detect the CM output voltage. If the CM-sense resistors R_{cs} in Fig. 12.16 are replaced with capacitors, the resistive output loading is eliminated, but these capacitors are open circuits at dc. To avoid a dc bias problem, switched capacitors can be used as the CM detector. A switched-capacitor (SC) CMFB scheme that is often used in switched-capacitor amplifiers and filters (see Section 6.1.7) is shown in Fig. 12.21. Here the network that consists of switches S_1 - S_6 and capacitors C_1 and C_2 sense the CM output voltage and subtract it from the desired CM output voltage V_{CM} . Voltage V_{CSBIAS} is a dc bias voltage. As in Fig. 6.8, assume that each switch is on when its control signal is high and is off when its control signal is low. The switches are controlled by two nonoverlapping clocks, ϕ_1 and ϕ_2 (that is, ϕ_1 and ϕ_2 are never high at the same time). In this section, we will assume that these switches are ideal. In practice, switches S_1 - S_6 are implemented with MOS transistors. As in the previous section, we use the simple op amp in Fig. 12.2 as the op amp in Fig. 12.21.

The SC CMFB circuit is a linear, balanced, discrete-time circuit. Therefore, all points on the axis of symmetry (shown as a dashed line in Fig. 12.21) operate at ac ground for differential signals. The op-amp CMC input is along the axis of symmetry, so V_{cmc} has a CM component but zero DM component. Therefore, the switched-capacitor circuit is a good CM sensor. To show that voltage V_{cmc} depends on the difference between the actual and desired CM output voltages, consider the CM half-circuit shown in Fig. 12.22a. Capacitor C_2 is not switched and connects from V_{cmc} to V_{oc} . Since V_{cmc} is the gate voltage of M_5 in Fig. 12.2, there is voltage gain from V_{cmc} to V_{oc} , which is modeled by controlled source a_{cmc} . Comparing this half-circuit to Fig. 6.10a, we see that C_2 connected across the gain stage and switched-capacitor C_1 form a switched-capacitor integrator. This integrator is in a negative feedback loop since its output V_{oc} is connected back to a switch that connects to C_1 .

When ϕ_1 is high, C_1 charges to $V_{CM} - V_{CSBIAS}$. When ϕ_2 is high, C_1 connects between V_{oc} and V_{cmc} . In steady state, V_{oc} is constant because the applied voltages V_{CM} and V_{CSBIAS} are both dc voltages and because the switched-capacitor integrator operates in a negative feedback loop. After V_{oc} becomes constant, C_1 does not transfer charge onto C_2 when ϕ_2 is high. This condition is satisfied if the charge on C_1 when ϕ_1 is high is the same when ϕ_2 is high, or

$$Q(\phi_1) = C_1(V_{CM} - V_{CSBIAS}) = Q(\phi_2) = C_1(V_{oc} - V_{cmc})$$
 (12.67)

This equation reduces to

$$V_{CM} - V_{oc} = V_{CSBIAS} - V_{cmc} ag{12.68}$$

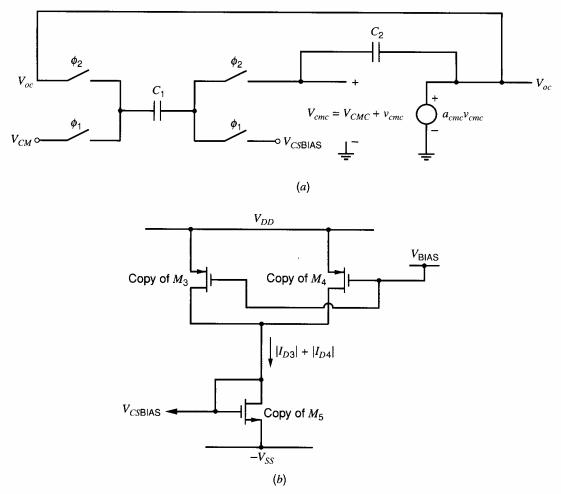

Figure 12.22. (a) A CM half-circuit for Fig. 12.21. (b) Replica bias circuit for generating V_{CSBIAS} for the differential op amp in Fig. 12.2.

If V_{CSBIAS} equals the nominal bias voltage required at the CMC input and if $|a_{cmc}| \gg 1$, V_{cmc} is about constant with $V_{cmc} \approx V_{CSBIAS}$. Then (12.68) reduces to

$$V_{oc} \approx V_{CM} \tag{12.69}$$

as desired. For the op amp in Fig. 12.2, bias voltage V_{CSBIAS} could be generated by passing a current equal to $|I_{D3}| + |I_{D4}|$ through a diode-connected copy of M_5 connected to $-V_{SS}$, as shown in Fig. 12.22b. The copies of M_3 and M_4 have the same source and gate connections as in the op amp and duplicate the currents $|I_{D3}|$ and $|I_{D4}|$ that flow in Fig. 12.2. The voltage V_{CSBIAS} is the gate voltage of the copy of M_5 . Since this bias circuit uses copies or replicas of the transistors in the op amp to generate V_{CSBIAS} , this technique is referred to as replica biasing.

An advantage of this CMFB approach is that the op-amp output voltage swing is not limited by this CM-sense circuit because it consists only of passive elements (capacitors) and switches. (If a switch is constructed of *n*-channel and *p*-channel transistors in parallel driven by clock ϕ and its inverse, respectively, it can pass any signal that falls between the power-supply voltages if $V_{DD} + V_{SS} > V_{tn} + |V_{tp}|$. In practice, an MOS transistor is not an ideal switch. It must have a W/L that is large enough to give a sufficiently low drain-source resistance when it is on. However, when each transistor turns off, charge from its channel and charge associated with its gate overlap capacitance transfer onto its drain and source nodes. Therefore, the MOS transistors acting as switches will transfer charge onto C_1 . Let ΔQ represent the net charge transferred onto C_1 each clock period. Including

the effect of this charge, (12.67) becomes

$$C_1(V_{CM} - V_{CSBIAS}) = C_1(V_{oc} - V_{cmc}) + \Delta Q$$
 (12.70)

or

$$V_{CM} - V_{oc} = V_{CSBIAS} - V_{cmc} + \frac{\Delta Q}{C_1}$$
 (12.71)

Comparing (12.71) with (12.68) shows that $\Delta Q/C_1$ introduces an offset in V_{oc} , making V_{oc} differ from V_{CM} when $V_{CSBIAS} = V_{cmc}$. If V_{CM} was chosen to maximize the op-amp output swing, a shift in V_{oc} will reduce the op-amp output swing. The magnitude of the charge transferred by each switch transistor increases with its width W [since the gate-channel and overlap capacitances are proportional to W as shown in (1.187) and (2.45)], so a trade-off exists between low switch on-resistance and small charge transfer. From (12.71), increasing C_1 reduces the effect of the transferred charge on V_{oc} , but increasing C_1 increases the capacitive loading at the op-amp outputs when ϕ_2 is high.

12.6 Fully Differential Op Amps

Some fully differential op amps are presented in this section. The singled-ended counterpart of each op amp was covered in previous chapters (low-frequency operation in Chapter 6 and compensation in Chapter 9). The two-stage op amp will be covered first, followed by single-stage op amps.

12.6.1 A Fully Differential Two-Stage Op Amp

A fully differential two-stage op amp is shown in Fig. 12.23. Compared to its single-ended counterpart in Fig. 6.16, two differences are the addition of M_9 - M_{10} , which is a copy of the common-source stage M_6 - M_7 , to generate the second output, and the removal of the gate-to-drain connection on M_3 to give a symmetric input stage. The input stage is a complementary version of the differential stage in Fig. 12.2. The common-mode control (CMC) input is the gate of tail current source M_5 . If the voltage at the gate of M_5 changes, the magnitudes of the drain currents in M_1 - M_4 change by equal amounts. Therefore, V_{ds3} and V_{ds4} change by equal amounts. These voltage changes are amplified by the

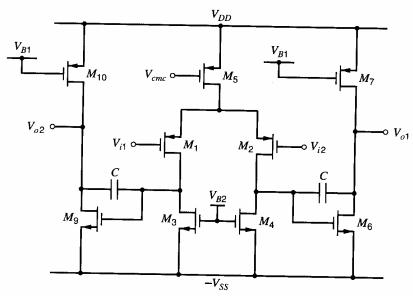

Figure 12.23. A fully differential two-stage CMOS op amp.

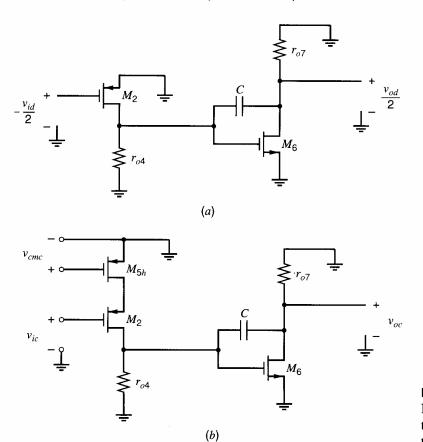

Figure 12.24. (a) The DM half-circuit and (b) the CM half-circuit for the op amp in Fig. 12.23.

common-source stages M_6 - M_7 and M_9 - M_{10} to cause equal changes in output voltages V_{o1} and V_{o2} , which changes V_{oc} . Therefore, the CM output voltage can be controlled by a CMFB loop that connects to the gate of M_5 .

In Fig. 12.23, two Miller compensation capacitors C are connected across the symmetric second stages. These capacitors compensate both the DM and CM half-circuits, which are shown in Fig. 12.24. Although not shown, any of the approaches described in Chapter 9 for eliminating the right-half-plane zero associated with feedforward through the compensation capacitor could be used here.

The DM half-circuit in Fig. 12.24a is a cascade of two common-source amplifiers with active loads. The low-frequency DM gain is

$$a_{dm0} = \frac{v_{od}}{v_{id}} = -g_{m2}(r_{o2}||r_{o4})g_{m6}(r_{o6}||r_{o7})$$
 (12.72)

The Miller-compensated second stage can be modeled by the circuit in Fig. 9.21 with $R_1 = r_{o2}||r_{o4}, g_m = g_{m6}, R_2 = r_{o6}||r_{o7}, C_1 = C_{1d}$, and $C_2 = C_{2d}$. (The capacitance C_{1d} at the input of the second stage and load capacitance C_{2d} of the second stage are not shown explicitly in Fig. 12.24a.) Therefore, the poles p_{1d} and p_{2d} of the DM half-circuit are given by (9.32) and (9.33). Assume that the op amp is operating in a feedback loop, the feedback factor f_{dm} for the DM feedback loop is frequency-independent, and the right-half-plane zero has been eliminated. Then to achieve 45° phase margin, the magnitude of the DM loop gain should be unity at the frequency $|p_{2d}|$. Since $|gain| \times frequency$ is constant from p_{1d} to p_{2d} due to the one-pole roll-off there, we can write

$$|a_{dm0}f_{dm}p_{1d}| = 1 \cdot |p_{2d}| \tag{12.73}$$

Substituting (12.72), (9.32), and (9.33) in (12.73) gives

$$\frac{g_{m2}}{C}f_{dm} \approx \frac{g_{m6}}{C_{2d}} \tag{12.74}$$

assuming that the DM load capacitance C_{2d} and the compensation capacitor C are much larger than the internal node capacitance C_{1d} . If the other values are known, the compensation capacitor is determined by (12.74).

The CM half-circuit is shown in Fig. 12.24b. The first stages of the CM and DM half-circuits are different, but the second stages are identical. To focus on the CMFB loop, we will assume $v_{ic} = 0$. (Nonzero v_{ic} will be considered later.) In the CM half-circuit, the first stage consists of common-source M_{5h} with common-gate M_2 and active load M_4 . As in Fig. 12.14b, M_{5h} is one half of M_5 , with $(W/L)_{5h} = (W/L)_5/2$ and $I_{D5h} = I_{D5}/2$. The first stage is followed by the common-source second stage, M_6 - M_7 . The low-frequency CMC gain is

$$a_{cmc0} = \frac{v_{oc}}{v_{cmc}} \approx g_{m5h}[(r_{o2}g_{m2}r_{o5h})||r_{o4}]g_{m6}(r_{o6}||r_{o7})$$
 (12.75)

Capacitance associated with the source of cascode M_1 introduces a pole p_x in the CMC gain. If $|p_x|$ is much larger than the magnitude of the nondominant pole $|p_{2c}|$ in (9.33) from the Miller-compensated second stage, pole p_x can be ignored, and the gain a_{cmc} can be approximated as having two poles that are given by (9.32) and (9.33). These poles can be different than the poles in the DM gain for two reasons. First the output load capacitances in the DM and CM half-circuits can be different, and second the output resistances of the first stages in the half-circuits can be different. The zero due to feedforward is the same as for DM gain and can be eliminated as described in Chapter 9. To simplify the following analysis, we will assume that all poles and zeros in the CMFB loop other than the two poles associated with the Miller compensation can be ignored. To achieve 45° phase margin, the magnitude of the CMFB loop gain should fall to unity at $|p_{2c}|$. Therefore,

$$|a_{cmc0}a_{cms0}p_{1c}| = 1 \cdot |p_{2c}| \tag{12.76}$$

where a_{cms0} is the low-frequency gain through the CM-sense circuit

$$a_{cms0} = \frac{v_{cmc}}{v_{oc}} \bigg|_{\omega = 0, \text{ CMFB loop open}} = \frac{v_{cms}}{v_{oc}} \bigg|_{\omega = 0, \text{ CMFB loop open}}$$
 (12.77)

Substituting (12.75), (9.32), and (9.33) in (12.76) and using $R_1 \approx r_{o2}g_{m2}r_{o5h}$ gives

$$\frac{g_{m5h}}{C}|a_{cms0}| \approx \frac{g_{m6}}{C_{2c}} \tag{12.78}$$

assuming that the CM load capacitance C_{2c} and the compensation capacitor C are much larger than the internal node capacitance C_{1c} . The compensation capacitor required for the CMFB loop can be found from (12.78).

Ideally, the compensation capacitor values calculated in (12.74) and (12.78) would be equal, and the CMFB and DM loops would each have a phase margin of 45° . In practice, these values are rarely equal. If the value of C is chosen to be the larger of the values given by (12.74) and (12.78), one feedback loop will have a phase margin of 45° , and the other loop will have a phase margin larger than 45° and will be overcompensated. A drawback of overcompensation is that the unity-gain frequency of the loop gain and the closed-loop bandwidth are smaller than they would be if the loop were optimally compensated. If the larger C is required to compensate the DM feedback loop, using that compensation capacitor will overcompensate the CMFB loop. Since the CMFB ideally operates on only dc signals, reducing its bandwidth may be acceptable. (See Section 12.8 for more on this

topic.) If the larger C is required to compensate the CMFB feedback loop, using that compensation capacitor will overcompensate the DM loop. However, reducing the bandwidth of the DM feedback loop by overcompensation is usually undesirable because this loop operates on the DM input signal, which may have a wide bandwidth.

An alternative to using the larger C value that optimally compensates the CMFB loop but overcompensates the DM loop is the following. The value of C that gives a 45° phase margin in the DM loop from (12.74) can be used if g_{m5h} is scaled down to satisfy (12.78). This approach gives a 45° phase margin for both feedback loops without sacrificing bandwidth in the DM loop. Scaling of $g_{m5h} = g_{m5}/2$ could be achieved by reducing $(W/L)_5$, but such scaling would reduce the CM input range of the op amp because decreasing $(W/L)_5$ increases $|V_{ov5}|$. Another solution is to split M_5 into two parallel transistors, one that has its gate connected to a bias voltage and the other with its gate connected to CMC, as described in Section 12.4.2 and Fig. 12.15. A drawback of this approach is that reducing g_{m5h} reduces $|a_{cmc0}|$, as can be seen in (12.75).

Ignoring limitations imposed by the CM-sense circuit, we see that each op-amp output in Fig. 12.23 can swing until a transistor in the second stage enters the triode region. The maximum value of V_{o1} is $V_{DD} - |V_{ov7}|$, and its minimum value is $-V_{SS} + V_{ov6}$. Therefore, the peak differential output voltage is

$$V_{od(\text{peak})} = V_{o1(\text{max})} - V_{o2(\text{min})} = V_{o1(\text{max})} - V_{o1(\text{min})} = V_{DD} - |V_{ov7}| - (-V_{SS} + V_{ov6})$$

$$= V_{DD} + V_{SS} - V_{ov6} - |V_{ov7}|$$
(12.79)

The CM input range of the op amp is limited in the positive direction by the tail current source, which transitions from active to triode when $|V_{ds5}| = |V_{ov5}|$; therefore, we want

$$V_{IC} < V_{DD} - |V_{GS1}| - |V_{ov5}| \tag{12.80}$$

The lower limit of the CM input range occurs when input transistor M_1 (or M_2) enters the triode region, so

$$V_{IC} > -V_{SS} + V_{GS6} + V_{t1} \tag{12.81}$$

EXAMPLE

Modify the single-ended two-stage op amp from the examples in Section 6.3.5 and Section 9.4.3 into a fully differential op amp. It will be used in the feedback circuit shown in Fig. 12.25, which represents the connections in a switched-capacitor circuit when one clock is high (assuming the switches are ideal). The capacitor values are $C_S = 2$ pF, $C_F = 5$ pF, and $C_L = 2$ pF. Design for 1-V peak output swing and phase margins of 45° or greater in the DM and CMFB loops. Use $V_{DD} = V_{SS} = 1.65$ V, and design for a CM output voltage of 0 V.

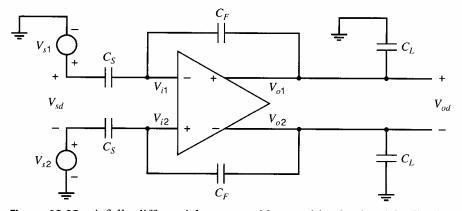

Figure 12.25. A fully differential op amp with capacitive load and feedback.

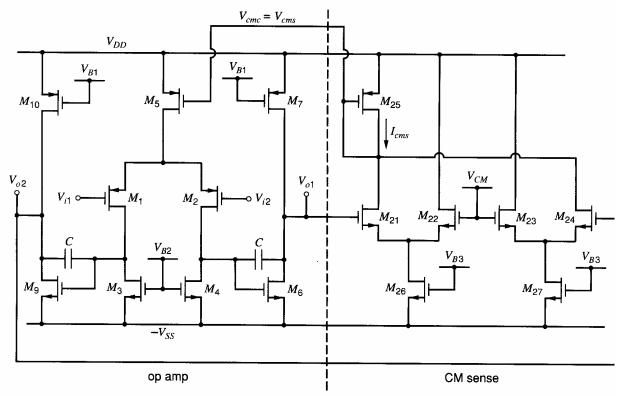

Figure 12.26. A fully differential two-stage CMOS op amp using the CMFB scheme from Fig. 12.19.

First, we will design the devices to satisfy the bias and low-frequency requirements. Then we will compensate the amplifier. Using the device sizes and bias currents from the example in Section 6.3.5, we have

$$(W/L)_1 = (W/L)_2 = 77$$
 $(W/L)_3 = (W/L)_4 = 4$ $(W/L)_5 = 25$ $(W/L)_6 = (W/L)_9 = 16$ $(W/L)_7 = (W/L)_{10} = 50$

with $L_{\rm drwn}=1~\mu{\rm m}, |I_{D1}|=|I_{D2}|=100~\mu{\rm A}$, and $I_{D6}=400~\mu{\rm A}$. In that example, these values gave a calculated dc gain of $a_{dm0}=-7500$ and a simulated gain of $a_{dm0}=-6200$.

For CMFB, we will use two differential pairs as shown in Fig. 12.26. Since the input stage in Fig. 12.23 is the complement of the op amp in Fig. 12.2, the CMFB circuit in Fig. 12.26 is the complement of the circuit in Fig. 12.19 to allow control of the op-amp tail current I_{D5} through a current mirror formed by M_5 and M_{25} . Also, the CM-sense output V_{cms} is taken from the drains of M_{21} and M_{24} , which makes the gain a_{cms} negative. This inversion is needed here to give negative feedback in the CMFB loop because the CMC gain a_{cmc} is positive at low frequencies in this two-stage op amp. We choose M_{25} to be matched to M_5 , so they form a unity-gain current mirror. Since the desired tail current is $|I_{D5}| = 200 \,\mu A$, we want

$$|I_{D25}| = I_{D26} = I_{D27} = 200 \,\mu\text{A}$$

Therefore, each transistor M_{21} - M_{24} nominally carries 100 μ A of drain current. These transistors must remain active over the entire range of the op-amp output swing. For a differential output voltage of 1 V peak, each op-amp output $(V_{o1} \text{ or } V_{o2})$ must swing $\pm 0.5 \text{ V}$. From (3.161), the transistors in a differential pair remain active as long as the magnitude of the differential input voltage is less than $\sqrt{2}V_{ov}$. Therefore, we want

$$\sqrt{2}V_{ov} = 0.5 \text{ V}$$

or $V_{ov} = 0.35 \text{ V for } M_{21}\text{-}M_{24}$. From (1.157), we get

$$\left(\frac{W}{L}\right)_{21} = \left(\frac{W}{L}\right)_{22} = \left(\frac{W}{L}\right)_{23} = \left(\frac{W}{L}\right)_{24} = \frac{2I_{D21}}{k'_{n}(V_{ov21})^{2}} = \frac{2(100)}{(194)(0.35)^{2}} = 8.4$$

The only remaining device sizes to be determined are for matched transistors M_{26} and M_{27} . Each device acts as a current source carrying 200 μ A. For those transistors to act as current sources, they should always be active. Focusing on M_{26} , we want $V_{ov26} < V_{ds26(min)}$. To determine $V_{ds26(min)}$, consider an extreme case when M_{21} just turns off as V_{o1} swings down to its lowest value. In this case, M_{22} carries 200 μ A, and

$$V_{gs22(\text{max})} = V_{t22} + \sqrt{\frac{2I_{D22(\text{max})}}{k'_n(W/L)_{22}}} = V_{t22} + \sqrt{\frac{2(200)}{194(8.4)}} = V_{t22} + 0.5 \text{ V}$$

The gate voltage of M_{22} is $V_{CM} = 0$. Therefore, the minimum source-body voltage for M_{22} , which is the minimum drain-source voltage of M_{26} , is

$$V_{sb22(\min)} = V_{ds26(\min)} = V_{s22(\min)} - (-V_{SS}) = V_{CM} - V_{gs22(\max)} + V_{SS}$$
$$= 0 - (0.5 + V_{t22}) + 1.65 = 1.15 - V_{t22}$$
(12.82)

Since V_{sb22} is not zero, the threshold voltage of M_{22} is given by (1.140) as

$$V_{t22} = V_{tn0} + \gamma \left[\sqrt{V_{sb22} + 2\phi_f} - \sqrt{2\phi_f} \right]$$
 (12.83)

Using the data in Table 2.4, (1.141), and (2.28), we calculate $|\phi_f| = 0.33$ V and $\gamma = 0.28$ V^{1/2} [assuming V_{sb22} is small and using $N_A + N_{si}$ as the effective substrate doping in (1.141)]. Solving (12.82) and (12.83) gives $V_{t22} = 0.67$ V, $V_{s22(\text{min})} = -1.17$ V, and

$$V_{sb22(\text{min})} = V_{ds26(\text{min})} = 1.15 - V_{t22} = 1.15 - 0.67 = 0.48 \text{ V}$$

If we chose $V_{ov26} = 0.38 \text{ V}$ (to allow for a -0.1 V shift in V_{CM}), then

$$\left(\frac{W}{L}\right)_{26} = \frac{2I_{D26}}{k'_n(V_{ov26})^2} = \frac{2(200)}{(194)(0.38)^2} \approx 14$$

Also, $(W/L)_{27} = 14$ since M_{26} and M_{27} are matched.

In the example in Section 9.4.3, a compensation capacitor of 3.2 pF provided a 45° phase margin for a feedback factor of unity and a 5-pF load. The DM half-circuits for this example with the independent voltage sources V_{s1} and V_{s2} set to zero are shown in Fig. 12.27a. Here, we have assumed that C_L is much larger than the input capacitance of the CM-sense devices M_{21} - M_{24} . The two feedback networks connect between the two half-circuits in this negative feedback circuit. The feedback factor is less than one because it is set by the capacitive divider formed by C_F and C_S . Also, the feedback networks affect the capacitive loading at the outputs. The upper DM half-circuit in Fig. 12.27a is redrawn in Fig. 12.27b with the feedback loop broken. Here, capacitor C_{idh} is the capacitance looking into the gate of M_1 in the DM half-circuit, which is the same as the capacitance looking into the gate of M_2 . Looking into the gate of M_2 , we see C_{gs2} and overlap capacitance C_{gd2} increased by the Miller effect as in (7.5); therefore,

$$C_{idh} = C_{gs2} + C_{gd2}(1 - a_{dm1}) \approx \frac{2}{3}C_{ox}W_2L_2 + C_{ol}W_2(1 - a_{dm1})$$
$$= \frac{2}{3}\left(4.43\frac{\text{fF}}{\mu\text{m}^2}\right)(77 \ \mu\text{m})(0.82 \ \mu\text{m}) + \left(0.35\frac{\text{fF}}{\mu\text{m}}\right)(77 \ \mu\text{m})(1 + 137) = 3.9 \ \text{pF}$$

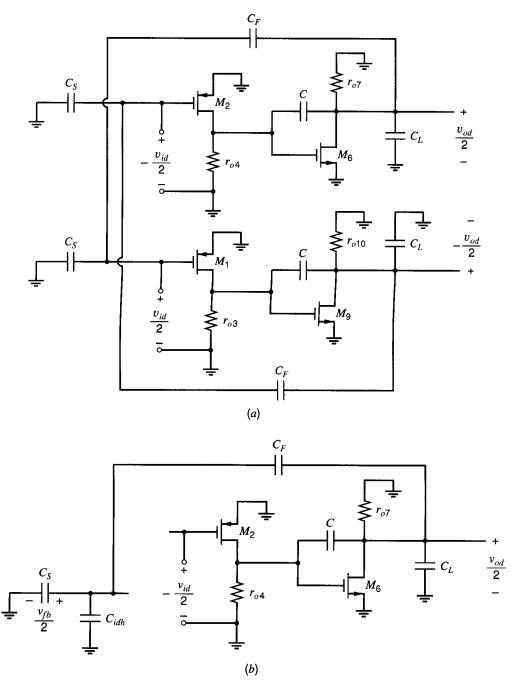

Figure 12.27. (a) The DM half-circuits for Figs. 12.25 and 12.26. (b) The upper DM half-circuit in (a) with the feedback loop broken.

Here, we used $L_2 = 1 \,\mu\text{m} - 2L_d = 0.82 \,\mu\text{m}$ and $a_{dm1} = -g_{m2}(r_{o2}||r_{o4}) = -137$ for the low-frequency gain of the first stage. These values follow from the example in Section 6.3.5. The total capacitive load from the output to ground in the DM half-circuit is

$$C_{2d} = C_L + \frac{C_F(C_S + C_{idh})}{C_F + C_S + C_{idh}} = 2 + \frac{5(2+3.9)}{5+2+3.9} = 4.7 \text{ pF}$$
 (12.84)

Here, we have assumed that C_L is much larger than the junction capacitance and other parasitic capacitances at the op-amp output. The DM feedback factor is

$$f_{dm} = \frac{v_{fb}/2}{v_{od}/2} \Big|_{\text{loop broken}} = \frac{C_F}{C_F + C_S + C_{idh}} = \frac{5}{5 + 2 + 3.9} = 0.459$$
 (12.85)

Substituting (12.84), (12.85), and values for $g_{m2} = g_{m1}$ and g_{m6} from the example in Section 9.4.3 into (12.74), we have

$$C \approx \frac{g_{m2}}{g_{m6}} C_{2d} f_{dm} = \frac{1.0}{1.55} (4.7 \text{ pF})(0.459) = 1.39 \text{ pF}$$
 (12.86)

This compensation capacitor gives a 45° phase margin in the DM half-circuit (ignoring the right-half-plane zero).

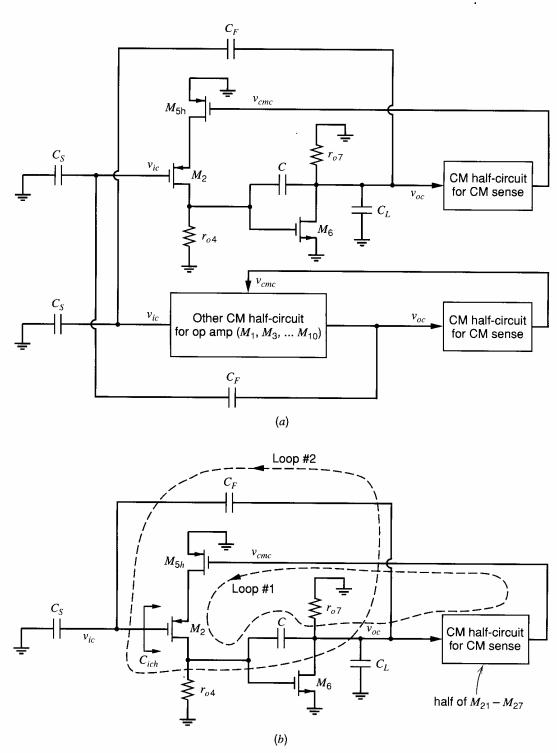

Figure 12.28. (a) The CM half-circuits for Figs. 12.25 and 12.26. (b) The upper CM half-circuit in (a) simplified.

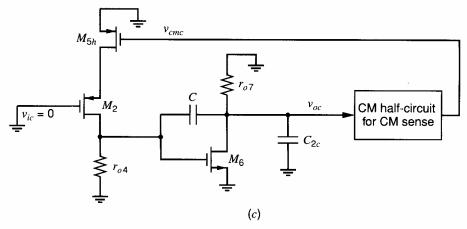

Figure 12.28. (c) The CM half-circuit in (b), focusing on the CMFB loop (loop #1).

The CM half-circuits are shown in Fig. 12.28a with the source voltages V_{s1} and V_{s2} set to zero. Only the upper CM half-circuit is shown in detail. The capacitive feedback networks connect between the two CM half-circuits. A simplified drawing of the upper CM half-circuit is shown in Fig. 12.28b. The key simplification here is that capacitor C_F , which was connected to the input of the lower CM half-circuit (which is the gate of M_1) in Fig. 12.28a, now connects to the gate of M_2 . This change does not affect the CM analysis because the elements and signals in the two CM half-circuits are identical.

In the CM half-circuit in Fig. 12.28b, there are two feedback loops. One loop is the CMFB loop that includes the CM-sense block. We will refer to this loop as loop #1. This loop is a negative feedback loop, since there are three inverting stages in the loop; actively loaded common-source stages M_{5h} and M_6 , and the inverting CM-sense circuit. The magnitude of the low-frequency gain in this loop is large because each common-source stage provides significant voltage gain. The other feedback loop goes through the op amp from v_{ic} to v_{oc} and then back from v_{oc} to the input v_{ic} through the capacitive divider formed by C_F and C_S , and it will be called loop #2. Here, loop #2 is a positive feedback loop because it contains two inverting gain stages. This feedback loop is stable, however, because the loop gain in loop #2, which is the product of the forward gain a'_{cm} and the feedback factor through the capacitive divider, has a magnitude that is less than one at all frequencies. The forward gain a'_{cm} in this loop, which is $a'_{cm} = v_{oc}/v_{ic}$ with the CMFB (loop #1) active, has a magnitude that is less than unity due to the presence of the CMFB loop (loop #1), which works to force $v_{oc} \approx 0$. (See Problem 12.27.) To explain this low gain, first consider the CM half-circuit with loop #1 disabled. In this case, if v_{ic} is nonzero, I_{d2} changes, which changes V_{gs6} and produces a nonzero v_{oc} . When the CMFB loop #1 is enabled, this loop senses any nonzero v_{oc} and adjusts V_{cmc} to produce a change in I_{d5} that counteracts the change in I_{d2} to give $v_{oc} \approx 0$.

The magnitude responses of the loop gains for these two loops are plotted in Fig. 12.29, ignoring any zeros and poles other than the dominant and nondominant poles, p_{1c} and p_{2c} , associated with the Miller-compensated gain stage in Fig. 12.28b. Here, loop #1 is assumed to be compensated so that its unity-gain frequency is equal to $|p_{2c}|$, which gives a 45° phase margin. Since loop #2 is stable, we need only focus on the stability and compensation of the high-gain CMFB loop (loop #1).

This CMFB loop is shown in Fig. 12.28c. Here, the lumped load capacitance C_{2c} includes the output loading due to C_L and the capacitive feedback network, including the capacitance C_{ich} looking into the gate of M_2 in Fig. 12.28b. This capacitance is smaller than C_{idh} because M_2 has a large source degeneration resistance (r_{o5h}) that provides local CM feedback. This feedback increases the impedance (decreases the capacitance) looking into the gate of M_2 . Also, this feedback reduces the magnitude of the voltage gain from the

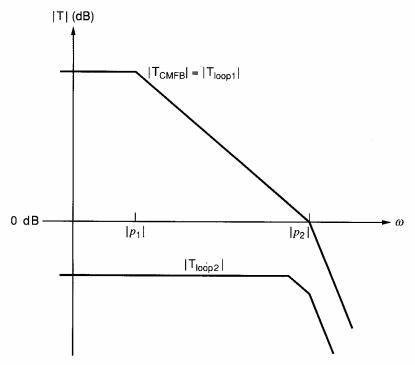

Figure 12.29. Plots of the loop gains for the two feedback loops in the CM half-circuit in Fig. 12.28b.

gate to the drain of M_2 , which decreases the Miller input capacitance due to C_{gd2} . Therefore, assuming $C_{ich} \ll C_S$, we find

$$C_{2c} = C_L + \frac{C_F(C_S + C_{ich})}{C_F + C_S + C_{ich}} \approx C_L + \frac{C_FC_S}{C_F + C_S} = 2 + \frac{5(2)}{5+2} = 3.43 \,\mathrm{pF}$$

Here, we also assumed that C_L is much larger than the input capacitance of the CM-sense half-circuit. To use (12.78) to calculate the compensation capacitor that gives a 45° phase margin in the CMFB loop, we must find the dc small-signal gain through the CM-sense circuit. In Fig. 12.26, I_{cms} flows through diode-connected M_{25} ; therefore,

$$v_{cmc} = -\frac{i_{cms}}{g_{m25}} \tag{12.87}$$

if $r_{o25} \gg 1/g_{m25}$. A small-signal version of (12.56) is $i_{cms} = g_{m22}v_{oc} = g_{m21}v_{oc}$. Using this expression and (12.87), the gain a_{cms} at low frequency is

$$|a_{cms0}| = \frac{|v_{cmc}|}{|v_{oc}|} \Big|_{\text{CMFB loop open}} = \frac{|v_{cmc}|}{|i_{cms}|} \frac{|i_{cms}|}{|v_{oc}|} \Big|_{\text{CMFB loop open}}$$

$$= \frac{g_{m21}}{g_{m25}} = \frac{\frac{2I_{D21}}{V_{ov21}}}{\frac{2|I_{D25}|}{|V_{ov25}|}} = \frac{\frac{2(100)}{0.35}}{\frac{2(200)}{0.5}} = 0.71$$
(12.88)

Solving (12.78) for a 45° phase margin in the CMFB loop, using (12.88) and the value of g_{m6} from the example in Section 9.4.3, gives

$$C = \frac{g_{m5h}}{g_{m6}} |a_{cms0}| C_{2c} = \frac{(g_{m5}/2)}{g_{m6}} |a_{cms0}| C_{2c}$$

$$= \frac{2(200 \,\mu\text{A})}{0.5 \,\text{V}} \frac{1}{2} (0.71)(3.43 \,\text{pF}) = 0.63 \,\text{pF}$$
(12.89)

From (12.86) and (12.89), a larger compensation capacitor is required to compensate the DM loop than the CMFB loop. Therefore, using C = 1.39 pF will give phase margins of 45° for the DM feedback loop and greater than 45° for the CMFB loop, which is acceptable.

To verify this design, SPICE simulations of this op amp were carried out with $C = 1.39 \,\mathrm{pF}$ in series with $R_Z = 758 \,\Omega$, which was found to eliminate the right-half-plane zero in the example in Section 9.4.3. The SPICE models are based on the data in Table 2.4. The phase margins of the DM and CMFB loops were simulated using techniques developed for fully differential circuits. The DM feedback loop has a simulated phase margin of 43° and unity-gain frequency of 53 MHz. The CMFB loop has a simulated phase margin of 62° and unity-gain frequency of 24 MHz. Thus, the CMFB loop is overcompensated. Changing the compensation capacitor to 0.63 pF, which is the value calculated from (12.89) to give a 45° phase margin in the CMFB loop, we find the simulated phase margin of the CMFB loop changes to 41°, but the DM phase margin drops to an unacceptably low 29°. These simulation results verify that the formulas in this section give a reasonable estimate for the compensation capacitor.

In the previous example, the op-amp output swing is limited by the linear input range of the CMFB circuit. The output swing could be increased by using either a switched-capacitor or resistive-divider CM detector.

An alternative CMFB approach for the op amp in Fig. 12.23 is to connect the gate of M_5 to a dc bias voltage and to use the gates of M_3 - M_4 as the CMC input. In this case, the first gain stage of the CM half-circuit in Fig. 12.28c consists of common-source M_4 with a cascoded active load. Also, the pole associated with the capacitance at the source of M_2 is not in the signal path of the CMFB loop.

12.6.2 Fully Differential Telescopic Cascode Op Amp

A fully differential cascode op amp is shown in Fig. 12.30. Compared to its single-ended complementary counterpart, which is the first stage in Fig. 6.25, the main difference is that diode connections are removed from transistors M_3 and M_{3A} . Also, the gates of cascode transistors M_{1A} - M_{4A} are connected to bias voltages here. The op-amp outputs are taken

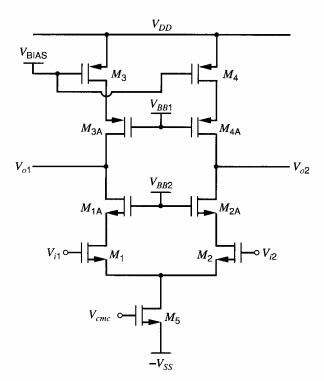

Figure 12.30. A fully differential CMOS telescopic-cascode op amp.

from the drains of M_{1A} and M_{2A} . The resulting circuit is symmetric with each output loaded by a cascoded current source. An advantage of the topology in Fig. 12.30 is that the DM signal path consists only of n-channel transistors. That is, only the n-channel transistors conduct time-varying currents. The p-channel transistors conduct constant currents. Such a configuration maximizes the op-amp speed because n-channel transistors have higher mobility and f_T than their p-channel counterparts (if the channel lengths and overdrive voltages are the same). One CMFB approach is to set the currents through M_3 - M_4 by connecting their gates to a dc bias voltage (set by a diode-connected transistor that is the input of a current mirror) and use the gate of M_5 as the CMC input. In this case, the magnitude of the low-frequency CMC gain $|a_{cmc0}|$ can be large since M_1 - M_2 and M_{1A} - M_{2A} provide two levels of NMOS cascoding, and M_{3A} - M_{4A} provide one level of PMOS cascoding. This cascoding increases the output resistance, but the two levels of NMOS cascoding introduce high-frequency poles in $a_{cmc}(s)$.

An alternative CMFB approach is to set the current through M_5 by connecting its gate to a dc bias voltage and use the gates of M_3 and M_4 as the CMC input. This approach has one level of cascoding in the CMC gain path, which introduces one high-frequency pole in $a_{cmc}(s)$. Here, however, the amplifying devices in the CMFB loop are p-channel M_3 and M_4 , which have lower mobility and f_T than n-channel M_5 if they have the same channel lengths and overdrive voltages.

The DM and CMFB feedback loops are compensated by the load capacitances at the op-amp outputs. The phase margin of the CMFB loop can be changed without changing the load capacitance, by splitting the transistor(s) that connect to the CMC input into parallel transistors, as described in Section 12.4.2 and shown in Fig. 12.15.

12.6.3 Fully Differential Folded-Cascode Op Amp

A fully differential folded-cascode op amp is shown in Fig. 12.31. Compared to its single-ended counterpart shown in Fig. 6.28, the main difference is that the diode connections on M_3 and M_{3A} have been eliminated. The resulting circuit is symmetric, and the outputs are taken from the drains of M_{1A} and M_{2A} .

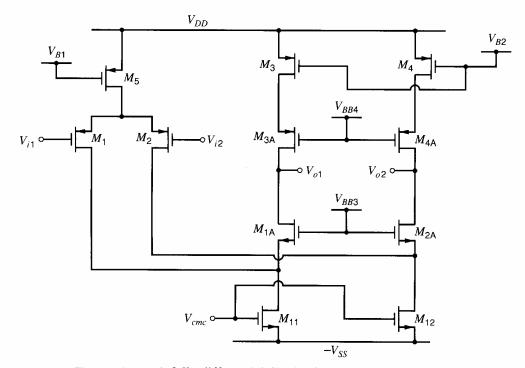

Figure 12.31. A fully differential CMOS folded-cascode op amp.

