreviation for the name of a peptide hormone); denoting derived (or as if derived) from a rat or rats; e.g. rGH.

r symbol for 1 concentration ratio. 2 rate of concentration change. 3 radius. 4 interatomic distance.

R symbol for 1 a residue of the α-amino acid L-arginine (alternative to Arg). 2 a residue of an incompletely specified base in a nucleic-acid sequence that may be either adenine or guanine. 3 a residue of an unspecified purine nucleoside (alternative to Puo). 4 an unspecified univalent group in a formula of an organic compound. The group must be attached by means of carbon and derived from an aliphatic, carbocyclic, or heterocyclic compound. Up to three such groups, when different, may be designated R, R', and R", or R¹, R², and R³; for more than three such groups, superscript numerals only should be used. 5 röntgen (a non-SI unit of radiation exposure). 6 resonance effect (in electron displacement).

R symbol for 1 electric resistance. 2 thermal resistance. 3 gas constant. 4 molar refraction.

R stereochemical descriptor denoting rectus; i.e. the absolute configuration of a chiral compound in which the priority (obtained using the Cahn-Ingold-Prelog sequence rules) of the substituent groups on the chiral centre decreases in a clockwise (right-handed) direction. For use as a prefix in chemical nomenclature, the descriptor is placed in parentheses and connected with a hyphen, e.g.(R)-alanine. For chiral compounds in which the relative but not the absolute configuration is known, rectus configuration is denoted by the prefix (R^*)-. See sequence rule. Compare S.

R_B symbol for R_B value.

Rf or RF symbol for Rf value.

R_p symbol for phosphorylation state ratio.

R_• symbol for saturation ratio.

RAB a gene encoding a Rab protein – any of a family of GTP-binding proteins similar to Ras proteins (see **RAS**) and probably involved in membrane traffic, etc. Example, Rab-2 from human and dog (identical sequences): database code RAB2_HUMAN, 212 amino acids (23.52 kDa).

rabbit aorta-contracting substance abbr.: RCS; a name given (in 1969) to an unstable factor released from guinea-pig lung that caused contraction of isolated strips of rabbit aorta. The activity was probably due to the presence of thromboxane A₂ (see thromboxane).

rabbit reticulocyte system a cell-free system, from lysed rabbit reticulocytes, that translates added eukaryote mRNAs from a wide variety of heterologous sources. Endogenous mRNA is destroyed using a Ca²⁺-dependent ribonuclease, micrococcal endonuclease; this enzyme is inactivated by adding EGTA. Heterologous mRNA is then added and is translated by the system.

rac- abbr. for racemo-.

RACE abbr. for rapid amplification of cDNA ends; a variation on the **polymerase chain reaction** designed for amplification of cDNA corresponding to low-abundance mRNA.

racemase any enzyme that interconverts the two enantiomers of a chiral compound; such enzymes are categorized in subclass EC 5.1 (which also includes epimerases). If more than one chiral centre is present, a racemase must invert configuration of all the chiral centres. Thus, the name methylmalonyl-CoA racemase, sometimes used for methylmalonyl-CoA epimerase (EC 5.1.99.1), is incorrect – the enzyme does not change configurations of the chiral centres of the CoA moiety.

racemate any homogeneous phase containing equimolar amounts of enantiomeric molecules.

racemic symbol: (±)- or (formerly) dl-; denoting the presence of equimolar amounts of the dextrorotatory and levorotatory enantiomers of a compound, regardless of whether the (optically inactive) product formed is crystalline, liquid, or gaseous. A homogeneous solid phase composed of equimolar amounts of enantiomeric molecules is termed a racemic compound, and a mixture of equimolar amounts of enantiomeric molecules present as separate solid phases is termed a racemic mixture; see also racemate. A (±)-product may be resolved into its (+)- and (-)-components. The term is derived from racemic acid [from Latin racemus, bunch of grapes], the optically inactive mixture of (+)- and (-)-tartaric acids sometimes found during the manufacture of wine. By extension, the term is applied to DL- and (RS)-mixtures. See D/L convention, optical isomerism, sequence rule. See also racemo-.

racemize or racemise to induce the formation of a mixture of the two possible enantiomers from one of the pure isomers of a chiral compound. —racemization or racemisation n.

racemo- abbr.: rac-; prefix (in chemical nomenclature) designating a racemate. It may be used as an alternative to the symbol (±)- or (for certain classes of racemic compounds) the symbol DL-. Compare meso-.

rachitic of, pertaining to, or afflicted with rickets.

rachitis an alternative name for rickets.

rachitogenic tending to cause rickets.

rad 1 symbol for radian. 2 symbol: rad or (to avoid possible confusion with rad (def. 1)) rd; the cgs unit of absorbed dose of ionizing radiation, equivalent to an absorption of 0.01 joule of energy per kilogram (= 100 ergs per gram) of irradiated material. Whereas the rad represents, in practice, about the same amount of energy as the röntgen (the exact equivalence depending on the material irradiated), it applies to any type of ionizing radiation in any medium. 1 rad = 0.01 Gy. 3 abbr. for radiation.

radial 1 of, resembling, or relating to a radius or ray; in rays.
2 emanating from the centre of a circle or a common central point. 3 spreading out uniformly in all directions on a surface.
-radially adv.

radian symbol: rad; the SI supplementary unit of plane angle. One radian is equal to the angle subtended at the centre of a circle by an arc whose length is equal to the radius. It is dimensionless. There are 2π radians in a circle; 1 rad \approx 57.295 78°.

radiant energy symbol: Q or W; the energy of any form of electromagnetic radiation. The SI derived unit is the joule.

radiant intensity symbol: I; the **radiant power** of radiation from a point source per unit of solid angle; i.e. $I = d\Phi/d\Omega$, where Φ is the radiant power and Ω is the solid angle measured in steradians. The SI unit is the watt per steradian (W sr⁻¹).

radiant power or radiant flux symbol: P or Φ ; the rate of flow of energy of radiation; i.e. $\Phi = dQ/dt$, where Q is the radiant energy. The SI derived unit is the watt.

radiation 1 the emission of energy from a source and its transmission as particles, rays, or waves, especially as electromagnetic rays or waves, sound waves, or streams of subatomic particles. 2 energy so transmitted, especially the corpuscular and electromagnetic rays emitted in the decay of radionuclides. 3 ionizing radiation. 4 divergence from a common point, especially radially from a central point or source.

radiation absorbed dose see absorbed dose, rad (def. 2). radiation biology an alternative name for radiobiology.

racemase, sometimes used for methylmalonyl-CoA epimerase (EC 5.1.99.1), is incorrect – the enzyme does not change configurations of the chiral centres of the CoA moiety.

radiation chemistry

giving rise to a variety of reaction products) and by occurring at higher radiation energies (i.e. by absorption either of electromagnetic radiation from the mid-ultraviolet region onwards or of high-energy particulate radiation) and thus by resulting always in the formation of detectable ions.

radiation chemistry the branch of chemistry concerned with radiation-chemical reactions. Compare radiochemistry.

radiation damage the totality of the harmful changes induced in a cell or tissue by radiation. The harmful effects may include formation of thymine dimers in DNA or of radicals from polyunsaturated acyl groups in lipids.

radiation dose equivalent see dose equivalent.