To satisfy KCL, the sum of the currents flowing through M_3 , M_4 , and M_5 must equal the sum of the drain currents flowing through M_{11} and M_{12} . To satisfy KCL with all transistors active and to accurately set V_{oc} , CMFB is used. The CMC input could be taken as the gate of M_5 , the gates of M_3 - M_4 , or the gates of M_{11} - M_{12} , which is shown in Fig. 12.31. With this last option, the CMFB loop contains less nodes than the other two cases, and the gain a_{cmc} is provided by common-source n-channel transistor M_{11} (or M_{12}), which has a larger g_m than p-channel M_3 (or M_4) if $(W/L)_{11} \approx (W/L)_3$ because $k'_n > k'_p$ and $I_{D11} > |I_{D3}|$.

The DM and CMFB feedback loops are compensated by the capacitances at the opamp outputs.

The folded-cascode op amp with active cascodes that is shown in Fig. 6.30 can also be converted to a fully differential op amp. 12 As for the folded-cascode op amp, there are three choices for the CMC input.

12.6.4 A Differential Op Amp with Two Differential Input Stages

The fully differential op amps presented above have two input terminals that accept one differential input. Those op amps can be used in the amplifier, integrator, and differentiator shown in Fig. 12.32. To implement a fully differential non-inverting gain stage with a very

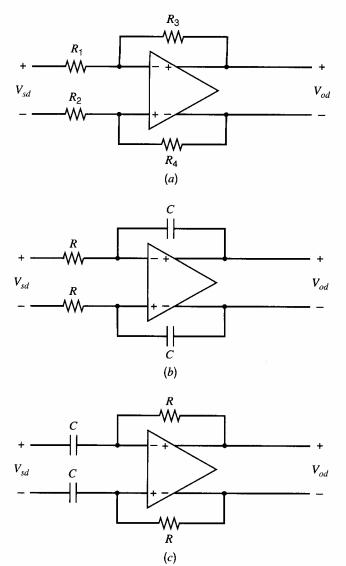

Figure 12.32. Fully differential (a) inverting gain stage, (b) integrator, and (c) differentiator.

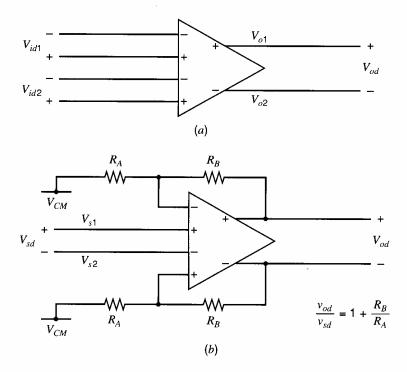

Figure 12.33. (a) An op amp with two pairs of inputs. (b) A noninverting fully differential feedback amplifier.

large input impedance, an op amp with four input terminals is needed. Two inputs connect to the feedback networks and the other two inputs connect to the differential signal source, as shown in Fig. 12.33. Assuming the magnitudes of the op amp gains from v_{id1} and v_{id2} to v_{od} are large, negative feedback forces $v_{id1} \approx 0$ and $v_{id2} \approx 0$. The two pairs of inputs are produced by two source-coupled pairs, as shown for a two-stage op amp in Fig. 12.34. The two source-coupled pairs, M_1 - M_2 and M_{1X} - M_{2X} , share a pair of current-source loads. Assuming the input pairs are matched, the differential small-signal voltage gain is the same from either input; therefore,

$$v_{od} = a_{dm}(v_{id1} + v_{id2}) (12.90)$$

The CM input range for the op amp must be large enough to include the full range of the input signals, V_{s1} and V_{s2} , because they connect directly to op-amp inputs. In this

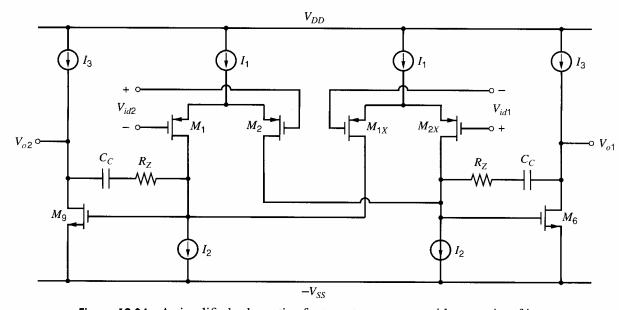

Figure 12.34. A simplified schematic of a two-stage op amp with two pairs of inputs.

op amp, the CMFB loop could adjust either I_1 or I_2 by controlling the gate voltages of the transistors that generate those currents.

12.6.5 Neutralization

In a fully differential op amp, a technique referred to as capacitive neutralization can be used to reduce the component of the op-amp input capacitance due to the Miller effect (see Chapter 7). Reducing the input capacitance increases the input impedance, which is desirable. Neutralization is illustrated in Fig. 12.35a. The gate-to-drain overlap capacitances are shown explicitly for M_1 and M_2 . First, ignore the neutralization capacitors C_n . Then the DM capacitance looking into either op-amp input (with respect to ground) is

$$C_{idh} = C_{gs1} + C_{gd1}(1 - a_{dm1}) (12.91)$$

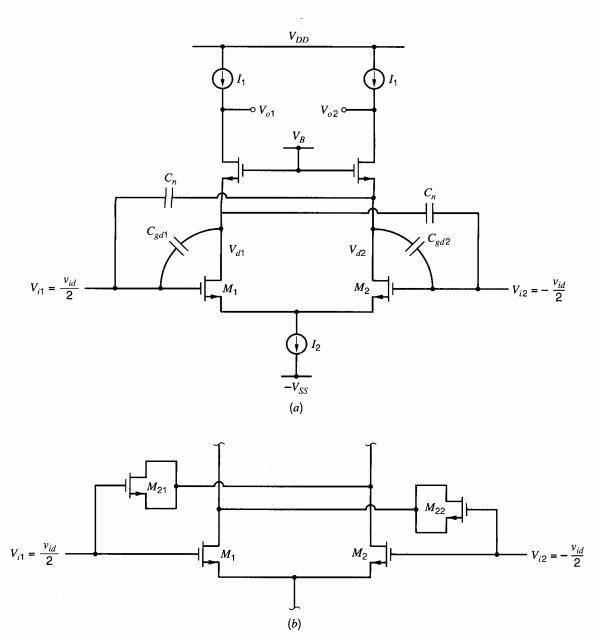

Figure 12.35. (a) An example of capacitive neutralization. (b) Using transistors M_{21} and M_{22} in cutoff to implement the neutralization capacitors.

where a_{dm1} is the low-frequency DM gain from the gate to drain of M_1 :

$$a_{dm1} = \frac{v_{d1}}{(v_{id}/2)} \bigg|_{\omega = 0} \tag{12.92}$$

Because the op amp is balanced, the low-frequency voltage gain across each capacitor C_n is $-a_{dm1}$. Therefore, when C_n is included, the capacitance in (12.91) becomes

$$C_{idh} = C_{gs1} + C_{gd1}(1 - a_{dm1}) + C_n(1 + a_{dm1})$$
 (12.93)

If $C_n = C_{gd1}$, (12.93) reduces to

$$C_{idh} = C_{gs1} + 2C_{gd1} (12.94)$$

which is less than the value in (12.91) if $|a_{dm1}| > 1$. The Miller effect on C_{gd1} is canceled here when $C_n = C_{gd1}$ because the gain across C_n is exactly the opposite of the gain across C_{gd1} . To set $C_n = C_{gd1}$, matched transistors M_{21} and M_{22} can be used to implement the C_n capacitors as shown in Fig. 12.35b.^{13,14} These transistors operate in the cutoff region because $V_{GD1} < V_{t1}$ and $V_{GD2} < V_{t2}$ since M_1 and M_2 operate in the active region. The capacitance C_n is the sum of the gate-to-drain and gate-to-source overlap capacitances. Setting $C_n = C_{gd1}$ gives

$$C_{gd1} = C_{ol}W_1 = C_n = C_{gd21} + C_{gs21} = 2C_{ol}W_{21}$$
 (12.95)

where C_{ol} is the overlap capacitance per unit width. Therefore, if $W_{21} = W_1/2$, $C_n = C_{gd1}$. Precise matching of C_n and C_{gd1} is not crucial here. For example, if C_n is slightly larger than C_{gd1} , the capacitance C_{idh} will be slightly less than the value in (12.94). A drawback of this technique is that junction capacitances associated with M_{21} and M_{22} increase the capacitances at the nodes where their sources and drains are connected, reducing the magnitude of the non-dominant pole associated with those nodes.

12.7 Unbalanced Fully Differential Circuits^{1,2}

In practice, every fully differential circuit is somewhat imbalanced, due to mismatches introduced by imperfect fabrication. When mismatches are included, the models and analysis of fully differential circuits become more complicated because the mismatches introduce interaction between the CM and DM signals. The DM-to-CM and CM-to-DM cross-gain terms, as defined in Section 3.5.4, are

$$A_{dm-cm} = \frac{v_{oc}}{v_{id}} \bigg|_{v_{ic} = 0}$$
 (12.96)

$$A_{cm-dm} = \left. \frac{v_{od}}{v_{ic}} \right|_{v_{id} = 0} \tag{12.97}$$

These cross gains are zero if a circuit is perfectly balanced and nonzero otherwise, as shown in Section 3.5.4. In a feedback circuit such as the inverting amplifier in Fig. 12.32a, imbalance in the op amp or in the feedback network generates nonzero cross-gain terms.

■ EXAMPLE

Compute the small-signal gains for the inverting amplifier shown in Fig. 12.32a. For simplicity, assume the op amp is balanced, has infinite input impedance, zero output

impedance, $a_{dm} \to -\infty$ and $a'_{cm} = -0.1$. (This a'_{cm} is the CM gain, including the effect of the CMFB loop.) The resistors across the op amp are matched with $R_3 = R_4 = 5 \text{ k}\Omega$, but the resistors that connect to the signal source are mismatched with $R_1 = 1.01 \text{ k}\Omega$ and $R_2 = 0.99 \text{ k}\Omega$. Therefore, the only imbalance in this circuit stems from the mismatch between R_1 and R_2 .

We will analyze this circuit using coupled half-circuits, which were introduced in Section 3.5.6.9. The two coupled half-circuits are shown in Fig. 12.36. The circuits are coupled by the nonzero resistor mismatch

$$\Delta R = R_1 - R_2 = 0.02 \,\mathrm{k}\Omega$$

The resistance R in the figure is the average value of the mismatched resistors

$$R = \frac{R_1 + R_2}{2} = 1 \text{ k}\Omega$$

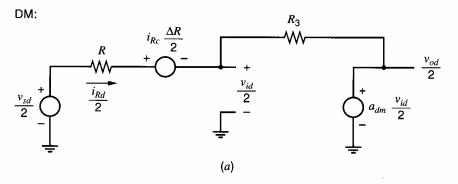

Letting $a_{dm} \rightarrow -\infty$ in the DM half-circuit gives

$$\frac{v_{od}}{2} = -\frac{R_3}{R} \left(\frac{v_{sd}}{2} - i_{Rc} \frac{\Delta R}{2} \right) \tag{12.98}$$

Analysis of the CM half-circuit gives

$$v_{oc} = -\frac{R_3}{R} \left(v_{sc} - \frac{i_{Rd}}{2} \frac{\Delta R}{2} \right) \frac{1}{1 + \left[\frac{R + R_3}{(-a'_{cm})R} \right]}$$
(12.99)

From these equations and the coupled half-circuits, exact input-output relationships could be found. However, for small mismatches, the approximate method described in Section 3.5.6.9 simplifies the analysis and provides sufficient accuracy for hand calculations. The key simplification in the approximate analysis is that the currents i_{Rd} and i_{Rc} are estimated from their respective half-circuits, ignoring mismatch effects. If the mismatch is ignored

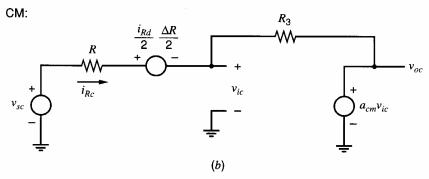

Figure 12.36. Coupled (a) DM and (b) CM half-circuits for the gain stage in Fig. 12.32a with a balanced op amp and mismatch in the feedback network.

in Fig. 12.36a (i.e., if $\Delta R = 0$), then

$$\frac{i_{Rd}}{2} \approx \frac{\hat{i}_{Rd}}{2} = \frac{v_{sd}}{2R} \tag{12.100}$$

since $v_{id}/2 = 0$ (because $a_{dm} \to -\infty$). Ignoring resistor mismatch in Fig. 12.36b, we find

$$i_{Rc} \approx \hat{i}_{Rc} = \frac{v_{sc}}{R + R_3} \left(1 + \frac{R_3}{R} \cdot \frac{1}{1 + \left[\frac{R + R_3}{(-a'_{cm})R} \right]} \right)$$
 (12.101)

Using (12.101) in (12.98) gives

$$\frac{v_{od}}{2} = -\frac{R_3}{R} \left\{ \frac{v_{sd}}{2} - v_{sc} \frac{\Delta R}{2(R+R_3)} \left(1 + \frac{R_3}{R} \cdot \frac{1}{1 + \left[\frac{R+R_3}{(-a'_{cm})R} \right]} \right) \right\}$$
(12.102)

Substituting (12.100) into (12.99) gives

$$v_{oc} = -\frac{R_3}{R} \left(v_{sc} - v_{sd} \frac{\Delta R}{4R} \right) \frac{1}{1 + \left[\frac{R + R_3}{(-a_{cm})R} \right]}$$
(12.103)

From (12.102),

$$A_{dm} = \frac{v_{od}}{v_{sd}} \bigg|_{v_{sc} = 0} = -\frac{R_3}{R} = -\frac{5}{1} = -5$$

$$A_{cm-dm} = \frac{v_{od}}{v_{sc}} \bigg|_{v_{sd} = 0} = \frac{R_3}{R} \frac{\Delta R}{(R + R_3)} \left(1 + \frac{R_3}{R} \cdot \frac{1}{1 + \left[\frac{R + R_3}{(-a_{cm})R} \right]} \right)$$

$$= \frac{5}{1} \cdot \frac{0.02}{(1+5)} \left(1 + \frac{5}{1} \cdot \frac{1}{1 + \left[\frac{1+5}{0.1(1)} \right]} \right) = 0.018$$

From (12.103),

$$A_{cm} = \frac{v_{oc}}{v_{sc}} \bigg|_{v_{sd} = 0} = -\frac{R_3}{R} \frac{1}{1 + \left[\frac{R + R_3}{(-a_{cm})R}\right]} = -\frac{5}{1} \cdot \frac{1}{1 + \left[\frac{1 + 5}{0.1(1)}\right]} = -0.082$$

$$A_{dm-cm} = \frac{v_{oc}}{v_{sd}} \bigg|_{v_{sc} = 0} = \frac{R_3}{R} \frac{\Delta R}{4R} \frac{1}{1 + \left[\frac{R + R_3}{(-a_{cm})R}\right]} = \frac{5}{1} \frac{0.02}{4(1)} \frac{1}{1 + \left[\frac{1 + 5}{0.1(1)}\right]} = 0.00041$$

The resistor mismatch causes nonzero cross-gain terms in the closed-loop amplifier. Exact analysis of this circuit gives essentially the same gain values as above.

A model for an op amp with mismatch (but assuming infinite input impedance and zero output impedance, for simplicity) is shown in Fig. 12.37. The equations corresponding

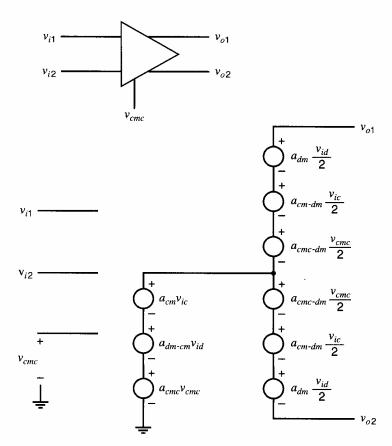

Figure 12.37. A simple smallsignal model of a fully differential amplifier including cross-gain terms, assuming infinite input impedance and zero output impedance.

to this model are

$$v_{od} = a_{dm}v_{id} + a_{cm-dm}v_{ic} + a_{cmc-dm}v_{cmc}$$
 (12.104)

$$v_{oc} = a_{cm}v_{ic} + a_{dm-cm}v_{id} + a_{cmc}v_{cmc} (12.105)$$

The cross-gain terms a_{cm-dm} , a_{dm-cm} , and a_{cmc-dm} are zero when the op amp is perfectly balanced. If the CM-sense circuit is not perfectly balanced, its output v_{cms} , which ideally is proportional to the CM output, contains a component that depends on the DM output:

$$v_{cms} = a_{cms}v_{oc} + a_{dm-cms}v_{od} (12.106)$$

Also, $v_{cmc} = v_{cms}$ when the CMFB loop is closed.

To illustrate the effect of feedback on the open-loop op-amp gains, consider the inverting amplifier in Fig. 12.32a with a balanced feedback network $(R_1 = R_2 \text{ and } R_3 = R_4)$ but with imbalances in the op amp. The circuit could be analyzed exactly to find the closed-loop gains, but the analysis is difficult. Therefore, we will use the approximate, coupled half-circuit analysis that was used in the last example. The coupled DM and CM half-circuits are shown in Fig. 12.38. The imbalances in the op amp are modeled by the a_{cm-dm} , a_{dm-cm} , and a_{cmc-dm} controlled sources in Fig. 12.38, based on (12.104) and (12.105). To simplify the analysis, we will assume that the CM-sense circuit is balanced (i.e., $a_{dm-cms} = 0$). Under this assumption, (12.106) reduces to

$$v_{cmc} = v_{cms} = a_{cms}v_{oc} \tag{12.107}$$

Substituting (12.107) in (12.104) and (12.105) gives

$$v_{od} = a_{dm}v_{id} + a_{cm-dm}v_{ic} + a_{cmc-dm}a_{cms}v_{oc}$$
 (12.108)

$$v_{oc} = a_{cm}v_{ic} + a_{dm-cm}v_{id} + a_{cmc}a_{cms}v_{oc}$$
 (12.109)

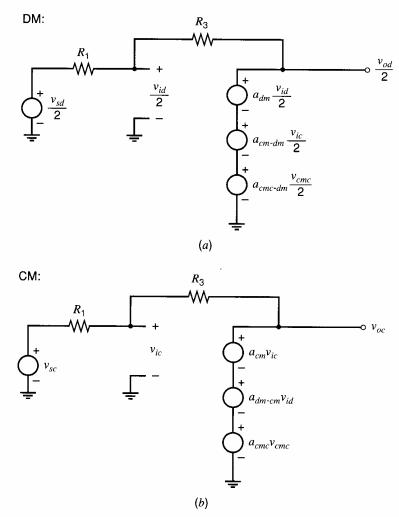

Figure 12.38. Coupled (a) DM and (b) CM half-circuits for the gain stage in Fig. 12.32a with an unbalanced op amp and a balanced feedback network.

To carry out the approximate analysis, each half-circuit is first analyzed with the coupling between the half-circuits eliminated. Then the results of these analyses are used to find the closed-loop cross gains. The coupling in the DM half-circuit is eliminated by setting $a_{cm-dm}=0$ and $a_{cmc-dm}=0$. With these changes, analysis of Fig. 12.38a gives

$$\hat{v}_{id} = -\frac{R_3}{R_1} \cdot \frac{1}{1 + \frac{R_1 + R_3}{(-a_{dm})R_1}} \frac{v_{sd}}{a_{dm}}$$
 (12.110)

Similarly, the coupling in the CM half-circuit is eliminated by setting $a_{dm-cm} = 0$. With this coupling eliminated, analysis of Fig. 12.38b gives

$$\hat{v}_{ic} = \frac{\hat{v}_{oc}}{a'_{cm}} = -\frac{R_3}{R_1} \cdot \frac{1}{1 + \frac{R_1 + R_3}{(-a'_{cm})R_1}} \frac{v_{sc}}{a'_{cm}}$$
(12.111)

where

$$a'_{cm} = \frac{a_{cm}}{1 + (-a_{cmc}a_{cms})} \tag{12.112}$$

Assuming $\hat{v}_{id} \approx v_{id}$, $\hat{v}_{ic} \approx v_{ic}$, and $\hat{v}_{oc} \approx v_{oc}$, (12.110) and (12.111) can be used in (12.108) to give

$$v_{od} = -\frac{R_3}{R_1} \cdot \frac{1}{1 + \frac{R_1 + R_3}{(-a_{dm})R_1}} v_{sd} + \frac{a'_{cm-dm}}{1 + \frac{(-a_{dm})R_1}{R_1 + R_3}} \frac{\frac{R_3}{R_3 + R_1}}{1 + \frac{(-a'_{cm})R_1}{R_1 + R_3}} v_{sc} \quad (12.113)$$

where

$$a'_{cm-dm} = a_{cm-dm} + a'_{cm} a_{cms} a_{cmc-dm}$$
 (12.114)

This gain has two components. The first term is a_{cm-dm} , which is the CM-to-DM gain of the op amp. The second term is the product of three gains: 1) a'_{cm} , which is the gain from v_{ic} to v_{oc} including the effect of the CMFB loop, 2) a_{cms} , which is the CM-sense gain from v_{oc} to $v_{cms} = v_{cmc}$, and 3) a_{cmc-dm} , which is the gain from v_{cmc} to v_{od} (due to mismatch in the op amp). Therefore, the second term in (12.114) is the gain through an indirect path from v_{ic} to v_{od} .

Again assuming $\hat{v}_{id} \approx v_{id}$, $\hat{v}_{ic} \approx v_{ic}$, and $\hat{v}_{oc} \approx v_{oc}$, (12.110) and (12.111) can be used in (12.109) to give

$$v_{oc} = \frac{\frac{a'_{cm}R_3}{R_1 + R_3}}{1 + \frac{(-a'_{cm})R_1}{R_1 + R_3}} v_{sc} + \frac{a'_{dm-cm}}{1 + \frac{(-a'_{cm})R_1}{R_1 + R_3}} \frac{\frac{R_3}{R_1 + R_3}}{1 + \frac{(-a_{dm})R_1}{R_1 + R_3}} v_{sd}$$
(12.115)

where

$$a'_{dm-cm} = \frac{a_{dm-cm}}{1 + (-a_{cmc}a_{cms})}$$
 (12.116)

Equations 12.113 and 12.115 relate the DM and CM source and output voltages for the feedback amplifier. The open-loop-gain and cross-gain terms in (12.108) and (12.109) have been modified by the feedback. To allow simplification of these gain terms, define

$$T_{dm} = \frac{(-a_{dm})R_1}{R_1 + R_3} \tag{12.117}$$

$$T_{cm} = \frac{(-a'_{cm})R_1}{R_1 + R_3} \tag{12.118}$$

$$T_{cmfb} = -a_{cmc}a_{cms} ag{12.119}$$

which are the loop gains around the DM, CM, and CMFB loops, respectively. Using (12.117)–(12.119), the closed-loop gain terms in (12.113) can be written as

$$A_{dm} = \frac{v_{od}}{v_{sd}} \bigg|_{v_{sc} = 0} = -\frac{R_3}{R_1} \cdot \frac{1}{1 + \frac{1}{T_{dm}}} \approx -\frac{R_3}{R_1}$$
 (12.120)

where $|T_{dm}| \gg 1$ has been used, and

$$A_{cm-dm} = \frac{v_{od}}{v_{sc}} \bigg|_{v_{sd} = 0} = \frac{a'_{cm-dm} \left(\frac{R_3}{R_3 + R_1}\right)}{(1 + T_{dm})(1 + T_{cm})}$$
(12.121)

As $|T_{dm}|$ increases, $|A_{cm-dm}|$ decreases. Therefore, $|T_{dm}| \gg 1$ is desired to reduce the magnitude of the closed-loop CM-to-DM cross gain. The $(1+T_{cm})$ term has little effect here since (12.112) usually gives $|a'_{cm}| \ll 1$; therefore, $(1+T_{cm}) \approx 1$.

Using (12.116)–(12.119), the closed-loop gain terms in (12.115) can be written as

$$A_{cm} = \frac{v_{oc}}{v_{sc}} \bigg|_{v_{sd} = 0} = \frac{\frac{a'_{cm}R_3}{R_1 + R_3}}{1 + T_{cm}} \approx \frac{a'_{cm}R_3}{R_1 + R_3}$$
(12.122)

where $(1 + T_{cm}) \approx 1$ has been used, and

$$A_{dm-cm} = \frac{v_{oc}}{v_{sd}} \bigg|_{v_{sc}=0} = \frac{a'_{dm-cm}}{1+T_{cm}} \frac{\frac{R_3}{R_1+R_3}}{1+T_{dm}}$$

$$= \frac{a_{dm-cm} \frac{R_3}{R_1+R_3}}{(1+T_{cmfb})(1+T_{dm})(1+T_{cm})}$$
(12.123)

As $|T_{dm}|$ or $|T_{cmfb}|$ increases, $|A_{dm-cm}|$ decreases. Therefore, the DM and CMFB loops work to reduce the closed-loop DM-to-CM cross gain. Again, the $(1 + T_{cm})$ term has little effect here since $|1 + T_{cm}| \approx 1$.

The analysis in this section shows how the closed-loop cross-gain terms for the feed-back amplifier in Fig. 12.32a are affected by imbalances in the op amp and feedback network. In practice, the imbalances are usually caused by random mismatches between components, and the effect of such mismatches on circuit performance is often evaluated through SPICE simulations.

12.8 Bandwidth of the CMFB Loop

Ideally, a fully differential circuit processes a DM input signal and produces a purely DM output signal. The closed-loop bandwidth required for the DM gain is set by the bandwidth of the DM signal. For example, consider the differential gain stage in Fig. 12.32a. To avoid filtering the signal, the closed-loop bandwidth of the DM gain must be larger than the highest frequency in the applied DM input signal. Since the closed-loop bandwidth is approximately equal to the unity-gain frequency of the DM loop gain (or return ratio), this unity-gain frequency should be about equal to the required closed-loop bandwidth. However, the unity-gain frequency required for the CMFB loop is not so easily determined. Consider a fully differential feedback circuit that is linear and perfectly balanced. If no ac CM signals are present in the circuit, the ac CM output voltage will be zero and the CM output voltage is constant. In such a case, the bandwidth of the CMFB loop is unimportant since it only operates on dc signals.

In practice, there are many sources of ac CM signals. For example, an ac CM signal can be present in the signal source, or CM noise can be introduced by coupling from a noisy power supply. Furthermore, even when the signal source is purely differential, an ac CM signal can be created by circuit imbalance that causes DM-to-CM conversion. Regardless of the source of an ac CM signal, the CMFB works to suppress the ac CM output signal and to give a CM output voltage that is about constant. Suppression of the ac CM output component is important for two reasons. First, if the CM output varies, the DM output swing must be reduced to allow for the CM output swing. Second, if two feedback amplifiers are cascaded, any ac CM output voltage from the first amplifier is a CM input voltage for the second amplifier, and any imbalance in the second amplifier will convert some of its CM input voltage into a DM output voltage.

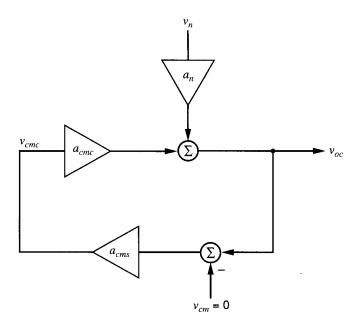

Figure 12.39. A model for the CMFB loop with injected noise v_n .

To see how the CMFB suppresses the ac CM output signal, consider the small-signal block diagram in Fig. 12.39. Here, v_n is a CM disturbance (for example, an ac signal on the power supply). The signal v_{cm} , which is the small-signal component of the applied dc voltage V_{CM} , is zero. Also, a_n is the voltage gain from the CM disturbance to the CM output voltage when the CMFB loop is disabled. That is,

$$a_n = \frac{v_{oc}}{v_n} \bigg|_{\text{no CMFB}} = \frac{v_{oc}}{v_n} \bigg|_{v_{cmc} = 0}$$
 (12.124)

When the CMFB is active, the small-signal gain from v_n to v_{oc} becomes

$$A_n = \frac{v_{oc}}{v_n} \bigg|_{\text{with CMFB}} = \frac{a_n}{1 + a_{cms}(-a_{cmc})}$$
 (12.125)

The CMFB gives $|A_n| \ll |a_n|$ at frequencies where $|a_{cms}(-a_{cmc})| \gg 1$. Therefore, $|a_{cms}(-a_{cmc})| \gg 1$ is desired at frequencies where a significant ac CM output voltage would be generated without CMFB. One possible objective is to satisfy this condition over the bandwidth of DM input signal, or equivalently to make the unity-gain frequencies of the DM and CMFB loops about equal. While desirable, this goal can be difficult to achieve in practice because the CMFB loop often includes more transistors and has more nondominant poles than the DM loop. In any case, suppression of spurious CM signals is an important consideration in determining the required bandwidth of the CMFB loop in practical fully differential amplifiers.

PROBLEMS

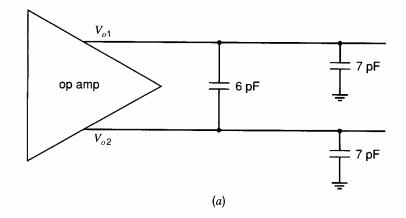

12.1 What are the swing limits for each output of the differential amplifier in Fig. 12.2? Use $|V_{ov}| = 0.2 \text{ V}$ for all transistors and $V_{tn} = -V_{tp} = 0.6 \text{ V}$. Assume $V_{DD} = V_{SS} = 2.5 \text{ V}$, $V_{ic} = 0$ and $\gamma = 0$. Also, assume that the common-mode feedback circuit does not limit the output swing. What value of V_{OC} gives the largest symmetric differen-

tial output swing? What is the peak value of V_{od} in this case?

12.2 Repeat 12.1 for the two-stage op amp in Fig. 12.23. Assume that switched-capacitor CMFB is used, which does not limit the output swing. Use the data in Problem 12.1.

- 12.3 A balanced fully differential circuit displays only odd-order nonlinearity. Use SPICE to verify this fact for the op amp in the example in Section 12.6.1.
- (a) Either use SPICE to find the distortion in the output waveform for a low-frequency differential sinusoidal input, or use SPICE to plot the dc transfer characteristic V_{od} versus V_{id} and verify that the characteristic is odd.
- **(b)** Repeat (a) with a 1% mismatch between W_1 and W_2 . Observe that even-order nonlinearity now exists.
- 12.4 For the op amp in Fig. 12.2, use the device data and operating point from the first example in Section 12.4.1. Assume all transistors operate in the active region.
- (a) Find the element values in the two models for the output ports in Fig. 12.7.
- (b) Find the element values in the two models for the input ports in Fig. 12.6. (The elements are capacitors.) Use $C_{gs} = 180 \, \text{fF}$ and $C_{gd} = 20 \, \text{fF}$.
- 12.5 For the op amp in Fig. 12.2, use the data from Problem 12.4 except use $I_{D5} = 100 \mu A$ and $|V_{ov}| = 0.1 \text{ V for all transistors.}$ Assume all transistors operate in the active region with C_{gs} = 180 fF and $C_{gd} = 20$ fF.
- (a) Find the element values in the two models for the output ports in Fig. 12.7.
- (b) Find the element values in the two models for the input ports in Fig. 12.6. (The elements are capacitors.)
- (c) Calculate the common-mode control gain a_{cmc} .
- (a) For the op amp in Problem 12.5, calculate a'_{cm} . Assume that the CMFB scheme in Fig. 12.17 is used and that $a_{cms} = 1$. Recall that $a'_{cm} = v_{oc}/v_{ic}$ when the CMFB loop is active.
- (b) Use SPICE to plot $|a'_{cm}|$ from 100 Hz to 100 MHz.
- 12.7 Repeat Problem 12.5c when the gates of M_3 and M_4 are the CMC input, and the gate of M_5 connects to a bias voltage.
- 12.8 The op amp in Problem 12.5 is connected in feedback as shown in Fig. 12.32a. The CMFB is as described in Problem 12.6. Compute the low-frequency closed-loop gains $A_{dm} = v_{od}/v_{sd}$ and $A_{cm} = v_{oc}/v_{sc}$ if $R_1 = R_2 = R_3 = R_4 =$ $100 \mathrm{M}\Omega$.
- 12.9 Calculate the DM output slew rate dV_{od}/dt for the op amp in Fig. 12.2. Assume $I_{D5} = 200 \,\mu\text{A}$ and a 5-pF capacitor is connected from each op-amp output to ground.

- 12.10 Calculate the CM output slew rate dV_{oc}/dt for the op amp in Fig. 12.2. Assume $I_{D5} = 200 \,\mu\text{A}$ and a 5-pF capacitor is connected from each op-amp output to ground.
- 12.11 Compute the output slew rate dV_{od}/dt for the op amp in the example in Section 12.6.1. Use the bias currents from the example and C =1.39 pF.
- 12.12 For this problem, use the op amp in Fig. 12.23 and the CMFB scheme in Fig. 12.17. Use the complement of the amplifier in Fig. 12.16b as the CM-sense amplifier, modified to give a negative dc gain. Assume the source followers in Fig. 12.17 have a low-frequency gain of 0.95 and $R_{cs} = 15 \text{ k}\Omega$. Use the transistor and op-amp operating-point data given in the example in Section 12.6.1.
- (a) Design the CM-sense amplifier so that the total low-frequency gain $a_{cms0} = v_{oc}/v_{cms} =$ -0.71, which is the same value as in the example in Section 12.6.1.
- (b) With this CMFB circuit, what are the swing limits for each op-amp output voltage (V_{o1} and V_{o2})? Assume that the biasing current source in each source follower in Fig. 12.17 is implemented with a NMOS transistor, and the current-source and source-follower transistors operate with $V_{GS} =$ 0.8 V and $V_{ov} = 0.2 \text{ V}$. For simplicity, assume V_{GS} is constant and take $\gamma = 0$.
- (c) What value of V_{CM} gives the largest symmetric output swing?
- (d) Verify that this CMFB circuit works correctly by running a SPICE simulation. Use the value of V_{CM} from part (c).
- 12.13 Compute the op-amp CM and DM load capacitances for the output loading in Fig. 12.40a and 12.40b. Assume the inverting voltage buffers in Fig. 12.40b are ideal.
- 12.14 (a) For the amplifier in Fig. 12.16b, estimate the pole associated with the RC time constant at the V_{cms} output node. Assume $|I_{D25}| =$ 0.4 mA, $V_{ov23} = 0.2$ V, and $V_{OC} = V_{CM}$. Ignore all capacitances except C_{gs23} in parallel with a fixed capacitance of 90 fF. Take $L_{eff} = 0.8 \mu m$. Use the data in Table 2.3.
 - **(b)** Repeat (a) except use $|I_{D25}| = 0.1 \text{ mA}$.
- (c) Compare the results in (a) and (b). Explain the difference.
- 12.15 A differential amplifier with local CMFB is shown in Fig. 12.41. Use $|V_{ov}| = 0.2 \text{ V}$ for all transistors, $V_{tn} = -V_{tp} = 0.6 \text{ V}, I_{D5} = 200 \text{ } \mu\text{A},$ $V_{An} = 10 \text{ V}, |V_{Ap}| = 20 \text{ V}, \text{ and } \gamma = 0. \text{ Assume}$ $V_{DD} = V_{SS} = 2.5 \text{ V} \text{ and } V_{ic} = 0.$

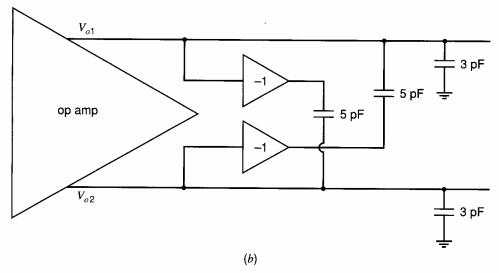

Figure 12.40. Output load networks for Problem 12.13.

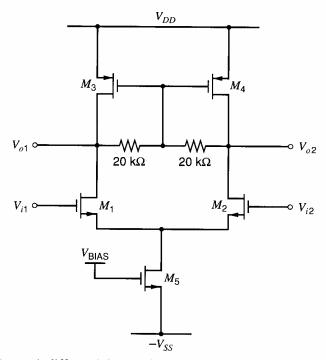

Figure 12.41. A differential amplifier with local common-mode feedback.

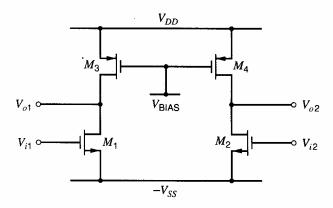

Figure 12.42. A differential amplifier without a tail current source.

(a) What is the dc common-mode output voltage of this amplifier?

(b) Compute the low-frequency gains a_{dm} and a_{cm} . Compare these gains with the gains calculated in the first example in Section 12.4.1.

12.16 A differential amplifier that does not use a tail current source is shown in Fig. 12.42.

(a) Compute the low-frequency gains a_{dm} and a_{cm} . For all transistors, drain currents are 100 μ A and $|V_{ov}| = 0.2$ V. Also, $V_{An} = 10$ V, and $|V_{Ap}| = 20$ V.

(b) Compare these gains with the gains calculated in the first example in Section 12.4.1.

12.17 (a) For the op amp in Fig. 12.2, assume the CM and DM load capacitances are $C_{Lc} = C_{Ld} = 2$ pF. Calculate the frequencies at which $|a_{dm}(j\omega)| = 1$ and $|a_{cmc}(j\omega)| = 1$, ignoring other capacitors. Use $|V_{ov}| = 0.25$ V for all transistors, $V_{tn} = -V_{tp} = 0.6$ V, $I_{D5} = 200$ μ A, $V_{An} = 20$ V, $|V_{Ap}| = 25$ V, and $\gamma = 0$.

(b) Calculate the unity-gain frequencies in part (a) if $C_{Lc} = 2$ pF and $C_{Ld} = 4$ pF.

(c) The unity-gain frequency for the CMC gain can be made equal to the DM unity-gain frequency in part (b) by splitting M_5 as shown in Fig. 12.15.

How should the 200 μ A current be split between M_{51} and M_{52} ? Assume $V_{ov51} = V_{ov52} = 0.25$ V.

12.18 For the CM-detector in Fig. 12.43, find $a_{cms}(s) = v_{cms}(s)/v_{oc}(s)$, assuming the CM-sense amplifier is ideal with unity gain. Then find $a_{cms}(s)$ when a capacitor C_{cs} is connected in parallel with each resistor R_{cs} . What is the effect of the C_{cs} capacitors?

12.19 A NMOS transistor is operating in the triode region. Find a formula for its transconductance $g_m = \partial I_d/\partial V_{gs}$. Compare it with g_m in the active region at the same dc drain current. Which is larger?

12.20 For the fully differential circuit in Fig. 12.32a, assume the op amp is ideal with $R_i = \infty$, $R_o = 0$, $a_{dm} = -\infty$, and $a_{cm} = 0$. Find the closed-loop gains $A_{dm} = v_{od}/v_{sd}$, $A_{cm} = v_{oc}/v_{sc}$, $A_{dm-cm} = v_{oc}/v_{sd}$, and $A_{cm-dm} = v_{od}/v_{sc}$, under the following conditions.

(a) $R_1 = R_2 = 1 \text{ k}\Omega \text{ and } R_3 = R_4 = 5 \text{ k}\Omega.$

(b) $R_1 = 1.01 \text{ k}\Omega$, $R_2 = 0.99 \text{ k}\Omega$, $R_3 = R_4 = 5 \text{ k}\Omega$.

12.21 For the circuit in Problem 12.20a, the applied source voltage is a single-ended signal with $V_{s1} = 0.2V \sin(100t)$ and $V_{s2} = 0$. Assume a CMFB loop forces $V_{OC} = 0$. What are $V_{o1}(t)$,

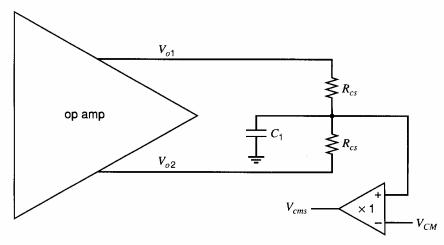

Figure 12.43. Circuit for Problem 12.18.

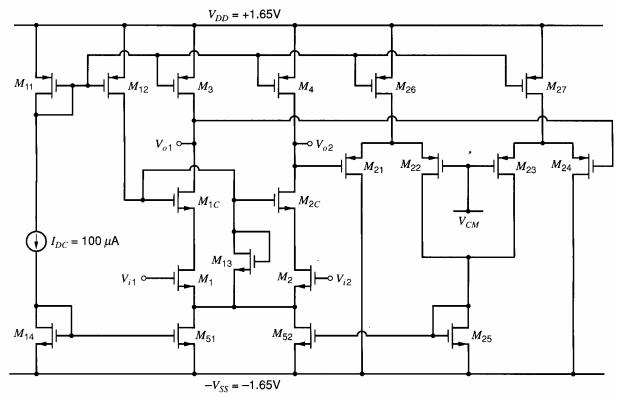

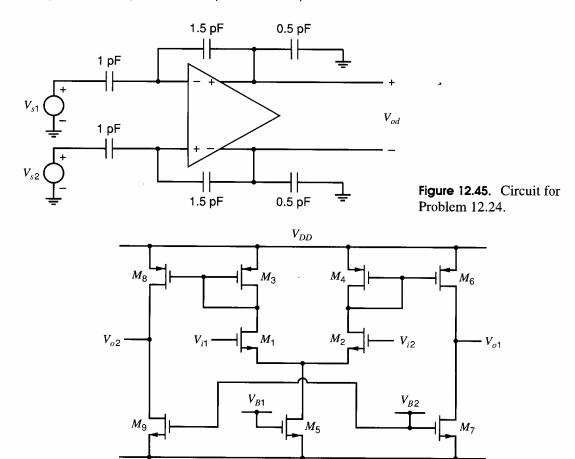

Figure 12.44. Circuit for Problem 12.23.

 $V_{o2}(t)$, $V_{od}(t)$, and $V_{oc}(t)$? What are $V_{i1}(t)$, $V_{i2}(t)$, $V_{id}(t)$, and $V_{ic}(t)$?

12.22 The op amp in Problem 12.4 is used with the CMFB scheme shown in Fig. 12.17. The circuit is perfectly balanced except that the CM-sense resistors are mismatched with the upper resistor $R_{cs1} = 10.1 \text{ k}\Omega$ and the lower resistor $R_{cs2} = 9.9 \text{ k}\Omega$. Assume the source followers and the CM-sense amplifier are ideal with gains of unity.

- (a) Compute the gains a_{cms} and a_{dm-cms} in (12.106).
- **(b)** Compute the low-frequency op-amp gains v_{od}/v_{id} , v_{oc}/v_{ic} , v_{od}/v_{ic} , and v_{oc}/v_{id} with the CMFB active.
 - (c) Use SPICE to simulate these gains.
- 12.23 A fully differential op amp with CMFB is shown in Fig. 12.44. For M_1 , M_{1C} , M_2 , and M_{2C} , use $W/L = (64 \mu m)/(0.8 \mu m)$. For M_3 - M_4 , M_{26} - M_{27} and M_{11} , $W/L = (96 \mu m)/(1.4 \mu m)$. For M_{21} - M_{24} , $W/L = (6 \mu m)/(0.8 \mu m)$. For M_{14} , M_{25} , and M_{52} , $W/L = (16 \mu m)/(0.8 \mu m)$. For M_{13} , $W/L = (1.4 \mu m)/(0.8 \mu m)$. Take $V_{CM} = -0.65$ V.
- (a) Choose W values for M_{12} and M_{51} so that $|I_{D13}|=20~\mu\text{A}$. Use $L=0.8~\mu\text{m}$ for M_{51} and $L=1.4~\mu\text{m}$ for M_{12} .
- **(b)** Use SPICE to find the low-frequency opamp gains v_{od}/v_{id} , v_{oc}/v_{ic} , v_{od}/v_{ic} , and v_{oc}/v_{id} with the CMFB active.

- (c) Calculate the output slew rate dV_{od}/dt if a 4-pF capacitor is connected from each op-amp output to ground.
- (d) What is the differential output voltage swing of this op amp? Assume $V_{ic} = V_{CM}$, and ignore body effect for this calculation.
- (e) Repeat (b) when the input transistors are mismatched with $W_1 = 63 \mu \text{m}$ and $W_2 = 65 \mu \text{m}$. (Note: With mismatch, the op-amp offset voltage is not zero.)
- (f) Repeat (b) when the load transistors are mismatched with $W_3 = 95 \mu \text{m}$ and $W_4 = 97 \mu \text{m}$.
- **12.24** The feedback circuit in Fig. 12.45 is a switched-capacitor circuit during one clock phase. Assume the op amp is the folded-cascode op amp in Fig. 12.31.
- (a) Calculate the DM and CM output load capacitances, considering only the capacitances in the Fig. 12.45.
- **(b)** If the op-amp bias currents are $|I_{D3}| = |I_{D4}| = 100 \, \mu\text{A}$ and $|I_{D5}| = I_{D11} = I_{D12} = 200 \, \mu\text{A}$, calculate the DM output slew rate dV_{od}/dt .
- (c) If all transistors have $|V_{ov}| = 0.15 \text{ V}$ and $V_{DD} = V_{SS} = 2 \text{ V}$, what is the maximum peak

 $-V_{SS}$ Figure 12.46. A fully differential current-mirror op amp.

differential output swing? Assume V_{BB3} and V_{BB4} are chosen to give maximum swing.

- **12.25** In the switched-capacitor CMFB scheme in Fig. 12.21, $C_1 = 0.1$ pF and $C_2 = 0.5$ pF.
- (a) With $V_{CSBIAS} = -1$ V, $V_{OC} = V_{CM} = 0.5$ V. If V_{CSBIAS} changes to -1.1 V, what is the new value of V_{OC} ? Assume $|a_{cmc}| \gg 1$.
- **(b)** Ignoring all capacitors except C_1 and C_2 , what are the CM and DM output load capacitors when the ϕ_1 switches are on and the ϕ_2 switches are off?
- (c) Repeat (b) when the ϕ_2 switches are on and the ϕ_1 switches are off.
- 12.26 A current-mirror op amp is shown in Fig. 12.46. Assume all NMOS transistors are matched and all PMOS transistors are matched. Use $|V_{ov}|=0.2 \text{ V}$ for all transistors, $V_{tn}=-V_{tp}=0.6 \text{ V}$, $I_{D5}=200 \text{ }\mu\text{A}$, $V_{An}=10 \text{ V}$, $|V_{Ap}|=20 \text{ V}$, and $\gamma=0$. Assume $V_{DD}=V_{SS}=1.65 \text{ V}$ and $V_{ic}=0$.
- (a) Calculate the model parameters in Fig. 12.7a. Assume the gates of M_5 , M_7 , and M_9 connect to bias voltages.

- **(b)** If the CMC input is the gate of M_5 and the gates of M_7 and M_9 connect to a bias voltage, compute a_{cmc} .
- (c) If the CMC input connects to the gates of M_7 and M_9 and the gate of M_5 connects to a bias voltage, compute a_{cmc} .
- (d) What are the output swing limits for each output? What value of V_{OC} gives the maximum symmetric output swing?
- **12.27** Find the low-frequency value of a'_{cm} for the two-stage op amp in the example in Section 12.6.1. Use the data in that example. Recall that $a'_{cm} = v_{oc}/v_{ic}$ when the CMFB loop is active.
- **12.28** Assume that the CMFB circuit in the example in Section 12.6.1 is changed so that the CM-sense amplifier has a low-frequency gain $|a_{cms0}| = 2.5$. Determine the compensation capacitor C needed in the op amp to assure that the CMC and DM feedback loops in the example have a phase margin of 45° or larger.
- **12.29** Neutralization capacitors C_n are to be added to cancel the Miller effect on C_{gd1} and C_{gd2}

in the two-stage op amp in the example in Section 12.6.1.

- (a) Show how the C_n capacitors should be connected in the op amp. What value of C_n should be used?
- **(b)** If these capacitors are constructed from MOS transistors operating in the cutoff region, what type of transistor and what device dimensions should be used?
- **12.30** Modify the CMFB schematic in Fig. 12.26 to inject currents at the drains of M_1 and M_2 , in a manner similar to that shown in Fig. 12.18. Give a set of bias current values on

the schematic. Assume $I_{D3} = I_{D4} = 150 \mu A$ and $I_{D6} = I_{D9} = 400 \mu A$.

12.31 A fully differential op amp with mismatch is connected in the feedback circuit in Fig. 12.32a with $R_1 = R_2 = 10 \text{ k}\Omega$ and $R_3 = R_4 = 40 \text{ k}\Omega$. The op amp model is shown in Fig. 12.37 where $a_{dm} = -181$, $a_{cm} = -2.89$, $a_{cmc} = -226$, $a_{dm-cm} = 8.95$, $a_{cm-dm} = 0.15$, and $a_{cmc-dm} = 11.6$. If the gain of the CMFB circuit is $a_{cms} = 0.76$, find the closed-loop gains $A_{dm} = v_{od}/v_{sd}$, $A_{cm} = v_{oc}/v_{sc}$, $A_{dm-cm} = v_{oc}/v_{sd}$, and $A_{cm-dm} = v_{od}/v_{sc}$.

1.1

(a) From (1-1) the built-in potential

$$\Psi_0 = V_T \ln \frac{N_A N_D}{n_i^2}$$
= 26 \(\text{Ln} \\ \frac{6 \times 10^{15} \times 10^{17}}{2.25 \times 10^{20}} = 751 \text{ mV}

from (1.14) the depletion-layer depth in the p-type region is,

$$W_{1} = \left[\frac{2 \times 1.04 \times 10^{-12} \times 5.75}{1.6 \times 10^{-19} \times 8 \times 10^{15} (1+0.08)} \right]^{1/2}$$

$$= 0.93 \text{ µm}$$

In the n-type region using (1.15)

$$W_2 = \left[\frac{2 \times 1.04 \times 10^{-12} \times 5.75}{1.6 \times 10^{-19} \times 10^{17} \times 13.5} \right]^{1/2}$$

$$= 0.074 \text{ ym}$$

From (1.7) the maximum field is

$$\mathcal{E}_{MAx} = -9 \frac{N_A}{\epsilon} W_1$$

$$= -1.6 \times 10^{-19} \times \frac{8 \times 10^{15} \times 0.93 \times 10^{4}}{1.04 \times 10^{-12}}$$

$$= -11.4 \times 10^{4} \text{ V/cm}$$

(b) For zero volts bias

$$V_0 + V_R = V_0 = 0.75$$
 $W_1 = 0.93 \sqrt{\frac{0.75}{5.75}} = 0.34 \,\mu\text{m}$
 $W_2 = 0.074 \sqrt{\frac{0.75}{5.75}} = 0.027 \,\mu\text{m}$
 $E_{\text{MAX}} = -11.4 \times 10^4 \times \frac{0.34}{0.93}$
 $= -4.17 \times 10^4 \,\text{V/cm}$

For 0.3V forward bias,

$$W_1 = 0.93 \sqrt{\frac{0.45}{5.75}} = 0.26 \, \mu$$

$$W_2 = 0.074 \sqrt{\frac{0.45}{5.75}} = 0.021 \, \mu \text{m}$$

$$\mathcal{E}_{\text{MAX}} = -11.4 \times 10^4 \times \frac{0.26}{0.93}$$

1.2

From (1.20), the zero bias junction capacitance is,

$$C_{jo} = A \left[\frac{9 \mathcal{E} N_A N_D}{2 (N_A + N_D)} \right]^{\frac{1}{2}} \frac{1}{\sqrt{\psi_o}}$$

$$= 2 \times 10^5 \times \left[\frac{1.6 \times 10^{19} \times 1.04 \times 10^{12} \times 8 \times 10^{15} \times 10^{17}}{2 (8 \times 10^{15} + 10^{17})^{\frac{1}{2}}} \right]^{\frac{1}{2}}$$

$$\times \frac{1}{\sqrt{0.75}}$$

Using (1.20) with $V_D = -5V$ wo obtain,

$$C_{j} = \frac{C_{j0}}{\sqrt{7.7}} = 0.2 \text{ pF}$$

$$C_{j} = \frac{C_{jo}}{\sqrt{0.6}} = 0.74 \text{ pF}$$

The break down voltage can be calculated from (1.24) using

Thus,

Thus,

$$4 \times 10^{5} = \left[\frac{2 \times 1.6 \times 10^{-19} \times 8 \times 10^{15} \times 10^{17} \times V_{R}}{1.04 \times 10^{-12} (8 \times 10^{15} + 10^{17})} \right]^{1/2}$$

$$BV_{CBO} = \frac{1.04 \times 10^{-12}}{3.2 \times 10^{-19} \times 10^{15}} \times 9 \times 10^{10} = 293 V$$

$$V_R = 70.2 V$$

From (1.81)

$$BV_{CEO} = \frac{48.8}{\sqrt[4]{200}} = 13 \text{ V}$$

$$BV_{CBO} = \frac{1.04 \times 10^{-12}}{3.2 \times 10^{-19} \times 10^{15}} \times 9 \times 10^{10} = 293 V$$

$$BV_{CEO} = \frac{293}{\sqrt{400}} = 65.5 \text{ V}$$

Junction curvature causes (1.24) to become

$$\left| \mathcal{E}_{MAX} \right| = 1.5 \left[\frac{2q N_A N_D V_R}{\mathcal{E}(N_A + N_D)} \right]^{\frac{1}{2}}$$

If Na >> ND, | Emax | = 3 x 105 V/cm

and $V_R = 150 \text{ V}$, then this equation gives

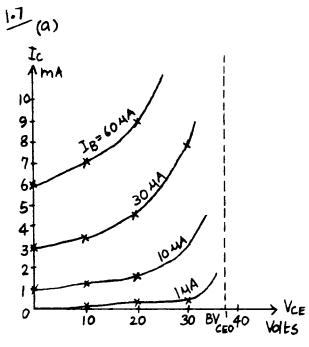

$$9 \times 10^{10} = 2.25 \frac{29 \, N_D V_R}{\epsilon}$$

$$N_D = \frac{9 \times 10^{10} \times 1.04 \times 10^{-12}}{3.2 \times 10^{-19} \times 150 \times 2.25}$$
$$= 8.7 \times 10^{14} \text{ atoms/cm}^3$$

The plane breakdown voltage is

$$BV_{CBO} = \frac{\mathcal{E}(N_A + N_D)}{29 N_A N_D} \mathcal{E}_{CRIT.}^2$$

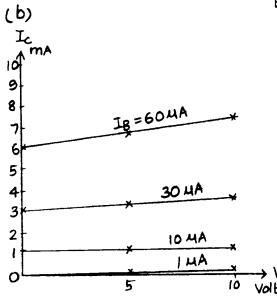

$$= \frac{1.04 \times 10^{-12}}{3.2 \times 10^{-19} \times 6 \times 10^{15}} \times 9 \times 10^{10} = 48.8 \text{ V}$$

$$I_{c} = \left(1 + \frac{V_{cE}}{V_{A}}\right) \frac{M \kappa_{F}}{1 - M \kappa_{F}} I_{B}$$

$$M = \frac{1}{1 - \left(\frac{V_{cB}}{B V_{cBO}}\right)^{n}}$$

Where $x_F = 0.99$, $V_A = 50 \text{ V}$ BV = 120 V, n = 4

$$g_{m} = \frac{I_{c}}{V_{T}} = \frac{O.2 \, mA}{26 \, mV} = 7.69 \, \frac{mA}{V}$$

$$V_{0} = \frac{I}{10^{-3}} = \frac{I}{10^{-3} (7.69 \, m)} = 130 \, k\Omega$$

$$V_{\pi} = \frac{B_{0}}{9m} = \frac{100}{7.69 \, m} = 13 \, k\Omega$$

$$C_{b} = C_{F} \, g_{m} = (15 \, ps) (7.69 \, m) = 115 \, fF$$

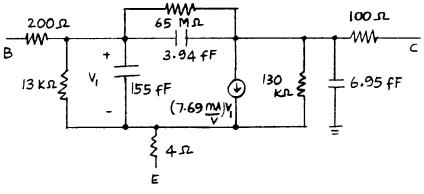

$$V_{M} = 5 \, \beta_{0} \, V_{0} = 5 \, (100) (130 \, k) = 65 \, M\Omega$$

$$C_{de} = 2 \, C_{de0} = 40 \, fF$$

$$C_{M} = \frac{C_{M0}}{\sqrt{1 + \frac{V_{CB}}{V_{0}}}} = \frac{10 \, fF}{\sqrt{1 + \frac{3}{0.55}}} = 3.94 \, fF$$

$$C_{CS} = \frac{C_{CS0}}{\sqrt{1 + \frac{V_{CS}}{V_{0}}}} = \frac{20 \, fF}{\sqrt{1 + \frac{4}{0.55}}} = 6.95 \, fF$$

$$C_{TT} = C_{b} + C_{Je} = 155 \, fF$$

$$g_{m} = \frac{I_{c}}{V_{f}} = \frac{1 \text{ mA}}{26 \text{ mV}} = 38.5 \frac{\text{mA}}{\text{V}}$$

$$V_{o} = \frac{1}{10^{3}} = \frac{1}{10^{-3} (38.5 \text{m})} = 26 \text{ K}\Omega$$

$$V_{ff} = \frac{B_{o}}{g_{m}} = \frac{100}{38.5 \text{ m}} = 2.6 \text{ K}\Omega$$

$$C_{b} = C_{f} g_{m} = (15 \text{ ps})(38.5 \text{ m}) = 577 \text{ fF}$$

$$V_{M} = 5 B_{o} V_{o} = 5 (100) (26 \text{ K}) = 13 \text{ M}\Omega$$

$$C_{de} \simeq 2 C_{de0} = 40 \text{ fF}$$

$$C_{M} = \frac{C_{MO}}{\sqrt{1 + \frac{V_{cB}}{V_{o}}}} = \frac{10 \text{ fF}}{\sqrt{1 + \frac{1}{0.55}}} = 5.96 \text{ fF}$$

$$C_{cs} = \frac{C_{cso}}{\sqrt{1 + \frac{V_{cs}}{V_{o}}}} = \frac{20 \text{ fF}}{\sqrt{1 + \frac{2}{0.55}}} = 9.29 \text{ fF}$$

For problem (1.9),
$$B(j\omega) = \frac{38.5 \text{ mA/v}}{j\omega 623 \text{ fF}} = \frac{61.86}{j\omega} = \frac{9.846}{j\text{ f}}$$

$$\frac{1.8}{100} f_{\text{T}} = 7.76 \text{ Hz}$$

$$\frac{1.9}{100} f_{\text{T}} = 9.846 \text{ Hz}$$

Hz

9.846

7.76

1.10 At high frequencies,

$$B(j\omega) = \frac{\omega_T}{j\omega} = \frac{g_m}{j\omega(C_H + C_{ff})}$$

 $C_{\pi} = C_b + C_{je} = 617 \text{ fF}$

For problem (1.8)

$$\beta(j\omega) = \frac{7.69 \text{ mA/V}}{j\omega} = \frac{48.46}{j\omega} = \frac{7.76}{jf}$$

r = 100 m , r = 100 m

$$I_{c} = 1 \, \text{mA}$$

$$g_{m} = \frac{1}{26} = 38 \, \text{mA}_{V}$$

$$r_{\pi} = \frac{100}{38} \, \text{K.R} = 2.6 \, \text{K.R}$$

$$r_{o} = 50 \, \text{K.R.}, \, r_{H} = 25 \, \text{M.R.}$$

$$C_{b} = 5.6 \, \text{pF}$$

$$C_{\pi} = 5.6 + 4.4 = 10 \, \text{pF}$$

1.12
(a)
$$Z_F = \frac{W_B^2}{2D_P} = \frac{10^{-6}}{26} = 38.5 \text{ ns}$$

$$f_T = \frac{1}{2\Pi} \frac{g_m}{C_b + C_{je}}$$

$$= \frac{1}{2\Pi} \frac{1}{Z_F + \frac{V_T C_{je}}{I_c}}$$

$$= \frac{1}{2\Pi} \frac{1}{38.5 + 0.1} \times 10^9 = 4.1 \text{ MHz}$$

$$Q = Z_F I_c = 38.5 \times 10^{-9} \times 0.5 \times 10^{-3}$$

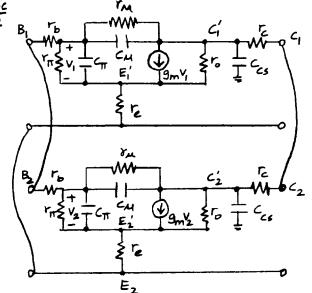

$$= 19.3 \text{ pc}$$

(b)
$$\frac{\Delta I_c}{I_c} = \frac{\Delta W_B}{W_B} = \frac{O.1}{10}$$
 per volt of V_{CE}
 $\therefore \Delta I_c = 0.5 \times \frac{1}{100}$ mA per volt of V_{CE}
 $\therefore r_o = \frac{\Delta V_{CE}}{\Delta I_c} = \frac{100}{0.5}$ KR = 200 KR

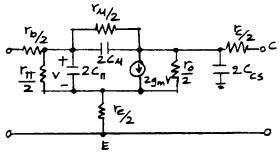

connect two transistors in parallel,
each with a collector bias current

ic

rm

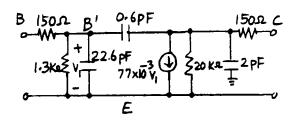

Points B_1' and B_2' will be at the same potential and can be connected. Also C_1' and C_2' , E_1' and E_2' . Thus, the composite device becomes as shown with a collector bias current I_c .

since Tb, Tc and Te are assumed constant, the values of these resistors are <u>halved</u> in the composite device as compared to the original device at the same total current.

independent of bias current, the values of these capacitors are doubled in the composite device since r_{Π} , r_{0} and r_{U} are proportional to $1/I_{c}$, the values of these resistors are unchanged in the composite device as compared to the original device with the same total current. Since g_{Π} is proportional to I_{c} , its value is unchanged in the composite device.

Finally, $C_{\Pi} = C_{je} + C_{b}$ where C_{je} is assumed constant and C_{b} is proportional to I_{c} . Thus, in the composite device, C_{je} is doubled and C_{b} is unchanged. As a consequence, C_{π} in the composite is larger than in the original device at the same total current, but the increase in C_{Π} is less than two times.

since current gain is 9 at 50 MHz, fr = 9x50 = 450 MHz at Ic=1mA $T_{T} = \frac{1}{2\pi f_{-}} = 0.354 \text{ ns}$ From (1.130), $C_T = C_F + \frac{C_{je} + C_{iq}}{g_m}$ $\therefore 0.354 = 0.25 + (C_{je} + C_{iq}) \times 26$:. Cje + Cy = 4 PF Given Cy = 0.6 pF , .. Cje = 3.4 pF At Ic = 2 mA $C_b = C_F g_m = 0.25 \times 10^{-9} \times \frac{1}{12} = 19.2 \text{ pF}$ $C_{\pi} = C_{je} + C_{b} = 3.4 + 19.2 = 22.6 \text{ pF}$ $g_{m} = \frac{1}{13} = 77 \text{ mA/V}$ $r_0 = \frac{V_A}{L} = \frac{40}{2} \text{ K}\Omega = 20 \text{ K}\Omega$ $V_{\Pi} = \frac{B_0}{g_m} = 1300 \Omega$

1.15

(a)
$$\frac{X'}{2} \frac{W}{L} = 97 \times 10 = 970 \text{ AA/}_{V^2}$$

so in triode region,

 $I_D = 970 \left[2(V_{GS} - 0.6) V_{DS} - V_{DS}^2 \right] \text{ AA}$

In active region (saturation),

 $I_D = 970 \left(V_{GS} - 0.6 \right)^2 (1 + 0.024 V_{DS}) \text{ AA}$

(b) From (1.140),

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$
From (1.141),

$$V_{t} = \sqrt{2\phi_{F}} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

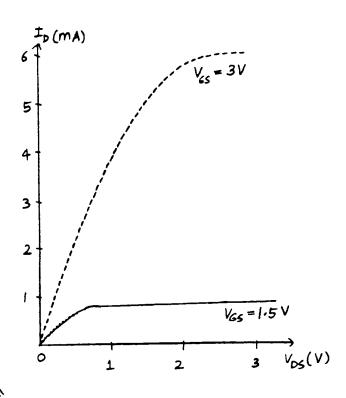

$$V_{t} = V_{t0} + 8 \left(\sqrt{2\phi_{F}} + V_{5B} - \sqrt{2\phi_{F}} \right)$$

$$V_{t} = V_{t0} + V$$

From (1.142), $C_{0x} = \frac{E_{0x}}{t_{0x}} = \frac{3.9 \times 8.85 \times 10^{-14}}{80 \times 10^{-8}} \times 10^{-8} = 4.3 \frac{fF}{4m^2}$ $= 4.3 \times 10^{-7} \frac{F}{cm^2}$

when $V_{SB} = 0$, $V_{t} = 0.6 \text{ V}$ when $V_{SB} = 0.5 \text{ V}$, $V_{t} = 0.63 \text{ V}$ when $V_{SB} = 1 \text{ V}$, $V_{t} = 0.65 \text{ V}$

$$V_{t} = 0.6 + 0.094 \left(\sqrt{1.6} - \sqrt{0.6} \right)$$

$$= 0.646 \text{ V}$$

$$I_{D} = \frac{x'}{2} \frac{W}{L} \left(V_{GS} - V_{t} \right)^{2} (1 + \lambda V_{DS})$$

$$= \frac{194}{2} \frac{10}{1} \left(1 - 0.646 \right)^{2} (1 + 0.024(2))$$

$$= 127 \text{ 4A}$$

$$= 0.646 \text{ V}$$

$$I_D = \frac{x'}{2} \frac{W}{L} (V_{GS} - V_4)^2 (1 + \lambda V_{DS})$$

$$= \frac{194}{2} \frac{10}{1} (1 - 0.646)^2 (1 + 0.024(2))$$

$$= 127 \text{ 4A}$$

From (1.180),

$$g_{m} = \sqrt{2 x' \frac{W}{L}} I_{D} = \sqrt{2 (194) 10 (127)}$$

= 702 $44/\sqrt{y}$

$$g_{mb} = \gamma \sqrt{\frac{\kappa' W_{/L} I_D}{2(2\Phi_F + V_{SB})}} = 0.094 \frac{194(10)(127)}{2(0.6+1)}$$

= 26 44/V

From (1.194),
$$\delta_0 = \frac{1}{71 I_D} = \frac{1}{0.024 (1274)}$$

= 328 K.D.

From (1.201),
$$C_{Sb} = \frac{C_{SbO}}{\sqrt{1 + \frac{V_{SB}}{V_0}}} = \frac{20 \text{ fF}}{\sqrt{1 + \frac{I}{0.7}}} = 13 \text{ fF}$$

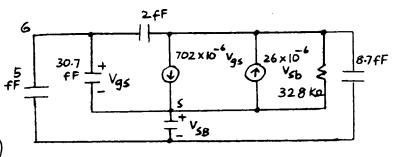

$$V_{DB} = V_{DS} + V_{SB} = 2 + 1 = 3V$$

From (1.202),
$$C_{ab} = \frac{C_{abo}}{\sqrt{1 + \frac{V_{ab}}{V_{ab}}}} = \frac{20 \, \text{fF}}{\sqrt{1 + \frac{3}{0.7}}} = 8.7 \, \text{fF}$$

From (1.191),

$$C_{gs_i} = \frac{2}{3} WLC_{ox} = \frac{2}{3} (10) (1) (4.3 f) = 28.7 fF$$

$$C_{gs} = C_{gs_i} + C_{gs_{oL}} = 28.7 + 2 = 30.7 fF$$

From (1.208),

$$f_{T} = \frac{1}{2\pi} \frac{g_{m}}{c_{gs} + c_{gd} + c_{gb}} = \frac{1}{2\pi} \frac{g_{m}}{37.7 \times 10^{-15}}$$

From (1.179)
$$g_{m} = x' \frac{W}{L} (V_{GS} - V_{+}) (1 + \lambda V_{DS})$$

$$= 194 \frac{10}{L} (V_{GS} - 0.6) (1 + \lambda V_{DS})$$

Here, $1+ \lambda V_{DS} = 1 + 0.024(3) = 1.072$ This term is usually ignored but is included here to demons--trate its use. Ignoring the

term would cause a 7.2% error

1.8	1.2	0.385	217

10% error occurs when $V_{65}=1.8 \text{ V}$ Reasonable since.

$$(V_{65} - V_{t})^{2} = (1.2)^{2} = 1.44$$

 $(T_{D}R_{sx})^{2} = [242.8 \times 10^{-6} (1718.2)]^{2}$
 $= 0.1740$
 0.17 is 12% of 1.44

Now use (1.230),

$$\frac{x'}{2}\frac{W}{L} = \frac{194}{2}\frac{2}{0.5} = \frac{388}{V^2}\frac{MA}{V^2}$$

$$R_{SX} = \frac{1}{E \times W} = \frac{1}{1.5 \times 10^6 (194)^{24}} = 1718.2$$

$$\frac{1}{2}\frac{W}{L}R_{SX} = 194 \times 4 \times 1718.2 \times 10^{-6} = 1.333$$

$$g_{m} = \frac{1}{L} \frac{W}{L} (V_{GS} - V_{+})$$

$$= \frac{M_{n} \frac{E_{OX}}{t_{OX}} \frac{W}{L} (V_{GS} - V_{+})}{L}$$

$$= \frac{M_{n} E_{OX}}{L} (50) \frac{W}{L} (V_{GS} - V_{+})$$

$$= 450 \frac{Lm^{2}}{L} (3.9) (8.854 \times 10^{-14} + C_{m})$$

$$L (4m) R g_{m} = \frac{1.1654 \times 10^{-3} \text{ MAy}}{L}$$

$$10 \quad 6.6 \times 10^{-3} \quad 0.77$$

$$2 \quad 3.175 \times 10^{-2} \quad 18.5$$

$$1 \quad 6.066 \times 10^{-2} \quad 70.7$$

$$0.5 \quad 0.11148 \quad 260$$

$$0.4 \quad 0.134 \quad 390$$

 $= \frac{1.1654 \times 10^{-3}}{1} R \frac{44}{V^2}$

$$= \frac{50(10 \, \text{Am}) \times \frac{10^4 \, \text{Am}}{1 \, \text{cm}} (0.1)}{1^2}$$

$$= \frac{7.769 \times 10^{-4}}{1^2} (0.1)$$

L (4m)	gm (44/v2)		
0.4 0.5 1.0 2.0	485 310 77.7 19.4 0.77	(24% error) (20% error) (10% error)	

Now with velocity saturation,

$$R = \frac{\sqrt{1 + \frac{2(V_{6s} - V_t)}{E_c L}} - 1}{\sqrt{1 + \frac{2(V_{6s} - V_t)}{E_c L}}}$$

$$g_{m} = (10 \text{ µm})(3.9) (8.854 \times 10^{-14} \text{ F}) 450 \frac{\text{cm}^{2}}{\text{V sec}}$$

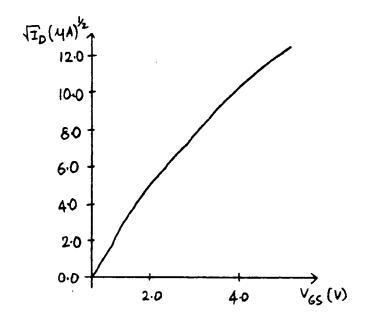

$$\times 1.5 \text{ R} \times \frac{10^{4} \text{ µm}}{1 \text{ cm}}$$

From (1.223),
$$I_D = \frac{\mu_D Cox}{2} \frac{W}{L} \left[V_{DS}(act) \right]^2$$

From (1.220), $V_{DS}(act) = \mathcal{E}_{cL} \left[\sqrt{1 + \frac{2(V_{GS} - V_t)}{\mathcal{E}_{cL}}} - 1 \right]$
 $\mathcal{E}_{cL} = 1.5 \quad V_t = 0.7 \text{ V}$

V ₆₅ (V)	V (act.)	I _D (4A)	(4A) (4A) (4A)	보'씬 (VGs-VF) ¹ (41A)	VX W (45-VE)2 (4A)	V ₆₅ −V _t (V)

For large V65, current is limited by velocity saturation

$$I_{D} = K_{x} \frac{W}{L} e^{V_{65}/NV_{T}} (1 - e^{V_{D5}/V_{T}})$$

$$g_{m} = \frac{\partial I_{D}}{\partial V_{65}} = \frac{1}{nV_{T}} K_{x} \frac{W}{L} e^{V_{65}/NV_{T}} (1 - e^{-V_{D5}/V_{T}})$$

$$= \frac{1}{nV_{T}} I_{D} = \frac{10 \times 10^{-9}}{1.5 \times 26 \times 10^{-3}} = 2.56 \times 10^{-7}$$

$$= 0.256 \frac{MA}{V}$$

$$f_{T} = \frac{g_{m}}{2\pi (C_{gs} + C_{gd} + C_{gb})} = \frac{0.256 \frac{MA}{V}}{2\pi (10 \text{ fF})}$$

$$= 4.076 \text{ MHz}$$

CHAPTER 2

From Fig. (2.2)

For p-type Si,

$$N_A = 1.5 \times 10^{16} \text{ atoms/cm}^3$$

For n-type Si,

$$\frac{2.2}{R_{D}} = \frac{1}{T} = \frac{1}{5} \frac{\Omega - cm}{5 \text{ ym}} = \frac{1 \Omega - cm}{5 \times 10^{4} \text{ cm}}$$

$$= 2000 \Omega / D$$

The doping profile has the form $N_{D}(x) = N_{DO} \exp\left(-\frac{x}{L}\right)$

The first step is to determine N_{DO} and L. Since at x=0,

$$N_D(x) = 10^{17} \text{ cm}^{-3}$$
, then
 $N_{DO} = 10^{17} \text{ cm}^{-3}$

At
$$x = 0.5 \, \text{Am}, \, N_D(x) = \frac{1}{e} \, N_D(0)$$

Thus,
$$N_D(x) = 10^{17} exp(-\frac{x}{0.54m})$$

The junction will exist at the point where the net doping $N_{A}(x) - N_{A}(x) = 0$

$$10^{17} \exp\left(-\frac{x_j}{0.54m}\right) = 10^{15}$$

..
$$x_j = 0.5 \, \text{4m} \, \text{ln} \, \frac{10^{17}}{10^{15}} = 2.3 \, \text{4m}$$

The sheet resistance is given by:

$$R_{D} = \left[q \overline{H}_{n} \int_{0}^{7} \left[N_{D}(x) - N_{A}(x) \right] dx \right]$$
Since the effective doping
$$is \quad N_{D}(x) - N_{A}(x)$$

$$\therefore q \left[800 \frac{cm^{2}}{v - sec} \right] \int_{0}^{2\cdot 3H^{m}} \frac{x}{|o|^{17}e^{-\frac{x}{0.5}H^{m}}|o|^{15}} dx$$

$$= q \left[800 \frac{cm^{2}}{v - sec} \right] \left[\left[-0.5 \times 10^{12} - 2.3 \times 10^{11} \right] + 0.5 \times 10^{13} \right]$$

$$= 1.6 \times 10^{-19} \times 800 \times 4.72 \times 10^{12}$$

$$= 1.6 \times 8 \times 4.72 \times 10^{-5}$$

$$\therefore R_{D} = \left[6.04 \times 10^{-4} \right]^{-1} = 1655 \Omega_{D}$$

2.4

Emitter-diffused

Pinch

2.5

From (2.17), for an npn-transistor,

$$Q_{B} = \frac{A \overline{D}_{n} q n_{1}^{2}}{I_{2}} exp\left(\frac{V_{BE}}{V_{T}}\right)$$

For VBE = 520 mV,

$$Q_{B} = \frac{(10^{-4} \text{cm}^{2})(13 \frac{\text{cm}^{2}}{\text{sec}})(1.6 \times 10^{-19})(2 \times 10^{20})}{10^{-5}} e^{(520/26)}$$

$$= 2.02 \times 10^{12} \text{ atoms/m}^{2}$$

For
$$V_{BE} = 580 \text{ mV}$$
, same expression gives: $Q_B = 2 \times 10^{13} \text{ atoms}/cm^2$

For
$$Q_B = 2.02 \times 10^{12}$$

$$R_D = \left[q \overline{M}_P Q_B \right]^{-1}$$

$$= \left[(1.6 \times 10^{14})(150 \frac{cm^2}{V \cdot sec})(2.02 \times 10^{12}) \right]^{-1}$$

$$= (4.85 \times 10^{-17})^{-1} = 21 \text{ K}^{52}/_{D}$$

2.6 (a) series base R:

Emitter periphery adjacent to a base contact is:

p = 4x 40 4m = 160 4m Distance from base contact to emitter is : 10 4m

$$\therefore R_{B} = R_{D} \left(\frac{10}{160} \right) = 100 \, \text{M}_{D} \left(\frac{1}{16} \right)$$
$$= 6.2 \, \text{L}$$

(b) Series collector resistance: For each of two emitters the effective buried layer dimensions

$$W_{BL} = (W+2T) = 20 \, \mu m + 2 (10 \, \mu m)$$

$$= 40 \, \mu m$$

$$L_{BL} = (L+2T) = 40 \, \mu m + 2 (10 \, \mu m)$$

$$= 60 \, \mu m$$

Using (2.18),

$$a = \left(\frac{20}{40}\right)^{-1}, \quad b = \left(\frac{40}{60}\right)^{-1}$$

$$2Y_{c_1} = \frac{(5 \text{ N-cm})(10 \text{ Mm})}{(20 \text{ Mm})(40 \text{ Mm})} \text{ in } \frac{2/1.5}{0.5}$$

$$= 360 \text{ N}$$

$$Y_{c_1} = 180 \text{ N}$$

$$V_{C2} = R_{BLD} \left(\frac{L}{W} \right) = 20 \frac{\Lambda}{D} \left(\frac{40}{140} \right) = 5.7 \Lambda$$
 V_{C3} : for buried layer

 $V_{C3} = 140 \text{ Mm}$
 $V_{C3} = 140 \text{ Mm}$

$$\therefore a = \frac{34}{14} = 2.43 ; b = 1$$

$$\therefore \chi_{c3} = \frac{(5 \text{ n-cm})(10 \text{ Hm})}{(140 \text{ Hm})(14 \text{ Hm})} \text{ en } \frac{2.43}{2.43-1}$$

$$= 158 \text{ s.}$$

$$\therefore R_{c} = 158 + 180 + 5.7 = 344 \text{ s.}$$

(C)
$$C_{jc} = (A_{bottom}^{+} A_{sidewall})^{C_{jc}} area$$

$$= \left[(140 \text{ Mm})(60 \text{ ym}) + \frac{\Pi_{1}^{2}}{2} \text{ ym}(280 \text{ ym} + 120 \text{ ym}) \right] \times 10^{-4} \text{ pF} / \text{(ym)}^{2}$$

$$= (8400 + 1885) \times 10^{-4}$$

$$= 1.03 \text{ pF}$$

(d)
$$Cje = (Cjebottom + Cjesidewall)$$

$$= 2 \left[Abottom + Asidewall\right] Cje/area$$

$$= 2 \left[(20 \mu)(40 \mu) + \frac{\pi}{2} \times 2 \mu(40 \mu) + 80 \mu\right] \times 10^4 \text{ pF/}_{2}$$

$$= 2.4 \text{ pF}$$

(e)
$$C_{substrate} = C_{sidewall} + C_{epi-sub} + C_{BL-sub}$$

$$C_{sidewall} = \frac{\pi}{2} \times (174m) [175 \text{ Mm} \times 2 + 140 \text{ Mm} \times 2] \times 10^{-4} \text{ pF}$$

$$= 1.6 \text{ pF}$$

$$C_{epi-sub} = (175 \times 140 - 85 \times 126) \times 10^{-4} \text{ pF}$$

$$= 1.4 \text{ pF}$$

$$C_{BL-sub} = (85 \times 126) \times 3.3 \times 10^{-4} = 3.5 \text{ pF}$$

$$C_{substrate} = 6.5 \text{ pF}$$

$$(f) \quad I_S = \frac{q n_i^2}{Q_B/\overline{D}_D} A_{EB}$$

From text example,

$$\frac{QB}{\overline{D}_{n}} = 5.7 \times 10^{11} \text{ cm}^{4} \text{ sec}$$

$$\therefore I_{s} = \frac{1.6 \times 10^{14} \text{ 2} \times 10^{20} \times 1600 \text{ 4m}^{2} \times \left(10^{-8} \frac{\text{cm}^{\frac{1}{2}}}{\text{4m}^{\frac{1}{2}}}\right)}{5.7 \times 10^{11}}$$

$$= 0.9 \times 10^{-15} \text{ A}$$

From (2.24), the p falloff begins at $I_c = 9.4 \text{ ND} \frac{Dp}{Wa}$

For this structure, the area A is the product of the emitter diffusion periphery 120 µm, and the effective sidewall depth. Regarding the sidewall as a quarter-cylinder this effective depth is the emitter junction depth multiplied by T/2. Thus,

Aeff = (120 4m) (34m) (1/2)=5.65×106 cm²

From Fig. (2.2), the donor density corresponding to a resistivity of 0.5 s.-cm is 1.2 × 10 16 cm³. Thus,

$$I_{c} = \frac{(1.6 \times 10^{-19})(5.65 \times 10^{-6})(1.2 \times 10^{16})(10)}{8 \times 10^{-4}}$$
$$= 13.56 \times 10^{-5} = 136 \text{ MA}$$

From (2.17), for a pnp transistor $Q_{B} = 9A\overline{D}_{p} \frac{n_{i}^{2}}{I_{c}} \exp\left(\frac{V_{BE}}{V_{T}}\right)$

For this device, $A = 2 \times (304 \text{m} \times 754 \text{m}) + 2 \times (604 \text{m} \times 304 \text{m})$ = 5100 (44m)² For $V_{BE} = 525 \text{ mV}$

$$Q_{B} = \frac{1.6 \times 10^{-13} \times 5100 \times 10^{-8} \times 10 \times 2 \times 10^{-20}}{10^{-5}} \exp\left(\frac{525}{26}\right)$$

= 9.6 × 1011

using Fig. (2.2), the donor density corresponding to 2.5-cm is 2.5 × 10¹⁵ cm⁻³

Since, $Q_B = W_B N_D$, then $W_B = \frac{Q_B}{N_D} = \frac{9.6 \times 10^{11}}{2.5 \times 10^{15}} = 3.84 \times 10^{15} \text{ cm}$ = 3.84 ym

Since the p-diffusion depth is 3 μ m, the total epithickness is 6.84 μ m, for $V_{BE} = 525$ mV. By a similar calculation, the total depth for $V_{BE} = 560$ mV is 17.45 μ m

The same resistances are :

For
$$V_{BE} = 525 \text{ mV}$$
 $R_{D} = \left[9 \overline{\mathcal{H}}_{D} Q_{B} \right]^{-1}$
 $= \left[(1.6 \times 10^{19})(800)(9.6 \times 10^{11}) \right]^{-1}$
 $= \left[12 \times 10^{5} \right]^{-1} = 8 \text{ kg/}_{D}$

For $V_{BE} = 560 \text{ mV}$
 $R_{D} = 2.12 \text{ kg/}_{D}$

2.9
First consider the 6µm resistor,
For 10 KD we need 100 squares
or 600 µm of length. The total

resistor area is that of the body plus clubbeads, or

 $A_{bottom} = 600 \, \mu \text{m} \times 6 \, \mu \text{m} + 2 \, (26 \, \mu \text{m})^2$ $= 4952 \, (4 \, \text{m})^2$

The sidewall area is equal to the total periphery multiplied by $(34m)(\frac{11}{2})$.