radiation inactivation method a technique, based on target theory, that enables the size of the functional unit of a biologically active macromolecule (or of its complexes with other molecules) to be estimated; it can be used on unpurified (e.g. membrane-bound) material. Determinations are made of the biological activity remaining in a sample after exposure to various large doses of ionizing radiation (electrons or X- or gamma radiation of at least 1 MeV), and the value, D_{37} , of the radiation dose, expressed in Mrad, required to reduce the activity to 37% of (i.e. e⁻¹ times) its original value is obtained; the relative molecular mass, M_r , of such a macromolecule may then be found from the empirical relationship

 $M_r = 6.4 \times 10^5/D_{37}$, where D_{37} is determined at 30 °C.

radiation source a quantity of radioactive material used as a source of ionizing radiation.

radical (in chemistry) 1 any molecular entity, charged or uncharged, that possesses an unpaired electron (but normally excluding any paramagnetic metal ion); often formed by homolysis of a covalent bond. Radical character is indicated in a formula by a centred dot symbolizing the unpaired electron and placed (if possible) beside the symbol for the atom of highest spin density; e.g. HOO., ·CH₃. The term free radical is now preferably restricted to any radical that does not form part of a radical pair. 2 a former name for group (def. 2).

radical anion see radical ion.

radical cation see radical ion.

radical centre the atom in any polyatomic radical (def. 1) on which the unpaired electron is largely localized.

radical ion any radical (def. 1) that carries an electric charge. One carrying a negative charge is termed a radical anion (e.g. the benzene radical anion, C₆H₆·-); one carrying a positive charge is termed a radical cation (e.g. the benzene radical cation, C_6H_6 .

radical pair any two radicals (def. 1) in close proximity in liquid solution, with a solvent cage. They may have been formed simultaneously, e.g. by homolysis, or have come together by diffusion. Whilst together, correlation of their unpaired electron spins occurs and manifests itself as a distortion of nuclear magnetic resonance spectra.

radical scavenger any substance that can react readily with, and thereby eliminate, radicals. In biological systems or materials, radical scavengers may function as antioxidants or may protect from damage by ionizing radiation. Among the important radical scavengers that function in animal tissues at physiological concentrations are the water-soluble substances ascorbate, glutathione, and the purine bases, and the fat-soluble substances tocopherols, the retinols, the carotenes, and the ubiquinones.

radioactivate to convert a stable nucleus into one undergoing radioactive decay by bombardment with high speed particles, including protons, alpha particles, neutrons, and deuterons. These are formed in a cyclotron or synchrotron from a radioactive source, and accelerated through a potential difference of a few thousand volts by a magnetic field before being focused on the substance to be converted.

radioactivation analysis or activation analysis a method for the qualitative and/or quantitative estimation of the chemical termination of the radionuclides formed when the sample is bombarded with neutrons or other particles.

radioactive having the properties associated with a radioactive

radioactive concentration the activity (def. 2) per unit quantity of any material in which a radionuclide occurs. See also specific activity.

radioactive decay see decay (def. 1b).

radioactive isotope or radioisotope any isotope of a chemical element whose nucleus is unstable and emits alpha, beta, or gamma rays. The product is another element, which may be stable or unstable; if the latter, it decays further. Thus, the principal isotope of uranium, ²³⁸U, emits an alpha particle and decays to ²³⁴Th, which emits a beta particle forming ²³⁴Pa; this chain continues to the formation of ²⁰⁶Pb, which is stable.

radioactive label or radiolabel a radioactive isotope incorporated into a molecule to confer on it the property of radioactivity.

radioactive tracer or radiotracer a radioactive substance that is added to a metabolic system in quantities (mass) too small to perturb the system, in order to follow, by isolating the radioactive intermediates formed, the sequence of transformations undergone normally by the same (nonradioactive) molecule under similar conditions.

radioactivity 1 the emission of radiation from certain nuclides by the spontaneous transformation of their nuclei. 2 (loosely) the radioactive material itself or its emitted radiation. See activity (def. 2).

radioallergosorbent test abbr.: RAST; a test used primarily for quantifying the levels of antigen-specific immunoglobulin E (IgE) in serum. A specific allergen, which has been covalently coupled to an insoluble Sephadex carrier, is incubated with serum containing the unknown amount of IgE. The carriers are then washed and further incubated with radiolabelled antibodies to IgE, the amount of radioactivity bound being a measure of the amount of IgE. The advantage of this method over the radioimmunosorbent test is that IgE specific to a particular antigen can be selectively quantified.

radioassay any type of assay in which a radioactive isotope is used in the measurement. The term embraces, e.g., immunoradiometric assay, radioimmunoassay, and competitive proteinbinding assay.

radioautogram or radioautograph or autoradiogram the pattern formed after development of an X-ray film that has been exposed to a paper, gel, or thin-layer chromatogram containing radioactive compounds.

radioautograph 1 an alternative term for radioautogram. 2 to prepare a radioautogram. —radioautography n.

radiobiology or radiation biology the study of the interaction between radiation and biological material.

radiocarbon any radioactive isotope of carbon, usually carbon-11 or carbon-14.

radiochemical purity abbr.: RCP; the proportion of the total activity (def. 2) that is present in the stated chemical form in a radioactive material.

radiochemistry the branch of chemistry concerned with the compounds of radioactive nuclides. Compare radiation chemistry.

radiochromatogram a chromatogram of substances some or all of which contain a radioactive isotope.

radiofrequency radiation electromagnetic radiation encompassing wavelengths in the region 1 mm (300 GHz) to 30 km (10 kHz) (frequencies in parentheses). This range includes microwave radiation and lies above that of infrared radiation.

radiography the use of X-rays to examine the internal structures of a body. An X-ray film is placed behind the body, through which X-rays are passed. After exposure, there are areas of the film in which development has not occurred due to absorption of the X-rays by structures of the body, thus yielding a pattern of these structures. —radiographer n.; radioelements in a sample. It depends on the identification and de-Bạn đang đọc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

radioimmunoassay abbr.: RIA; a highly sensitive method of assay of nonradioactive material. A known amount of antibody (Ab) directed against the substance (antigen, Ag) to be assayed is saturated with a mixture of Ag and radioactive Ag (Ag*), so that total Ag (Ag + Ag*) is in excess. When nonradioactive Ag is added to Ab along with Ag*, Ag and Ag* compete for binding to Ab, so that less Ag* will be found in the antibody-antigen complex as the ratio Ag:Ag* increases. If the antibody-antigen complex is then separated from free antigen, the total amount of antigen (the substance being assayed) can be calculated from the ratio Ab-Ag*:Ag* and the known titre of antibody. It is often convenient to attach the antigen to plates so that the amount of ligand bound to the plate is proportional to the amount of test antibody.

radioimmunosorbent test abbr.: RIST; a test used primarily for quantifying total serum immunoglobulin E (IgE) levels. Antibodies specific for IgE, covalently linked to an insoluble dextran, are incubated first with a known amount of radiolabelled IgE and then with the serum containing the unknown amount of IgE. From the decrease in the amount of radiolabel bound to the immobilized antibodies, due to competition by the unlabelled IgE in the serum, the total amount of IgE in the serum can be estimated.

radioiodinate to incorporate one or more atoms of radioiodine (usually iodine-125 or iodine-131) into a molecule.

radioiodine any radioactive isotope of iodine, notably iodine-125 (half-life 60 days) and iodine-131 (half-life 8 days).

radioisotope a radioactive isotope.

radiolabel 1 a radioactive label. 2 to incorporate a radiolabel. radioligand any ligand containing a radioactive isotope; see also Scatchard plot.

radiology the study and use of radiation and radioactive substances, especially in the diagnosis and treatment of disease. It includes the use of diagnostic X-rays in radiography, the therapeutic use of ionizing radiation to treat disease (radiotherapy), and the experimental and diagnostic use of radioisotopes introduced into the body. —radiological adj.; radiologically adv.; radiologist n.