The periphery is,

P-6004m+6004m+6x264m+ 2(26-6)4m

= 1396 Am

Thus,

 $A_{\text{sidewall}} = 1396 \, \mu \text{m} \times 3 \, \mu \text{m} \times \frac{\Pi}{2}$ = 6578 $(\mu \text{m})^2$

The total area is,

Atotal = 11,530 (4m)2

For the 10¹⁵ cm⁻³ epi concentration the capacitance per unit area for 3ero bias is from Fig. (2,29) equal to 10⁻⁴ pF/wm)²

Thus, C_{total} = 11,530 (4m) × 10 + pF (4m) = 1.15 pF

For the 12 ym resistor, we need 1200 ym of length

Thus, $A_{bottom} = 12 \, \mu m \times 1200 \, \mu m + 2 (26 \mu)^2$ = 15,750 (4m)²

Asidewall = $\frac{\pi}{2}$ [1200x2 + 26x6 + 2(26-12)] x 3

 $= 12,177 (\mu m)^2$

.. Atotal = 27,929 (4m)

: Ctotal 27,929 (4m) x 10 + pf = 2.8 pf

2.10
(1) $I_s = A_{EB} q \frac{n_i^2}{Q_B} D_{Pb}$ $= \left[90 \text{Mm} \times 75 \text{ Mm} - 30 \text{Mm} \times 55 \text{ Mm} \right] \times 10^{-8} \frac{\text{cm}^2}{\text{M}^2} \times \frac{(1.6 \times 10^{-19})(2 \times 10^{\circ})(10 \text{ cm}^2/\text{sec})}{\left(\frac{10^5 \text{ atoms}}{\text{cm}^3} \right) \times 14 \text{ Mm} \times 10^{4} \text{cm}}$ $= 1.17 \times 10^{-14} \text{ A}$

(2) $Cje = A_{bottom} \times 10^{-4} \text{ pF}/(\mu m)^2$ $+ A_{sidewall} \times 10^{-3} \text{ pF}/(\mu m)^2$ $= (90 \times 75 - 30 \times 55)(\mu m) \times 10^{-4} \frac{\text{pF}}{(4 \text{ m})^2}$ $+ \frac{\pi}{2} (60 + 110) (3)(\mu m)^2 \times 10^{-3} \frac{(\mu m)^2}{(4 \text{ m})^2}$ = 0.51 + 0.8 = 1.31 pF

(3) $C_{\mu} = C_{epi-sidehall} + C_{bottom}$ $= \frac{\pi}{2} (40 \times 2 + 125 \times 2) \times (17) (\mu m)^{2} \times 10^{-4} pF$ $+ (140 \times 125) (\mu m)^{2} \times 10^{-4} PF$ $(\mu m)^{2}$ = 1.4 + 1.75 = 3.15 pF

(4) $T_F = \frac{W_B^2}{2D_P} = \frac{\left[(14 \text{ Hm}) (10^4 \text{ cm/Hm}) \right]^2}{2 \times 10 \text{ cm}^2/\text{sec}}$ = 98 nsec

For an npn transistor $Q_{B} = \frac{q A \overline{D}_{n} n_{i}^{2}}{I_{c}} exp\left(\frac{V_{BE}}{V_{r}}\right)$ $= \frac{(1.6 \times 10^{19})(10^{-4} n_{i}^{2})(13)(2 \times 10)}{10^{-5}} e^{\frac{4.80}{26}}$ $= 4.3 \times 10^{11} \text{ atoms/cm}^{2}$ $R_{B} = \left[9.4 p_{i} Q_{B}\right]^{-1}$ $= \left[1.6 \times 10^{19} \times 150 \text{ cm}^{2} \times 4.3 \times 10^{11}\right]^{-1}$ $= 97 \text{ k}\Omega_{B}$

In order to contain $4.3 \times 10^{11} \frac{\text{atoms}}{\text{cm}^2}$ of the n-type epi-impurity, the width of the collector depletion layer at punch-thru is, $W_0 = \frac{4.3 \times 10^{11} \text{ atoms/cm}^2}{10^{15} \text{ cm}^{-3}}$

$$= 4.3 \times 10^{-4} \text{ cm} = 4.3 \text{ Am}$$

Using (1-15) and assuming that $N_A >> N_D$,

$$W_{D} = \sqrt{\frac{2 \varepsilon (\Psi_{0} + \Psi_{R})}{q N_{D}}} = 4.3 \text{ A/m}$$

$$= \sqrt{\frac{2 \times 1.04 \times 10^{-12} \times (0.55 + V_{R})}{1.6 \times 10^{-17} \times 10^{15}}}$$

.. VR = 13.7 V

For $V_{BE} = 560 \text{ mV}$, same expressions give, $Q_B = 9.4 \times 10^{12} \text{ atoms/cm}^2$ $R_{\Box} = 4.43 \text{ k}\Omega/_{\Box}$ $W_0 = 94 \text{ Mm}$ $V_0 = 6,796 \text{ V}$

From (1.157), $I_{D} = \frac{M_{n}C_{ox}}{2} \frac{W}{L} (V_{GS}^{-}V_{+})^{2}$ $100 MA = \frac{M_{n}C_{ox}}{2} \frac{W}{L} (1.5 - V_{+})^{2} \rightarrow (1)$ $10 MA = \frac{M_{n}C_{ox}}{2} \frac{W}{L} (0.8 - V_{+})^{2} \rightarrow (2)$

Divide (1) by (2) and solve for V_{+} gives $V_{+} = 0.48V$.

substituting for vt in (1) gives,

$$4n \cos \frac{W}{L} = 191 4A/V$$

$$V_{t} = \phi_{MS} + 2\phi_{f} + \frac{Q_{b}}{C_{OX}} - \frac{Q_{SS}}{C_{OX}}, (2.27)$$

(i) For unimplanted transistors, From Table 2.1, $\phi_{MS} = -0.1V$

From (2.28),

$$\Phi_f = \frac{KT}{9} \ln \frac{N_A}{n_i} = 0.026 \ln \frac{10^{16}}{1.45 \times 10^{10}}$$

$$= 0.35.$$

From (2.30),

$$\frac{Q_{55}}{C_{0x}} = \frac{1.6 \times 10^{-19} \times 10^{11}}{8.6 \times 10^{-8}} = 0.19 \text{ V}$$

From (1.137),

$$Q_{bo} = \sqrt{29} N_{A} \varepsilon \cdot 2\Phi_{f}$$

$$= \left[2 \times 1.6 \times 10^{-19} \times 10^{16} \times 11.6 \times 8.86 \times 10^{14} \times 2 \times 0.35 \right]^{\frac{1}{2}} = 4.8 \times 10^{-8} \frac{\text{coulombs}}{\text{cm}^{2}}$$

$$V_{t} = -0.1 - 2 \times 0.35 - 4.8 \times 10^{-8} - 0.19$$

$$= -1.55$$

(ii) For implanted transistors, $N_A = 1 \times 10^{16} - 0.9 \times 10^{16} = 10^{15} \text{ cm}^{-3}$

From Fig.(2.29), the depletion layer width corresponding to a doping level of 10¹⁵cm⁻³ is ~1 Mm, while the implant depth is only 0.3 Mm

$$\frac{1.09 \times 10^{16} \times 0.3 \times 10^{4} \times 1.6 \times 10^{19}}{8.6 \times 10^{-8}}$$
= -1.05

The metallurgical channel length is $L = L_{drawn} - 2L_{d} = 7 \mu m - 2(0.3) = 6.4 \mu m$

The effective channel length is L minus the width of the depletion region at the drain. In the active region, the voltage at the drain end of the channel is = $V_{GS} - V_t = V_{OV}$ To calculate V_{OV} , assume at first that $L_{eff} = L$. Then from (1.166)

$$V_{OV} = \sqrt{\frac{2I_D}{k' \, W_L}} = \sqrt{\frac{2(10 \, \text{MA})}{700 \, \frac{\text{cm}^2}{\text{V.S}} \cdot 0.86 \, \frac{\text{ff}}{\text{M}^2} \left(\frac{100}{6.4}\right)}}$$
$$= 0.15 \, \text{V}$$

Thus, the voltage across the drain depletion region = 5-0.15 = 4.85 V To estimate the depletion-region width, assume it is a one-sided step junction that mainly exists in the lightly doped side since the channel and the drain are both n-type regions, the built in potential of the junction is near zero. Using (1.14) and assuming ND >> NA,

$$X_{d} = \sqrt{\frac{2 \, \mathcal{E} \, (\, \forall \, Ds - \forall \, ov)}{q \, N_{A}}} = \sqrt{\frac{2 \, (\, 1 \cdot 04 \times 10^{-12}) \, (\, 5 - 0.15)}{1 \cdot 6 \times 10^{-19} \, (\, 2 \times 10^{16} + 10^{15})}}$$

Therefore, since
$$t_0 = \frac{1}{\pi I_D} = \frac{\text{Leff}}{\text{d} x_d} \frac{dx_d}{dv_{DS}}$$

$$\Rightarrow v_0 = 5 \text{ M.n.} = \frac{5.85 \text{ Hm}}{10 \text{ MA}} / \frac{dx_d}{dv_{DS}}$$

So, $\frac{dX_0}{dV_{DS}} = 0.12 \frac{\mu m}{V}$. Since, the $\frac{dV_{DS}}{dV_{DS}}$ other device uses the same technology, $\frac{dX_0}{dV_{DS}}$ is unchanged But, should calculate Vov for 2^{nd} transistor,

$$V_{OV} = \sqrt{\frac{2I}{x'W}} = \sqrt{\frac{2(30)}{(60.2)}} = 0.48 \text{ V}$$

$$SO, X_{d} = \sqrt{\frac{2(1.04 \times 10^{-12})(5-0.48)}{1.6 \times 10^{-17}(2.1 \times 10^{-16})}}$$

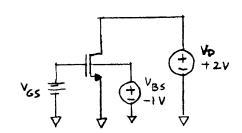

$$= 0.53 \text{ Am}$$

Leff = 12 - 2(0.3) - 0.53) = 10.87 4m

$$r_0 = \frac{\text{Leff}}{I_D} / \frac{dX_d}{dV_{DS}} = \frac{10.87 \text{ Mm}}{30.4A} / 0.12$$

Note that using the same Vovas for the 1st transistor (0.15v) gives an answer of 3.1 Ms. (The change hardly matters)

2.15

First to estimate X_d and Leff Leff = $L_{drawn} - 2L_d - X_d \rightarrow (1)$

$$X_{d} = \sqrt{\frac{2 \epsilon_{si} (V_{Ds} - V_{OV})}{q (N_{A} + N_{i})}} \longrightarrow (2)$$

$$I_{D} = \frac{MnC_{ox}}{2} \frac{W}{L_{eff}} \left(V_{65} - V_{t}\right)^{2} \longrightarrow (3)$$

Leff, Xq and Vov= (VGs-Vt) can be

found by solving (1), (2), (3).

To avoid solving non-linear equations, the following procedure is used: find Xd by substituting Ldrawn-2Ld for Leff in (3) and use the result in (2).

From (3),

$$V_{GS}-V_{t} = \sqrt{\frac{2I_{D}}{M_{n}Cox}} \frac{2I_{D}}{M_{n}Cox} \frac{2I_{D}}{M_{c}Cox} \frac{2\times 20MA}{450 \frac{cm^{2}}{V.sec} \frac{4.32}{(4m)^{2}} \left(\frac{10Mm}{14m-2(0.09Mm)}\right)}$$

$$= 0.130 \text{ V}$$

From (2),

$$x_d = \sqrt{\frac{2 \times 11.6 \times 8.86 \times 10^{-14} (2-0.13)}{1.6 \times 10^{-14} (5 \times 10^{15} + 4 \times 10^{16})}}$$

$$= 0.231 \text{ ym}$$

From (1),

(a)
$$g_{m} = \sqrt{2 \, K' \frac{W}{L_{eff}}} \, I_{D}$$

$$= \sqrt{2 \times 194 \frac{MA}{V^{2}} \times \frac{10}{0.589}} \times 20 \, MA$$

$$= 363 \, MA/V$$

(b) From (1.200),
$$g_{mb} = \frac{\chi g_m}{2\sqrt{2\phi_f + V_{SB}}} = \chi g_m$$

where $\chi = \sqrt{\frac{2q E_{S_1} N_T}{C_{OX}}} = from(1.141)$

N_T is the effective dopant density at the bottom of the channel-substrate depletion layer, it can be

cither NA (substrate doping) or NA + Ni . To determine which one applies, we have to find $\chi'_{d max}$, i.e., the depletion depth under the channel,

$$x'_{d \text{ max}} = \sqrt{\frac{2 \epsilon_{si} (2 | \Phi_p| + V_{sB})}{9 (N_a + N_i)}}$$

But,

$$\phi_{p} = \frac{KT}{9} \ln \frac{N_A + N_i}{n_i}$$
= 0.026 \text{ ln } \frac{4 \times 10^{16} + 5 \times 10^{15}}{1.45 \times 10^{10}} = 0.389

$$x'_{d} = \frac{2 \times 11.6 \times 8.86 \times 10^{-14} (2 \times 0.389 + 1)}{1.6 \times 10^{-19} (4 \times 10^{14} + 5 \times 10^{15})}$$

$$= 0.225 \, \mu m$$

> 0.16 ym (effective implant depth)

since $\chi'_{d max} > \chi_i$, the depletion capacitor is the series combination of the capacitors as shown,

$$\begin{array}{c|c}
 & \stackrel{c}{=} \stackrel{c_{j_1}}{=} \stackrel{\chi_i}{=} \stackrel$$

Now X can be calculated from the following relationships,

The actual depletion depth is

$$x_{d_{max}} = \left[\frac{2 \epsilon_{si}}{q N_A} (\phi_f + |\phi_p| + v_{sB} - x_i^2 \frac{N_i}{N_A})^{1/2}\right]$$

(cf. Muller and kamins : Device Electronics for Integrated circuits, 2nd ed., 1986; equation (10.6.2))

$$\phi_f = \frac{KT}{2} \ln \frac{N_A}{R_i} = 0.026 \ln \frac{5 \times 10^5}{1.45 \times 10^{10}} = 0.33 V$$

$$X_{d_{\text{max}}} = \frac{2 \times 11.6 \times 6.86 \times 10^{-4} (0.33 + 0.389 + 1)}{1.6 \times 10^{-19} \times 5 \times 10^{15}}$$

$$-\frac{(0.16 \times 10^{-4} \text{cm})^{2} (4 \times 10^{16})}{5 \times 10^{15}} \right]^{\frac{1}{2}}$$

= 0.453 Am

$$C_{jl} = \frac{11.6 \times 8.86 \times 10^{-14}}{0.16 \times 10^{-4}} = 6.42 \times 10^{-8} \text{ f/cm}^2$$

$$C_{j2} = \frac{11.6 \times 8.86 \times 10^{-14}}{(0.453 - 0.16) \times 10^{-4}} = 3.51 \times 10^{-8} F/cm^2$$

$$\chi = \frac{2.27 \times 10^{-8}}{4.32 \times 10^{-7}} = 0.0526$$

$$g_{mb} = \chi g_m = 0.0526 \times 363 \times 10^{-6} = 19.1 \frac{44}{V}$$

From (2.37),

$$V_{OV} = \sqrt{\frac{2I_D}{X'(W/Leff)}} = \sqrt{\frac{2 \times 20 \text{ 4A}}{194 \text{ MA/v}^2(10M/0.5894)}}$$

= 0.110 V

$$\chi_{d} = \sqrt{\frac{2 \epsilon_{si} (V_{DS} - V_{ov})}{q(N_A + N_i)}}$$

$$\frac{d X_d}{d V_{DS}} = \frac{X_d}{2(V_{DS} - V_{DW})} = \frac{0.231 \, \text{Am}}{2(2 - 0.11)} = 0.061 \, \text{Am}_V$$

$$\int_{0}^{\infty} = \left(\frac{I_{D}}{L_{eff}} \frac{dX_{d}}{dV_{DS}}\right)^{-1} = \left(\frac{20 \text{ MA}}{0.589 \text{ Mm}} \times 0.061 \text{ Mm/V}\right)^{-1}$$

$$= 482.78 \text{ K}\Omega$$

(d)
$$C_{gs} = \frac{2}{3} W L_{eff} C_{ox} + C_{oL}$$

= $\frac{2}{3} \times 10 \times 0.589 \times 4.32 \times 10^{-15}$
+ $0.35 \times 10^{-15} \times 10$

= 20.5 fF

(e)
$$C_{gd} = C_{OL} = 0.35 \times 10^{-15} \times 10 = 3.5 \text{ fF}$$

(f)
$$C_{db} = C_{jo} \times (drain area) + C_{jswo} \times Periphery$$

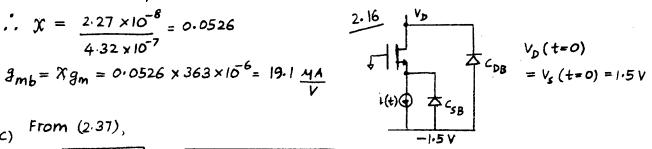

$$\sqrt{1 + V_{DB}/4},$$

$$= 0.2 \times 10 \times 1 + 1.2 (10 + 1 \times 2) \quad \text{fF}$$

$$\sqrt{1 + (3/6.7)}$$

(g) C_{sb} = C_{jo} × (source area) + C_j's wo × periphery

$$\sqrt{\frac{1+\sqrt{58}/\phi_0}{\sqrt{1+(\frac{1}{07})}}} = \frac{0.2 \times 10 \times 1 + 1.2(10 + 1 \times 2)}{\sqrt{1+(\frac{1}{07})}} fF$$
= 10.5 fF

(i) Initially transistor is off, current source discharges COL+ CSB. The rate of voltage change is,

(ii) Transistor enters saturation region; drain current starts to flow, discharges Col+CDB and $\frac{2}{3}$ Cox WL + Col + Csb. The discharge rate of drain voltage is

$$\frac{V}{t} = \frac{10 \text{ MA}}{C_{OL} + C_{DB}}$$

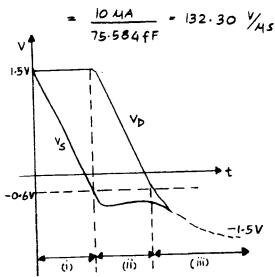

$$= \frac{10 \text{ MA}}{0.35 \frac{\text{ff}}{\text{M}} \times 10 \text{ Mm} + 0.2 \frac{\text{ff}}{\text{f}} \times 10 \text{ Mm} \times (1 \text{ Mm} + 0.09 \text{ Mm})}{4 \text{ Mm}} + 1.2 \frac{\text{ff}}{\text{Mm}} (12 \text{ Mm})$$

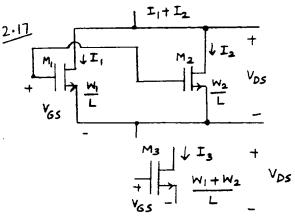

$$= 500 \text{ V/H} < \frac{10 \text{ MA}}{\text{Mm}}$$

(iii) Transistor enters triode region,

current discharges $C_{ox}WL + C_{DB} + C_{SB}$ + 2 C_{OL} at a rate of,

$$\frac{V}{t} \stackrel{=}{=} \frac{10.4A}{\left\{4.32(10)(1-2(0.09))+0.2(10)(1+0.09)2\right.} + 1.2(12)2+0.35(2)(10)\left.\right\}}$$
= overlaps

Note that all the transistors have equal terminal voltages. So,

$$V_{6S_1} = V_{6S_2} = V_{6S_3} = V_{6S}$$

$$V_{DS_1} = V_{DS_2} = V_{DS_3} = V_{DS}$$

$$V_{5B_1} = V_{5B_2} = V_{5B_3} = V_{5B}$$

If $V_{SB} \neq 0$, there is a body effect but $V_{t_1} = V_{t_2} = V_{t_3} = V_t$

case 1: All active

$$I_{1} = \frac{K'}{2} \frac{W_{1}}{L} (V_{GS} - V_{t})^{2} (1 + \lambda V_{DS})$$

$$I_{2} = \frac{K'}{2} \frac{W_{2}}{L} (V_{GS} - V_{t})^{2} (1 + \lambda V_{DS})$$

$$I_{1} + I_{2} = \frac{K'}{2} \left(\frac{W_{1} + W_{2}}{L} \right) \left(V_{GS} - V_{t} \right)^{2} (1 + \lambda V_{DS})$$

$$I_{3} = \frac{K'}{2} \left(\frac{W_{1} + W_{2}}{L} \right) \left(V_{GS} - V_{t} \right)^{2} (1 + \lambda V_{DS})$$

$$= I_{1} + I_{2}$$

case 2 : All triode

$$I_{1} = \frac{x'}{2} \frac{W_{1}}{L} \left[2(V_{GS} - V_{t}) V_{DS} - V_{DS}^{2} \right]$$

$$I_{2} = \frac{x'}{2} \frac{W_{2}}{L} \left[2(V_{GS} - V_{t}) V_{DS} - V_{DS}^{2} \right]$$

$$I_{1} + I_{2} = \frac{x'}{2} \left(\frac{W_{1}}{L} + \frac{W_{2}}{L} \right) \left[2(V_{GS} - V_{t}) V_{DS} - V_{DS}^{2} \right]$$

$$I_{3} = \frac{x'}{2} \left(\frac{W_{1} + W_{2}}{L} \right) \left[2(V_{GS} - V_{t}) V_{DS} - V_{DS}^{2} \right]$$

$$= I_{1} + I_{2}$$

Mz can operate in active or triode region. M, always operates in triode region

$$I_1 = \frac{x'}{2} \left(\frac{W}{L} \right)_1 \left[2 \left(V_{65} - V_{t} \right) V_{D5_1} - V_{D5_1}^2 \right] = I_2$$

Solve for V_{D5_1} ,

$$V_{DS_{1}}^{2} - 2(V_{6S} - V_{t})V_{DS_{1}} + \frac{2I_{2}}{x'(\frac{W}{L})_{1}} = 0$$

$$V_{DS_{1}} = 2(V_{6S} - V_{t}) + \sqrt{4(V_{6S} - V_{t})^{2} - 4\frac{2I_{2}}{x'(\frac{W}{L})_{1}}}$$

$$\frac{2}{2}$$

 V_{DS_1} must be $< V_{GS} - V_{t}$ or M_1 would be in active region.

$$V_{DS_1} = V_{GS} - V_t - \sqrt{(V_{GS} - V_t)^2 - \frac{2I_2}{x'(\frac{W}{t})_1}}$$

Assume Mz is active,

$$I_{2} = \frac{x'}{2} \left(\frac{W}{L} \right)_{2} \left(V_{GS} - V_{DS_{1}} - V_{t} \right)^{2}$$

$$= \frac{x'}{2} \left(\frac{W}{L} \right)_{2} \left[V_{GS} - V_{t} - \left(V_{GS} - V_{t} \right) + \sqrt{\left(V_{GS} - V_{t} \right)^{2} - \frac{2 I_{2}}{x' \left(\frac{W}{L} \right)_{1}}} \right]^{2}$$

$$= \frac{x'}{2} \left(\frac{W}{L} \right)_{2} \left(V_{GS} - V_{t} \right)^{2} - \left(\frac{W}{L} \right)_{2} \frac{I_{2}}{\left(\frac{W}{L} \right)_{1}}$$

$$I_{2} \left(1 + \left(\frac{W}{L} \right)_{2} / \left(\frac{W}{L} \right)_{1} \right) = \frac{x'}{2} \left(\frac{W}{L} \right)_{2} \left(V_{GS} - V_{t} \right)^{2}$$

$$I_{2} = \left[\frac{x'}{2} \left(\frac{W}{L} \right)_{2} / 1 + \left(\frac{W}{L} \right)_{2} / \left(\frac{W}{L} \right)_{1} \right] \left(V_{GS} - V_{t} \right)^{2}$$

$$= \frac{x'}{2} \left(\frac{W}{L_{1} + L_{2}} \right) \left(V_{GS} - V_{t} \right)^{2}$$

If
$$M_2$$
 and M_3 are active,

$$I_3 = \frac{\chi'}{2} \left(\frac{W}{L_1 + L_2} \right) \left(V_{GS} - V_t \right)^2 = I_2$$

Assume M_2 is in thode region,

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[2 \left(V_{GS} - V_{DS_1} - V_t \right) \left(V_{DS} - V_{DS_1} \right) - \left(V_{DS} - V_{DS_1} \right)^2 \right]$$

$$V_{DS_1} = V_{GS} - V_t - \sqrt{\left(V_{GS} - V_t \right)^2 - \frac{2I_2}{\chi'(\frac{W}{L})_1}}$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[2 \sqrt{\left(V_{GS} - V_t \right)^2 - \frac{2I_2}{\chi'(\frac{W}{L})_1}} \right] - \left(V_{GS} - V_t \right) + \sqrt{\left(V_{GS} - V_t \right)^2 - \frac{2I_2}{\chi'(\frac{W}{L})_1}} \right]$$

Let $X = V_{DS} - \left(V_{GS} - V_t \right) - \frac{I_2}{\chi'(\frac{W}{L})_1}$

Then,

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[2 \times Y + 2 \cdot Y^2 - X^2 - 2 \times Y \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[2 \times Y + 2 \cdot Y^2 - X^2 - 2 \times Y \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right) - \frac{I_2}{\chi'(\frac{W}{L})_1} \right]$$

$$= \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right)^2 - \frac{I_2}{\chi'(\frac{W}{L})_1} \right]$$

$$V_{DS} - 2 V_{DS} \left(V_{SS} - V_t \right) + \left(V_{SS} - V_t \right)^2$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right)^2 - \frac{I_2}{\chi'(\frac{W}{L})_1} \right]$$

$$V_{DS} - 2 V_{DS} \left(V_{SS} - V_t \right) + \left(V_{SS} - V_t \right)^2$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right)^2 - \frac{I_2}{\chi'(\frac{W}{L})_1} \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right)^2 - \frac{I_2}{\chi'(\frac{W}{L})_1} \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right) - \left(V_t \right)^2 \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right) - \left(V_t \right)^2 \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right) - \left(V_t \right)^2 \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_2 \left[\left(V_{GS} - V_t \right) - \left(V_t \right)^2 \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_1 \left[\left(V_{GS} - V_t \right) - \left(V_t \right)^2 \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_1 \left[\left(V_{GS} - V_t \right) - \left(V_t \right)_2 \left(V_t \right)_2 \left(V_t \right) \right]$$

$$I_2 = \frac{\chi'}{2} \left(\frac{W}{L} \right)_1 \left[\left(V_t \right)_1 \left(V_t \right)_2 \left(V_$$

(a) curve B;

(i) The cost of a 40,000 mil chip is

$$C = \frac{C_W}{(NY_{HS})Y_{df}Y_{ft}} = \frac{100}{(47)(10.9)(0.8)} + \frac{0.6}{0.8}$$

$$= 3.71$$

NYws = 47 is obtained from fig. (2.70)

(ii) The cost of two 20,000 mil² chips is,

$$C_{Y_2} = \frac{100}{(200)(0.9)(10.8)} + \frac{0.6}{0.8} = 1.44$$

$$C_{total} = C_{1/2} \times 2 = 2.88$$

.. Putting the system on two chips is more economical

(b) curve A ;

(i) For a 40,000 mil²chip,

$$C = \frac{100}{(115)(0.9)(0.8)} + \frac{0.6}{0.8} = 1.1$$

 $C_{\text{total}} = 1.1 \times 2 = 2.2$

.. one chip is more economical.

(c) <u>curve</u> c:

i) for a 40,000 mil chip,

$$C = \frac{100}{12(0.9)(0.8)} + \frac{0.6}{0.8} = 12.3$$

(ii) For two 20,000 mil chips,

$$C_{1/2} = \frac{100}{(80)(0.9)(0.8)} + \frac{0.6}{0.8} = 2.49$$

.. using two chips is more economical

 $\frac{2.20}{\text{Area} = (150 \text{ mils})^2 = 22,500 \text{ mil}^2}$

(a) curve A,

$$C = \frac{C_W}{(N Y_{WS})(Y_{df})(Y_{ft})} + \frac{C_P}{Y_{ft}}$$

$$= \frac{130}{(360)(0.8)(0.8)} + \frac{0.4}{0.8} = 1.06$$

 $NY_{HS} = 360$ is obtained from Fig.(2.70)

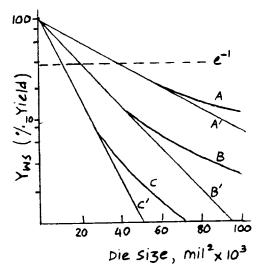

(b) curve B,

$$C = \frac{130}{(140)(0.8)(0.8)} + \frac{0.4}{0.8} = 1.95$$

(c) curvec,

$$C = \frac{130}{(60)(0.8)(0.8)} + \frac{0.4}{0.8} = 3.89$$

2.21
(a) When $Y_{WS} = e^{-1} = 0.37$ From Curve A, $A_0 = 36,000 \text{ mil}^2$ Curve B, $A_0 = 20,000 \text{ mil}^2$ curve C, $A_0 = 11,000 \text{ mil}^2$

curves A', B' and c' are predicted by the equation.

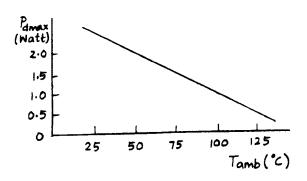

(b) In fig (2.69), gross die/wafer is inversely proportional to the die size, i.e., N. KA-1, K is the proportionality constant related to the wafer size (more specifically, K is the effective or usable area on the wafer). By (2.56), the cost per unit silicon area is,

$$\frac{C}{A} = \frac{C_W}{ANY_{WS}Y_{df}Y_{ft}} + \frac{C_P}{AY_{ft}}$$

$$= \frac{C_W}{K e^{-\Lambda/\Lambda_0}Y_{df}Y_{ft}} + \frac{C_P}{AY_{ft}}$$

Each K can be obtained from fig (2.69). e.g. K= 1.15 × 105 mil for 4' water.

2.22 the total thermal resistance is 50°C/watt

3.1

$$20 \text{K} \Omega$$
 $4 250 \text{ 4A}$ (from fig (2.30))

 $R_{IN} = Y_{\pi} = \frac{B}{g_{m}}$
 $= 100 \text{ f.x} \times 200$
 $= 20.8 \text{ k} \Omega$
 $G_{m} = g_{m} = \frac{I_{c}}{V_{T}} = \frac{1}{104} \frac{A}{V_{V}}$
 $R_{o} = R_{c} \parallel Y_{o} = 200 \text{ k} \parallel \frac{1}{19m}$
 $= 20 \text{ k} \parallel \frac{104 \Omega}{2 \times 10^{4}} = 20 \text{ k} \parallel 520 \text{ k}$
 $= 19.3 \text{ k} \Omega$

3.2

Now, when

$$I_{c} \rightarrow \infty$$

$$A_{v} = \left(\frac{\gamma_{m}}{R_{s} + r_{m}}\right) g_{m} \left(\gamma_{o} \parallel R_{c}\right)$$

$$= \frac{\beta \left(\gamma_{o} \parallel R_{c}\right)}{r_{s} + \gamma_{m}} = \beta \left(\frac{\gamma_{A}}{I_{c}} \parallel R_{c}\right)$$

$$I_{c} \rightarrow \infty$$

$$A_{v} \rightarrow 0 \text{ because } R_{c} \rightarrow 0$$

$$I_{c} \rightarrow 0$$

$$A_{v} \rightarrow 0 \text{ because } g_{m} \rightarrow 0$$

$$A_{v} = \beta \left(\frac{\frac{V_{A}}{I_{c}} R_{c}}{\frac{V_{A}}{I_{c}} + R_{c}} \right) \left(\frac{1}{R_{s} + \frac{\beta V_{T}}{I_{c}}} \right)$$

$$= \beta \left(\frac{I_{c} R_{c}}{1 + \frac{I_{c} R_{c}}{V_{A}}} \right) \left(\frac{1}{R_{s} I_{c} + \beta V_{T}} \right)$$

$$\therefore A_{v} = \beta \left[\frac{\left(\frac{I_{c} R_{c}}{\beta V_{T}} \right)}{\left(1 + \frac{I_{c} R_{c}}{V_{A}} \right) \left(1 + \frac{R_{s} I_{c}}{\beta V_{T}} \right)} \right]$$

$$\frac{\partial A_{V}}{\partial I_{c}} = 0$$

$$\frac{\partial I_{c}}{\partial I_{c}} = 0$$

$$\frac{1}{|I - \frac{I_{c}R_{c}}{V_{A}}|} = 0$$

$$1 - \frac{A \times I_{c}}{|I + A_{c}|} = 0$$

$$1 - \frac{A \times I_{c}}{|I + A_{c}|} = 0$$

$$1 - \frac{A \times I_{c}}{|I + A_{c}|} = 0$$

$$1 - \frac{A \times I_{c}}{|I + A_{c}|} = 0$$

$$1 - \frac{A \times I_{c}}{|I + A_{c}|} = 0$$

$$1 - \frac{A \times I_{c}}{|I + A_{c}|} = 0$$

$$1 - \frac{A \times I_{c}}{|I + A_{c}|} = 0$$

$$1 - \frac{I_{c}R_{c}}{|I + A_{c}|} = 0$$

$$R_{S} = 50 \text{ K.s.}, R_{C} = 50 \text{ K.s.}, \beta = 200$$

$$V_{A} = 120 \text{ V}$$

$$I_{COPT.} = \sqrt{\frac{120 \text{ V}}{50 \text{ K.s.}}} \left(\frac{26 \text{ mV} \times 200}{50 \text{ K.s.}} \right) = 0.5 \text{ mA}$$

$$A_{VOPT.} = (200) \times' \left[\frac{1}{(1 + \frac{1}{x'})(1 + x')} \right] \times \frac{50 \text{ K}}{50 \text{ K}}$$

$$\text{Where, } \chi' = \sqrt{\frac{\text{VA}}{\beta \text{V}_{T}}} \left(\frac{R_{S}}{R_{C}} \right) = 4.8$$

$$\therefore A_{TC} = 200 \times 4.8 \times 1$$

$$A_{v_{OPT}} = 200 \times 4.8 \times \left[\frac{1}{\left(1 + \frac{1}{4.8}\right) \left(1 + 4.8\right)} \right]$$

$$= 137$$

DC voltage on RC = 0.5 x 50 = 25 V

 $V_{O} = V_{DD} - R_{D} \frac{MC_{OX}}{2} \frac{W}{L} (V_{GS} - V_{t})^{2}$ Triode edge $V_{DS} = V_{GS} - V_{t} = V_{O}$ $V_{DS} = V_{DD} - R_{D} \frac{MC_{OX}}{2} \frac{W}{L} V_{DS}^{2}$ $V_{DS} = 3 - \frac{5K}{2} (200M) (10) V_{DS}^{2}$ $5V_{DS}^{2} + V_{DS} - 3 = 0$ $V_{DS} = -\frac{1 + \sqrt{61}}{10} = 0.0681 V = V_{O}$ $0.681 V = V_{GS} - V_{t} = V_{t} - V_{t}$ $0.681 = V_{t} - 0.6$ $1.281 = V_{t}$ $S.S. \frac{V_{O}}{V_{t}} = -g_{m}R_{D} = -6.81$ V_{t}^{2} $g_{m} = \frac{K'}{W} \frac{W}{L} (V_{GS} - V_{t})^{2} = 200M (10)(0.681)$ $= 1.36 \frac{MA}{V_{t}}$

unity gain gmRD=1,

$$g_{m} = \frac{1}{R_{D}} = \frac{1}{5k} = 200H(10)(V_{65} - V_{t})$$

$$0.1 = V_{65} - V_{t}$$

$$0.1 + 0.6 = 0.7 V = V_{t}$$

$$I_{D} = \frac{200H(10)(0.1)^{2}}{2} = 10 \text{ MA}$$

$$V_{0} = 3 - 10 \text{ MA}(5k\Omega) = 2.95 V$$

In active region:

$$g_{m} = k' \frac{W}{L} (V_{GS} - V_{t})$$

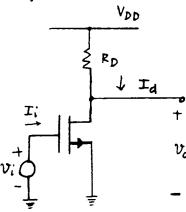

$$g_{m} = \sqrt{2 k' \frac{W}{L} I_{D}}$$

get maximum gm at max. In just be fore In gets large enough to bring mosfet in linear region.

In linear region:

 $g_m = \frac{k' w}{L}$ (VDS) which decreases as ID increases SO, the maximum g_m occurs at the edge between active and linear regions.

$$\frac{V_0}{V_i} = -6.81 = \text{maximum gain}$$

3.6

Driven by current source:

$$\frac{\partial e}{\partial x} = \frac{\partial x}{r_0 + r_e}$$

$$= \frac{\partial x}{r_0 + r_e} - \frac{\partial x}{\partial r_0 + r_e}$$

$$= \frac{\partial x}{r_0 + r_e} - \frac{\partial x}{r_0 + r_e}$$

$$\frac{\partial x}{\partial x} = \frac{1}{R_0} = \frac{1 - \partial x}{r_0 + r_e}$$

$$\frac{\partial x}{\partial x} = \frac{1}{R_0} = \frac{1 - \partial x}{r_0 + r_e}$$

$$\frac{\partial x}{\partial x} = \frac{1}{R_0} = \frac{1 - \partial x}{r_0 + r_e}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \partial x}{r_0 + r_e}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \partial x}{1 + \beta_F}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

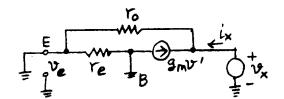

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

$$\frac{\partial x}{\partial x} = \frac{1 - \beta_F}{1 + \beta_F}$$

Now, 5 >> 1 and $\beta_{\epsilon} \gg 1$, so

$$\frac{V_r}{i_r} = R_0 = B_F R_0$$

For common-base driven from voltage source:

this zero, since emitter shorted to ground for small signals.