radiolysis the cleavage of chemical bonds by high-energy radiation. —radiolytic adj.; radiolyse vb.

radiometer 1 any instrument used to measure radiant energy. 2 Crookes radiometer a specific type of radiometer in which the different behaviour of a polished surface, which reflects energy, and a blackened surface, which absorbs it, is utilized to cause a rotor to turn at a rate related to the intensity of radiation. [After William Crookes (1832-1919), British chemist and physicist.] —radiometric adj.; radiometry n.

radiomimetic 1 describing any drug or other chemical substance, typically an alkylating agent, whose effects in living systems (e.g. carcinogenic, immunosuppressive, mutagenic) resemble those produced by ionizing radiation; more loosely, describing any such agent able to cause gene and chromosome mutations. 2 a radiomimetic (def. 1) substance or agent.

radionuclide a radioactive nuclide. —radionuclidic adj. radionuclidic impurity any radionuclide, other than the nuclide that should be present, in a radioactive material.

radionuclidic purity or radiopurity (of a radioactive material) the proportion of the total activity (def. 2) that is in the form of the stated radionuclide.

radiotherapy see radiology.

radiotracer an alternative name for radioactive tracer.

radixin a protein of the erythrocyte band 4.1 family present in a variety of eukaryotic cells; it shares about 75% homology with human ezrin. It is an actin barbed-end capping protein, highly concentrated in the undercoat of the cell-to-cell adherens junction and the cleavage furrow in the interphase and mitotic phase. Example from human: database code RADI_HUMAN, 583 amino acids (68.49 kDa).

radyl (in chemical nomenclature) a term used to indicate any acyl, alkyl, or alkenyl group where this cannot be specified in **RAF** any of a family of genes encoding Raf proteins; there are at least three Raf proteins, Raf-1, A-Raf, and B-Raf. These are protooncogene cytoplasmic serine/threonine protein kinases (EC 2.7.1.-) of the Ras/Mos family; they show similarity to members of the protein kinase C family in both their conserved C-terminal catalytic and regulatory N-terminal domains. Example, Raf-1 (human), which has binding domains for ATP, phorbol ester, and diacyl glycerol: database code KRAF_HUMAN, 648 amino acids (72.97 kDa). This protein is involved in transduction of mitogenic signals from the cell membrane to the nucleus. In the mouse, raf is the transforming gene of the mouse sarcoma virus, 3611, v-Raf having a truncated regulatory domain that causes constitutive activation of kinase activity. The c-Raf-1 protein kinase, a 74 kDa protein, has been found in all mammalian cells tested. Raf-1 is an important mediator of signals involving cell growth, transformation, and differentiation and is activated by a wide variety of extracellular stimuli. It has MAP kinase kinase kinase activity. In many cell types, Raf functions immediately downstream of the G-protein Ras (see RAS) in the activation pathway; although Ras does not directly activate Raf, it mediates translocation of Raf-1 from cytoplasm to plasma membrane where it is activated. In some cells Raf may be phosphorylated and activated by members of the protein kinase C family. The first physiological substrate to be discovered for Raf kinase was a protein kinase (MEK) of yeast that is required for meiotic recombination and which on phosphorylation can activate MAP kinase.

raffinose or gossypose or melitose or melitriose the trisaccharide $O-\alpha$ -D-galactopyranosyl- $(1\rightarrow 6)$ - $O-\alpha$ -D-glucopyranosyl- $(1\rightarrow 2)$ β-D-fructofuranoside; it occurs in plants almost as commonly as sucrose, being present, e.g., in cereal grains, cotton seeds, and many legumes. It is the first member of a series in which galactosyl residues are attached to sucrose, others being the tetrasaccharide stachyose and the pentasaccharide verbascose; these are all synthesized from sucrose by transfer reactions in which an α -D-galactopyranoside of myo-inositol (i.e. galactinol) is the donor of the galactosyl residues.

r.a.m. abbr. for relative atomic mass.

Ramachandran plot or conformational map a plot that shows the ranges of bond angles that are permissible and the main types of structure of an L-polypeptide chain (e.g. α helix, βpleated sheet). As the peptide bond, -C'O-NH-, is planar, a polypeptide chain has only two degrees of freedom per residue, the twist about the C^{α} -N bond axis, ϕ , and that about the C^{α} -C' axis, ψ . Some foldings will be easily achieved; others will be impossible because they would bring neighbouring unbonded atoms or groups within van der Waals contact distances. The Ramachandran plot shows the permitted range within a plot of ϕ against ψ . [After G. N. Ramachandran (1922 -).1

Raman, (Sir) Chandrasekhara Venkata (1888-1970), Indian physicist; Nobel Laureate in Physics (1930) 'for his work on the scattering of light and for the discovery of the effect named after him'.

Raman scattering the inelastic scattering of a photon by a molecule, producing in the scattered light weak radiation of frequencies not present in the incident light. The sample does not have an absorption band at the wavelength of the incident light (compare fluorescence) and the frequency differences between the weak Raman lines in the spectrum and the exciting line are characteristic of the scattering substance and independent of the frequency of the exciting line. [After C. V. Raman.]

Raman spectrum a plot of Raman scattering over a range of fre-

Ramón y Cajal, Santiago (1852-1934), Spanish anatomist and histologist; Nobel Laureate in Physiology or Medicine (1906) jointly with C. Golgi 'in recognition of their work on the structure of the nervous system'.

Ramsay, (Sir) William (1852-1916), British physical and inorganic chemist; Nobel Laureate in Chemistry (1904) 'in recog-Ban đang đọc một quyển sách được tặng bởi HUY NGUYÊN. Nếu ban có nhu cầu về sách sinh học, xin liên hế:

RAN

rare earth r

nition of his services in the discovery of the inert gaseous elements in air, and his determination of their place in the periodic system'.

RAN a gene encoding a small nuclear G-protein, first identified as a well-conserved gene distantly related to *H-RAS*. Its product, Ran, interacts with **RCC1**, and the complex is involved in regulating cell-cycle progression and messenger RNA transport. In the absence of RCC1, GDP-Ran predominates and this results in activation of **M-phase-promoting factor** and chromatin condensation. The presence of RCC1 activates nucleotide exchange on Ran, increasing the amount of GTP-Ran and preventing premature chromatin condensation. Example from *Mus musculus*: database code RAN_MOUSE, 216 amino acids (24.42 kDa). See also nuclear pore.

random coil the condition in solution of a linear polymer that exhibits little side group interaction, or resistance to rotation about the bonds in its chain. There are no preferred conformations. Quantitative expressions have been developed for the average radius of gyration. The term has formerly been incorrectly applied to various states of protein chains.

random copolymer a polymer of more than one species of monomer, in which the sequence of species within the polymer is not predetermined by controlled steps during synthesis, but depends only on random collisions between the reactant molecules. An example is the sequence of bases in RNA synthesized from nucleoside diphosphates by polynucleotide phosphorylase.

random mechanism or random pathway (for an enzymic reaction involving two substrates, $A + B \rightleftharpoons C$) a mechanism in which the enzyme, E, may first react with either substrate and the resulting enzyme-substrate complex then reacts with the second substrate, e.g. $A + E \rightleftharpoons EA$ then $EA + B \rightleftharpoons EAB$, or, $B + E \rightleftharpoons EB$ then $EB + A \rightleftharpoons EAB$, subsequently $EAB \rightleftharpoons E + C$. Compare ordered mechanism.

random sample a selection of part of a population made in such a way that no individual is favoured over any other individual. See also sample, statistical sample.

ranitidine a competitive antagonist at histamine H_2 receptors, being the major and pharmacologically more selective analogue of the imidazole derivative, cimetidine. It inhibits histamine- and pentagastrin-evoked gastric acid secretion and cardiac stimulation and also inhibits gastric secretion evoked by physiological stimuli, agonists at muscarinic cholinoceptors, and gastrin. It is used in the treatment of gastric and duodenal ulcers. One proprietary name: Zantac (hydrochloride).

RANTES abbr. for regulated upon activation, normal T-cell expressed and secreted chemokine; other names: small inducible cytokine A5; a chemokine secreted by T cells and macrophages on stimulation by mitogens, that acts as a chemoattractant, and stimulates basophils and eosinophils. Example from human (precursor): database code SISD_HUMAN, 91 amino acids (10.07 kDa); residues 1-23 are the signal, 24-91 RANTES.

ranunculeic acid another name for columbinic acid.

rapamycin an immunosuppressant (and antifungal agent) from Streptomyces hygroscopicus; it is used to reduce rejection of organ transplants. It is a lipid-soluble macrocyclic lactone, with the unusual feature of a cyclohexane ring with hydroxyl and methoxyl substituents. It competes with FK506 for a common binding site on FKBP. See also cyclosporin.

rapamycin

RAPD PCR abbr. for random polymorphic DNA PCR; a variation of the **polymerase chain reaction** in which many short (≈10 nucleotide) primers are used. The products of the reaction from different sources can lead to recognition of polymorphisms and physical maps.

rape or colza a herbaceous plant, Brassica napus, of the mustard family, Cruciferae; it resembles a turnip, and the seeds yield valuable rapeseed oil.

rapeseed oil oil derived from the seed of rape; it is widely used as a lubricant and cooking fuel, and for the manufacture of animal foodstuffs, soap, and synthetic rubber. It contains erucic acid, which has cardiotoxic effects varying with species; rape varieties of low erucic acid content have recently been developed.

rapid-reaction kinetics the kinetic analysis of an enzyme reaction before the steady state is reached. The stopped-flow method is commonly used, in which two independent sources of substrate and enzyme are mixed immediately before flow through a spectrophotometer cell. An opposing syringe stops the flow immediately before activating the detection and recording system, such that reaction times of a few milliseconds can be achieved. Characteristically, reaction rates may be appreciably faster than during the steady state. In the quenched flow modification of the method, a further reagent is added to stop the reaction immediately before detection and recording. See also relaxation kinetics.

Rapoport-Lübering shunt a unique feature of erythrocyte glycolysis in which the glycolytic intermediate 3-phosphoglyceroyl phosphate is converted by bisphosphoglycerate mutase to 2,3-bisphosphoglycerate, which is in turn converted to 3-phosphoglycerate and inorganic phosphate by bisphosphoglycerate phosphatase, both reactions being catalysed by a single enzyme molecule. The shunt bypasses the near equilibrium phosphoglycerate kinase reaction, one of the two ATP-generating reactions of glycolysis. Since 2,3-bisphosphoglycerate is an important intracellular modulator of hemoglobin function, regulation of the Rapoport-Lübering shunt balances the energy needs and oxygen-transporting function of the red cell. [After Samuel Mitja Rapoport (1912—) and J. Lübering.]

rare earth (strictly) an oxide of a rare earth metal, or (more loosely), a rare earth metal itself.

and methoxyl substituents. It competes with FK506 for a common binding site on FKBP. See also cyclosporin.

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

RAS an oncogene (v-ras) first discovered in the retroviruses Harvey and Kirsten rat sarcoma viruses; three closely related (85% homology) oncogenes are now known, Ha-ras, Ki-ras, and N-ras. Their cellular counterparts encode 21 kDa guanine nucleotide-binding proteins that play a pivotal role in regulating growth and differentiation in nearly every eukaryotic cell studied. There are two subfamilies, the Rho and Rac proteins (involved in relaying signals from the cell-surface receptors to the actin cytoskeleton) and the Rab family (involved in regulating the traffic of intracellular transport vesicles). Ras proteins undergo a number of modifications of the N and C termini that result in their localization to the plasma membrane. Ras binds both GTP and GDP with high affinity. It is considered active in the GTP-bound form and inactive in the GDP-bound form. The intrinsic rate of nucleotide exchange and GTPase activity is very slow. Ras GDP predominates in resting cells, but when Ras is activated by occupied receptors, specific guanine nucleotide exchange factors (GEFs), e.g. Sos, enhance nucleotide exchange leading to Ras-GTP, GTP exceeding GDP in cytoplasm. Ras-GTP then activates downstream effector proteins such as Raf-1 (see RAF). Activated GTPase activating protein (GAP) causes the formation of inactive Ras-GDP. The retroviral oncogene, v-ras, encodes a protein that differs from the c-ras product as a result of a point mutation. If this affects amino acids 12, 13, 59, 61, or 63 the protein fails to hydrolyse its bound GTP and so persists abnormally in its active state, constitutively transmitting an intracellular signal for cell proliferation. Alternatively, some transforming mutations increase the rate at which Ras can exchange guanine nucleotides, e.g. when amino acids 116, 117, 119, or 146 are affected, again increasing the amount of Ras-GTP. Activated ras oncogenes have been found in up to 30% of all human tumours analysed, with the most common point mutations being at codons for amino acids 12 and 13. In some types of malignancy, the figure is nearly 100%. Two genes corresponding to H-ras occur in yeast; they encode Gproteins that inhibit adenylate cyclase. 3-D structure known (including GDP bound to guanine nucleotide-binding domain) for human protein H-Ras-1: database code NRL_4Q21, 168 amino acids (19.07 kDa).

RAST abbr. for radioallergosorbent test.

rate coefficient see rate constant.

rate constant or rate coefficient symbol: k; a constant relating the concentration of a reactive species to the velocity of a reaction; thus for a first order reaction (see order of reaction) such as: EA \rightarrow E + A, the rate of reaction, v, is proportional to the concentration of the reactant EA, so v = k[EA], where k is the first-order rate constant. For a second order reaction, e.g. $E + A \rightarrow EA$, the rate is proportional to the product of the reactant concentrations, i.e. v = k[E][A], where k is the secondorder rate constant.

rate-determining step see rate-limiting step.

rate-limiting step the slowest step in a reaction sequence; i.e. the step with the smallest rate constant.

rate of consumption see rate of reaction.

rate of conversion symbol: $\dot{\xi}$; for a specified chemical reaction, the rate of increase of the extent of reaction at any moment in time, regardless of the conditions under which the reaction is carried out: $\dot{\xi} = d\xi/dt$, where ξ is the extent of reaction and t is time. In the case of a reaction with one-to-one stoichiometry, such as a typical simple enzyme-catalysed reaction, the extent of reaction is equal to the amount of a reactant consumed or the amount of a product formed. Rate of conversion is an extensive quantity (see extensive property), its dimensions are (amount of substance) divided by time, and it is expressed in mol s⁻¹ (compare rate of reaction). It is therefore independent of the volume of the system. Where this volume remains constant, as during a typical enzyme-catalysed reaction, the rate of conversion is equal to the rate of reaction multiplied by the volume: $\dot{\xi} = \nu \hat{V}$. The term was formerly known in physical chemistry as rate of reaction. See also catalytic activity NGU PEN: New Ban dang doc một quyển sách được tạng bởi HUY NGU PEN: New ban có như câu về sách sinh học, xin liên hệ:

rate of formation see rate of reaction.