Thus,
$$\frac{v_x}{i} = R_0 = r_0$$

Thus, we get much higher ro when the CB stage is driven from a high source resistance.

$$\frac{3.7}{+} \frac{1}{v_i} \frac{1}{v_o} = 10 \text{ kg.}$$

From (3.54) - (without RL and gmb)

$$R_{i} = \frac{r_{0} + R_{D}}{1 + g_{m}r_{0}}$$

$$r_{0} = \frac{1}{\pi I_{D}} = \frac{1}{(0.01)(1004)} = 1M\Omega$$

$$g_{m} = \sqrt{2 \, \chi'(\frac{W}{L}) \, I_{D}} = \sqrt{2 (200) (100) 100}$$

$$R_{i} = \frac{|M\Omega + 10 K\Omega|}{2000} \approx \frac{|M\Omega|}{2000} = \frac{1}{g_{m}} = 500\Omega$$

$$\frac{100 4A}{V_{i}} \approx \frac{1}{V_{o}} = \frac{1}{g_{m}} = \frac{1}{2} = \frac{1}{2}$$

$$R_i = r_{\pi} + R_L (1+\beta)$$

= 200 × 26 \(\darksquare + 500 \times 201 \(\darksquare \dark

$$R_0 = \left(\frac{R_S}{1+\beta} + \frac{1}{g_m}\right) \parallel R_L$$

$$=\left(\frac{5k}{201}+26\right)||500$$

Voltage gain =
$$\frac{1}{1 + \frac{R_S + Y_{\Pi}}{(1+\beta)R_L}}$$

$$= \frac{1}{1 + \frac{5 \cdot 0K + 5 \cdot 2K}{(201)(500)}}$$

B vt affects vo and vice-versa, solve iteratively,

$$V_{t} = V_{to} + Y \left(\sqrt{2 \phi_{F}} + V_{SB} - \sqrt{2 \phi_{F}} \right)$$

$$Y = \sqrt{2 q_{E} N_{A}}$$

$$C_{ox}'$$

$$\Rightarrow Y = \sqrt{2 (1.6 \times 10^{-19}) (11.7 \times 8.854 \times 10^{-14}) (2 \times 10^{15})}$$

$$1.38 \times 10^{-7}$$

$$= 0.19 \sqrt{V}$$

$$V_{SB} = V_{o} - (use ans. from (a) to start)$$

$$\Phi_{F} = V_{T} \ln \frac{N_{A}}{N_{i}} = (26 \text{mV}) \ln \frac{2 \times 10^{15}}{1.5 \times 10^{10}} \approx 0$$

= 0.84V

So,
$$V_0 = 3 - 0.84 - 0.6 = 1.49$$

(Try again)
 $V_t = 0.7 + 0.19 \left[\int 0.6 + 1.63 - \int 0.6 \right]$
= 0.83
(Not much change)
So, $V_0 = 3 - 0.83 - 0.67 = 1.5 \text{ V}$

$$\frac{V_0}{V_1} = \frac{g_m}{g_m + g_{mb}} = \frac{1}{1 + x}$$

$$x = \frac{0.19}{2\sqrt{0.6 + 1.5}} \approx 0.07$$

$$\Rightarrow \frac{V_0}{V_1} = \frac{1}{1 + 0.07} \approx 0.93$$

© Use Vo from(b) at first $\Rightarrow I = 2004 + \frac{1.5}{100 k} \approx 21544A$ $V_0 = 3 - 0.83 - \sqrt{\frac{2(215)}{90.10}} = 1.48 V$

(Not much change from(b) so don't bother to recalculate V_t)

To find
$$a_v = \frac{v_o}{v_i}$$
, use $a_{v'} = 0$ CVG from (b) = 0.93

$$a_{v}^{\prime} = \frac{W}{500t} \times R = 100 K$$

$$a_{v}^{\prime} = \frac{W}{500t}$$

$$a_{v}^{\prime} = \frac{W}{500t}$$

@ Use Vo from (c) at first,

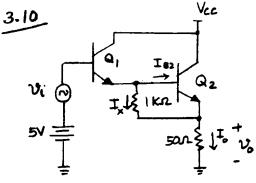

$$I = 200 + \frac{1.48}{10k} = 348 \text{ MA}$$

 $V_0 = 3 - 0.83 - \sqrt{\frac{2(348)}{90.10}} = 1.29V$
 $V_t = 0.7 + 0.19 (\sqrt{0.6 + 1.29} - \sqrt{0.6})$
 $= 0.81 \text{ V}$
 $I = 200 + \frac{1.29}{10k} = 329 \text{ MA}$
 $V_0 = 3 - 0.81 - \sqrt{\frac{2(329)}{90.10}} = 1.33 \text{ V}$
 $Q_y' = \frac{1}{1 + \chi}$; $\chi = \frac{0.19}{2(\sqrt{0.6 + 1.33})}$

Fout =
$$\frac{1}{[g_m(1+x)]}$$
; $g_m = \sqrt{2(329)} \frac{90(10)}{90(10)}$
 $= 0.77 \frac{mA}{V}$
Fout = $\frac{1}{0.77(1.07)} = 1.2 \frac{k}{V}$

$$\Rightarrow a_v = 0.93 \frac{10K}{11.2K} = 0.83$$

⇒ a, = 0.93

The DC voltage across the 50.52 resistor is,

$$V_0 = 5 - 0.7 - 0.7 = 3.6 V$$

Thus, $I_0 = \frac{3.6 V}{50.0} = 72 \text{ mA}$

The current Ix is,

$$I_X = \frac{0.7 \,\text{V}}{1 \,\text{K.s.}} = 0.7 \,\text{mA}$$

The emitter current of Q_2 is $I_{E2} = I_0 - I_v = 71.3 \text{ mA}$

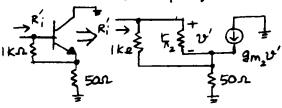

$$I_{B2} = \frac{I_{E2}}{1+B} = \frac{71.3}{201} = 0.35 \text{ mA}$$

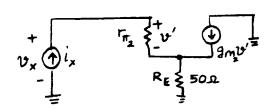

Thus, the emitter current of Q1 is

$$I_{EI} = I_{x} + I_{B2} = 0.7 + 0.35$$

= 1.05 mA

calculation of Ri:

$$V_{x} = i_{x} r_{n_{2}} + (i_{x} + g_{m_{2}} r_{n_{2}} i_{x}) R_{E}$$

$$\frac{V_{x}}{i_{x}} = r_{n_{2}} + (1 + g_{m_{2}} r_{n_{2}}) R_{E}$$

Now, the I ka resistor is connected in parallel with rn, , so define a new effective r_{π_2} ,

$$r_{\pi_{2}} = r_{\pi_{2}} || \perp k$$

$$R_{1}' = (r_{\pi_{2}} || \perp k) + [1 + g_{m_{2}}(r_{\pi_{2}} || \perp k)] R_{E}$$

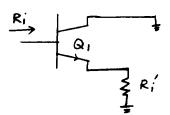

$$r_{\pi_{2}} = \frac{B}{g_{m_{2}}} = 200 \times \frac{26 \,\text{mV}}{71 \,\text{mA}} = 73 \,\Omega$$

$$r_{\pi_{2}}' = 73 \,|| \perp k = 68 \,\Omega$$

$$\therefore R_{1}' = 66 \,\Omega + [1 + (\frac{71 \,\text{mA}}{26 \,\text{mV}})(68 \,\Omega)] = 0.993$$

$$= 9.4 \,k\Omega$$

Now consider Ri

$$R_{i} = \delta_{\pi_{i}} + (1+\beta) R_{i}'$$

$$= 200 \left(\frac{26 \text{ mV}}{1.05 \text{ mA}} \right) + (201) (9.4 \text{ Kr.})$$

$$= (4.95 \text{ K} + 1.88 \text{ M}) \Omega$$

$$= 1.89 \text{ M}\Omega$$

calculation of voltage gain,

(a) gain from input to emitter of Q, (Use Eq. (3.20)

$$Av_1 = \frac{1}{1 + \frac{r_{R_1}}{(1+\beta)R_1'}}$$

$$Av_1 = \frac{1}{1 + \frac{r_{\pi_i}}{(1+\beta)R_i'}} = \frac{1}{1 + \frac{4 \cdot 9 \, \text{K}}{(201)(9 \cdot 4 \, \text{K})}}$$

= 0.997

(b) Gain from base of Q2 to output. Use Eq. (3.20), substitute gmr for Bo

$$A_{v_{2}} = \frac{1}{1 + \frac{b_{n}'}{n'}}$$

$$(1 + g_{m}''_{n})R_{L}$$

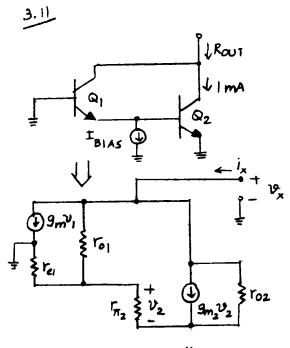

$$= \frac{1}{1 + \frac{68 \Omega}{26 m^{3}}}$$

$$= 0.993$$

voltage = 0.997 x 0.993 = 0.990 gain

 $= 108(109) 60 \text{ Kn}$
 $= 706 \text{ Mn}$
SPICE gives $R_0 = 1.15 \text{ Gn}$ for $V_0 = 1.0 \text{ V}$
The main difference between hand calculations and SPICE here stems from the fact that V_A is very small here.
As a result, V_{DS} is not negligible compared to V_A . S_0 , $V_0 = \frac{V_0 + V_{DS}}{I_D}$
for each transistor $V_{DS_1} = V_{GS_2} \approx 0.7 \text{ V}$
 $V_{DS_2} = V_0 - V_{DS_1}$
If $V_0 = 1.0 \text{ V}$, $V_{DS_2} \approx 0.3 \text{ V}$
 $V_{DS_3} = V_{GS_2} + V_{GS_3} \approx 1.4 \text{ V}$
 $V_0 = \frac{V_0 + V_{DS_1}}{I_{O1}} = \frac{6.7}{I_{O0} + 100} = 67 \text{ Kg}$
 $V_0 = \frac{6.3}{I_{O0} + 100} = 63 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$
 $V_0 = \frac{7.4}{I_{O0} + 100} = 74 \text{ Kg}$

3.16

From (3.7), $6m = -\frac{av}{z_0}$

From (3.141), av = 9mi

At low frequency . 20 = Ro

From (3.137), $R_0 = \frac{1}{g_{m_1} + g_{mb_1}} \left(\frac{1}{g_{m_2} r_{oi}} \right)$

CENTR

V(2)/VO

IMPUT RESISTANCE AT OUTPUT RESISTANCE AT V(2)

 $\therefore G_{m} \simeq \frac{\frac{g_{m_{1}}}{g_{m_{1}}+g_{mb_{1}}} = -(g_{m_{1}}r_{o_{1}})g_{m_{2}}}{\frac{1}{g_{m_{1}}+g_{mb_{1}}}\left(\frac{1}{g_{m_{2}}r_{o_{1}}}\right)}$ From (1.163), | VAP |= Left (dxd / dv.) Left = Larawn 2L4 - Xd = 0.4-2(0.09)-0-1 = 0.12 HM $|V_{AP}| = \frac{0.12}{0.00} = 3V$ From (1.194), $Y_{01} = \frac{|V_{AP}|}{|I_{D1}|} = \frac{3V}{30 \text{ kg}} = 30 \text{ kg}$: ID, = - I2 = -100 MA From (1.180), 9m1 = \(\frac{2 \k' \frac{\w_1}{1} | \ID, \) = $\sqrt{2(65)(\frac{30}{0.12})(100)} = 1800 \text{ MA/V}$ $gm_2 = \sqrt{2 \, K_n'} \, \frac{W_2}{L_2} \, Ip_2$ = $\sqrt{2(194)(\frac{10}{0.12})(100)} = 1800 \text{ MAY}$ $(I_{D_2} = I_1 - I_2 = 100 \text{ MA})$ $G_{\rm m} = -(1800 \, \frac{4A}{V} \times 30 \, \text{K}) \, 1800 \, \frac{4A}{V}$ = -(54) (1800 MA) $= -97.2 \, \underline{mA}$

VGS = 0.98 V

3.17

$$V_{CC} = I_{D_2}(IOK) + V_{BE_2} + V_{GS_2}$$
 $5 = I_{D_2}(IOK) + 0.7 + V_{GS_2}$
 $5 = \frac{200M}{2} \frac{20}{1} (V_{GS_2} - 0.6)^2 (IOK) + 0.7 + V_{GS_2}$
 $5 = 20(V_{GS_2} - 0.6)^2 + 0.7 + V_{GS_2}$
 $0 = 20 V_{GS_2}^2 - 23 V_{GS_2} + 2.9$
 $V_{GS_2} = \frac{23 \pm \sqrt{(23)^2 - 4.20(2.9)}}{40}$
 $= \frac{23 \pm 17.23}{40} = 1.006 \text{ or } \frac{0.14}{2}$

Too small for $I_{D_2} > 0$
 $I_{D_2} = \frac{200}{2} \frac{20}{1} (1.006 - 0.6)^2$
 $= 330 \text{ MA}$
 $V_{BQ_2} = 5 - I_{D_2}(IOK) = 1.7 \text{ V}$
 $V_{EQ_1} = 1.7 - 0.7 = 1.0 \text{ V}$
 $I_{RL_1} = \frac{5-1}{1 \text{ K}} = 4 \text{ mA}$
 $I_{D_1} = \frac{X'}{2} \left(\frac{W}{L}\right) (V_{GS_1} - V_t)^2 = I_{RL_1} + I_{RL_2}$

Assume the dc input is adjusted so that $I_{C_1} = I_{C_2}$. Then,

 $V_{CQ_1} = 5 - I_{C_1}(IOK) = 5 - 330M(IOK)$
 $= 1.7 \text{ V}$

So, Q₁ operates in the forward

active region,

 $I_{D_1} = \frac{200}{2} \frac{300}{1} (V_{6S_1} - 0.6)^2$

= 4 mA + 3304A = 43304A=ID,

small signal parameters:

$$g_{m}(m_{1}) = \sqrt{2(200) \frac{300}{10}(4330)}$$
 $= 22.8 \text{ mA/V}$
 $g_{m}(M_{2}) = \sqrt{2(200) \frac{20}{10}(330)}$
 $= 1.62 \frac{mA}{V} = \frac{1}{615 \Omega}$
 $g_{m}(Q_{1}) = \frac{330 \text{ MA}}{26 \text{ mV}} = \frac{1}{79 \Omega} = g_{m}(Q_{2})$
 $1 = \frac{1.7 - 0.7}{1 \text{ K}} = 1 \text{ mA}$
 $g_{m}(Q_{3}) = \frac{1 \text{ mA}}{1 \text{ K}} = \frac{1}{26 \text{ mV}} = \frac{1}{26 \Omega}$
 $g_{m}(Q_{3}) = \frac{1 \text{ mA}}{26 \Omega} = \frac{1}{2.6 \Omega}$
 $g_{m}(Q_{3}) = \frac{1}{100} = \frac{100}{2.6 \Omega} = 2.6 \text{ K}\Omega$
 $g_{m}(Q_{3}) = \frac{1}{100} = \frac{100}{2.6 \Omega} = 2.6 \text{ K}\Omega$
 $g_{m}(Q_{3}) = \frac{1}{100} = \frac{100}{2.6 \Omega} = 2.6 \text{ K}\Omega$
 $g_{m}(Q_{3}) = \frac{1}{100} = \frac{1}{26 \Omega} = \frac{1}{2.6 \Omega} = \frac{1}{2.6$

then the small-signal collector current of
$$Q_1 = -g_m(M_1)V_1\frac{R_{L_1}}{R_{L_1}+R_{i_1}}\left(\frac{B}{B+1}\right)$$

The resistance to small-signal ground at the collector of Q_1

$$= R_{L_2} \parallel (r_{\pi_3} + (B+1)R_{L_3})$$

The gain of emitter follower Q_3

$$= g_m(Q_3)R_{L_3}$$

$$= g_m(Q_3)R_{L_3}$$

$$1+g_m(Q_3)R_{L_3}$$

$$\frac{V_0}{V_1} = -g_m(M_1)\frac{R_{L_1}}{R_{L_1}+R_{i_1}}\left(\frac{B}{B+1}\right)\left\{\frac{R_{L_2}}{R_{L_2}}\left[\frac{r_{\pi_3}+(B+1)R_{L_3}}{r_{\pi_3}+(B+1)R_{L_3}}\right]\right\}$$

$$\times \frac{g_m(Q_3)R_{L_3}}{1+g_m(Q_3)R_{L_3}}$$

$$= -22.8\frac{mA}{V}\left(\frac{1000}{1086}\right)\left(\frac{100}{101}\right)\left\{\frac{100}{101}\right\}\left[\frac{1000/26}{1+\frac{1000}{26}}\right]$$

$$= -184$$

To model velocity saturation, use (1.232)

$$R_{SX_{1}} = \frac{1}{\epsilon_{c} \, k' w_{1}} = \frac{1}{1.5 \times 10^{6} \, (200 \, \text{M}) \, (300 \, \text{M})} = 11.1 \, \Omega$$

$$R_{SX_{2}} = \frac{1}{\epsilon_{c} \, k' w_{2}} = \frac{1}{1.5 \times 10^{6} \, (200 \, \text{M}) \, (20 \, \text{M})} = 167 \, \Omega$$

                                                                                                                          V(2,5)/VI
INPUT RESISTANCE AT VI
                                                                                                                          V(2.5)/VI
                                                                                                                                                                                                 = 2.690E+06
                                                                                                                          OUTPUT RESISTANCE AT V(2,5)
                                                                                                                                                                                                = 1.994E+05
```

3.20

First consider the balanced case in which the lok resistor is present in the collector of Q1. For this,

$$I_{c_1} = I_{c_2} = \frac{1}{2} \left(\frac{15V - 0.7V}{10 \text{ kg}} \right) = 0.71 \text{ mA}$$

$$A_{dm} = -g_{m}R_{c} = -10 \text{ K} \left(\frac{0.71 \text{ mA}}{26 \text{ mV}} \right)$$

= -273

$$A_{cm} = \frac{-g_m R_c}{1 + 2g_m R_E \left(1 + \frac{1}{\beta}\right)} = \frac{-R_c}{2R_{TAIL}} = -\frac{1}{2}$$

Now, we are applying a signal to the V_{i1} input, and taking the V_{o2} output only

$$V_{02} = V_{0c} - \frac{V_{0d}}{2} = A_{cm}V_{ic} - \frac{1}{2}A_{dm}V_{id}$$

$$Now. V_{ic} = V_{i1} + V_{i2} = \frac{1}{2}V_{i}$$

Now,
$$V_{ic} = \frac{V_{i_1} + V_{i_2}}{2} = \frac{1}{2}V_i$$

 $V_{id} = V_{i_1} - V_{i_2} = V_i$

Thus,
$$V_{02} = Acm \left(\frac{1}{2}V_i\right) - \frac{1}{2}A_{dm}V_i$$

$$\frac{V_{02}}{V_i} = \frac{1}{2} \left(A_{cm} - A_{dm} \right)$$
$$= \frac{1}{2} \left(-\frac{1}{2} - (-273) \right) = 136$$

the common mode input resistance is much larger than the D.M.

input resistance, so

$$R_{i} = R_{id} = 2r_{\pi} = 2\beta \left(\frac{26mV}{0.71mA}\right)$$

By inspection, if we neglect r_0 , $R_{OUT} = R_C = 10 \text{ kg}$ The D.M. Half circuit is:

$$R_{ceff} = R_{c} || \frac{R_{L}}{2}$$

$$R_{eff} = \frac{R_{E}}{2}$$

$$R_{eff} = \frac{R_{E}}{2}$$

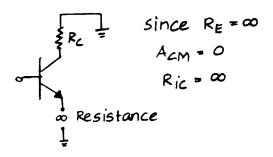

$$Adm = \frac{g_{m}R_{eff}}{1 + g_{m}R_{eff}(1 + \frac{1}{\beta})}$$

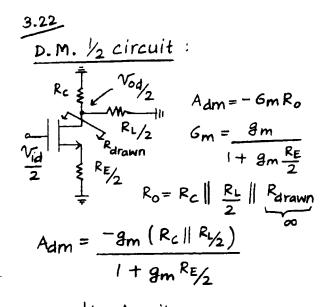

$$= \frac{g_{m}(R_{c} \parallel \frac{R_{L}}{2})}{1 + g_{m}\frac{R_{E}}{2}(1 + \frac{1}{\beta})}$$

Similarly,

Rid = 2 [
$$\frac{1}{\pi} + (1+\beta)\frac{R_E}{2}$$
]

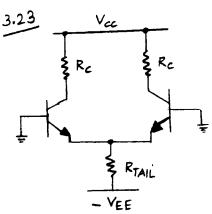

The c.m. half-circuit looks like:

C.M. 1/2 circuit: Rest R1/2 Per Rest open Rest open

Since the resistance connected to the source $\rightarrow \infty$, 6m here = 0and Acm = 0

For,
$$R_{id} = 2M\Omega$$
, $Y_{rr} = 1M\Omega = \frac{\beta}{g_{rr}}$
 $g_{m} = \frac{\beta}{10\Omega} = \frac{200}{10\Omega} = \frac{1}{5K\Omega}$
 $I_{c} = V_{T}/5K\Omega = 5.2MA$

Now,
$$A_{dm} = -g_{m}R_{c} = -500$$

... $R_{c} = 500/I_{5K_{R}} = 2.5 \text{ M}_{\Sigma}$

... $R_{c} = 500/I_{5K_{R}} = 2.5 \text{ M}_{\Sigma}$

... $R_{c} = 500/I_{5K_{R}} = 2.5 \text{ M}_{\Sigma}$

The DC voltage drop across R_{c}

Is $I_{c}R_{c} = (5.2 \times 10^{6})(2.5 \times 10^{6}) = 13V$

For a transistor V_{CE} of $1V$,

When the bases are grounded,

 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{BE} = 0.3V$

... $V_{CC} = 0.3V + 13V = 13.3V$
 $V_{CB} = V_{CE} - V_{$

and VEE = 13 + VBE = 13.7 V

From Table (2.4),

$$\mu_{\rm n} C_{\rm o} = 450 \times \frac{3.9 \times 8.854 \times 10^{-14}}{0.06 \times 10^{-5}}$$

= 194 44/1/2 = χ'

$$\Delta I_{d} = 0.85 I_{TAIL}$$

$$= \frac{X'}{2} \frac{W}{L_{eff}} (0.2) \int \frac{2I_{TAIL}}{\frac{X'}{2} \frac{W}{L_{eff}}} - (0.2)^{2}$$

$$Also, 6m = 1.0 \frac{mA}{V} = \int I_{TAIL} \frac{X'}{L_{eff}} \frac{W}{L_{eff}}$$

Also,
$$6m = 1.0 \frac{mA}{V} = \sqrt{I_{TAIL} k' \frac{W}{L_{eff}}}$$

$$\Rightarrow k' \frac{W}{L_{eff}} = \frac{1 \times 10^6 \text{ A/V}^2}{T_{TAIL}} \rightarrow 2$$

substituting @ in O,

Solve for I :

$$I_{TAIL}^{2} = \sqrt{\frac{4 \times 10^{6} \pm (4 \times 10^{6})^{2} - 4(7.225 \times 10^{3})(0.04)}{2(7.225 \times 10^{3})}}$$

$$I_{TAIL}^2 = 4.226 \times 10^8 \text{ or } 1.310 \times 10^{-8}$$

$$\frac{W}{L_{eff}} = \frac{1 \times 10^{-6}}{194 \times 10^{-6} (205.6 \times 10^{-6})} = 25.1$$

$$V_{OV} = \sqrt{\frac{205.6}{174(25)}} = 0.206 \text{ V}$$

If
$$I_{TAIL} = 114.4 \text{ MA}$$
,

$$\frac{W}{L_{AR}} = \frac{1 \times 10^{-6}}{194 \times 10^{-6} (114.4 \times 10^{-6})} = 45.0$$

$$V_{OV} = \sqrt{\frac{114.4}{194(45)}} = 0.114V$$

This overdrive is too small because the range would be only ± 12 (0-14) which is 162 mV which is less than the 200 mV input.

$$L_{eff} = L_{drawn} - 2L_{d} - X_{d} = 1.4m - 2(0.09) - 0$$

$$= 0.62 \text{ 4m}$$

$$\Rightarrow \frac{W}{\text{Left}} = \frac{W}{0.824m} = 25.1$$

For the emitter coupled pair, using (3.216),

$$|V_{OS}| = V_T \left(\frac{\Delta T_S}{T_S} + \frac{\Delta R_c}{R_c} \right)$$

But, for uniform-base transistor,

$$\left| \frac{\Delta I_s}{I_s} \right| = \left| \frac{\Delta W_B}{W_B} \right|$$

Thus, in this case,

$$\begin{vmatrix} V_{OS} \end{vmatrix} = V_T \left(\frac{\Delta W_B}{W_B} \right) = 26 \text{ mV} \times 0.1$$

$$= 2.6 \text{ mV}$$

From (3.248),

$$V_{OS} = \Delta V_{t} + \frac{(V_{GS} - V_{t})}{2} \left(-\frac{\Delta R_{L}}{R_{L}} - \frac{\Delta (W_{/L})}{W_{/L}} \right)$$

$$V_{GS} - V_{t} = \sqrt{\frac{I_{TAIL}}{K' W_{/Leff}}}$$

$$X' = \frac{450 \times 3.39 \times 8.86 \times 10^{-14}}{80 \times 10^{-8}} = 194 \text{ MA/V2}$$

$$V_{GS} - V_{t} = \sqrt{\frac{50 \, \text{M}}{194 \, \text{M} \left(\frac{10}{0.82}\right)}} = 0.145$$

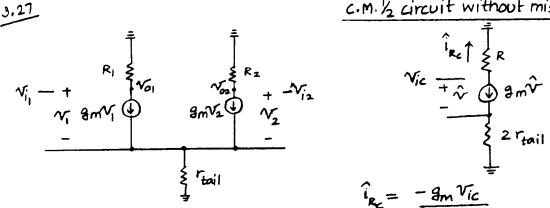

If
$$(\%_L)_1 > (\%_L)_2$$
, $v_{os} < 0$

since we don't know whether (1/2), > (1/2)2

or
$$(W_L)_2 > (W_L)_1$$
, we can only calculate

the magnitude of Vos

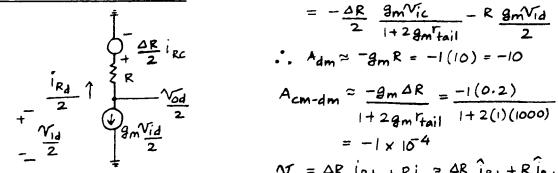

$$|V_{os}| = 0 + \frac{0.145}{2} (0 + 0.02) = 1.45 \text{ mV}$$

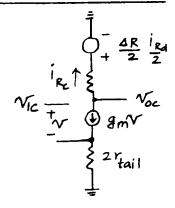

Let
$$R = \frac{R_1 + R_2}{2}$$

 $\Delta R = R_1 - R_2$

Exact D.M. 1/2 circuit:

Exact C.M. 1/2 circuit:

D.M. 1/2 circuit without mismatch:

$$\frac{\hat{I}_{Rd}}{\frac{1}{2}} = \frac{\hat{I}_{Rd}}{\frac{1}{2}} R$$

$$\frac{\hat{I}_{Rd}}{\frac{1}{2}} = \frac{1}{2} g_m \frac{V_{id}}{2}$$

$$\hat{I}_{Rd} = -g_m V_{id}$$

C.M. /2 circuit without mismatch:

$$\hat{l}_{Rc} = -\frac{g_{m} v_{ic}}{1 + 2a r_{ic}}$$

From exact 1/2 circuits;

$$V_{od} = \frac{\Delta R}{2} i_{Rc} + R \frac{i_{Rd}}{2} \approx \frac{\Delta R}{2} \hat{i}_{Rc} + R \frac{\hat{i}_{Rd}}{2}$$

$$= -\frac{\Delta R}{2} \frac{g_m V_{ic}}{1 + 2g_m f_{ail}} - R \frac{g_m V_{id}}{2}$$

$$A_{cm-dm} \approx \frac{-g_m \Delta R}{1 + 2g_m r_{tail}} = \frac{-1(0.2)}{1 + 2(1)(1000)}$$
$$= -1 \times 10^{-4}$$

$$V_{oc} = \frac{\Delta R}{2} \frac{i_{Rd}}{2} + Ri_{Rc} = \frac{\Delta R}{2} \frac{\hat{i}_{Rd}}{2} + R\hat{i}_{Rc}$$

$$= -\frac{\Delta R}{2} g_{m} \frac{V_{id}}{2} - \frac{Rg_{m} V_{ic}}{1 + 2g_{m} V_{tail}}$$

$$\therefore A_{dm-cm} = -\frac{g_{m} \Delta R}{4} = -\frac{1(0.2)}{4}$$

$$= -0.05$$

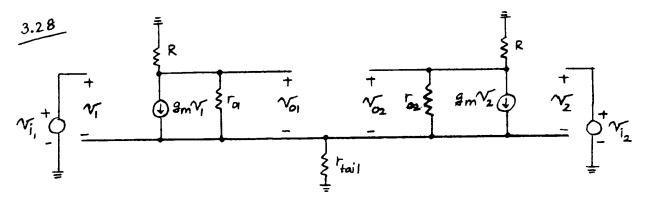

$$A_{cm} = -g_m R = -1(10) \approx -0.005$$

 $1 + 2g_m r_{tail} + 2(1)(1000)$

$$\frac{Adm}{A_{cm}} \approx \frac{10}{0.005} = 2000$$

$$\frac{A_{dm}}{A_{cm-dm}} \approx \frac{10}{1 \times 10^4} = 100,000$$

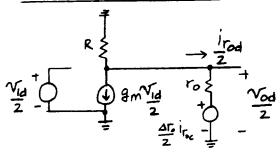

$$\frac{Adm}{Adm-cm} = \frac{10}{0.05} = 200$$

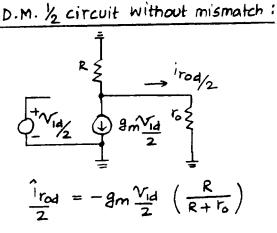

Let
$$r_0 = \frac{r_{01} + r_{02}}{2}$$

 $\Delta r_0 = r_{01} - r_{02}$

Exact D.M. 1/2 circuit:

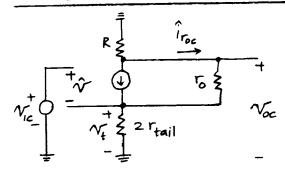

The bottom of the CM 1/2 circuit is essentially a source follower, since gm (2 Ttail) >> 1, V_ = Vic. Also, the current that flows in R is equal to the current

C.M. 1/2 circuit without mismatch:

that flows in 2 rtail. So,
$$-\frac{V_{oc}}{R} = \frac{V_{t}}{2r_{tail}}$$

$$\hat{I}_{roc} = \frac{V_{oc} - V_{t}}{r_{o}} = \frac{-V_{t} \left(\frac{R}{2r_{tail}} + 1\right)}{r_{o}}$$

$$\approx -\frac{V_{t}}{r_{o}} = \frac{-V_{t} \left(\frac{R}{2r_{tail}} + 1\right)}{r_{o}}$$

From exact D.M. & circuit,

$$\frac{V_{od}}{2} = \frac{\Delta r_o}{2} i r_{oc} \frac{R}{R + r_o} + \frac{i r_{od} r_o}{2}$$

$$\approx \frac{\Delta r_o}{2} \hat{r}_{oc} \frac{R}{R + r_o} + \frac{\hat{r}_{rod}}{2} r_o$$

$$\approx \frac{\Delta r_o}{2} \left(\frac{-V_{ic}}{r_o} \right) \frac{R}{R + r_o} - \frac{2mV_{id}}{2} \frac{R}{R + r_o} r_o$$

$$A_{dm} = \frac{V_{od}}{V_{id}} = -g_m r_o \frac{R}{R + r_o} = Im (500 K) \frac{10}{(510)}$$

= -9.8

$$A_{cm-dm} = \frac{V_{od}}{V_{ic}} = \frac{-\Delta I_o}{I_o} \frac{R}{R+I_o} = \frac{-10k}{500k} \frac{10}{510}$$
$$= -3.9 \times 10^{-4}$$

From exact c.m. 1/2 circuit, use superposition,

$$V_{oc} = \frac{-R}{2 r_{tail}} V_t = \frac{-R}{2 r_{tail}} V_{ic}$$

$$A_{cm} = \frac{V_{oc}}{V_{ic}} \simeq \frac{-R}{2r_{tail}} = \frac{-10}{2000} = -0.005$$

second, set Vic = 0,

From KCL (With V= 0-V+)

$$g_m V_t + \frac{V_t}{2r_{tail}} + \frac{V_t + \frac{\Delta r_o}{2} \frac{ir_{od} - V_{oc}}{2}}{r_o} = 0$$

$$V_{t} \left(\frac{g_{m} + \frac{1}{2r_{tail}} + \frac{1}{r_{o}}}{r_{o}} \right) + \frac{\Delta r_{o}}{r_{o}} \frac{i_{rod} - V_{oc}}{r_{o}} = 0$$

$$\approx g_{m}$$

$$\approx 8m$$
Also, $V_{t} = -\frac{2r_{tail}}{R} V_{oc}$

$$\frac{\Delta r_o}{r_o} \frac{i_{rod}}{4} = \frac{v_{oc}}{r_o} + \frac{2r_{tail}}{R} g_m v_{oc}$$
Use $i_{rod} \approx \hat{i}_{rod} = -g_m v_{id} \frac{R}{R + r_o}$

$$\frac{\Delta T_0}{r_0} \left(-\frac{gmVid}{4} \frac{R}{R+r_0}\right) = V_{oc} \left(\frac{1}{r_0} + \frac{2r_{ini}}{R}g_m\right)$$

$$\approx V_{oc} \frac{2r_{ini}}{R}g_m$$

$$Adm-cm = \frac{V_{oc}}{V_{id}} \approx \frac{-1}{4} \frac{\Delta r_0}{r_0} \frac{R}{R+r_0} \frac{R}{2r_{tail}}$$

$$= \frac{-1}{4} \frac{10}{500} \frac{10}{510} \frac{10}{2000}$$

$$= -4.9 \times 10^{-7}$$

$$Adm = -gmr_o\left(\frac{R}{R+r_o}\right) = -9.8$$

$$A_{cm-dm} = -\frac{\Delta r_o}{r_o} = \frac{R}{R + r_o} = -3.9 \times 10^{-4}$$

Both of these values are unchanged from the case with finite tail

$$A_{cm} \simeq \frac{-R}{2r_{tail}} = 0$$
 as $r_{tail} \rightarrow \infty$

Adm-cm
$$\approx -\frac{1}{4} \frac{\Delta r_o}{r_o} \frac{R}{R+r_o} \frac{R}{2r_{tail}}$$

= 0 as $r_{tail} \rightarrow \infty$

CHAPTER 4

Assume

(1) All transistors are identical $I_{S_1} = I_{S_2} = I_{S_3} = I_{S_4} = I_{S_5} = I_{S_5}$

(2)
$$V_{BE}(on) = 0.7 \text{ V}$$

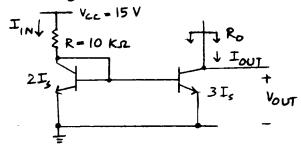

(3)
$$V_A = 130 V$$

(4)
$$\beta_F \rightarrow \infty$$
 (to ignore base currents)

transistors a, and Q_2 operate in parallel and can be replaced by one equivalent transistor Q_A with a saturation current of 2Is

similarly, transistors Q3-Q5 operate in parallel and can be replaced by one equivalent transistor QB with a saturation current of 3Is.

Redrawing the circuit,

From (4.8) with $\beta_F \rightarrow \infty$

$$I_{OUT} = \frac{I_{SB}}{I_{SA}} I_{N} \left(1 + \frac{V_{CEB} - V_{CEA}}{V_{A}}\right)$$

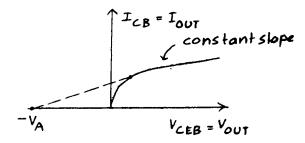

$$I_{IN} = \frac{15 - 0.7}{10 \text{ K}} = 1.43 \text{ mA}$$

$$I_{OUT} = \frac{3I_s}{2I_s} (1.43 \text{ mA}) (1 + \frac{V_{OUT} - 0.7}{130})$$

$$I_{OUT}(V_{OUT} = |V|) = \frac{3}{2}(1.43)(1 + \frac{0.3}{130}) = 2.15 \text{ mA}$$

$$I_{OUT}(V_{OUT} = 5V) = \frac{3}{2}(1.43)(1 + \frac{4.3}{130}) = 2.22 \text{ mA}$$

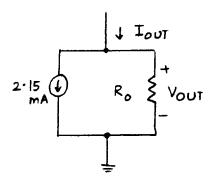

$$I_{OUT}(V_{OUT} = 30V) = \frac{3}{2}(1.43)(1 + \frac{29.3}{130}) = 2.63 \text{ mA}$$

$$R_0 = \Gamma_{0B} = \frac{I}{Slope} = \frac{V_A + V_{CEB}}{I_{CB}}$$

$$= \frac{V_A}{I_{OUT}(V_{out} \mid V)} = \frac{130 = 60.5 \text{ kg}}{2.15 \text{ mA}}$$

we can model the output of the current mirror as,

```

**** SMALL-SIGNAL TRANSFER CHARACTERISTICS

V(2)/VO = 1.000E+00 INPUT RESISTANCE AT VO = 6.090E+04

ASSUME

(1) All transistors are identical $I_{S_1} = I_{S_2} = I_{S_3} = I_{S_4} = I_{S_5} = I_{S}$

(2)
$$V_{BE} = 0.7 V$$

$$(3) V_A = 130 V$$

(4)
$$\beta_F = 200$$

Transistors Q₁ and Q₂ operate in parallel and can be replaced by an equivalent transistor with a saturation current of 2I_s similarly, transistors Q₃-Q₅ operate in parallel and can be replaced by an equivalent transistor Q₈ with a saturation current of 3I_s Redrawing the circuit.

 $2I \downarrow \xi R = 10 \text{ Ks.}$ $Q_{A} \qquad Q_{B} \downarrow I_{OUT}$ $2I_{S} \qquad Q_{A} \qquad Q_{B} \downarrow I_{OUT}$ $2I_{S} \qquad Q_{A} \qquad Q_{A} \qquad Q_{OUT}$

$$I_{IN} = \frac{15-0.7}{10 \, \text{K}} = 1.43 \, \text{mA}$$

From (4.8),

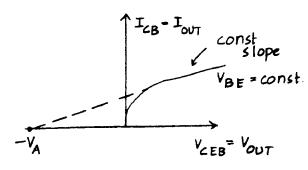

$$I_{OUT} = \frac{\frac{I_{SB}}{I_{SA}} I_{IN} \left(1 + \frac{V_{CEB} - V_{CEA}}{V_{A}}\right)}{1 + \frac{1 + \frac{I_{SB}}{I_{SA}}}{\beta_{F}}}$$

$$I_{OUT} = \frac{\frac{3}{2} \left(1.43 \text{ mA}\right) \left(1 + \frac{V_{OUT} - 0.7}{130}\right)}{1 + \frac{1 + \frac{3}{2}}{200}}$$

$$I_{OUT}(V_{OUT} = |V|) = 2.12 \text{ mA}$$

$$I_{OUT}(V_{OUT} = 5V) = 2.19 \text{ mA}$$

$$I_{OUT}(V_{OUT} = 30V) = 2.60 \text{ mA}$$

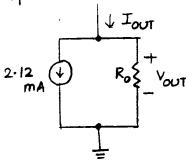

$$R_{0} = r_{0B} = \frac{1}{\text{slope}}$$

$$= \frac{V_{A} + V_{CEB}}{I_{C}} \approx \frac{V_{A}}{I_{OUT}}$$

$$\approx \frac{130}{2.12 \text{ mA}} = 61.3 \text{ k.s.}$$

SIMPLE CURRENT MIRROR SIMULATION (INCLUDE BASE CURRENTS)

From Table (2.4),

$$x' = A_{n}C_{ox}$$

$$= 450 \times 3.9 \times 8.86 \times 10^{-14}$$

$$0.08 \times 10^{-5}$$

$$= 194 \quad 4A/v^{2}$$
Tout = 50 HA (1+ π ΔV_{ps})

From condition (c), π $\Delta V_{ps} \leq 0.01$

and $\Delta V_{ps} = 1V \Rightarrow \pi \leq 0.01 V^{-1}$

From conditions (a) and (b)

$$50 \quad 4A = \frac{x'}{2} \frac{W}{L_{eff}} (V_{6s} - V_{t})^{2} \text{ where}$$

$$V_{6s} - V_{t} = 0.2 V$$

$$50 \quad 4 = \frac{194}{2} \frac{W}{L_{eff}} (0.2) \Rightarrow \frac{W}{L_{eff}} = 12.9$$

$$\lambda \leq \frac{1}{100V}; \quad \text{Also from the table}$$

$$\frac{d \times a}{d V_{ps}} \leq 0.02 \quad \mu \text{m/v}$$

$$\lambda = \frac{1}{V_{A}} = \frac{d \times a/d V_{ps}}{L_{eff}} \leq \frac{1}{100V}$$

$$\Rightarrow \text{Leff} \Rightarrow 2.4 \text{m}$$

$$L_{drawn} = 2.4 \text{m} + 2(0.09) = 2.16.4 \text{m}$$

$$\approx 2.2 \quad 4 \text{m}$$

The minimum length that satisfies the constraints minimizes the required gate area

Then W = 12.9 x 2.2 4m = 28 4m

$$V_{OS_{M2}} = V_{OUT} - V_{DS_{M1}} = V_{OUT} - V_{GS_{M1}}$$

$$V_{GS_{M1}} = V_{t} + \sqrt{\frac{2I_{D}}{X'W/L_{eff}}}$$

$$= 0.6 + \sqrt{\frac{2004}{1944^{100}6.82}}$$

$$V_{DS} = V_{65} - V_{t}$$

= 0.692 - 0.6 = 0.092 V

assume no body effect on Vi

$$V_{DS} - V_{DS} = 1.216 V$$

$$g_{db} = 30 \frac{11.7 \text{ fA}}{(1.216)^2} = 0.238 \frac{PA}{V}$$

$$r_{db} = \frac{1}{g_{db}} = 4200 6\Omega$$

$$R_0 = 379 \text{ M}_{\text{L}} 1142006 \Omega = 379 \text{ M}_{\text{L}}$$

No change due to substrate

leakage

$$V_{DS} - V_{DS_{ACT}} = 2.216 V$$
 $I_{DB} = 2 (2.216) (100 \text{ M}) e^{-30/2.216}$
 $= 1.46 \text{ nA}$
 $g_{db} = 29.7 \text{ nA/V}$
 $r_{db} = 33.7 \text{ M}\Omega$
 $R_0 = 33.7 \text{ M}\Omega \parallel 379 \text{ M}\Omega = 30.9 \text{ M}\Omega$

output resistance dominated

by substrate leakage.