rate of reaction or velocity of reaction or (sometimes) reaction rate 1 symbol: v: for a specified enzyme-catalysed reaction of a typical kind (i.e. one involving a single substrate, S, a single product, P, one-to-one stoichiometry between them, and constant-volume conditions), the rate of consumption of substrate or the rate of formation of product at any moment in time is given by:

$$v = -d[S]/dt = d[P]/dt,$$

where [S] and [P] are respectively the concentrations of substrate and product, and t is time. A similar set of relationships applies where there are several reactants in one-to-one stoichiometry, but if the overall stoichiometry is not one-to-one – a situation rarely arising in enzyme kinetics - the relationships are more complicated. Where intermediates are formed in amounts comparable to those of the reactants, there is timedependent stoichiometry and a rate of reaction for the complete reaction cannot be specified. Rate of reaction is an intensive quantity (see intensive property), its dimensions are (amount-of-substance concentration) divided by time, and it is expressed in mol L-1 s-1 (compare rate of conversion). See also initial velocity, limiting rate. 2 (formerly, in physical chemistry) the extensive quantity now termed rate of conversion.

rate theory of agonist action a theory of agonist action stating that the response to an agonist is proportional to the number of receptor-agonist associations per unit time, i.e. to the rate of receptor occupation, the binding of agonist to receptor being reversible. The response is therefore maximal at time zero and falls exponentially to an equilibrium value.

Rayleigh see Strutt.

Rayleigh ratio symbol: R; the ratio of the intensity of light scattered by particles (molecules) in solution at an angle θ from the incident beam, I_{θ} , multiplied by the square of the distance, r, from the particle to the detector, divided by the intensity of the incident light, I_0 , i.e. $R = I_{\theta}r^2/I_0$. The reduced **Rayleigh ratio**, $R_{\theta} = I_{\theta} r^2 / I_0 (1 + \cos^2 \theta)$. Many literature references do not distinguished between these two. See also Rayleigh scattering. [After J. W. Strutt, Lord Rayleigh.]

Rayleigh scattering the elastic scattering of photons of light by molecules or atoms of the substance through which the light is passing. When light passes through a liquid or gas, atoms or molecules are polarized by the electric vector of the light, thus inducing a rapidly fluctuating dipole in the atoms or molecules in the light path. The fluctuating dipole leads to the emission of electromagnetic waves in various directions of the same frequency as the incident radiation, and this emission is seen as scattered light. See also Rayleigh ratio. [After J. W. Strutt, Lord Rayleigh.]

Rb symbol for rubidium.

RB a human tumour suppressor gene that encodes a nuclear phosphoprotein, retinoblastoma protein. Inactivation or loss of RB on both copies of the chromosome (13q14) leads to retinoblas-

R band see Giemsa's stain.

RBC or rbc or r.b.c. abbr. for red blood cell. See erythrocyte. Rbe abbr. for relative biological effectiveness (i.e. quality factor).

RBS abbr. for Réné Borghgraef solution; the proprietary name for any of a range of general-purpose surfactants and decontaminating agents, especially for laboratory use, that have combined detergent and chelating properties. They are identified with a number or other designation, e.g. RBS 25, RBS 35, RBS solid.

RCC1 a chromatin-bound guanine nucleotide release (or exchanging) factor. Its function is required for the normal coupling of the completion of DNA synthesis and the initiation of mitosis, and in its absence mitosis initiates before DNA replication is complete. RCC1 therefore appears to be involved in the regulation of this process. It is also necessary for RNA export from the nucleus. It binds to and acts on the nuclear RCF receptor a

database code RCC_CANAL, 464 amino acids (51.27 kDa). [From regulator of chromosome condensation.]

RCF abbr. for relative centrifugal force.

R chromophore a chromophore that gives rise to low-intensity absorption bands at long wavelengths. Compare K chromophore. [From German Radikal.]

RCP abbr. for radiochemical purity.

RCS abbr. for rabbit aorta-contracting substance.

rd symbol for rad (def. 2) (alternative to rad).

Rd abbr. for rubredoxin.

rDNA 1 abbr. for ribosomal DNA. 2 (sometimes) abbr. for recombinant DNA; use not recommended because of possible confusion with ribosomal DNA.

Re- prefix (in chemical nomenclature) denoting rectus (i.e. right, or clockwise) configuration of a face of a trigonal atom. See Re/Si convention.

Re symbol for rhenium.

Re symbol for Reynolds number.

RE abbr. for (eukaryotic) response element.

reactancy of enzymes the number of reactants involved in an enzyme-catalysed reaction in a given direction. The numbers of kinetically important substrates or products in an enzyme mechanism are designated by Uni (1), Bi (2), Ter (3), or Quad (4). Thus, e.g., Uni Uni indicates one substrate and one product, and Ter Bi indicates three substrates and two products.

reactant any material participating in a chemical reaction in a given direction.

reaction (in chemistry) any process in which molecules interact with one another, leading to chemical or physical change.

reaction centre see photosystem. Compare photosynthetic reaction centre.

reaction intermediate a transient chemical species, with a lifetime appreciably longer than a molecular vibration time, formed directly or indirectly from the reactants of a chemical (often enzymic) reaction, and that further reacts (directly or indirectly) to give the reaction products.

reaction rate (sometimes) an alternative term for rate of reac-

reaction time an alternative name for latent period (def. 1).

reactivate to restore activity to any enzymic or cellular system. reactive describing any molecular entity or centre that is capable of reacting readily. Thus, a reactive centre is the point in the molecule at which electron configurations favour a reaction.

reactive oxygen a highly active oxygen species, such as super-

reactivity the degree to which a molecule or centre is reactive. reading (in molecular biology) the process of one-way linear decoding of a nucleotide sequence during, e.g., transcription or translation.

reading frame any sequence of bases in DNA that codes for the synthesis of either a protein or a component polypeptide. The point of initiation of reading determines the frame, i.e. the way in which the bases will be grouped in triplets as required by the genetic code. For example, the sequence

-ATGGTCA-

could be grouped

-A,TGG,TCA-

or

-AT,GGT,CA-

or

-ATG,GTC,A-

depending on the point at which the reading frame begins. See also open reading frame.

readthrough the continuation of DNA transcription beyond a normal termination sequence, due to a failure of RNA polymerase to recognize the termination signal. Readthrough may also occur in translation, where a mutation has caused a ter-Ban dang doc một quyển sách được tặng bởi HUY NGUYÊN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

mination codon to be converted to a codon for an amino acid (a sense codon); this is the underlying etiology of several hemoglobinopathies. See also readthrough protein.

readthrough protein a product formed by translation of a messenger RNA when one of its termination codons is misread or is recognized by a suppressor tRNA. Polypeptide-chain synthesis then continues until the next termination codon is reached, resulting in the production of a variant protein with a C-terminal extension.

reagent 1 any chemical substance that reacts or participates in or is necessary for a reaction. 2 a substance used for the detection or determination of another substance by chemical or microscopical means, usually in solution; e.g. the Folin-Ciocalteu reagent.

reagent grade a level of purity of a chemical; chemicals of this quality conform to the specifications established by the Committee on Analytical Reagents of the American Chemical Society and may often be sufficiently pure to use as primary standards in an analytical laboratory, with information concerning the actual percentage of impurities or at least the maximum limit of impurities being given on the label.

reagin 1 a term originally used to describe a heat-labile antibody-like substance in the serum of many people suffering from atopic allergies and that has now been identified as immunoglobulin E (IgE). The immediate hypersensitivity (type I) generated by the binding of IgE to its specific antigen on the surface of mast cells involves the release of cell mediators via the reaginic or anaphylactic mechanism. 2 a special kind of antibody response produced by syphilities that has specificity for cardiolipin antigens.

real-time (in computing) indicating that a computer monitors a process continuously as it occurs, in distinction to the analysis of recorded data.

rearrangase or S-S rearrangase an alternative name for protein disulfide isomerase.

rearrangement reaction a reaction in which molecular bonds are rearranged without the loss of any atom from the molecule, e.g. as in the conversion of glucose 6-phosphate to fructose 6-phosphate.

recA a gene in Escherichia coli encoding a protein, RecA, involved in genetic recombination and in the SOS response for DNA repair (see SOS repair). The protein has two activities: (1) a DNA-dependent ATPase in the presence of single-stranded DNA that catalyses the ATP-dependent uptake of singlestranded DNA to form the heteroduplex required in recombination. (2) In the presence of DNA fragments it becomes a protease (RecA*; EC 3.4.99.37) that cleaves a specific Ala-|-Gly bond in certain repressor molecules, including its own repressor (see lexA). This allows all the SOS genes to be activated. Example from E. coli and Shigella flexneri (identical sequences): database code RECA_ECOLI, 352 amino acids (37.80 kDa); 3-D structure known; eight motifs. See also exodeoxyribonuclease V, recombinational repair, recombinase.

recalcitrance or persistence the ability of a substance to remain in a particular environment in an unchanged form.

recBC a gene in Escherichia coli for exodeoxynuclease V, an ATP-dependent nuclease specific for double-stranded DNA; it mediates genetic recombination.

recDNA (sometimes) abbr. for recombinant DNA.

receptor any cellular macromolecule that undergoes combination with a hormone, neurotransmitter, drug, or intracellular messenger to initiate a change in cell function. Receptors are concerned directly and specifically in chemical signalling between and within cells. Cell-surface receptors, e.g. the acetylcholine receptor and the insulin receptor, are located in the plasma membrane, with their ligand-binding site exposed to the external medium. Intracellular receptors, e.g. steroidhormone receptors, bind ligands that enter the cell across the plasma membrane.

receptor assay 1 the determination of receptor numbers and

Huynguyen Co. LTD. Biotechnology, Trades and Services, 201 Luong Nhu Hoc, Dist 5, HCMC,

recombinational r

binding at various concentrations of ligand is measured, often by use of a radioactive ligand, and is analysed by means of a Scatchard plot. 2 the determination of the concentration of a ligand by utilizing a purified receptor in a manner similar to that used in radioimmunoassay; in this case the receptor, rather than an antibody, performs the role of specific binding agent.

receptor cross-talk interaction between two receptors such that one receptor, when activated, modulates the action of the other. This type of interaction often involves the production by the first receptor of a second messenger, which then modulates the action of the second receptor.

receptor-destroying enzyme an enzyme that brings about chemical change in a (usually membrane-bound) receptor, leading to inactivation of the receptor. Knowledge of the specificity of the enzyme provides information about the nature of the groups or linkages exposed to enzyme attack, and thus to receptor structure or orientation in the membrane. Examples are sialidase and trypsin.

receptor-effector complex the complex that results when an occupied receptor binds to another protein (the effector), the activation of which by the occupied receptor leads to signal transduction.

receptor-mediated describing a response that requires the intermediary action of a receptor, especially one located in a membrane.

receptor-mediated endocytosis a form of endocytosis involving the internalization (i.e. passage into the cell interior) of stretches of membrane into which receptors have clustered after binding of ligand. The cytoplasmic surfaces of these stretches of membrane are coated with clathrin and are termed coated pits. See also endosome.

receptor transformation see transformation (def. 3).

recessive describing an allele that lacks effect when accompanied in the same diploid by a dominant form of the same gene. Most (not all) defective mutant genes are recessive to their normal functional counterparts. —recessivity n.

recipient bacterium see bacterial conjugation.

reciprocal 1 expressed in the reverse direction, in response to an initial application of any force or stimulus. 2 (in mathematics) the inverse value, obtained when the values of numerator and denominator are reversed; the reciprocal of x is obtained by evaluating 1/x.

reciprocal plot a plot in which the units of both the ordinate and the abscissa are reciprocals of the values that have been determined. Compare Lineweaver-Burk plot.

recircularization or recircularisation the restoration of circularity to a plasmid vector following the insertion of recombinant DNA. The plasmid used for gene cloning is a small circular molecule. This is cut with a restriction endonuclease to create linear DNA molecules. The foreign DNA fragment with the same cohesive ends is then annealed to the cut plasmid to form a recombinant DNA circle. The DNA molecule containing the foreign DNA insert is then covalently sealed with DNA ligase. Recircularization also occurs during the replication of some DNA phages by a rolling circle replication mechanism.

recognition any specific binding interaction between molecules. Such interaction between two molecules is based on the existence of recognition sites, one (or more) on each of the interacting molecules, that are tailored to fit in such a way that highly specific binding occurs; i.e. the two molecules uniquely 'recognize' each other. See also chiral recognition, molecular recognition.

recognition sequence the part of the sequence of a macromolecule that is able to recognize and bind to a particular sequence in another macromolecule.

recognition site 1 (in proteins) a site for recognition of another protein, involving a specific sequence of amino acids; the latter may be in a single chain (e.g. target sites for protein phosphorylation), or may involve amino acids in separate chains brought into juxtaposition by quaternary structure.

ing a specific sequences of bases; see restriction endonuclease. 3 (in pharmacology) a region of a receptor macromolecule to which an endogenous agonist binds.

recombinant clone a population of bacteria or other host derived from a single cell into which a vector containing recombinant DNA has been introduced.

recombinant DNA a fragment of deoxyribonucleic acid (DNA) that has been inserted into a cloning vector, thereby leading to its use in the isolation of a clone of cells characterized by the presence of the fragment. The term is derived from the concept that insertion into the vector is a form of genetic recombination. [Note: The abbreviation rDNA has sometimes been applied to recombinant DNA, but this use is discouraged (rDNA having been pre-empted for ribosomal DNA); while alternatives such as recDNA or rtDNA have been suggested, IUBMB considers a standard abbreviation unnecessary.] See also recombinant DNA technology

recombinant DNA technology an area of biotechnology concerned with the manipulation of recombinant DNA. It has many important applications, including (1) DNA sequencing, which may lead to the ability to predict the primary structure of a protein where this is the product of a cloned gene, (2) the synthesis of recombinant protein by a suitable expression system, and (3) the production of DNA probes (def. 3) for use in hybridization techniques. The technology has led, e.g., to the production of human insulin for the treatment of diabetics, human growth hormone for administration to children with growth defects, and a vaccine for hepatitis B. DNA probes are essential for the detection of aberrant genes which are the cause of numerous diseases and the technique has the potential for gene therapy. See also genetic engineering.

recombinant protein a protein coded for by a gene - recombinant DNA – that has been cloned in a system that supports expression of the gene and translation of messenger RNA (see expression system). Modification of the gene by recombinant DNA technology can lead to expression of a mutant protein. Proteins coexpressed in bacteria will not possess post-translational modification, e.g. phosphorylation or glycosylation. Eukaryotic expression systems are needed for this; see, e.g., baculovirus.