From condition (a), $V_{omin} = 0.2 \text{ V}$ This is split across M, and M₂ Therefore, $V_{ov} = V_{6s} - V_t = 0.1 \text{ V}$

From this and condition (b),

$$50 \text{ MA} = \frac{194 \text{ M}}{2} \left(\frac{\text{W}}{\text{Left}}\right) (0.1)^2$$

$$\Rightarrow \frac{W}{L_{eff}} = 51.5$$

$$r_0 = \frac{1}{\pi I_0}$$
 where $\pi = \frac{dx_d}{dV_{0S}} / L_{eff}$

So,
$$r_0 = \frac{\text{Leff}}{50 \, \text{M} \left(0.02 \, \frac{\text{Mm}}{\text{V}}\right)} = \frac{\text{Leff}}{1 \times 10^{-12}}$$

$$R_0 = \frac{\Delta V_{OUT}}{\Delta I_{OUT}} = \frac{IV}{0.0002 (I_D)} = \frac{IV}{0.0002 (50 \text{ J})}$$

From (4.50), Ro = 102 gm2 101

$$\Rightarrow R_0 \cong \left(\frac{\text{Leff}}{10^{-12}}\right)^2 2(194)(51.5)(50)$$

$$= \frac{\text{Leff}}{10^{-21}} = 100 \text{ M.D.}$$

Therefore, Leff = 0.32 4m

$$L_{drawn} = L_{eff} + 2L_{d} = 0.32 + 2(0.09)$$

= 0.5 ym

$$W = (51.5)(0.32) = 16.5 \,\mu m$$

4.8

Me and My operate in triode region.

$$I = \frac{K'}{2} \left(\frac{W}{L}\right)_{8} \left(V_{GS_{8}} - V_{+}\right)^{2}$$

$$I = \frac{K'}{2} \left(\frac{W}{L}\right)_{7} \left[2\left(V_{GS_{7}} - V_{+}\right)V_{DS_{7}} - V_{DS_{7}}\right]$$

$$I = \frac{K'}{2} \left(\frac{W}{L}\right)_{4} \left[2\left(V_{GS_{6}} - V_{+}\right)V_{DS_{6}} - V_{DS_{6}}\right]$$

$$\left(\frac{W}{L}\right)_{8} \left(V_{OV_{8}}\right)^{2} = \left(\frac{W}{L}\right)_{7} \left[2\left(2V_{OV_{8}}\right)V_{OV_{8}} - V_{OV_{8}}\right]$$

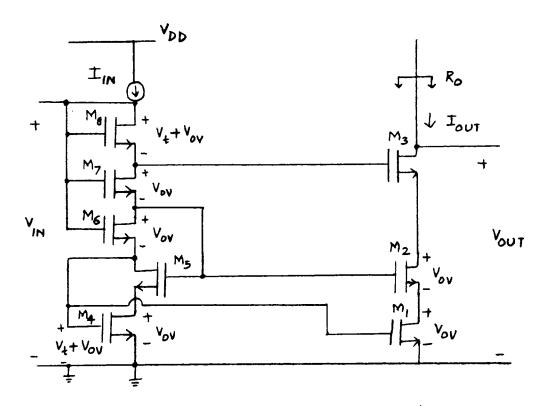

$$= \left(\frac{W}{L}\right)_{6} \left[2\left(3V_{OV_{8}}\right)V_{OV_{8}} - V_{OV_{8}}\right]$$

$$\left(\frac{W}{L}\right)_{8} \left(V_{OV_{8}}\right)^{2} = \left(\frac{W}{L}\right)_{7} \left(3V_{OV_{8}}\right) = \left(\frac{W}{L}\right)_{6} \left(5V_{OV_{8}}\right)$$

$$\left(\frac{W}{L}\right)_{7} = \frac{1}{3} \left(\frac{W}{L}\right)_{8}$$

$$\left(\frac{W}{L}\right)_{6} = \frac{1}{5} \left(\frac{W}{L}\right)_{8}$$

In practice, $(\frac{W}{L})_{t}$ and $(\frac{W}{L})_{t}$ would be even smaller to increase $v_{DS_{c}}$ and $v_{DS_{t}}$ slightly so that all the transistors in the output branch of a current mirror using the circuit operate in the active region

$$V_{IN} = V_{6S_{4}} + V_{DS_{6}} + V_{DS_{7}} + V_{6S_{8}}$$

$$= V_{4} + V_{0V} + V_{0V} + V_{0V} + V_{4} + V_{0V}$$

$$= 2V_{4} + 4V_{0V}$$

$$V_{OUT_{(min)}} = V_{DS_{1}} + V_{DS_{2}} + V_{DS_{3}} (min)$$

$$= V_{0V} + V_{0V} + V_{0V}$$

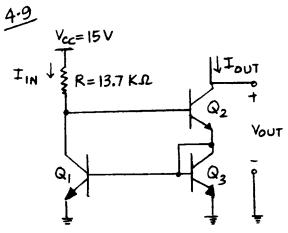

Systematic gain error = 0 (because $V_{DS_4} = V_{DS_1} = V_{OV}$)

 $= 3 V_{OV}$

Assuming M_1-M_3 operate in the active region, the output resistance [ignoring the body effect as in (4.53)] is $R_0 \cong {}^{r_0}(g_m r_o)^2$

where, $g_m = g_{m_1} = g_{m_2} = g_{m_3}$

and $r_0 = r_{01} = r_{02} = r_{03}$ if $M_1 = M_2 = M_3$

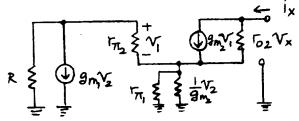

From (4.100)
$$I_{OUT} = I_{C_2} = I_{IN} \left[1 - \frac{2}{\beta^2 + 2\beta + 2} \right]$$

$$I_{IN} = \frac{15 - 2 \times 0.7}{13.7 \text{ K}} = 0.993 \text{ mA}$$

$$I_{OUT} = 0.993 \left[1 - \frac{2}{200^2 + 2 \times 200 + 2} \right]$$

$$\approx 0.993 \text{ mA} \approx 1 \text{ mA}$$

The small signal circuit is:

Each transistor has the same $I_c = 1 \, \text{mA}$. Same r_{π} , g_m and r_o . Neglect r_{π_i} compare to $l_{g_{m_3}}$ circuit becomes:

$$R \neq \begin{array}{c|c} & & & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\$$

At (B)
$$i_{x} = g_{m}V_{1} + \frac{V_{x} - V_{2}}{r_{o}} \rightarrow 0$$

At (A) $\frac{V_{1} + V_{2}}{R} + g_{m}V_{2} + \frac{V_{1}}{r_{n}} = 0 \rightarrow 2$
At (C) $\frac{V_{1}}{r_{n}} + g_{m}V_{1} + \frac{V_{x} - V_{2}}{r_{o}} = g_{m}V_{2} \rightarrow 3$
 $\therefore V_{1} \left(\frac{1}{r_{n}} + g_{m}\right) + \frac{V_{x}}{r_{o}} = V_{2} \left(g_{m} + \frac{1}{r_{o}}\right) \rightarrow 4$
From (2), $V_{1} \left(\frac{1}{R} + \frac{1}{r_{n}}\right) = -V_{2} \left(\frac{1}{R} + g_{m}\right)$
 $\therefore V_{1} = -V_{2} \frac{1 + g_{m}R}{1 + \frac{R}{r_{n}}} \rightarrow 5$
(5) in (4):
 $-V_{2} \frac{1 + g_{m}R}{r_{n}} / \frac{1}{r_{n}} + g_{n} + V_{x} = V_{2} \left(g_{m} + \frac{1}{r_{n}}\right)$

$$-V_{2} \frac{1+g_{m}R}{1+\frac{R}{r_{m}}} \left(\frac{1}{r_{m}} + g_{m}\right) + \frac{V_{x}}{r_{o}} = V_{2} \left(g_{m} + \frac{1}{r_{o}}\right)$$

$$\therefore V_{x} = V_{2} r_{o} \left[g_{m} + \frac{1}{r_{o}} + \frac{\left(g_{m} + \frac{1}{r_{m}}\right)\left(1 + g_{m}R\right)}{1+\frac{R}{r_{m}}}\right]$$

(5) in (1):

$$1_{x} = -g_{m}V_{2} \frac{1+g_{m}R}{1+\frac{R}{r_{\pi}}} + \frac{V_{x}}{r_{o}} - \frac{V_{z}}{r_{c}} \rightarrow 0$$

(6) in (7):

$$\frac{i_{X}}{V_{X}} = \frac{1}{r_{o}} - \frac{\left[\frac{1}{r_{o}} + g_{m} \frac{1 + g_{m}R}{1 + R/r_{m}}\right]}{r_{o} \left[g_{m} + \frac{1}{r_{o}} + \frac{(g_{m} + \frac{1}{r_{m}})(1 + g_{m}R)}{1 + R/r_{m}}\right]}$$

$$= \frac{1}{r_{o}} \left[\frac{g_{m} (1 + R/r_{m}) + \frac{1}{r_{o}} (1 + g_{m}R)}{(g_{m} + \frac{1}{r_{o}})(1 + \frac{R}{r_{m}}) + (g_{m} + \frac{1}{r_{m}})(1 + g_{m}R)}\right]$$

$$R_{o} = \frac{V_{X}}{i_{X}} = r_{o} \left[1 + \frac{1}{r_{o}} + \frac{1}{r_{o}} \frac{R}{r_{m}} + g_{m}(1 + g_{m}R)}{g_{m} + 2 g_{m}R} + \frac{1}{r_{o}} \frac{R}{r_{m}}\right]$$

$$\cong r_{o} \left[1 + \frac{1}{r_{o}} + \frac{1}{r_{o}} \frac{R}{r_{o}} + \frac{1}{r_{o}} \frac{R}{r_{m}}\right]$$

$$\cong r_{o} \left[1 + \frac{1}{r_{o}} + \frac{1}{r_{o}} + \frac{R}{r_{m}} \frac{R}{r_{m}}\right] \rightarrow \mathcal{B}$$

$$\left(: g_{m} - \frac{\beta_{o}}{r_{\pi}} >> \frac{1}{r_{\pi}}, g_{m}R = \frac{\beta_{o}R}{r_{\pi\tau}} >> \frac{R}{r_{\sigma}\beta_{o}} \right)$$

In this problem $g_m = \frac{1 \text{ mA}}{26 \text{ mV}} = \frac{1}{26} \text{ T}$

$$r_{\Pi} = \frac{\beta_0}{g_m} = 5.2 \text{ k}\Omega$$
, $R = 13.7 \text{ k}\Omega$

$$\Gamma_0 = \frac{130 \,\mathrm{V}}{1 \,\mathrm{mA}} = 130 \,\mathrm{K}\Omega$$

:.
$$R_0 = 130 \, \text{K} \left[1 + \frac{528}{6.27} \right] = 11.1 \, \text{Ms.}$$

(If
$$R \rightarrow \infty$$
 then $R_o = r_o \left[1 + \frac{\beta_o}{2} \right]$

If Vour changes by 5V then, Iour changes by

$$\Delta I_{out} = \frac{\Delta V_{out}}{R} = \frac{5}{11.1} \text{ MA} = 0.45 \text{ MA}$$

The percentage change in Iour is

$$\frac{0.45 \times 10^{-6}}{10^{-3}} \times 100 = 0.045\%$$

G≱/B

From (1.140),
$$V_{t_{2}} = V_{t_{2,10}} + Y \left[\sqrt{2 \phi_{f}} + V_{SB_{2}} - \sqrt{2 \phi_{f}} \right]$$

$$C_{OX} = \frac{3.9 \times 6.86 \times 10^{-14}}{80 \times 10^{-8}} = 4.3 \times 10^{7} \frac{F}{cm^{2}}$$

$$Y = \frac{1}{4.3 \times 10^{7}} \sqrt{2(1.6 \times 10^{14})(11.6)(8.86 \times 10^{14}(5 \times 10^{15}))}$$

$$= 0.094 V^{\frac{1}{2}}$$
From (1.135),
$$2\phi_{f} = 2 V_{f} \ln \frac{5 \times 10^{15}}{1.45 \times 10^{10}} = 663 \text{ mV}$$

$$S0, V_{t_{2}} = -1 + 0.094 \left[\sqrt{1.663} - \sqrt{0.663} \right]$$

$$= -0.955$$

$$I_{D_{2}} = \frac{K'}{2} \left(\frac{W}{L_{eff} 2} \right) \left(V_{GS_{2}} - V_{t_{2}} \right)$$

$$= \frac{194}{2} \frac{10}{0.62} \left(0 + 0.955 \right)^{2} = 1.08 \text{ mA}$$
From (4.120),
$$\frac{V_{O}}{V_{i}} = -gm_{i} \left(r_{Oi} || r_{O2} || \frac{1}{gmb_{2}} \right) = \frac{-gm_{i}}{g_{Oi} + g_{O2} + g_{mb_{2}}}$$

$$g_{m_{1}} = \sqrt{2(194) \frac{100}{0.62} (1080)} = 7.2 \text{ mA/V}$$
From (1.199),
$$g_{mb_{2}} = \frac{Y \times \left(\frac{W}{L_{eff}} \right)_{2} \left(V_{GS_{2}} - V_{t_{2}} \right)}{2 \sqrt{2 \phi_{f}} + V_{SB_{2}}} = \frac{0.094(194) \frac{10}{0.82} (0.955)}{2 \sqrt{1.663}}$$

$$= 82.3 \text{ MA/V}_{V}$$

$$g_{OI} = g_{O2} = r_{OI}^{-1} - r_{O2}^{-1} = \frac{I_{D}}{L_{eff}} \frac{dX_{4}}{dV_{DS}} = \frac{1.08}{0.82} (0.02)$$

= 26.3 MA/V

 $\frac{\sqrt{6}}{\sqrt{6}} = -\frac{7.2 \text{ m}}{2.(26.3 \text{ m}) + 82.3} = -53$

$$V_{A_{pnp}} = 50 V$$
 $V_{A_{npn}} = 130 V$ $V_{A_{npn}} = 50$ $V_{A_{npn}} = 200$

Assume no device mismatch

$$I_{C_3} + V_{CC}$$

$$I_{C_3} + I_{C_4} + I_{C_6} + I_{C_$$

= 1388

INPUT RESISTANCE AT OUTPUT RESISTANCE AT V(6)

4.14

In the figure below,

$$I_1 = I_2 = I_3 = I_4 = 50 \text{ MA}$$

and

From (1.163), $V_{An} = \frac{\text{Leff}}{\frac{dx_{4}}{dV_{DS}}}$ $\Rightarrow V_{An} = \frac{1 - 2(0.12)}{0.08} = \frac{1 - 2(0.16)}{0.04} = 16V$

$$\frac{V_0}{V_i}$$
 = + 6m R₀ = 0.914 m (119 K)
= 109

From SPICE (inserted at the end),

$$\frac{V_0}{V_i}$$
 = 142 and R₀ = 138 Ks.

The difference between the hand calculations and SPICE in this case stems from the fact that early voltages are small. As a result, the expressions for transconductance and output resistance should be changed.

 $I_D = \frac{x'}{2} \frac{W}{I} (V_{65} - V_t)^2 (I + 7V_{05})$

From (1.165)

So,
$$V_{6S} - V_{t} = \sqrt{\frac{2J_{D}}{x' \frac{W}{L}(1+\lambda V_{DS})}}$$

Then, $g_{m} = x' \frac{W}{L} \sqrt{\frac{2J_{D}}{x' \frac{W}{L}(1+\lambda V_{DS})}}$
 $g_{m} = \sqrt{\frac{2}{x' \frac{W}{L}}} \frac{I_{D}(1+\lambda V_{DS})}{I+\lambda V_{DS}}$
 $= \sqrt{\frac{2(127)}{50}} \frac{50}{1-2(0.12)} \frac{(50)(1+\frac{2.5}{9.5})}{9.5}$
 $= 1027.32 \ \text{MA/V}$
 $\frac{V_{0}}{V_{i}} = (1.03 \ \frac{\text{MA}}{V}) (240 \ \text{Kp.} || 336 \ \text{Kp.})$
 $= 144.2$

Although these final hand calculations are more accurate than the original hand calculations, hand calculations usually use the original formulae for simplicity.

$$\approx -\frac{\Delta g_m}{g_m} \left[1 + \frac{2 r_{tail}}{r_0}\right]$$

(d) Next assume $\frac{1}{g_{m_3}} = 0$. Find g_{m_3} Ed from $r_{01} \neq r_{02}$ alone.

$$\begin{array}{lll} i_{2}\left[1-\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)\right] & (f) & E_{m}=\frac{1}{1+g_{m3}}\frac{1}{G_{03}} + \frac{(g_{m3}g_{m3}g_{m})^{2}G_{3}}{1+g_{m3}f_{03}} \\ &=i_{1}\left[1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)\right] & \approx \frac{1}{1+g_{m3}f_{03}} + \frac{g_{m3}g_{m3}g_{m3}}{g_{m3}} \\ &=\frac{1}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)} & \approx \frac{1}{g_{m3}f_{03}} + \frac{g_{m3}g_{m3}g_{m3}}{g_{m3}g_{m3}} \\ &=\frac{1}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)-1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)} & \approx \frac{1}{g_{m3}f_{03}} + \frac{2g_{m3,4}}{g_{m3,4}} \\ &=\frac{2}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)} & \approx 2\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right) \\ &=\frac{2}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)} & \approx \frac{1}{g_{m3}f_{03}} + \frac{2g_{m3,4}}{g_{m3,4}}\left(1-\frac{2g_{m3,4}}{2g_{m3,4}}\right) \\ &=\frac{2}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)} & \approx 2\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right) \\ &=\frac{1}{1+\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right)} & \approx 2\Gamma_{tail}\left(\frac{1}{\Gamma_{01}}-\frac{1}{\Gamma_{02}}\right) \\ &=\frac{1}{g_{m3}f_{03}} + \frac{2g_{m3,4}}{g_{m3,4}}\left(1-\frac{2g_{m3,4}}{2g_{m3,4}}\right) \\ &=\frac{1}$$

**** SMALL-SIGNAL TRANSFER CHARACTERISTICS

I(VOUT)/VI = -9.237E-0
IMPUT RESISTANCE AT VI = 1.000E+2
OUTPUT RESISTANCE AT I(VOUT) = 5.240E+0

Without mismatch

From (4.186),

$$\mathcal{E}_{d} \simeq \frac{1}{g_{m_3} r_o(dp)}$$

$$= \frac{1}{1m (1 \text{ Meg})} = \frac{1}{1000}$$

From (4.187),

$$\mathcal{E}_{m} \simeq \frac{1}{g_{m_3} r_{o3}}$$

$$= \frac{1}{1 \text{ m (1 Meq)}} = \frac{1}{1000}$$

From (4.185),

$$G_{m}[cm] \stackrel{?}{=} \frac{\mathcal{E}_{d} + \mathcal{E}_{m}}{2T_{fail}}$$

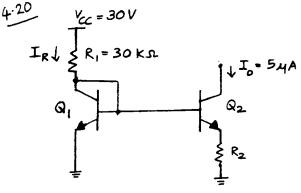

$$= \frac{2}{1000} = -2 \times 10^{-9} \text{ A/V}$$

$$= \frac{2}{2(0.5 \text{ Meg})}$$

CMRR (without mismatch)

$$= \frac{1 \text{ mA/V}}{2 \times 10^{-9} \text{ A/V}} = 500,000$$

So, mismatch reduces CMRR

$$I_{R} = \frac{V_{CC} - V_{BE}(on)}{R_{1}} = \frac{30 - 0.7}{30k} = 0.977 \text{ mA}$$

$$V_{BE_{1}} = V_{BE_{2}} + I_{o}R_{2}$$

$$\therefore I_{o}R_{2} = V_{T} \ln \frac{I_{c_{1}}}{I_{o}} \approx V_{T} \ln \frac{I_{R}}{I_{o}}$$

$$\therefore R_{2} = \frac{V_{T}}{I_{o}} \ln \frac{I_{R}}{I_{o}} = \frac{26 \text{ mV}}{5 \text{ MA}} \ln \frac{0.977 \text{ mA}}{5 \text{ MA}}$$

$$= 27 \cdot 4 \text{ ks.}$$

$$R_{0} = I_{02} \left(1 + \frac{g_{m_{2}}R_{2}}{1 + g_{m_{2}}R_{2}} \right)$$

$$I_{02} = \frac{130 \text{ V}}{5 \text{ MA}} = 26 \text{ Ms.}$$

$$R_{2} = 27 \cdot 4 \text{ ks.}$$

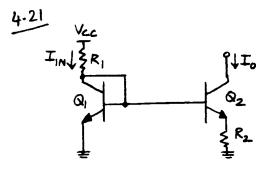

$$g_{m_{2}} = \frac{1}{26} \frac{5}{1000} = 1.9 \times 10^{4} \text{ A/V}$$

$$P_{0} = 200$$

$$P_{0} = 200$$

$$R_0 = 26 \left(1 + \frac{1.9 \times 10^{-4} \times 27.4 \times 10^3}{1 + 1.9 \times 10^{-4} \times 27.4 \times 10^3} \right)$$

= 158 M D

$$I_{IN} = \frac{V_{CC} - V_{BE}(on)}{R_{I}} = \frac{V'}{R_{I}}$$

where V'= Vcc - VBE (on)

$$I_0R_2 = V_1 \ln \frac{V'}{I_0R_1}$$

$$\therefore R_2 = \frac{V_T}{I_o} \ln \frac{V'}{I_o R_1}$$

Let $f = R_1 + R_2 = R_1 + \frac{V_T}{T_o} \ln \frac{V'}{I_o R_1}$

$$\frac{df}{dR_1} = 1 + \frac{V_T}{I_o} \frac{I_o R_1}{v'} \left(-\frac{v'}{I_o R_1^2} \right)$$
$$= 1 - \frac{V_T}{I_o} \frac{I}{R_1} = 0$$

$$\therefore R_1 = \frac{V_T}{I} \text{ and }$$

$$R_2 = \frac{V_T}{I_o} \ln \left(\frac{V'}{I_o} \frac{I_o}{V_T} \right)$$

These give minimum total resistance for given V_{cc} and I_{o} for Problem (4.20), $V_{cc} = 30V$ and $I_{o} = 5 \, \text{MA}$.

$$R_{1} = \frac{26 \text{ mV}}{5 \text{ MA}} = 5.2 \text{ kg}$$

$$R_{2} = \frac{26 \text{ mV}}{5 \text{ MA}} \text{ ln } \frac{29.3}{0.026} = 36.5 \text{ kg}$$

This value of R, is too small in

practice as the current drawn from the supply is about $\frac{30-0.7}{5.2 \, \text{k}} = \frac{5.6 \, \text{mA}}{5.2 \, \text{k}}$ high

4.22

Circuit as shown in fig (4.31a)

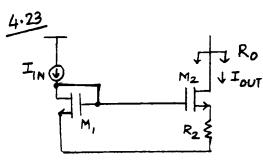

with $V_{cc} = 15V$, $R_1 = 20 \text{ kg}$, $R_2 = 10 \text{ kg}$ $I_{IN} = \frac{15 - 0.7}{20 \text{ kg}} = 0.72 \text{ mA}$

 $I_{OUT}R_2 = V_T ln \frac{I_{c_1}}{I_{OUT}} \approx V_T ln \frac{I_{IN}}{I_{out}}$

 $I_{OUT} = \frac{V_T}{R_2} \ln \frac{I_{IN}}{I_{OUT}} = 2.6 \times 10^6 \ln \frac{0.72 \text{ mA}}{I_{OUT}}$

By trial and error we find out,

Fout = 10.9 4A

$$V_{OV_i} = \sqrt{\frac{2I_{iN}}{\mathcal{K}'(W_iL)_i}}$$

$$\left(\frac{W}{L}\right)_{1} = \frac{2I_{1N}}{x'(V_{0V_{1}})^{2}} = \frac{200}{194(0.2)^{2}} = 25.8$$

$$\sqrt{I_{OUT}} = -\sqrt{\frac{2}{x'(\%_{1})_{2}}} + \sqrt{\frac{2}{x'(\%_{1})_{3}}} + 4R_{2}V_{ov_{1}}$$

$$\frac{1}{2R_{2}}$$
Which gives

$$\times \frac{\sqrt{2x'(\%)_2}}{\sqrt{2x'(\%)_2}}$$

$$g_{m_2}R_2 = -1 + \sqrt{1 + 2R_2V_{oV_1} \mathbf{x}'(\frac{m_L}{L})_2}$$

$$\longrightarrow 0$$

$$R_0 = r_{02} (1 + g_{m_2} R_2)$$

$$g_{m_2}R_2 = \frac{R_0}{r_{02}} - 1$$

$$V_A = \frac{L}{dX_4/dV_{DS}} = \frac{1}{0.02} = 50$$

$$r_{02} = 50 = 5 M \Omega$$

Putting @ in O,

$$1 + 2R_2 V_{OV_1} x' \left(\frac{W}{L}\right)_2 = 100$$

$$2R_2V_{OV_1}x'\left(\frac{W}{L}\right)_2 = 99$$

$$R_2 = \frac{\text{Swing} - V_{\text{ON}}}{T}$$

$$R_{2} = \frac{\text{Swing} - \text{Vov}_{2}}{\text{I}_{out}}$$

$$I_{out}R_{2} = \text{Swing} - \sqrt{\frac{2 I_{out}}{\mathcal{K}'(\%_{L})}}$$

where from 3, we can put

$$\left(\frac{V_{\perp}}{V_{\perp}}\right)_{2} = \frac{99}{2R_{2}V_{0}V_{1}X'}$$

$$I_{OUT}R_2 = Swing - \sqrt{2 \frac{I_{OUT}}{k'} \frac{2R_2V_{OV_i}k'}{99}}$$

$$I_{out}R_2 + \sqrt{\frac{4}{99}} V_{ov_1}I_{out} \sqrt{R_2} - swing = 0$$

$$\frac{\sqrt{2x'(\%)_{2}}}{\sqrt{2x'(\%)_{2}}} \qquad \sqrt{R_{2}} = \frac{-\sqrt{\frac{4}{99}} \sqrt{\text{ov}_{1}} I_{\text{out}}}{2 I_{\text{out}}} + \frac{1}{2 I_{\text{out}}} \frac{1}{\sqrt{\frac{4}{99}} \sqrt{\text{ov}_{1}} \sqrt{\frac{4}{99}} \sqrt{\text{ov}_{1}} I_{\text{out}} + 4 I_{\text{out}} \text{ swing}}$$

$$\frac{\sqrt{2x'(\%)_{2}}}{\sqrt{\frac{4}{99}} \sqrt{\text{ov}_{1}} I_{\text{out}} + 4 I_{\text{out}} \text{ swing}}$$

$$\frac{2 I_{\text{out}}}{2 I_{\text{out}}}$$

 $\sqrt{R_2}$ must be greater than zero,

$$\frac{\sqrt{R_2} = \sqrt{\frac{4}{99}} (0.2) 10^{-5}}{2 \times 10^{-5}} + \frac{4 \times 10^{-5}}{99} + \frac{4 \times 10^{-5}}{10^{-5}} = \frac{2 \times 5584 \times 10^{-3}}{10^{-5}} = 126$$

$$R_2 = 16.36 \text{ K}\Omega$$

$$\left(\frac{W}{L}\right)_2 = \frac{99}{2(16.36 \,\mathrm{K})(0.2)(196 \,\mathrm{HA})} = 77.2$$

$$\frac{4.24}{(a)} I_{OUT} = 0.14A \text{ when } I_{IN} = 14A$$

$$I_{OUT} = I_{IN} \exp\left[-\frac{I_{IN}R}{nV_T}\right] (4.206)$$

$$\Rightarrow R = \frac{nV_T}{I_{IN}} \ln \frac{I_{IN}}{I_{OUT}}$$

$$R = \frac{(1.5)(26 \text{ mV})}{(14A)} \text{ en } 10 = 90 \text{ kg}$$

To keep transistor in weak inversion $V_{65}-V_{4} < 0$. Input transistor conducts more current,

$$I_{IN} = \frac{W}{L} I_{t} exp \left[\frac{V_{6S_{1}} - V_{t}}{n V_{T}} \right]$$

$$n V_{T} Ln \frac{I_{IN}}{W} = V_{GS_{1}} - V_{t} < 0$$

$$\vdots I_{IN} < \frac{W}{L} I_{t}$$

$$\vdots I_{IN} < \frac{W}{L} I_{t}$$

$$\frac{W}{L} > \frac{I_{IN}}{I_{t}} = \frac{I \, 4A}{O \cdot I \, 4A} = 10$$

(b)
$$I_{OUT} = 0.1 \text{ 4A}$$
 when $R = 10 \text{ ksl}$

$$Ln \ \frac{I_{IN}}{I_{OUT}} = \frac{I_{IN}R}{n V_{T}}$$

Trial & Error :

$$V_{CC} = 15V$$

$$I_{IN} \downarrow R_{IN} = 13.7 \text{ Kn} \downarrow I_{o}$$

$$Q_{2} \qquad \qquad Q_{3}$$

$$Q_{1} \qquad \qquad Q_{3}$$

$$Q_{1} \qquad \qquad Q_{2} \qquad \qquad Q_{3}$$

Assume:

$$I_{S} = 5 \times 10^{-15} A$$

$$B_{0} = 200$$

$$V_{BE_{1}} + V_{BE_{2}} = V_{BE_{3}} + I_{0}R_{2}$$

$$I_{C_{1}} \approx I_{C_{2}} = I_{1N} ; I_{0} = I_{E_{3}}$$

$$I_{1N} = \frac{15 - 2 \times 0.7}{13.7 \text{ K}} = 0.993 \text{ mA}$$

$$V_{T} \ln \frac{I_{C_{1}}}{I_{S}} + V_{T} \ln \frac{I_{C_{2}}}{I_{S}}$$

$$= V_{T} \ln \frac{I_{0}}{I_{S}} + I_{0}R_{2}$$

$$\vdots I_{0} = \frac{V_{T}}{R_{2}} \ln \frac{I_{1N}^{2}}{I_{0}I_{S}} = \frac{26 \text{ mV}}{700 \Omega} \ln \frac{(0.993 \times 10^{-3})^{2}}{(5 \times 10^{-15}I_{0})}$$

By trial and error, $I_0 \approx 0.97 \text{ mA}$ Rs is the equivalent resistance looking into the base of Q_2

$$R_{S} = \frac{2}{gm} = 2 \frac{V_{T}}{I_{IN}} = 52 \cdot \Omega << T_{II}$$
Where $T_{III} = 2.6 \text{ kg} \cdot \Omega \cdot \Omega = \frac{1}{26} \text{ T}$

$$R_{O} = T_{O3} \left(1 + \frac{g_{M3}R_{2}}{1 + g_{M3}R_{2}}\right) = 3.2 \text{ Mg}$$
Where, $T_{O3} = \frac{V_{A}}{T_{A}} = 130 \text{ kg}$

$$\frac{4.26}{R_1 \leq loke} \qquad V_{CC} = 15V$$

$$Q_2$$

$$R_2 = 1 kn$$

$$S = \frac{V_{CC}}{I_{OUT}} \frac{\partial I_{OUT}}{\partial V_{CC}}$$

For this circuit

$$I_{OUT} \approx \frac{V_{BE_1}}{R_2}$$

$$I_{C_1} = \frac{V_{CC} - V_{BE_1} - V_{BE_2}}{R_1} \text{ and }$$

$$V_{BE_1} = V_T \ln \frac{I_{C_1}}{I_S}$$

$$I_{OUT} = \frac{V_T}{R_2} \ln \frac{V_{CC} - V_{BE_1} - V_{BE_2}}{I_s R_1}$$

If VBE (on) << Vcc then,

$$\frac{\partial I_{OUT}}{\partial V_{CC}} \approx \frac{V_T}{R_2} \frac{I}{V_{CC} - V_{BE_1} - V_{BE_2}}$$

and
$$S = \frac{V_{CC}}{I_{OUT}} \frac{V_T}{R_2} \frac{1}{V_{CC} - V_{BE_1} - V_{BE_2}}$$

$$I_{c_1} \approx \frac{15-0.7-0.7}{10} = 1.36 \text{ mA}$$

$$V_{BE_1} = 26 \text{ ln } \frac{1.36 \times 10^{-3}}{5 \times 10^{-5}} \text{ mV}$$

= 0.685 V

$$I_{OUT} = \frac{0.685}{1} = 0.685 \text{ mA}$$

$$5 = \frac{15}{0.685 \times 10^{-3}} \frac{26 \times 10^{-3}}{1000} \frac{1}{13.6} = 0.04$$

From
$$(4.245)$$
,

 $V_{BE(on)} = V_T \ln I_1 T^{-r} E e^{V_{CO/V_T}}$

Put $I_1 = I_o [1 - K_1(T - T_o)]$

where $K_1 = 1500 \times 10^{-6}$
 $V_{BE(on)} = V_T [\ln \{I_o[1 - K_1(T - T_o)]\}\}$
 $- \chi \ln T + \ln E + \frac{V_{CO}}{V_T}]$
 $= V_{CO} - V_T [\chi \ln T - \ln E - \ln I_o - \ln \{1 - K_1(T - T_o)\}\}]$
 $\simeq V_{CO} - V_T [\chi \ln T - \ln E I_o] - V_T K_1(T - T_o)$

Using $\ln (1 + \chi) \approx \chi$,

Now, $V_{OUT} = V_{BE(on)} + KV_T$
 $V_{OUT} = V_{CO} - V_T \chi \ln T + V_T (K + \ln E I_o) - V_T K_1(T - T_o)$
 $= V_T (T - T_o) \rightarrow 0$
 $= V_T (T - T_o) \rightarrow 0$

$$\frac{V_{T_o}}{T_o} \left(K + Ln EI_o \right) - \frac{V_{T_o}}{T_o} Y Ln T_o - \frac{V_{T_o}}{T_o} Y$$
$$- V_{T_o} K_i = 0$$

: $K + Ln EI_o = Y Ln T_o + Y + K_1 T_o \rightarrow 2$ (2) \rightarrow 1) gives,

$$V_{OUT} = V_{GO} + V_{T} % ln \frac{T_{O}}{T} + V_{T} Y_{-} V_{T} k_{I} (T_{-} 2T_{o})$$
At $T_{-} T_{O}$, $V_{OUT} = V_{GO} + V_{TO} & + V_{TO} K_{I} T_{O}$

If $T_{O} = 298^{\circ} K$, $K_{I} = 1500 \times 10^{-6}$
 $V_{TO} = 26 \text{ mV}$, $V_{GO} = 1.205 \text{ V}$

$$V_{OUT} = 1.205 + 3.2 \times 26 \times 10^{-3} + 26 \times 10^{-3} \times 1500 \times 10^{-6} \times 298$$
$$= 1.2996 \text{ V}$$

For zero
$$TC_F$$
 of V_{OUT} at 25°C
We require $V_{OUT} = 1.262 \text{ V}$
 $V_{OUT} = V_{BE_1} + \frac{R_2}{R_3} \left(V_{BE_1} - V_{BE_2} \right)$
 $= V_{BE_1} + 0.1 \frac{R_2}{R_3}$
If $I_1 = 200 \text{ MA}$, then

$$V_{BE_1} = V_T \ln \frac{200 \times 10^{-6}}{5 \times 10^{-15}} = 0.635 V$$

$$1.262 = 0.635 + 0.1 \frac{R_2}{R_3}$$

$$\therefore \frac{R_2}{R_3} = 6.27 \longrightarrow \bigcirc$$

Also,
$$R_1 = \frac{V_{OUT} - V_{BE_1}}{I_1} = \frac{1.262 - 0.635}{200 \times 10^{-6}}$$

= 3.135 k.D.

NOW,
$$V_{BE_2} = V_{BE_1} - 0.1 = 0.535 \text{ V}$$

$$\therefore I_2 = I_s e^{V_{BE_2}/V_T} = 5 \times 10^{15} e^{535/26}$$

$$= 4.32 \, \mu A$$

$$R_2 + R_3 = \frac{1.262 - 0.535}{4.32 \times 10^{-6}} = 168.3 \text{ K}\Omega$$

From (1), $R_2 = 6.23 R_3$

:
$$R_3 = 23.1 \text{ k}\Omega$$
 , $R_2 = 145.2 \text{ k}\Omega$

$$V_{EB_2} = V_T \ln \frac{I_{c_2}}{I_{s_2}} = V_T \ln \frac{I_{E_2}}{I_{s_2}}$$
(because base current is ignored)

$$I_{E_2} = \frac{\Delta V_{EB}}{R_3}$$

Now double I_{S_1} and I_{S_2} . ΔV_{EB} is constant. See (4.272). Therefore, I_{E_2} and I_{c_2} are constant. So, V_{EB_2} changes by $V_7 \ln \frac{1}{2} = -18 \text{ mV}$ From (4.248), $V_{EB_2} = V_{GO} - V_T [(Y-K) \ln T - \ln (EG)]$

$$\frac{dV_{EB_{2}} - V_{T}(Y-K)_{-}(Y-K)_{$$

under nominal conditions, the slope of the V_{EB} term and the slope of the ΔV_{EB} term at the output are set equal in magnitude and opposite in polarity at 25°C to set $TC_F=0$. However, under the specified conditions, V_{EB_2} has fallen by IB mV, and its slope has fallen by IB mV, IB mV

$$=\frac{18}{298}=60 \text{ AV/}_{K}=60 \text{ AV/}_{C}$$

since V_{EB_2} contributes directly to the output (see 4.266), the output slope changes by the same amount.

Therefore,
$$\frac{dV_{av}}{dT} = -60 \, \text{MV/}_{\text{C}}$$

4.30

With Is, and Is, adjusted from the nominal value but the gain equal to the nominal value, SPICE gives

With the gain readjusted so that $V_{OUT} = target$ at 25°C,

$$\frac{dV_{out}}{dT}\bigg|_{T=25^{\circ}C} = 0$$

Therefore, the case of $I_s \neq$ nominal can be corrected by trimming the gain to set the output equal to the target

0. 8.6891E+16 1.0861E+16

$$V_{R_3} = V_{EB_1} - V_{EB_2}$$

Therefore,

$$V_{OUT} = V_{EB_2} + V_{EB_1} - V_{EB_2} + V_{R_2}$$

$$V_{OUT} = V_{EB_1} + \frac{R_2}{R_3} \Delta V_{EB}$$

$$V_{OUT} = V_{EB_1} + KV_T$$
 where $K \times \frac{R_2}{R_3}$

Therefore, if R3 is 1% low, then

Thus,

$$\frac{dV_{out}}{dT}\bigg|_{T=T_o} = 0.01 \text{ K } \frac{V_{T_o}}{T_o}$$

$$\frac{... \frac{dV_{out}}{dT}}{|T=T_{o}|} = 0.01 \frac{0.66}{298^{\circ} K}$$

$$= 22 \frac{MV_{o}}{c}$$

(a)
$$I_{C_2} = \frac{V_{BE_1} - V_{BE_2}}{R_3}$$

Negative feed back forces

$$V_{C_2} = V_{BE_1} - V_{OS}$$

$$V_{OUT} = V_{BE_1} - V_{OS} + (V_{BE_1} - V_{BE_2}) \frac{R_2}{R_3}$$

Therefore, the output-referred offset is equal to -Vos here From (4.271),

$$\frac{dV_{OUT}}{dT}\bigg|_{T=T_{O}} = -\frac{V_{OS}(OUT)}{T_{O}}$$

$$\frac{dV_{OUT}}{dT}\Big|_{T=298^{\circ}K} = \frac{30 \text{ mV}}{298} = 101 \text{ MV/c}$$

(b) Vos > 0 reduces Vout so pick

R₂ too big. This magnifies the

△V_{BE} term, ∴ △Vout > 0

$$\frac{4.33}{V_{GS}} = V_{t} + V_{ov}$$

$$V_{GS} = V_{t} (T = 298^{\circ} K) - M \Delta T + \sqrt{\frac{2I}{x'(T = 298^{\circ} K)(\frac{T}{298})^{n} \frac{W}{L}}}$$

$$\frac{dV_{GS}}{dT} = -M + V_{OV}(T = 298^{\circ}k) \frac{n}{2} \left(\frac{T}{298}\right)^{\frac{n}{2} - 1} \frac{1}{298} = 0$$

$$\frac{2I}{K'(T=298^{\circ}K)\frac{W}{L}} \frac{n}{2} \left(\frac{T}{298}\right)^{\frac{n}{2}-1} \frac{1}{298} = m$$

$$\sqrt{\frac{W}{L}} = \sqrt{\frac{2I}{x'(T=298)^{k}}} \left(\frac{n}{2m \ 298}\right) \left(\frac{T}{298}\right)^{\frac{n}{2}-1}$$

$$\frac{W}{L} = \frac{2I}{x'(T=298^{\circ}k)} \left[\frac{\eta}{2m(298)} \left(\frac{T}{298} \right)^{2(\frac{\eta}{2}-1)} \right]$$

Make
$$\frac{dV_{6s}}{dT} = 0$$
 at $T = 298$ °k

$$\frac{W}{L} = \frac{2I}{\chi'(T=296^{\circ}k)} \left[\frac{n}{2m(298)} \right]^{2}$$

$$= \frac{2(200)}{104} \left[\frac{1.5}{2(0.002)(298)} \right]^{2}$$

Since
$$M_3 = M_4$$
, $|I_{D_3}| = |I_{D_4}| = I_{D_1}^2$

$$I_{D_2} = I_{B|AS}$$

$$I_{B|AS}R = V_{6S_1} - V_{6S_2}$$

$$I_{B|AS} = \frac{1}{R} \left(V_{+_1} - \sqrt{\frac{I_{B|AS}}{\frac{\mathcal{U}_h C_{OX}}{2} \left(\frac{W}{L} \right)_1}} - V_{+_2}$$

$$- \sqrt{\frac{I_{B|AS}}{\frac{\mathcal{U}_h C_{OX}}{2} \left(\frac{W}{L} \right)_2}}$$

Ignoring body effect,

$$V_{t_1} = V_{t_2}$$

$$I_{BIAS} = \frac{1}{R} \sqrt{\frac{2 I_{BIAS}}{\mathcal{A}_{In} C_{ox}}} \left(\sqrt{\left(\frac{L}{N}\right)_{I}} - \sqrt{\left(\frac{L}{W}\right)_{2}} \right)$$

$$\therefore I_{BIAS} = \frac{2}{R^2 \mathcal{A}_{In} C_{ox}} \left(\sqrt{\left(\frac{L}{W}\right)_{I}} - \sqrt{\left(\frac{L}{W}\right)_{2}} \right)^2$$

$$\frac{1}{I_{BIAS}} \frac{dI_{BIAS}}{dT} = \frac{-1}{\mu_n} \frac{d\mu_n}{dT} - \frac{2}{R} \frac{dR}{dT}$$

$$(4.243), \quad \mu_n \times T^{-n}$$

Here $H_{\mathbf{z}}$ is the mobility of the specific doping material used for the resistor. The above two terms tend to cancel each other.

small- signal model KCL: $i_x = \frac{V_1 - V_{dd}}{r} + V_1 gm_1$ $\rightarrow V_1 \left(\frac{1}{r_{a2}} + g_{m_1} \right) = i_x + \frac{V_{ad}}{r_{a2}}$ $V_2 = V_{dd} - \frac{1}{4} = V_R + V_{r_{\delta_2}}$ = $i_x R + [i_x - g_{m_1}(V_1 - V_R)] r_{02}$ $\sqrt{ad} - \frac{1x}{gm} = i_x R + i_x r_{02} - gm_2 r_{02} V_1 + gm_2 r_{02} i_x R$ $V_{dd} = \frac{1}{x} (R + r_{o2} + g_{m_2} r_{o2} + \frac{1}{g_{m_2}})$ $-\frac{g_{m_2}r_{o_2}(i_x+V_{ad/r_{o_3}})}{g_{m_1}+i_{o_3}}$ $V_{ad}\left(1+\frac{g_{m_2}r_{o_2}}{1+g_{m_1}r_{o_3}}\right)=i_x(R+r_{o_2}+r_{o_3}+r_{o$ gm2 roz R + 1/- gm2 roz ros) Assume roz = ros, $\frac{l_{bias}}{V_{dd}} = \frac{l_{x}}{V_{dd}} = \frac{l_{+} \frac{gm_{2}}{gm_{z}} r_{02}(R-l_{-})}{gm_{z} r_{02}(R-l_{-})}$

$$\frac{4.36}{\left(\frac{W}{L}\right)_{1}} = \frac{100 \text{ 4m}}{1 \text{ 4m}} \left(\frac{W}{L}\right)_{2} = \frac{50 \text{ 4m}}{1 \text{ 4m}}$$

Ignore channel length modulation

for top mosfet current mirror.

Then
$$|I_{D_3}| = |I_{D_4}|$$
 and $I_{D_1} = I_{D_2}$
Also ignore base currents $|I_{c_1}| = |I_{c_2}|$
 $V_{GS_1} + V_T \ln \frac{|I_{C_1}|}{I_{S_1}} = V_{GS_2} + V_T \ln \frac{|I_{C_2}|}{I_{S_2}}$

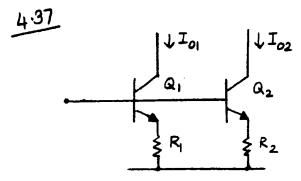

$$V_{GS_2} - V_{GS_1} = V_T \ln \frac{I_{c_1}}{I_{c_2}} \frac{I_{S_2}}{I_{S_1}} = 4 \ln 10$$

Neglect body effect, V+, = V+2

$$\int \frac{2 I_{C_{1,2}}}{u_{n} C_{ox}} \left(\sqrt{\left(\frac{L}{N}\right)_{2}} - \sqrt{\left(\frac{L}{N}\right)_{1}} \right) = V_{7} \ln 10$$

$$I_{c_{1,2}} = \left(\frac{V_r \ln 10}{\sqrt{L_0} - \sqrt{L_0}}\right)^2 \frac{\mu_n c_{ox}}{2} = 203 \, \mu_A$$

                                                                                            VCC
                                                                  INPUT RESISTANCE AT
                                                                                                       = 5.445E+03
                                                                                                      = 3.410E+04
                                                                  CHIPPIPE RESISTANCE AT I(VIBIAS)
```

$$R = \frac{1}{2} (R_1 + R_2), I_c = \frac{1}{2} (I_{01} + I_{02})$$

$$\frac{\Delta I_c}{I_c} = \frac{1}{1 + g_m R} \frac{\Delta I_s}{I_s} + \frac{g_m R}{K} \left[-\frac{\Delta R}{R} + \frac{\Delta K}{K} \right]$$

$$\approx \frac{1}{1+g_{m}R} \frac{\Delta I_{s}}{I_{s}} + \frac{g_{m}R}{1+g_{m}R} \left[-\frac{\Delta R}{R} \right]$$

$$\rightarrow 0$$

We want
$$\Delta I_c = 0.01$$

Now
$$\Delta I_s = \Delta V_{BE} = \frac{2}{26} = 0.077$$

$$\frac{\Delta R}{R} = 0.005$$

: Worst case in (1)

$$0.01 = \frac{1}{1+x}(0.077) + \frac{x}{1+x}(0.005)$$

where $x = g_m R$. Solve for X.

$$x = g_m R = 13.4$$

$$\frac{9 \text{ IcR}}{\text{KT}} = 13.4$$

$$V_{OS} = V_T \left[\frac{\Delta I_{SP}}{I_{SP}} - \frac{\Delta I_{SN}}{I_{SN}} + \frac{2}{\beta_F} \right]$$

Worst case is,

$$V_{os} = 26 (0.05 + 0.05 + \frac{2}{15}) \text{ mV}$$
 $V_{ov_N} = \sqrt{\frac{2 (I_{TAIL}/2)}{x'_N (W_L)_N}}$
= 6.1 mV

If Q3 and Q4 have emitter resistors Ra and R4, then

$$\frac{I_{C_3}}{\kappa_3} R_3 + V_{BE_3} = \frac{I_{C_4}}{\kappa_4} R_4 + V_{BE_4} \qquad |V_{OVP}| = \sqrt{\frac{2(I_{TAIL/2})}{\kappa_P(M_L)_P}}$$

From (4.296), the mismatch in

Ica and Icu is

$$\frac{\Delta I_c}{I_c} \simeq \frac{1}{1+g_m R} \frac{\Delta I_s}{I_s} + \frac{g_m R}{1+g_m R} \left[\frac{-\Delta R}{R} + \frac{\Delta K}{A} \right]$$

$$= \frac{1}{1+\frac{50 \times 10^{-6} (2000)}{26 \times 10^{-3}}} (0.05)$$

$$+ \frac{3.85}{1+3.85} \left[0.005 + \frac{0.1}{15} \right]$$

(Using
$$\frac{\Delta \kappa}{\kappa} = \frac{1}{\beta} \frac{\Delta \beta}{\beta}$$
)

Thus,
$$\Delta I_c = 1.96 \times 10^{-2}$$

Again using (4.315) with

$$\frac{\Delta I_{sp}}{I_{sp}} = \frac{\Delta I_c}{I_c} = 1.96 \times 10^{-2}$$

We have

$$V_{oS} = 26 \left[0.0196 + 0.05 + \frac{2}{15} \right] \text{ mV}$$

= 5.3 mV

$$V_{OS} = V_{t_1} - V_{t_2} + \frac{V_{OV_N}}{2} \left[\frac{V_{t_3} - V_{t_4}}{\frac{|V_{OV_P}|}{2}} + \frac{\Delta (W_L)_P}{(W_L)_P} - \frac{\Delta (W_L)_N}{(W_L)_N} \right]$$

$$V_{OV_N} = \sqrt{\frac{2(I_{TAIL}/2)}{x'_N(W_L)_N}}$$

$$(W_L)_N = \frac{(W_L)_1 + (W_L)_2}{2} = 10$$

$$V_{\rm OV_N} = \sqrt{\frac{100 \, \text{M}}{194 \, \text{M} (10)}} = 227 \, \text{mV}$$

$$({}^{\text{W}}_{\text{L}})_{p} = \underline{({}^{\text{W}}_{\text{L}})_{3} + ({}^{\text{W}}_{\text{L}})_{4}} = 30$$

$$V_{OV_p} = \sqrt{\frac{100 \text{ M}}{65 \text{ M} (30)}} = 227 \text{ mV}$$

worst case is:

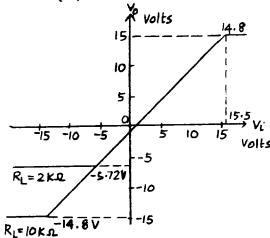

$$V_{OS} = 10 \text{ mV} + \frac{227 \text{ mV}}{2} \left[\frac{20 \text{ mV}}{227 \text{ mV}} + 0.05 + 0.05 \right]$$
$$= 10 \text{ mV} + 113 \text{ mV} (0.188) = 31.4 \text{ mV}$$

CHAPTER 5

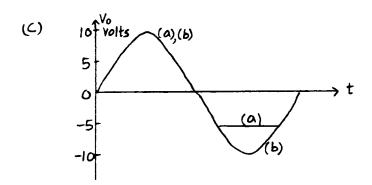

$$I_{R} = \frac{V_{CC} - V_{BE_{3}}}{R_{3}} = \frac{15 - 0.7}{5k} = 2.86 \text{ mA}$$

Thus, I = 2.86 mA

(b) $I_a R_L = 2.86 \times 10 = 28.6 \text{ V}$ Thus, the lower limit on V_o is $(-V_{cc} + V_{ce})$

TOTAL HARMONIC DISTORTION = 1.270E-01 PERCENT

2.000E+04 1.361E-03 1.368E-04 -4.854E+01 -4.853E+01 3.000E+04 5.184E-03 5.210E-04 1.545E+02 1.545E+02 4.000E+04 6.781E-05 6.815E-06 2.441E+01 2.441E+01 5.000E+04 3.059E-03 3.075E-04 1.394E+02 1.394E+02 6.000E+04 9.325E-06 9.372E-07 -1.650E+01 -1.650E+01 7.000E+04 1.951E-03 1.961E-04 -1.577E+02 -1.577E+02 8.000E+04 6.078E-05 6.109E-06 -2.101E+01 -2.100E+01 9.000E+04 1.086E-02 1.091E-03 -1.996E+01 -1.996E+01

$$\frac{R_{L} = 10 \text{ kg}}{\hat{V}_{om}} = \frac{V_{cc} - V_{cE}}{V_{cE}} = 14.8 \text{ V}$$

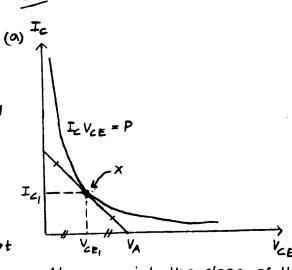

$$\hat{I}_{om} = \frac{\hat{V}_{om}}{R_{L}} = \frac{14.8}{10} = 1.48 \text{ mA}$$

$$P_{L} = \frac{1}{2} \times 14.8 \times 1.48 = 11.0 \text{ mW}$$

(c)
$$\frac{R_L = 2K\Omega}{\eta} = \frac{P_L}{P_{SUPPLY}} = \frac{8.2}{2 \times 42.9} = 9.6\%$$
 $R_L = 10 K\Omega$
 $\eta_c = \frac{11}{2 \times 42.9} = 12.6\%$

(d) For maximum efficiency, $R_L = \frac{V_{CC} - V_{CE(Sat.)}}{I_0} = \frac{14.8}{2.86} \text{ k.s.}$ = 5.17 Kg $P_{L} = \frac{1}{2} \frac{\hat{V}_{am}^{2}}{R_{L}} = \frac{1}{2} \frac{(14.8)^{2}}{5.18} mW = 21.1 mW$ $I_{C_{1}} = \frac{10.35 \text{ V}}{2 \text{ k.s.}} = 5.18 \text{ mA}$ $\therefore P_{C_{1}} = 10.35 \times 5.18 = 53.6 \text{ mW}$

At any point the slope of the hyperbola is

$$\frac{dI_c}{dV_{ce}} = \frac{d}{dV_{ce}} \frac{P}{V_{ce}} = \frac{-P}{V_{ce}} = \frac{-I_c}{V_{ce}}$$

At X,
$$\frac{dI_c}{dV_{ce}} = \frac{-I_{ci}}{V_{ce_i}}$$

The slope of the tangent is thus $+\frac{-I_c}{V_{ce}}$, and thus

$$\frac{-I_c}{V_A - V_{ce_i}} = \frac{-I_{c_i}}{V_{ce_i}}$$

:. x is the midpoint of the tangent

(b) Maximum dissipation occurs at midpoint of the load line R = 2 Ks. Midpoint is where $V_{CE_1} = \frac{20.7}{2} = 10.35 \text{ V}$

corresponding current is

$$I_{c_1} = \frac{10.35 \,\text{V}}{2.10} = 5.18 \,\text{mA}$$

Mid-point is where

$$V_{ce_1} = \frac{1}{2} (15 + 2.86 \times 10) = 21.8 \text{ V}$$

corresponding current is

$$I_{c_1} = 2.86 - \frac{21.8 - 15}{10} = 2.18 \text{ mA}$$

(c) since V_{cc} is constant, the average power drawn from the supplies is independent of signal level and equals $2 V_{cc}I_a$. Thus, average power dissipated in $Q_1 + average$ power dissipated in $R_L = V_{cc}I_a$. Thus, the average

power in Q1 = Vcc IQ - 1 Vom = Pav

$$R_L = 2K\Omega$$
 $P_{av} = 42.9 - 8.2 = 34.7 \text{ mW}$

$$\frac{R_{L} = 2 \, \text{k}\Omega}{\hat{I}_{om} = 2.86 \, \text{mA}, \, \hat{V}_{om} = 5.72 \, \text{V}}$$

: base current of Q₁ has a peak signal value = $\frac{1}{B} \hat{I}_{om} = 0.0286 \text{ mA}$ Since Voltage gain is unity, peak input voltage = \hat{V}_{om}

: average signal power delivered is
$$P_i = \frac{1}{2} \times 0.0286 \times 5.72 \text{ mW}$$

Powergain =
$$\frac{P_L|_{MAX}}{P_i} = \frac{8.2}{0.082}$$

= 100

$$\frac{R_{L} = 10 \text{ K}\Omega}{\frac{1}{\beta} \hat{I}_{om}} = \frac{1.48}{100} = 0.0148 \text{ mA}$$

$$\hat{V}_{om} = 14.8 \text{ V}$$

$$P_1 = \frac{1}{2} \times 0.0148 \times 14.8 = 0.11 \text{ mW}$$

$$\hat{V}_{o} = |V|$$
; $\hat{I}_{o} = \frac{\hat{V}_{om}}{R_{L}} = \frac{1}{2} mA$

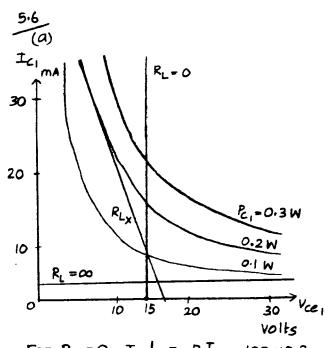

$$I_{Q} = 2.86 \text{ mA}$$

Quiescent

$$A_{V_Q} = \frac{R_L}{R_L + \frac{1}{g_m}} = \frac{2000}{2000 + 9 \cdot 1} = 0.9955$$

$$\frac{V_0 = IV}{A_V} = \frac{I_c}{2000} = 0.9962$$

$$\frac{V_0 = -1V}{A_V} = \frac{I_C = 2.36 \text{ m A}}{2000} = 0.9945$$

For
$$R_L = 0$$
, $I_{C_1} = \beta I_{B_1} = 100 \times 0.3$
= 30 mA

 $R_L = \infty$ has max. value of P_{c_1} of approx. 0.1 W at $V_{ce_1} = 30 \text{ V}$

(b) From the graph $R_L = R_{L_X}$ is the minimum value of R_L for $P_C < 0.2W$ This has a value $R_{L_X} \cong 310 \text{ s}$

$$A_V = \frac{g_m}{g_m + g_{mb}} = \frac{1}{1 + x}$$
From (1.200), $x = \frac{x}{2\sqrt{2\phi_f + V_{SB}}}$

(a) When
$$V_i = \max$$

From (5.62),
 $V_0 = -3.1 + (-0.25 + \sqrt{0.25^2 + 0.5 - 0.8 + 0.5 \sqrt{0.6} + 3.1})^2$

$$= -0.68906 V$$

$$V_{SB} = -0.68906 + 2.5 = 1.81094 V$$

$$X^{+} = \underline{0.5} = 0.16101$$

$$2\sqrt{0.6 + 1.81094}$$

$$A_{V}^{+} = \underline{1} = 0.86132$$

$$1 + 0.16101$$

(b) When $V_1 = 0$, From (5.62), $V_0 = -3.1 + (-0.25 + \sqrt{0.25^2 - 0.8 + 0.5} \sqrt{0.6 + 3.1})^2$ = -1.11683 V $V_{SB} = -1.11683 + 2.5 = 1.38317 \text{ V}$ $X_Q = \frac{0.5}{2\sqrt{0.6 + 1.38317}} = 0.17753$ $AV_Q = \frac{1}{2\sqrt{0.6 + 1.38317}} = 0.84923$

(c) When Vi = min

From (5.62),

$$V_{o} = -3.1 + (-0.25 + \sqrt{0.25^{2} - 0.5 - 0.8 + 0.5 \sqrt{0.6 + 3.1}})^{2}$$

$$= -1.53767 V$$

$$V_{58} = -1.53767 + 2.5 = 0.96233 V$$

$$X^{-} = \frac{0.5}{2\sqrt{0.6 + 0.96233}} = 0.20001$$

$$A_{V} = \frac{1}{1 + 0.20001} = 0.83333$$

$$(a) \quad v_0 = a_1 v_1^2 + a_2 v_1^2 + a_3 v_1^3 + \dots$$

$$A_V = \frac{dv_0}{dv_i} = a_1 + 2a_2 v_1^2 + 3a_3 v_1^2 + \dots$$

(b) Let
$$v_i = \hat{v}_i \sin \omega t$$

 $A_v^+ = a_1 + 2a_2 \hat{v}_i + 3a_3 \hat{v}_i^2 + \cdots$
 $A_{v_Q}^- = a_i$
 $A_v^- = a_1 - 2a_2 \hat{v}_i + 3a_3 \hat{v}_i^2$

(c)
$$E^{\dagger} = \frac{A_{v}^{\dagger} - A_{v_{0}}}{A_{v_{0}}} = \frac{2a_{2}\hat{v}_{i} + 3a_{3}\hat{v}_{i}^{2}}{a_{1}}$$

$$E^{-} = \frac{A_{v}^{-} - A_{v_{0}}}{A_{v_{0}}} = \frac{-2a_{2}\hat{v}_{i} + 3a_{3}\hat{v}_{i}^{2}}{a_{1}}$$

$$E^{\dagger} + E^{-} = \frac{6a_{3}\hat{v}_{i}^{2}}{a_{1}}$$

$$E^{\dagger} - E^{-} = \frac{4a_{2}\hat{v}_{i}}{a_{1}}$$

(d) From (5.54),
$$H_{D_2} = \frac{1}{2} \frac{a_2}{a_1} \hat{v}_i$$

$$= \frac{E^+ - E^-}{8}$$
From (5.57), $H_{D_3} = \frac{1}{4} \frac{a_3}{a_1} \hat{v}_i^2 = \frac{E^+ E^-}{24}$

(e)
$$E^{+} = \frac{A_{V}^{+} - Av_{Q}}{Av_{Q}} = \frac{0.86132 - 0.84923}{0.84923}$$

$$= 0.01423$$

$$E^{-} = \frac{A_{V}^{-} - Av_{Q}}{Av_{Q}} = \frac{0.83333 - 0.84923}{0.84923}$$

$$= -0.01872$$

$$H_{D_{2}} = \frac{E^{+} - E^{-}}{8} = \frac{0.01423 + 0.01872}{8}$$

$$= 0.00412$$

$$H_{D_3} = \frac{E^+ + E^-}{24} = \frac{0.01423 - 0.01872}{24}$$
$$= -1.87 \times 10^{-4}$$

Example gives,

$$H_{D_2} = 0.0040$$
 $H_{D_3} = -1.8 \times 10^{-4}$

$$V_{1N} + V_{in} + V_{out} + V_{out$$

$$V_{BE_3} = V_{BE_4} = 659 \text{ mV}$$

$$\vdots I_{C_2} = 10^{-15} e^{536/26} = 0.9 \text{ MA}$$

$$V_i = V_0 + V_{BE_2} = 5 - 0.536 = 4.46 V$$

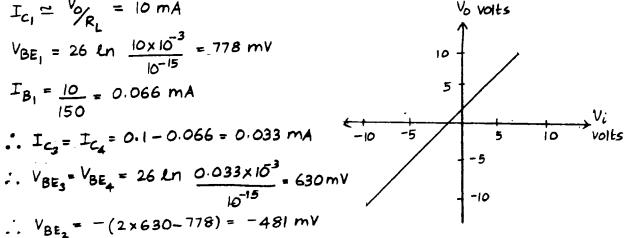

$$V_i = V_0 + V_{BE_2} = -10.78 V$$

$$V_0 = 10 V$$

$$I_{C_1} = V_0 + V_{BE_2} = -10.78 V$$

$$V_0 = 10 V$$

$$V_0 = 10$$

5.14

(a)
$$R_L = 10 \text{ K.s.}$$
 $V_0 = -V_{CC} + V_{CE_3}(\text{sat.})^+ V_{be_2}$
 $= -15 + 0.2 + 0.7 = -14.1 \text{ V}$
 $V_0^{\dagger} = \frac{V_{CC} - V_{bel}}{1 + \frac{R_l}{\beta_1 R_L}} = \frac{15 - 0.7}{1 + \frac{20}{50 \times 10}} = 13.8 \text{ V}$

$$\frac{R_{L} = 2 \, \text{K} \Omega}{V_{0}^{-} = -14.1 \, \text{V}}$$

$$V_{0}^{+} = \frac{15 - 0.7}{1 + \frac{20}{100}} = 11.9 \, \text{V}$$

(b)
$$\frac{R_L = 10 \text{ K.s.}}{P_L |_{MAX}} = \frac{1}{2} \frac{\hat{V}_0^2}{R_L} = \frac{1}{2} \frac{13.8^2}{10} = 9.52 \text{ mW}$$

$$I_{Supply} = \frac{1}{\pi} \frac{\hat{V}_0}{R_L} = \frac{1}{\pi} \frac{13.8}{10} = 0.44 \text{ mA}$$

Psupply =
$$2 \times 15 \times 0.44 = 13.2 \text{ mW}$$

 $\eta_c = \frac{9.52}{13.2} = 72.1 \%$

Average power dissipated perdevice

$$= \frac{1}{2} (P_{SUPP} | y^{-P_L})$$

$$= \frac{1}{2} (13.2 - 9.52) = 1.84 \text{ mW}$$

$$\frac{R_{L} = 2 \, \text{k} \, \Omega}{P_{L} \Big|_{MAX} = \frac{1}{2} \frac{11.9^{2}}{2} = 35.4 \, \text{mW}}$$

$$I_{\text{supply}} = \frac{1}{\pi} \frac{11.9}{2} = 1.89 \text{ mA}$$

Psupply = 2 x 15 x 1.89 = 56.8 mH

$$\eta_c = \frac{35.4}{56.8} = 62.3\%$$

Average power dissipated per device $=\frac{1}{2} \times (56.8 - 35.4) = 10.7 \text{ mW}$

(a)
$$R_L = 10 \text{ K}\Omega$$

 $V_0 = -V_{CC} + V_{CE_{17}(sat.)} + V_{be_{23}} + V_{be_{20}}$
 $= -15 + 0.2 + 0.7 + 0.7 = -13.4 \text{ V}$
 $V_0^+ = V_{CC} - V_{CE_{13}A(sat.)} - V_{be_{14}}$
 $= 15 - 0.2 - 0.7 = 14.1 \text{ V}$
 $R_L = 1 \text{ K}\Omega$

$$R_{L} = 1 K\Omega$$

$$V_{A}^{-} = -13.4 V$$

For positive outputs, Q14 is limited to a current

$$V_0^+ = 44 \times 0.2 = 8.8 \text{ V}$$

$$P_{L}|_{MAX} = \frac{1}{2} \frac{\hat{V}_{0}^{2}}{R_{L}} = \frac{1}{2} \frac{13.4^{2}}{1} = 89.8 \text{ mW}$$

$$I_{\text{SUPPly}} = \frac{1}{\pi} \frac{\hat{V}_0}{R_L} = \frac{1}{\pi} \frac{13.4}{1} = 4.27 \text{ mA}$$

Peak dissipation occurs for

$$V_0 = V_{ce} = \frac{V_{cc}}{2} = 7.5 \text{ V}$$

$$I_C = \frac{V_o}{R_i} = 7.5 \text{ mA}$$

5.16

(a) Peak device dissipation =
$$\frac{v_{cc}^2}{4R_L}$$

Put $\frac{V_{cc}^2}{4R_L} = 100 \times 10^{-3}$
 $\therefore R_L = \frac{15^2}{400 \times 10^{-3}} = 563 \Omega$

MAX. $P_L = \frac{1}{2} \frac{\hat{V}_0^1}{R_L} = \frac{1}{2} \frac{13 \cdot 4^2}{0.563} = 160 \text{ mW}$
 $I_{Supply} = \frac{1}{\pi} \frac{\hat{V}_0}{R_L} = \frac{1}{\pi} \frac{13 \cdot 4}{0.563} = 7.58 \text{ mA}$

Psupply = $30 \times 7.58 = 227 \text{ mW}$
 $\eta_c = \frac{160}{227} = 70.4\%$

(b) $\frac{V_{cc}^2}{227} = 200 \times 10^{-3}$
 $\downarrow R_L = 282 \Omega$

However for this value of R_L , the output current is limited

 $I_0|_{max} = \beta_{14} \times 0.22 = 44 \text{ mA}$
 $\therefore V_0^+ = 0.282 \times 44 = 12.4 \text{ V} = \hat{V}_0$
 $\therefore P_L = \frac{1}{2} \frac{\hat{V}_0^2}{R_L} = 273 \text{ mW}$
 $\downarrow I_{cl}$
 $\downarrow I_$

Max. P_L occurs as shown above where $R_L = \frac{13.4}{44} = 304.\Omega$ (note: Max. device dissipation is less than 200 mW)

... $P_L = \frac{1}{2} \frac{\hat{V}_0^2}{R_L} = \frac{1}{2} \frac{13.4^2}{304} = 295 \text{ mW}$ $T_{\text{supply}} = \frac{1}{17} \frac{\hat{V}_0}{R_L} = 14.0 \text{ mA}$ Psupply = $14.0 \times 30 = 420 \text{ mW}$ $\eta_C = \frac{295}{420} = 70\%$

5.17

$$V_0 = -10V$$
, $R_L = 1 \text{ K.D.}$
 $\therefore I_{C20} = -\frac{10}{1} = -10 \text{ mA}$
 $V_{BE}_{20} = -V_T \ln \frac{10^{-2}}{10^{-4}} = -718 \text{ mV}$
 $I_{C_{19}} = I_{C_{18}} = 0.22 \text{ mA}$
 $\therefore V_{BE_{19}} = V_{BE_{18}} = 619 \text{ mV}$
 $\therefore V_{BE_{14}} = 2 \times 619 - 718 = 520 \text{ mV}$

$$I_{C_{14}} = 10^{-14} e^{520/26} = 4.9 \text{ MA}$$

$$I_{C_{23}} = 0.22 \text{ mA} + I_{B_{20}} = 0.42 \text{ mA}$$

$$5.18$$

$$(a) V_0^+ = V_{CC} - V_{CE_3}(sat) - V_{be_5} - V_{be_4}$$

$$= 12 - 0.2 - 0.7 - 0.7 = 10.4 V$$

$$V_0^- = -V_{CC} + V_{CE_2}(sat) + V_{be_1} + V_{D_1}$$

$$= -12 + 0.2 + 0.7 + 0.7 = 10.4 V$$

(b) For
$$V_0 = 0$$
, D_1 , Q_4 and Q_5 are off $P_Q = 2 \times 12 \times 2 \text{ mW} = 48 \text{ mW}$

(c)
$$P_L \mid_{max} = \frac{1}{2} \frac{10.4^2}{8} = 6.76 \text{ W}$$
 $I_{supply} = \frac{1}{\pi} \frac{\hat{V}_0}{R_L} = \frac{1}{\pi} \frac{10.4}{8} = 414 \text{ mA}$

• $P_{supply} = 2 \times 12 \times 414 \times 10^{-3} = 9.94 \text{ W}$
 $P_{supply} + P_a = 9.99 \text{ W}$

5.19
(a)
$$V_0^{\dagger} = V_{CC} - V_{BE_2} - V_{CE_7}(sat.)$$

$$= 15 - 0.7 - 0.2 = 14.1 V$$

$$V_0^{-} = -V_{CC} + V_{CE_1}(sat.) + V_{BE_3}$$

$$= -15 + 0.2 + 0.7 = -14.1 V$$

(b)
$$I_{c_7} = 0.15 \text{ mA}$$

$$I_{c_5} = I_{c_6} \simeq 0.15 \text{ mA}$$

$$V_{BE_5} = V_{BE_6} = V_T \text{ Ln } \frac{0.15 \times 10^3}{10^{-14}} = 609 \text{ mV}$$

$$I_{c_1} \simeq 0.15 \text{ mA}$$

$$I_{C_{34}} = (\beta_4 + 1) I_{S_3} e^{-V_{BE34}} V_7$$

$$2 V_{BE6} = V_{BE2} - V_{BE34}$$

$$= V_7 \ln \frac{I_{C_2}}{I_{S_2}} + V_7 \ln \frac{I_{C_{34}}}{(\beta_4 + 1) I_{S_3}}$$

But $I_{c_{34}} = I_{c_2}$, because $V_0 = 0$

: 12 18 mV = 26 ln
$$I_{c_2}^2$$

 $I_{s_2}(\beta_4+1)I_{s_3}$

$$\frac{1218}{26} = \ln \frac{I_{c_2}^2}{10^{-14} \times 151 \times 10^{-15}}$$

$$I_{c_2} = 0.58 \text{ mA}$$

(c)
$$P_{c}|_{max} = \frac{V_{cc}^{2}}{4R_{L}} = 100 \times 10^{-3} \text{ W}$$

$$R_{L} = \frac{225}{0.4} = 563 \, \Omega$$

This requires $I_{c2(peak)} = \frac{|4\cdot|}{563} = 25 \text{ mA}$

But B2 x 0.15 = 150 x 0.15 = 22.5 mA

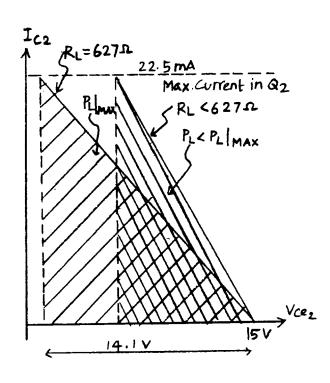

.. Q2 cannot supply this current max. power occurs when

$$\frac{14.1}{R_L} = 22.5 \text{ mA}$$

: RL = 627 12 - then Pc | ~ 100 mW

$$P_L = \frac{1}{2} \frac{\hat{V}_0^2}{R_L} = \frac{1}{2} \frac{1401^2}{627} = 159 \text{ mW}$$

Peak current in $Q_4 = 22.5 \text{ mA}$ Peak current in $Q_3 = 22.5 = 0.15 \text{ mA}$

5.20
(a) Bias
$$V_0 = 0$$

$$|I_{C_5}| = 100 \text{ MA}$$

$$|I_{C_6}| = 500 \text{ MA}$$

$$|I_{D_3}| = |I_{B_5}| + |I_{B_6}|$$

$$= \frac{600 \text{ MA}}{20} = 30 \text{ MA}$$

$$|I_{D_1}| = \frac{V_{BE_3}}{R_1} = \frac{0.8}{10 \text{ K}} = 60 \text{ MA}$$

$$I_{C_3} = 500 - 80 = 420 \text{ MA}$$

$$|I_{D_2}| = \frac{V_{BE_2}}{R_2} = \frac{0.8}{10 \text{ K}} = 80 \text{ MA}$$

$$|I_{D_2}| = \frac{V_{BE_2}}{R_2} = \frac{0.6}{10 \text{ K}} = 80 \text{ MA}$$

From kVL, $V_{6S_1} + V_{BE_1} = V_{6S_2} + V_{BE_3}$ (where $V_{6S_1} < 0$ and $V_{6S_2} < 0$) Since $I_{D_1} = I_{D_2}$, $V_{6S_1} = V_{6S_2}$ Then $V_{BE_1} = V_{BE_3}$ as expected Then $I_{C_1} = I_{C_3} = 420 \, \mu$ A and $I_{C_2} = I_{C_1} - |I_{D_2}| = 340 \, \mu$ A

(b) Maximum swing

$$V_o^+ = 5 - V_{BE_1} - V_{CE_6(Sat)} - |I_{C_6}R_4|$$

$$= 5 - 0.6 - 0.1 - 5004(100)$$

$$= 4.05 \text{ V}$$

Minimum swing

If
$$V_i = -5V$$
, Q_i is off
 $V_0 = V_i + V_{SG_2} = V_i + |V_{GS_2}|$
 $V_0 = V_i + |V_{t_2}| + |V_{GS_2} - V_{t_2}|$

If Mz operates in the active region,

$$|V_{GS_2} - V_{t_2}| = \sqrt{\frac{2|I_{D_2}|}{J < (W_{L})_2}}$$

$$= \sqrt{\frac{2(80)}{26(500)}} = 0.11 \text{ V}$$

and $V_o = -5 + 0.7 + 0.11 = -4.19V$ But then $V_{SD_2} = V_o - (-5 + V_{BE_2})$ $= V_o - (-5 + 0.8)$ $= V_o + 4.2$ = -4.19 + 4.2 = 0.01V

since V_{SD2} < | V_{GS2}-V+2 |,

Mz operates in the triode region

A quadratic equation could be solved to find V_{SD_2} , but it is not worth the trouble because V_0 is set mainly by the supply voltage and V_{BE_2}

For simplicity, assume $V_{SD_2} = 0.1 \text{ V}$ Then $V_0 = -5 + V_{BE_2} + V_{SD_2}$ = -5 + 0.8 + 0.1= -4.1 V

```

The negative Limit on Vo is reached when M6 reaches the edge of the active region

$$V_0^- - V_{SS} + V_{OV_6} + V_{Sg_2}$$

= $-V_{SS} + V_{OV_6} - V_{qS_2}$

and $V_{gS_2} < 0$, when M_2 conducts because M_2 is an enhancement-mode PMOs transistor.