recombinase 1 an enzyme that recognizes specific sites involved in the joining of V-region gene segments in L- and Hchain gene segment pools in the generation of antibody. 2 RecA protein (see recA) is also a recombinase, the activity of which is increased in Escherichia coli following damage to DNA. RecA binds to a region of single-stranded DNA and catalyses the formation of duplex DNA; hydrolysis of ATP is involved. A recombinase recognizes and binds to each of two recombinant sites on different DNA molecules or within the same DNA. One DNA strand in each site is cleaved at a specific point within the site, and the recombinase becomes covalently linked to the DNA at the cleavage site through a phosphotyrosine (sometimes a phosphoserine) bond. The transient protein-DNA linkage preserves the phosphodiester bond lost in cleaving the DNA; cofactors such as ATP are unnecessary in subsequent steps. The cleaved DNA strands are rejoined to new partners, with new phosphodiester bonds created at the expense of the protein-DNA linkage. The result of the initial breakage and rejoining process is the Holliday junction. To complete the reaction, the process must be repeated at a second point within each of the two recombination sites. In summary the recombinase can be viewed as a site-specific endonuclease and ligase in one package.

recombination see genetic recombination, recombinant DNA, immunoglobulin synthesis.

recombinational heteroduplex see heteroduplex.

recombinational repair a mechanism to restore the integrity of DNA when replication of DNA stops at a thymine dimer but resumes after the dimer is passed, creating a gap. The undamaged parental strand recombines into the gap, a process pro-2 (in nucleic acids) a site for recognition of a protein, involvemented by RecA protein (see recA). The new gap in the parental Ban dang doc một quyển sách được tạng bởi HUY NGUYÊN. Nếu bạn có nhu cầu về sách sinh học, xin liên hệ:

reductive alkyl

strand is filled by the action of **DNA polymerase** and **DNA ligase**. The thymine dimer itself is not repaired in this process but time is allowed for the excision system to repair this damage later

recoverin

recoverin an EF-hand Ca²⁺-binding protein, apparent molecular mass 26 kDa; also known as cancer-associated retinopathy protein. It selectively localizes to the retina and pineal gland and is implicated in the activation of retinal rod guanylate cyclase by rhodopsin, possibly being involved in the blocking of the phosphorylation of rhodopsin, by forming an inhibitory complex with rhodopsin kinase. It has been identified as an autoantigen in cancer-associated retinopathy, a putative autoimmune process. Example from human: database code RECO_HUMAN, 199 amino acids (22.97 kDa).

recovery the portion of material or activity that remains after any extraction or purification, usually expressed as a percentage of the amount that was present as starting material.

recruitment the action by any cell, cell constituent, or molecule that brings about the cooperation of any other component in performance of any function.

recrystallize or recrystallise to dissolve a crystalline substance and subsequently crystallize it from the solution, usually to increase the purity of the substance. —recrystallization or recrystallization n.

rectangular hyperbola a hyperbola whose asymptotes are at right angles. It is sometimes said that, for enzymes that follow so-called Michaelis kinetics, the plot of initial rate against substrate concentration has the shape of the curve of a rectangular hyperbola. It is true that the Michaelis-Menten equation does yield a curve that is part of a rectangular hyperbola, but the axes of the hyperbola must be rotated through 45°, and displaced, if they are to coincide with the axes of the Michaelis-Menten plot.

rectification 1 (in physics) the process of obtaining a direct current from an alternating electrical supply. 2 (in physiology) the regulation of membrane conductance by the voltage across the membrane; strong rectification implies that ionic channels carrying current are open at some membrane potentials and shut at others. Conductance is low at very negative membrane potentials, but increases as the potential becomes less negative. 3 (in chemistry) the process of purifying a liquid by distillation.

rectus Latin right; used to describe the right, or clockwise, configuration of one of the two faces of a compound containing a trigonal carbon atom. It is designated by the prefix Re-. Compare sinister. See also Re/Si convention.

recycle to pass again through a system one or more times after return to a starting condition or state.

red drop a phenomenon in photosynthesis, in which the **quantum yield** is relatively constant in light of wavelengths between 500 and 600 nm, but drops dramatically at longer wavelengths.

redistil or (US) redistill to distil again that which has already been distilled, usually as an aid to purification of liquids.

red marrow see bone marrow.

red muscle dark, skeletal, voluntary muscle that is relatively rich in myoglobin and cytochromes, and derives energy for contraction from a high oxidative capacity, in contrast to white muscle, which has a high glycolytic capacity. The distinction between muscle types should more strictly be based on muscle-fibre types. Type I fibres have a high oxidative capacity based on a high activity of tricarboxylic-acid cycle and respiratory chain enzymes. Type IIA fibres have high oxidative and high glycolytic capacity. Type IIB fibres have low oxidative and high glycolytic capacity. The proportions of these fibres vary in different muscle types; accordingly the muscle may have the ability to engage in very rapid but quickly exhausted 'fast twitch' contractions characteristic of white muscle, or less powerful but more sustained contractions typical of red muscle.

redox balance the ratio of the number of reductions to the number of oxidations in a given metabolic pathway. Compare redox state.

redox couple the oxidized (electron acceptor) and the reduced (electron donor) forms of the species of a given **redox reaction**; e.g. NAD⁺ and (NADH + H⁺). The potential of any redox couple in solution can be measured against a reference electrode, and a table of relative potentials constructed. See **redox potential**.

redox hypothesis a now discounted model for the Pasteur effect in glycolysing muscle extracts. Addition of redox indicators that changed the redox state in the direction of oxidation decreased the rate of lactate formation; it was therefore suggested that the effect of oxygen might be connected with a change of the redox state in the same direction.

redox indicator see indicator (def. 3).

redox potential or oxidation-reduction potential symbol: E_0 ; for a particular redox couple at a given pH and temperature, the potential of an electrode (usually bright platinum) immersed in a solution containing 1 M oxidant and 1 M reductant, relative to a standard hydrogen electrode. The more 'reducing' the couple, the more negative is E_0 ; the convention in biochemistry is that the more 'oxidizing', the more positive is E_0 . Some standard potentials, measured against the hydrogen electrode, are: NAD+/NADH + H+, -0.32 V; fumarate/ succinate, +0.032 V; cytochrome $b(Fe^{3+})/c$ ytochrome $b(Fe^{2+})$, +0.25 V; $O_2 + 2H^+/H_2$, +0.82 V.

redox reaction a chemical reaction in which the oxidation of one reactant is coupled to the reduction of a second reactant, electrons being transferred from the reactant being oxidized to that being reduced.

redox state the ratio of the concentration of the oxidized member of a redox couple to the concentration of the reduced member; e.g. [NAD+]/[NADH] or [Fe³⁺]/[Fe²⁺]. The term should only be applied to a particular redox system and not to a heterogeneous system.

red shift any shift of the peaks of a spectrum to longer wavelengths (i.e. towards the red end of the spectrum), including a shift from the red to infrared. Compare blue shift.

red tide a bloom of the dinoflagellate *Ptychodicus brevis* (*Gymnopodium breve*), an organism that produces **brevetoxins** and causes epidemics of food poisoning.

reduce to cause or undergo reduction.

reduced Rayleigh ratio see Rayleigh ratio.

reducing agent any substance acting as a reductant. Compare oxidizing agent.

reducing end the end of an oligo- or polysaccharide molecule that carries a potential hemiacetal or hemiketal (reducing) group.

reducing sugar any sugar that will reduce heated alkaline solutions of cupric salts, such as Fehling's or Benedict's solutions, due to the presence of a hemiacetal or hemiketal group.

reductant the chemical species that donates an electron in an oxidation-reduction reaction; i.e. the species that undergoes oxidation in such a reaction. Compare oxidant.

reductase a donor:acceptor oxidoreductase enzyme (EC class 1) when named after the more oxidized alternative substrate and when O₂ is not a substrate. See oxidoreductase.

reduction the chemical process by which oxygen is withdrawn from, hydrogen is added to, or (more generally) an electron is added to (with or without addition of a proton) a molecular entity. Compare oxidation.—reductive adj.; reduce vb.

reduction division the first division of meiosis.

reduction potential the electrode potential that measures the tendency of one half of a **redox reaction** to proceed so as to gain electrons. See oxidation potential, redox potential.

reductive alkylation the reaction of amino groups with an alkyl carbonyl group, followed by reduction of the resulting Schiff base with a reducing agent such as sodium borohydride.

redox abbr, for reduction-oxidation; see oxidation-reduction. See reductive amination.

Nu t Roads

reductive amination

regener

reductive amination the process whereby ammonia or a primary or secondary amine reacts with ketones and aldehydes in the presence of reducing agents such as H2 and a metal catalyst, or more conveniently, NaBH₄ or its derivative NaBH₃CN, to produce primary, secondary, or tertiary amines. In a formal sense, the amine is alkylated in this reaction while the carbonyl group is reduced, hence the term reductive amination, or alternatively reductive alkylation. Amino acids have been made from oxo acids by this process. A variation of reductive amination, termed the Eschweiler-Clarke reaction, involves the methylation of an amine to the tertiary amine stage using formic acid as the reducing agent and formaldehyde as the methylating reagent.

reductive carboxylic-acid cycle or reductive tricarboxylicacid cycle a metabolic cycle used by members of the Chlorobiaceae for CO₂ fixation. The usual operation of the tricarboxylic-acid cycle is reversed, with three enzyme replacements, and other supplementary reactions are used. Initially one CO₂ reacts with succinyl-CoA to form oxoglutarate; oxoglutarate synthase (EC 1.2.7.3) replaces the usual oxoglutarate dehydrogenase complex. A second CO₂ converts oxoglutarate to isocitrate with use of isocitrate dehydrogenase, and isocitrate proceeds to citrate. Citrate is then cleaved by ATP citrate (pro-S) lyase to acetyl-CoA and oxaloacetate; the latter recycles to succinyl-CoA with fumarate reductase (NADH) replacing succinate dehydrogenase. These operations reverse the usual tricarboxylicacid cycle and convert two CO₂ to acetyl-CoA. A net gain of oxaloacetate is possible by conversion of acetyl CoA and one CO₂ to pyruvate (pyruvate synthase), pyruvate to phosphoenolpyruvate (phosphoenolpyruvate synthase) and phosphoenolpyruvate and one CO2 to oxaloacetate (phosphoenolpyruvate carboxylase). The overall result is that four CO₂ yield a net gain of the four-carbon oxaloacetate.

reductive methylation a specific form of reductive alkylation. in which the alkyl group is methyl. Formaldehyde is often used as a reagent in this case.

reductive pentose-phosphate cycle or Calvin cycle other names: carbon reduction cycle; C₃ cycle/pathway; more appropriately, Calvin-Bassham cycle; the cyclic set of reactions, occurring in chloroplasts in the majority of higher plants (C₃ plants), that results in the fixation of CO₂ as glucose using the ATP and the NADPH formed in the light reactions of photosynthesis. Briefly, CO₂ reacts with ribulose 1,5-bisphosphate under the action of ribulose-bisphosphate carboxylase (Rubisco), EC 4.1.1.39, to form two molecules of 3-phosphoglycerate; these are phosphorylated (by ATP) to 1,3-bisphosphoglycerate, which in turn is reduced (by NADPH) to glyceraldehyde 3-phosphate. This is then converted by aldolase, transketolase, and other enzymes to fructose 6-phosphate and ribulose 5-phosphate; the latter being phosphorylated (ATP) to ribulose 1,5-biphosphate, completing the cycle. See also Hatch-Slack pathway.

reductione any reducing substance with a chemical structure containing the stabilized enediol -C(OH)=C(OH)-. Reductones are generated when monosaccharides are heated for prolonged periods with strong alkali, whereby the enols originally produced are broken down to strongly reducing fragments. Another notable example is ascorbic acid, and in some contexts reductiones are described as 'apparent ascorbate', i.e. the reductive acids that are present in certain processed foods and react similarly to ascorbate, interfering with its determination.

Re-face (of an atom or molecule) see Re/Si convention.

reference something that acts as a standard in relation to quality, quantity, or type against which other values or characteristics can be compared; e.g. reference spectrum.

reference electrode any electrode, selected by convention, against which the electronegativity of compounds is measured. The standard biochemical reference is the hydrogen electrode, normally a platinum electrode in hydrochloric acid through which hydrogen gas is passed. A cell is constructed such that another electrode is immersed in a test solution and the potent tems involved in proliferation are more highly activated than Ban dang doc một quyển sách được tặng bởi HUY NGUYEN. Nếu bạn có nhu cấu về sách sinh học, xin liên hệ:

tial difference between these two half-cells is measured. For convenience, however, the reference electrode is often a calomel electrode, and after measurements have been made against this, the electronegativity against the hydrogen electrode can be calculated from the known difference between this and the hydrogen electrode.

reflect to change the path of electromagnetic radiation, when it meets a surface, such that it returns partially or completely in a direction on the same side of the surface as the source.

reflectometer see densitometer (def. 1).

reflex (in physiology) an automatic or involuntary response of the nervous system to a stimulus. A reflex may be a monosynaptic spinal reflex (e.g. a simple motor response to a sensory stimulus), involving transmission through the spinal cord only, or polysynaptic and involving synaptic transmission in the brain. A conditioned reflex is one that is learned through repeated association of a stimulus with either rewarding (e.g. food) or aversive (e.g. punishment) events.

refolding (for proteins) the restoration of three-dimensional structure in a manner that may or may not achieve a full return to the native state following denaturation.

refraction the change in direction undergone by a wave of electromagnetic radiation on passing through a boundary between two media in which its velocity differs. Snell's law states that $n_1 \sin \theta_1 = n_2 \sin \theta_2$, where n_1 and n_2 are the refractive indices of the two media, and θ_1 and θ_2 are the angles between the radiation and the normal to the boundary in the corresponding media. [After Willebrord Snell (1591-1696), Dutch astronomer and mathematician.]

refractive index abbr.: RI; symbol: n; for a given medium, a measure of the degree of refraction induced by the medium when light or other electromagnetic radiation passes through it. The refractive index of a medium is the ratio of the speed of light in a vacuum, c_0 , to the speed of light in the medium, c; i.e. $n = c_0/c$. For many practical purposes the speed of light in air may be used instead of that in a vacuum.

refractivity a measure of the extent to which a medium will cause the deviation of a ray of light or other electromagnetic radiation entering its surface. If the refractive index of a medium is n, its refractivity is (n-1). The specific refractivity is given by $(n-1)/\rho$, where ρ is the density of the medium. The molecular refractivity is the specific refractivity multiplied by the relative molecular mass.

refractometer an instrument for measuring refractive index.

refractory 1 (of a clinical condition) resistant to treatment. 2 (of a cell or tissue) resistant to stimulation, as by a drug, hormone, or nerve impulse, especially during a period following previous stimulation. See also tachyphylaxis. 3 (of a substance or material) resistant to heat, corrosion, mechanical deformation, or other aggressive agents causing alteration. 4 a substance or material having such resistance.