5.22

$$2 \oint_{fp} = 650 \text{ mV}$$

$$2 \oint_{fp} = 750 \text{ mV}$$
Table (2.3)
$$\chi'_{n} = 127 \text{ MA/V}; \quad \chi'_{p} = 58 \text{ MA/V}$$

$$V_{tn} = 0.7 \text{ V}; \quad V_{tp} = -0.7 \text{ V}$$

$$C_{0x} = \frac{3.9 \times 8.854 \times 10^{-14}}{150 \times 10^{-8}} = 2.3 \frac{fF}{\text{Mm}^{2}}$$

$$\chi'_{n} = \sqrt{2(1.6 \times 10^{-19})} \frac{11.6 \times 8.86 \times 10^{-14} \times 4 \times 10^{15}}{2.3 \times 10^{-7}}$$

$$= 0.158 \sqrt{V}$$

$$\chi'_{p} = \sqrt{2(1.6 \times 10^{-19})} \frac{11.6 \times 8.86 \times 10^{-14} \times 3 \times 10^{16}}{2.3 \times 10^{-7}}$$

$$= 0.432 \sqrt{V}$$
For $V_{o} = 1V$, $V_{SB} = 1 + 2.5 = 3.5 \text{ V}$

$$V_{t_{1}} = 0.7 + 0.16 \left(\sqrt{0.65 + 3.5} - \sqrt{0.65}\right)$$

$$= 0.9 \text{ V}$$

$$VoV_{3} = \sqrt{\frac{2(104)}{56(50)}} = 83 \text{ mV}$$
At peak output, we want
$$V_{GS_{1}} = 2.5 - 0.083 - 1 = 1.417 \text{ V}$$

$$I_{D_{1}} = \frac{\chi'_{1}}{2} \left(\frac{W}{L}\right)_{1} \left(V_{GS_{1}} - V_{t}\right)^{2}$$

$$Ip_{1(max)} = \frac{1 \text{ V}}{1 \text{ K}} = 1 \text{ mA}$$

$$\left(\frac{W}{L}\right)_{1} = \frac{2 \text{ Ip}_{1}}{\chi'_{1} \left(V_{GS_{1}} - V_{t}\right)^{2}} = 59$$

For Vo = -1V , VSB = -1-2.5 = -3.5

= -1.21 V

Vt2 - -0.7 -0.43 (V0.75+3.5 - 10.75)

$$V_{oV_6} = \sqrt{\frac{2(10)}{127(25)}} = 0.079 \text{ V}$$
At peak output, want
$$V_{GS_2} = -2.5 + 0.079 - (-1) = 1.421 \text{ V}$$

$$\left(\frac{W}{L}\right)_2 = \frac{2(1000)}{58(-1.421 + 1.21)^2} = 775$$

$$I_{d_4} = |I_{d_5}| = \frac{1}{10}I_{d_1}$$

$$\left(\frac{W}{L}\right)_4 = \frac{(W_L)_1}{10} = 5.9$$

$$\left(\frac{W}{L}\right)_5 = \frac{(W_L)_2}{10} = 77.5$$

COME

Assume
$$M_2 = off$$
 $KCL - I_{al} = V_{ab}/R_{L}$

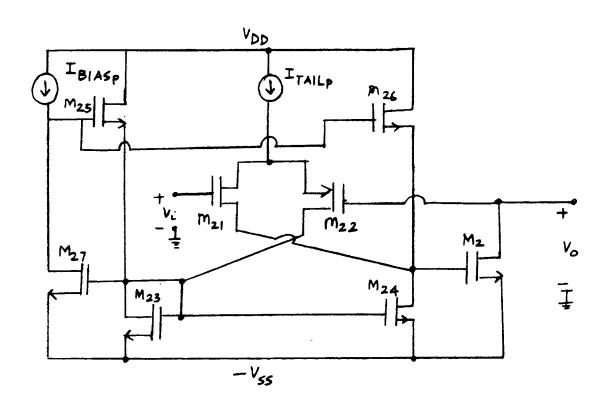

From $(5 \cdot 112)$, $\frac{x'}{2} \frac{W}{L} (V_{gs} + V_{t})^{2} = V_{gs}/R_{L}$

Sub in $(5 \cdot 110)$, $\frac{x'}{2} \frac{W}{L} \{-V_{o}V + A [V_{o} - (V_{i} - V_{osp})]\}^{2} = \frac{V_{o}}{R_{L}}$
 $\frac{x'}{2} \frac{N}{L} \{V_{o}^{2} + A^{2} [V_{o} - V_{i} - V_{osp}]\}^{2} - 2AV_{o} [V_{o} - (V_{i} - V_{osp})]\}^{2} = \frac{V_{o}}{R_{L}}$
 $\frac{x'}{2} \frac{W}{L} \{V_{ov}^{2} + A^{2} [V_{o} - V_{i}]^{2} + V_{osp}^{2} + 2(V_{o} - V_{i})V_{osp}] - 2AV_{o} [V_{o} - V_{i} + V_{osp}]\}$
 $= V_{o}R_{L}$
 $V_{o}^{2} (\frac{x'}{2} \frac{W}{L})A^{2}$
 $+ V_{o} \{\frac{x'}{2} \frac{W}{L} \{-2V_{i}A^{2} + 2V_{osp}A^{2} - 2AV_{o}V\} - \frac{1}{R_{L}}\}$
 $+ \frac{x'}{2} \frac{W}{L} \{V_{ov}^{2} + V_{i}^{2}A^{2} + V_{osp}A^{2} - 2V_{i}V_{osp}A^{2} + 2AV_{o}V_{i} - 2AV_{o}V_{o}V_{o}P\} = 0$
 $V_{o} = -b \pm \sqrt{b^{2} - 4ac}$
 $Q_{o} = \frac{x'}{2} \frac{W}{L} A^{2}$
 $Q_{o} = \frac{x'}{2} \frac{W}{L} A^{2} (V_{i}^{2} + V_{osp}^{2} - 2V_{i}V_{osp}A^{2} + 2V_{o}V_{o}V_{o}P) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i}^{2} + V_{osp}^{2} - 2V_{i}V_{osp} + 2V_{o}V_{o}V_{o}P)$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2} \frac{W}{L} A^{2} (V_{i} + \frac{V_{o}V}{A} - V_{osp}) - \frac{1}{R_{L}}$
 $Q_{o} = -\frac{x'}{2}$

Vo must be less than
$$V_i$$

$$V_0 = V_i + \frac{V_{ov} - V_{osp} + \frac{1}{x' \frac{W}{L} A^2 R_L}}{\frac{1}{x' \frac{W}{L} A^2} \sqrt{\frac{1}{R_L^2} + \frac{2x' \frac{W}{R} \frac{A^2}{R_L} (V_i + \frac{V_{ov} - V_{osp}}{A})}}$$

 $|I_{D_{17}}| + |I_{D_{13}}| + |I_{D_{14}}|$ flows from V_{DD} to $-V_{SS}$. $|I_{D_1}|$ flows from V_{DD} to M_2 in Problem (5.24)

In Problem (5.24),

$$I_{D_{27}}+I_{D_{23}}+I_{D_{24}}$$
 flows from V_{DD} to $-V_{SS}$. I_{D_2} flows from M_1 in fig (5.35) to $-V_{SS}$

Therefore, the standby power dissipation is.

$$\begin{split} & \left[|ID_{17}| + |ID_{13}| + |ID_{14}| \right] \left[V_{DD} - (-V_{SS}) \right] \\ & + \left[I_{D_{27}} + I_{D_{23}} + I_{D_{24}} \right] \left[V_{DD} - (-V_{SS}) \right] \\ & + \left| I_{D_{1}} \right| \left[V_{DD} - (-V_{SS}) \right] \le 70 \text{ mW} \end{split}$$

From (a) and (e),

$$\left[\frac{|I_{01}|}{|OO|} + \frac{|I_{01}|}{|O|} + \frac{|I_{01}|}{|OO|} + \frac{|I_{02}|}{|OO|} + \frac{$$

$$|I_{D_1}|[1+0.4+0.02]5 \le 70 \text{ mW}$$

 $|I_{D_1}| \le 9.9 \text{ mA} = 10 \text{ mA}$

Use max standby current to mirrimize distortion

$$|I_{D_{13}}| = |I_{D_{14}}| = \frac{9.9 \text{ mA}}{10} = 990 \text{ MA} \approx 1 \text{ mA}$$

$$I_{TAIL} = 5 I_{BIAS} = 500 \text{ MA}$$

$$I_{D_{27}} = \frac{I_{D_2}}{100} = 99 \text{ MA} \approx 100 \text{ MA} = I_{BIASP}$$

Gain Error & 1%

From (5.117),
$$\frac{1}{2Ag_{m}R_{L}} \le 0.01$$

To minimize distortion, use the maximum allowed error-amplifier gain = 5

$$g_{m_{1}} > \frac{1}{2AR_{L}(0.01)} = \frac{1}{2(5)(100)(0.01)}$$

$$= 0.1 \frac{A}{V} = 100,000 \frac{MA}{V}$$

$$g_{m_{1}} = \sqrt{2 \frac{\chi_{p}'(\frac{N}{I})|T_{p_{1}}|}{2}}$$

From Table (2.3),

$$C_{OX} = \frac{3.9 \times 8.86 \times 10^{-14}}{150 \times 10^{-8}} = 2.3 \times 10^{-7} \frac{F}{cm^2}$$

$$\sqrt{2(58)(\frac{W}{L}),(100004A)} > 100,000$$

$$\left(\frac{W}{L}\right)$$
 \geqslant 8620 \approx 8700

$$\left(\frac{W}{L}\right)_{17} = \frac{\left(\frac{W}{L}\right)_{1}}{100} = 87$$

$$\left(\frac{W}{L}\right)_{13} = \left(\frac{W}{L}\right)_{14} = \frac{\left(\frac{W}{L}\right)_{1}}{10} = 870$$

$$g_{m_2} = \sqrt{2 \, \kappa_n' \left(\frac{W}{L}\right)_2 \, I_{D_2}}$$

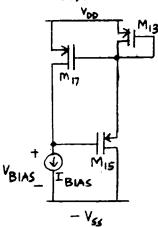

$$\chi_n' = 2.3 \times 10^{-7} \times 550 \frac{cm^2}{V.5} = 127 \text{ MA/V}^2$$

$$\left(\frac{W}{L}\right)_2 > 3940 \simeq 4000$$

$$\left(\frac{W}{L}\right)_{27} = \frac{\left(W_{L}\right)_{2}}{100} = 40$$

$$\left(\frac{W}{L}\right)_{23} = \left(\frac{W}{L}\right)_{24} = \frac{\left(\frac{W}{L}\right)_2}{10} = 400$$

Let VBIAS = Voltage across IBIAS

$$V_{BIAS} = V_{DD} - (-V_{SS}) - |V_{GS_{17}}| - |V_{GS_{15}}| \ge 0.5$$

$$2.5 - (-2.5) \quad |V_{t_{17}}| + \sqrt{\frac{2I_{BIAS}}{x_p^{(1)}(N_L)_{17}}} \qquad V_{BIAS} = V_{DD} - \left[-V_{SS} + V_{GS_{27}} + V_{GS_{27}}$$

| VGS,5 | is max. When |ID15 | is max That is when $I_{D_{12}} = 0$ 50, |IDIS | max = |IDIS | = 1 mA

Note: this worst case condition may not occur in practice because m12 may not turn off completely

$$\sqrt{2(127)(W_{L})_{2}(10000 \text{ yA})} > 100,000 \quad |V_{GS15}|_{max} = |V_{t15}| + \sqrt{\frac{2|I_{D15}|_{max}}{x_{p}'(\frac{W}{L})_{15}}}$$

$$\left(\frac{W}{L}\right)_{2} > 3940 \simeq 4000$$

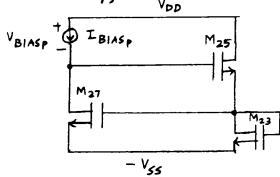

$$\left(\frac{W}{L}\right)_{2} = \left(\frac{W_{L}}{L}\right)_{3} =$$

$$5-0.7-0.2-0.7-\sqrt{\frac{2(1000)}{58(WL)_{15}}} > 0.5 V$$

$$\sqrt{\frac{2(1000)}{58(\frac{W}{L})_{15}}} \leq 2.9 \text{ V}$$

$$\left(\frac{W_{L}}{15}\right)_{15} \geqslant \frac{2(1000)}{58(2\cdot9)^{2}} = 4\cdot1 \approx 4$$

similarly,

$$V_{\text{BIAS}p} = V_{\text{DD}} - \left[-V_{SS} + V_{GS_{27}} + V_{GS_{25}} \right] \geqslant 0.5V$$

$$V_{OV_{27}} = \left[\frac{2(100)}{100} \right] = 0.2V$$

$$V_{\text{OV}_{25}(\text{max.})} = \sqrt{\frac{2(10)\,\text{I}_{\text{BIAS}}}{(\frac{\text{W}_{\text{L}}}{\text{J}_{25}}|27}} \text{ When } |I_{\frac{\text{R}_{21}}{2}}| = 0$$

$$5-0.7-0.2-0.7-\sqrt{\frac{2(1000)}{127(W_L)_{25}}} \geqslant 0.5 \text{ V}$$

$$\left(\frac{W}{L}\right)_{25} > \frac{2(1000)}{127(2.9)^2} = 1.9 \approx 2$$

Error amplifier gain

From (5.141) for the top amp

$$A = \frac{gm_{11}}{gm_{11}}$$
 (ignore body effect)

$$A = 5 = \sqrt{\frac{2 \left(\frac{\text{ITAIL}_{2}}{2} \right) \mathcal{X}_{n}^{\prime} \left(\frac{W_{L}}{L} \right)_{II}}{2 \left(\frac{\text{II}_{D14}}{1 - \frac{\text{ITAIL}_{2}}{2} \right) \mathcal{X}_{p}^{\prime} \left(\frac{W}{L} \right)_{II}}}$$

$$= \sqrt{\frac{250(127)(W_{L})_{11}}{750(58)(W_{L})_{16}}} = \sqrt{\frac{0.73(W_{L})_{11}}{(W_{L})_{16}}}$$

So,
$$(W_L)_{11} = \frac{A^2(W_L)_{16}}{0.73} = \frac{25(4)}{0.73} = 137 = 140$$

similarly, for the bottom amp,

$$A = \frac{g_{m_{21}}}{g_{m_{24}}}$$

$$A = 5 = \sqrt{\frac{2 (|T_{AIL}P_{2}|) \chi_{p}' (|W_{L}|)_{21}}{2 (|I_{D_{24}} - I_{TALP_{2}}|) \chi_{p}' (|W_{L}|)_{26}}}$$

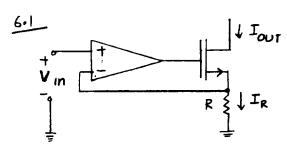

$$= \sqrt{\frac{(250)(57)(W_{L})_{21}}{(750)(127)(W_{L})_{26}}} = \sqrt{\frac{0.15(W_{L})_{21}}{(W_{L})_{26}}}$$

But,
$$(W_L)_{26} = (W_L)_{25} = 2$$

So,
$$(W/L)_{21} = \frac{A^2(W/L)_{26}}{0.15} = \frac{25(2)}{0.15} = 333 = 3$$

For ideal opamp,

$$I_R = \frac{V_{in}}{R} = I_{out}$$

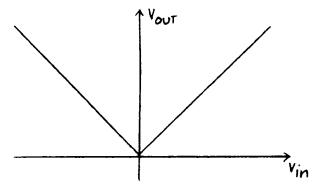

$$\Rightarrow I_{out} = \frac{V_{in}}{R}$$

6.2

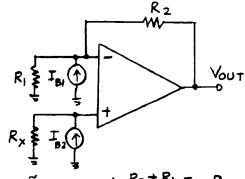

For Vin positive, Vo is negative, diode is reverse biased and

For Vin negative, Vo is positive, After the diode turns on, we

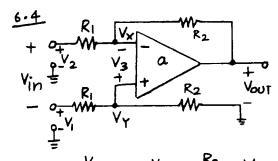

6.3

 $V_{OUT} = -R_2 I_{B_1} + \frac{R_2 + R_1}{R_1} I_{B_2} R_X$ If $I_{B_1} = I_{B_2}$, then $V_{OUT} = 0$, When

$$R_2 = \frac{R_2 + R_1}{R_1} R_X$$

$$\therefore R_X = \frac{R_1 R_2}{R_1 + R_2} = R_1 \parallel R_2$$

$$V_3 = \frac{V_{OUT}}{a}$$
, $V_Y = \frac{R_2}{R_1 + R_2} V_1$
 $V_X = V_Y - V_3 = \frac{R_2}{R_1 + R_2} V_1 - \frac{V_{OUT}}{a} \rightarrow \bigcirc$

$$\frac{V_2 - V_X}{R_1} = \frac{V_X - V_{OUT}}{R_2} \longrightarrow ②$$

Eliminating Vx from (1) & (2),

$$A_{v} = \frac{V_{out}}{V_{2} - V_{1}} = \frac{V_{out}}{V_{in}}$$

$$= \frac{-R_{2}/R_{1}}{1 + \frac{1}{a}\left(1 + \frac{R_{2}}{R_{1}}\right)} \longrightarrow 3$$

Require, $A_v \geqslant 999$ when a change -50%. From 3 the new gain value after a change is,

$$A_{v}^{\prime} = \frac{-R_{2}/R_{1}}{1 + \frac{(1 + R_{2}/R_{1})}{1/2}}$$

$$\approx -\frac{R_{2}}{R_{1}} \left[1 - \frac{2}{a} \left(1 + \frac{R_{2}}{R_{1}} \right) \right]$$

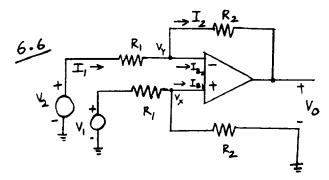

change from nominal is,

$$A_{v}^{\prime} - A_{v} = \Delta A_{v} = \frac{1}{a} \left(1 + \frac{R_{2}}{R_{1}}\right) \frac{R_{2}}{R_{1}}$$
for $\frac{R_{2}}{R_{1}} \approx 1000$, we require
$$\Delta A_{v} \leq 1 : a \geq 10^{6}$$

$$CMRR = \left(\frac{\Delta V_{os}}{\Delta V_{ic}}\right)^{-1}$$
(from (6.48))

For $\Delta V_{ic} = 10V - (-10V) = 20V$, We require $\Delta V_{os} \leq 1 \text{ mV}$

$$\therefore CMRR \geqslant \left[\frac{10^{-3}}{20}\right] = 86 \, dB$$

With 1= 12=0

①
$$V_X = -I_{B_1}(R_1 \parallel R_2) = V_Y \text{ (virtual now)}$$

$$\hat{\mathbf{I}}_{1} = \underbrace{0 - V_{Y}}_{R_{1}} = \mathbf{I}_{B2} + \mathbf{I}_{2}$$

$$\Rightarrow \mathbf{I}_{2} = -\underbrace{V_{Y}}_{R_{1}} - \mathbf{I}_{B2} .$$

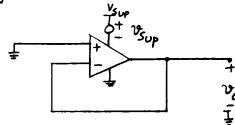

(3)
$$V_0 = V_Y - I_2 R_2$$

 $= V_X + \left(\frac{V_Y}{R_1} + I_{B2}\right)^{R_2}$
 $= V_X \left(1 + \frac{R_2}{R_1}\right) + I_{B2} R_2$
 $= -I_{B_1} \frac{R_1 R_2}{R_1 + R_2} \left(\frac{R_1 + R_2}{R_1}\right) + I_{B2} R_2$
 $= \left(I_{B2} - I_{B1}\right) R_2 = -I_{OS} R_2$
 $|I_{DS}| = IOO nA$
 $V_0 = \left(IOO nA\right) R_2 \le IO mV$
 $R_2 \le \frac{IO mV}{IOO nA} = IOO K_D$
Also, gain $= -\frac{R_2}{R_1} = -IO$

one solution:

 $R_1 = \frac{R_2}{10} \leq 10 \text{ ks.}$

original connection:

$$v_o = A^+ v_{sup}$$

The same output can be obtained in the following configuration

From (651),
$$PSRR^{+} = A_{dm}$$

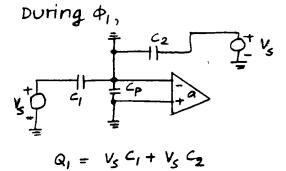

$$v_o = \frac{v_{sup}}{PSRR^+}$$
 Adm

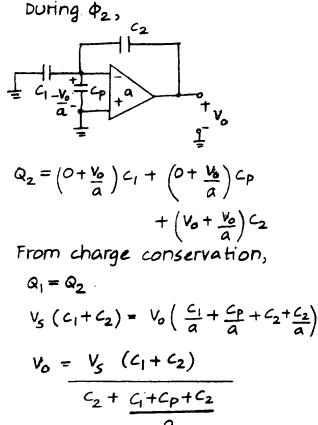

In the voltage follower configuration, $A_{dm} = 1$.

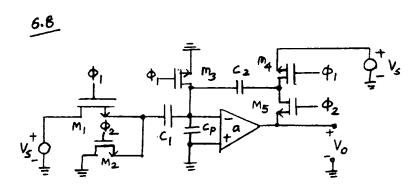

So,
$$v_o = \frac{v_{sup}}{PSRR^+}$$
 (1)

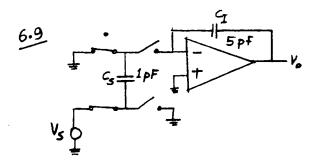

Therefore, peak output =
$$\frac{v_{SUP}}{PSRR} = \frac{20}{10} \text{ mV}$$

= $\frac{20}{10} \text{ mV}$

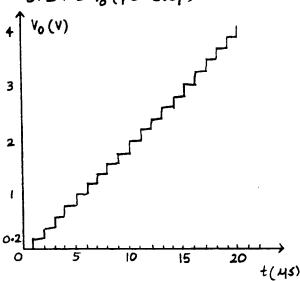

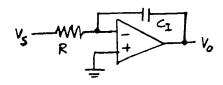

Each cycle on Cs

$$Q = C_3V_5 = 1pF(IV) - 1pC$$

transfer to C_I

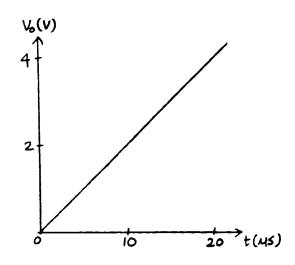

(b) continuous time

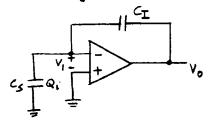

$$\frac{V_0}{V_S} = \frac{1}{RC_I S} = \frac{C_S}{C_I} \frac{f}{S}$$

$$V_0 = f \frac{C_s}{C_I} \int V_s dt$$
$$= 10^6 \frac{1}{5} \int 1 dt$$

(c) finite gain

Initial charge on cs capacitor

discharge cs into cI

$$\frac{V_0}{V_0} = -1000$$

final charge on Cs = - 4, Cs

final charge on CI = (%-VI)CI

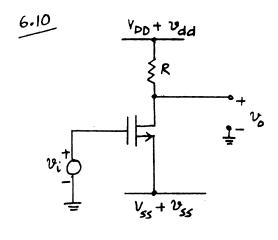

charge conservation

$$(V_0 - V_1) C_I - V_1 C_S = C_S (1V)$$

$$V_o + \frac{V_o}{1000} + \frac{V_o}{1000} (0.2) = 0.2$$

$$V_0 = \frac{0.2 \text{ V}}{1 + \frac{1.2}{1000}} \text{ per step}$$

Cerror term

$$\frac{v_o}{v_i} = -g_m(R||Y_o)$$

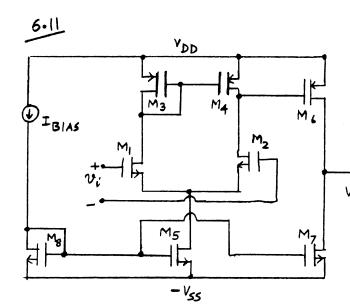

$$\frac{v_o}{v_{ad}} = \frac{r_o}{R + r_o}$$

From (6.51),
$$PSRR^{\dagger} = \frac{r_0}{R + r_0} = \frac{-1}{g_m R + r_0}$$

$$\frac{v_o}{v_{ss}} = \left(g_m + \frac{1}{v_o}\right) \left(R \| v_o\right)$$
From (6.51), PSRR = $\left(g_m + \frac{1}{v_o}\right) \left(R \| v_o\right)$

$$-g_m \left(R \| v_o\right)$$

$$PSRR^{-} = -\left(1 + \frac{1}{g_{m}r_{o}}\right)$$

(a)
$$A_{v} = \frac{v_{o}}{v_{i}} = -g_{m_{i}}(r_{o2}||r_{o4})g_{m_{6}}(r_{o6}||r_{o7})$$

Same as (6.56)

$$A_{v} = -\frac{2}{V_{ov_{i}}} \frac{2}{|V_{ov_{i}}|} \left(\frac{V_{A2} |V_{A4}|}{V_{A2} + |V_{A1}|} \right) \left(\frac{|V_{A6}| |V_{A7}|}{|V_{A6}| + V_{A7}} \right)$$

(b) output swing

(C) If (6.66) is satisfied,

$$V_{o} = V_{DD} - V_{SD_{6}}$$

$$= V_{DD} - V_{SG_{3}}$$

$$= V_{DD} + V_{t_{3}} + V_{ov_{3}}$$

Note Vov3 < 0,

Also V_{43} <0 for enhancement mode

$$V_{OS}(sys) = \frac{V_{DD} + V_{t3} + V_{OV_3} - \frac{V_{DD} - V_{ss}}{2}}{A_{T}}$$

(d) CMRR

From (6.71),

CMRR = $(2gm_1 r_{tail})gm_3(r_{02} || r_{04})$ Where $r_{tail} = r_{05}$

(e) CM Input range To keep M_5 in active region, $V_{IC} > V_{OV_3} + V_{t_1} + V_{OV_1} - V_{SS}$

To keep M₁ in active region, $V_{6D_1} < V_{t_1}$ $V_{IC} - (V_{DD} + V_{t_3} + V_{0V_3}) < V_{t_1}$

$$V_{IC} < V_{DD} + V_{t_3} + V_{t_1} + V_{OV_3}$$

Note $V_{OV_3} < O$

Also $V_{t_3} < O$ for enhancement mode. So, the CM input range is,

 $V_{OV_5} + V_{t_1} + V_{OV_1} - V_{SS} < V_{IC}$
 $< V_{DD} + V_{t_3} + V_{t_1} + V_{OV_3}$

(f) From an argument similar to that leading to (6.86), A ≃ 0. So, PSRR → ∞ for low frequencies with perfect matching. Also,

$$A^{+} = \frac{v_0}{v_{ad}} = \frac{v_{a7}}{v_{o6} + v_{o7}} = \frac{v_{A7}}{|v_{A6}| + v_{A7}}$$

Then $PSRR^{+} = \frac{Adm}{A^{+}}$ $= \frac{-\frac{2}{V_{oV_{1}}} \frac{2}{|V_{oV_{6}}|} \left(\frac{V_{A_{2}}|V_{A_{4}}|}{|V_{A_{2}}| |V_{A_{4}}|} \right) \left(\frac{|V_{A_{6}}|V_{A_{7}}|}{|V_{A_{6}}| + V_{A_{7}}|} \right)}{\frac{V_{A_{7}}}{|V_{A_{6}}| + V_{A_{7}}|}}$ $= \frac{-2}{V_{oV_{1}}} \frac{2}{|V_{oV_{1}}|} \left(\frac{V_{A_{2}}|V_{A_{4}}|}{|V_{A_{1}}| + |V_{A_{1}}|} \right) |V_{A_{6}}|$

(a) For simplicity, replace M5 in Fig (6.16) with an ideal current source. Although this change makes the common mode gain of the opamp zero, this change does not affect the characteristics of the circuit for differential mode inputs

In the circuit above, the gate of M2 is grounded and the input is applied to only the gate of M1. The resulting differential-mode input is the same as in Fig 6.16. The common mode input above may differ from that in Fig 6.16. In fact the common mode input in Fig 6.16 is not specified. However, the effect of a common mode input in Fig 6.16 in Fig 6.16 is small as long as M5 operates as a current source.

Also, a common-mode input in the drawing above has no effect on the output as long as all the transistors operate in the active region.

The first term in (6.69) predicts in that if the only mismatch is $V_{11} > V_{12}$, $V_{05} > 0$. Assume at first $V_{11} = V_{12}$. Then allow V_{11} to increase while $V_{11} = 0$ since M_{11} is a p-channel device, increasing V_{11} increases I_{03} , which decreases V_{01} . Since the gain from V_{11} to V_{01} is positive, V_{11} must be increased to increase V_{01} so that $V_{054} = V_{053}$. Therefore, $V_{05} > 0$ in this case.

The second term in (6.69) predicts that if $V_{t3} > V_{t4}$, $V_{os} > o$ Assume at first $V_{t3} = V_{t4}$. Then allow V_{t3} to increase while $V_i = 0$. Since $V_{GS_4} = V_{GS_3} = V_{t3} + V_{OV_3}$, increasing V_{t3} increases V_{GS_4} , which decreases V_{o} . Since the gain from V_i to V_o is positive, V_i must be increased to increase V_o so that $V_{DS_4} = V_{DS_3}$. Therefore, $V_{os} > o$ in this case.

The third term in (6.69) predicts that if $(\frac{W}{L})_3 > (\frac{W}{L})_4$, $V_{05} < 0$ because $V_{0V(L_2)} < 0$

for p-channel input devices. Assume at first that $\binom{W}{L}_3 = \binom{W}{L}_4$. Then allow $\binom{W}{L}_3$ to increase when $V_i = 0$. This change decreases V_{0V_3} , which in turn decreases V_{6S_4} because $V_{6S_4} = V_{6S_3} = V_{43} + V_{0V_3}$. As a result, $V_{6S_4} = V_{6S_3} = V_{43} + V_{0V_3}$. As a result, $V_{6S_4} = V_{6S_3} = V_{43} + V_{0V_3}$. As a result, $V_{6S_4} = V_{6S_3} = V_{43} + V_{0V_3}$. As a result, $V_{6S_4} = V_{6S_3} = V_{43} + V_{0V_3}$. As a result, $V_{6S_4} = V_{6S_3} = V_{43} + V_{0V_3}$. As a result, $V_{6S_4} = V_{6S_3} = V_{43} + V_{0V_3}$. As a result, $V_{6S_4} = V_{6S_5} = V_{6S_5$

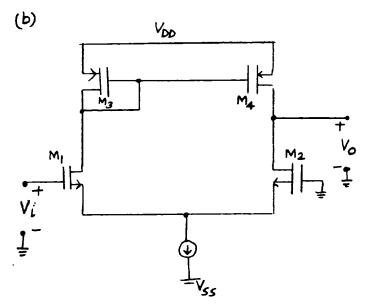

The last term in (6.69)

predicts that if $(\frac{W}{L})_{1} > (\frac{W}{L})_{2}$, $V_{OS} > 0$ because $V_{OV(1-2)} = 0$ for

p-channel input devices.

Assume at first that $(\frac{W}{L})_{1} = (\frac{W}{L})_{2}$. Then allow $(\frac{W}{L})_{1}$ to increase while $V_{i} = 0$.

This change increases I_{D3} and decreases $V_{OS} > 0$ As a result, V_{i} must be increased to increase $V_{OS} > 0$ in this case.

First term: Increasing V_{4} , while $V_{i} = 0$ decreases $I_{D_{i}}$, which decreases V_{0} . So V_{i} must be increased to increase V_{0} and force $V_{0S_{3}} = V_{0S_{4}}$. Therefore, $V_{0S} > 0$ in this case.

Second term: Increasing V_{t3} while $V_{i}=0$ decreases V_{564} because $V_{564}=V_{563}=-V_{t3}-V_{0V_3}$. So, this change decreases V_0 . Therefore, V_i must be increased to increase V_0 , and $V_{05}>0$ in this case.

Third term: Increasing $(W_L)_3$ while $V_i = 0$ decreases $|V_{0V_3}|$, decreasing V_{SG_4} and V_0 . Therefore, V_i must be increased to increase V_0 , and $V_{0S} > 0$ in this case.

Last term: Increasing (WL), while $V_i = 0$ increases I_{D_i} , in turn decreasing

ID2 because the tail current is constant. As a result Vo increases. Therefore, Vi must be decreased to decrease Vo, and Vos CO in this case.

In practice, the polarity of the mismatches is not usually known. The main value of this problem is in developing a physical insight about the

behaviour of a differential pair with a current mirror load.

6.13 From (6.69),

$$V_{0S} = \Delta V_{+}(3-4) \frac{g_{m_3}}{g_{m_1}}$$

From (1.180) with $\left(\frac{W}{L}\right)_{3} = \left(\frac{W}{L}\right)_{1}$
and $|I_{D_1}| = |I_{D_3}|$,
 $\frac{g_{m_3}}{g_{m_1}} = \sqrt{\frac{u_3}{u_1}}$

 $\mu_3 = mobility of M_3$ $\mu_1 = mobility of M_1$

(a)
$$V_{os} = \Delta V_{t(3-4)} \sqrt{\frac{450}{150}} = 10 \text{ mV} (\sqrt{3})$$

= 17.3 mV
(b) $V_{os} = \Delta V_{t(3-4)} \sqrt{\frac{150}{450}} = 10 \text{ mV} (\frac{1}{\sqrt{3}})$
= 5.8 mV

(c) The offset is smaller in (b) because the mobility of p-channel transistors is tess than that of n-channel transistors

with an n-channel input pair

- (1) The input-referred offset voltage resulting from the mismatch between the thresholds of M3 and M4 is reduced.
- (2) VDD can be included in the common mode input range using only enhancement mode transistors

- (3) PSRR is improved.
- (4) The W/L of the input transis--tors needed to obtain a given transconductance is reduced. As a result, the input capacitance is reduced.
- (5) The input-referred thermal noise voltage is reduced (see chapter 11)

```

- mg, | Vt = | V and | Vov | = 0.2 V
- → To operate M_5 in the active region, $V_{IC} < V_{DD} |V_{t_1}| |V_{OV_1}| |V_{OV_5}|$ $V_{IC} < V_{DD} |\cdot 4|V$
- To operate M_{IA} in the active region, $V_{SD(IA)} > |V_{OV_{IA}}| = 0.2v$ $V_{S(IA)} = |V_{IC}| + |V|$ $V_{D(IA)} = -V_{SS} + V_{t3} + V_{oV_3} + V_{t3A} + V_{oV_{3A}}$ $= -V_{SS} + 2.4v$

$$V_{SD(1\overline{A})} = V_{1C} + |V - (-V_{SS} + 2.4 V) > 0.2 V$$

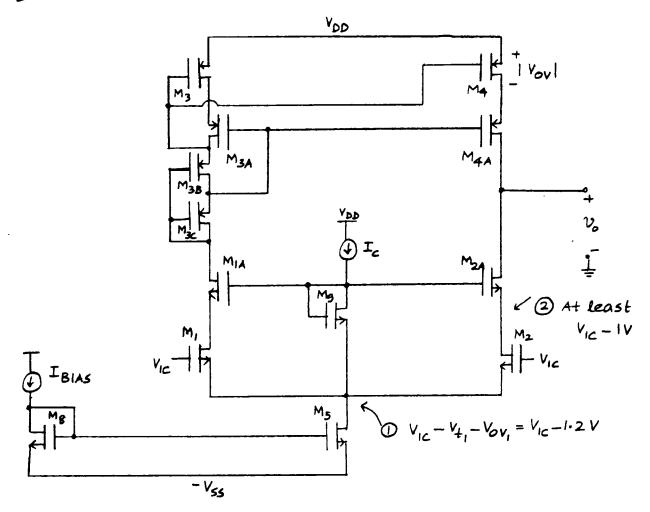

$$V_{1C} - |V + V_{SS}| > 0.2 V$$

$$V_{1C} > -V_{SS} + |V - (-V_{SS} + 2.4 V) > 0.2 V$$

To simultaneously satisfy both constraints on V_{IC} , the minimum supply difference = $V_{DD} - (-V_{SS}) = V_{DD} + V_{SS} = 3V$

This value can be reduced with smaller threshold and overdrive magnitudes.

Maximum swing:

Minimum swing:

To keep M5 in the active region,

$$V_{1C} > -V_{55} + V_{t_1} + V_{OV_1} + V_{OV_5} = -V_{55} + 1.4 \text{ V}$$

Minimum swing:

For example, if
$$V_{DD} = V_{SS} = 1.5 V$$

-0.9 V < V_0 < 1.1 V

6.18To operate M_5 in the active region,

$$V_{IC} < V_{DD} + V_{4,} + V_{OV_1} + V_{OV_5}$$
 $V_{IC} < V_{DD} - 1 \cdot V - 0.2 \cdot V - 0.2 \cdot V$
 $V_{IC} < V_{DD} - 1.4 \cdot V$

To operate M, in the active region,

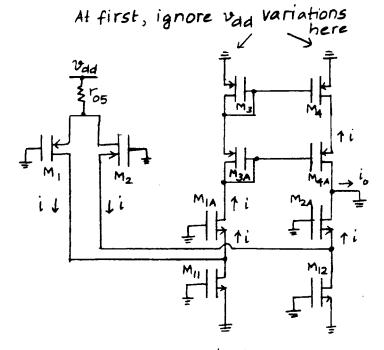

$$V_{eD_i} > V_{t_i}$$

so a channel does not exist
at the drain of M,

$$V_{GD_1} > V_{t_1}$$
 $V_{G_1} = V_{1C}$
 $V_{D_1} = -V_{SS} + V_{OV_{11}}$
 $V_{1C} - (-V_{SS} + V_{OV_{11}}) > V_{t_1}$
 $V_{1C} > -V_{SS} + V_{OV_{11}} + V_{t_1}$
 $V_{1C} > -V_{SS} + O.2 V - 1V$
 $V_{1C} > -V_{SS} - O.8 V$

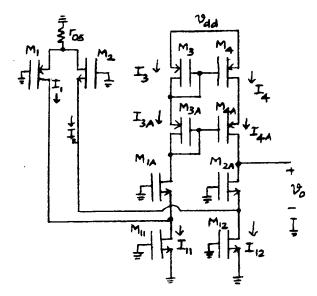

In the bias circuit, $v_{gS(102)} = 0$ because $I_{BIAS} = constant$ In other words, $v_{gS(102)} = v_{gS(102)} = v_{gS(102)} = constant$. Therefore, v_{Ad} Variations also appear on $v_{gS(5)} = 0$

consider v_{dd} variations through M_5 with $v_{gs(5)}=0$. M_5 can be modeled simply as r_{os} in the following small signal model

Here, the vad Variation appears as a common-mode input to the differential pair, causing a common mode change in the drain currents of M_1 and $M_2(i)$. Since the drain currents of M_1 and M_{12} are constant, the source currents of M_{14} and M_{24} are i (as labeled). Since the gate current of M_{14} is zero, the small-signal current in the drain of M_{14} is also i. This small-signal current is mirrored to the drain of M_{44} by the cascode current mirror. Therefore, $i_0 = i - i = 0$

So, the gain from v_{dd} to the output is zero here. Now, consider v_{dd} variations on the sources of M_3 and M_4

 $I_3 = I_{3A} = constant because$ M_1 and M_{11} act as current

sources. So, $v_{gS_{(3)}} = v_{gS_{(3a)}} = 0$ Since $v_{gS_{(4)}} = v_{gS_{(3)}}$, $v_{gS_{(4)}} = 0$ Since $v_{dS_{(3)}} = v_{dS_{(4)}}$, $v_{gS_{(4a)}} = v_{gS_{(3a)}}$ $I_{4A} = I_{3A}$ because $I_{11} = I_{12}$ and $I_{11} = I_{12}$

Therefore, $v_{ds}(4a) = v_{ds}(3a) = v_{gs}(3a)$ and v_{dd} variations appear at the output $v_{o} = 1$

In the bias circuit,

 $I_{D(108)}^{\sim}$ constant because $I_{BIAS} = constant$ and because M_{101} , M_{102} , M_{108} and M_{109} form a cascode current mirror Therefore, $v_{gS_{(107)}} = 0$ Similarly, $v_{gS_{(106)}} = 0$ Therefore, variations in $-v_{ss}$ also appear on v_{B1AS_2} and v_{B1AS_3} Since $v_{gS_{(11)}} = v_{gS_{(12)}} = v_{gS_{(107)}} = 0$, M_{11} and M_{12} can be modeled

simply as to and to 12

 v_{ss} variations cause equal or common-mode variations in the drain currents of m_{1A} and m_{2A} , which cancel at the output because of the cascode current mirror Therefore $\frac{v_o}{v_{ss}} = o$

	vss	VSS =

For
$$I_{O(max)} = \pm 100 \, \text{HA}$$
,

 $I_{D_{11}} = I_{D_{12}} = 100 \, \text{HA}$

Then half of $I_{D_{11}}$ should come from M_1 and the other half from from M_{1A}

So, $|I_{D_1}| = |I_{D_2}| = |I_{D_{1A}}| = I_{D_{2A}} = 50 \, \text{HA}$

So,
$$|I_{D3A}| = |I_{D_3}| = |I_{D_4}| = |I_{D_{4A}}| = 50 \mu A$$

For the output swing requirement, concentrate on the output branch

$$\frac{V_{DD}=1.5 V}{V_{DS_4}} = V_{SD_3} = V_{SG_3} = |V_{tp}| + |V_{OV}|$$

$$\frac{V_{DD}=1.5 V}{V_{DS_4}} = V_{SD_3} = V_{SG_3} = |V_{tp}| + |V_{OV}|$$

$$\frac{V_{DD}=1.5 V}{V_{DS_4}} = V_{SS_3} = |V_{tp}| + |V_{OV}|$$

$$\frac{V_{DD}=1.5 V}{V_{DS_4}} = V_{SS_3} = |V_{tp}| + |V_{OV}|$$

$$\frac{V_{DS_4}}{V_{DS_4}} = V_{SS_3} = |V_{tp}| + |V_{OV}|$$

$$\frac{V_{DS_4}}{V_{OV}} = V_{SG_3} = |V_{tp}| + |V_{OV}|$$

$$\frac{V_{DS_4}}{V_{DS_4}} = V_{SS_3} = |V_{tp}| + |V_{OV}|$$

$$\frac{V_{DS_4}}{V_{DS_4}} = V_{SS_5} = |V_{tp}| + |V_{DS_5}|$$

$$\frac{V_{DS_4}}{V_{DS_4}} = V_{SS_5} = |V_{tp}| + |V_{DS_4}|$$

$$\frac{V_{DS_4}}{V_{DS_4}} = V_{DS_5} = |V_{DS_5}| + |V$$

$$V_{O(p-p)} = V_{DD} - (-V_{SS}) - |V_{tp}| - 4V_{oV} - 300 \, \text{mV}$$
Requirement $V_{Op-p} > 1.5 \, \text{V}$

$$1.5 < 1.5 - (-1.5) - 0.6 - 4V_{oV} - 0.3$$

$$-0.4 < -4V_{oV} \rightarrow V_{oV} < 0.1 \, \text{V}$$

$$I = \frac{x'}{2} \frac{W}{L} V_{oV}^2 \Rightarrow \frac{W}{L} = \frac{2I}{x' V_{oV}^2}$$

$$\left(\frac{W}{L}\right)_{12} = \frac{2(100)}{194(0.1)^2} \approx 100$$

$$\left(\frac{W}{L}\right)_{24} = \frac{2(50)}{194(0.1)^2} \approx 50$$

$$\left(\frac{W}{L}\right)_{4} = \left(\frac{W}{L}\right)_{4A} = \frac{2(50)}{64.7(0.1)^{2}} \approx 150$$

For the common-mode range requirement: To operate Mi in the active region

$$V_{6D_1} > V_{t_1} = -0.8V$$

$$V_{G1} = V_{1C}$$

$$V_{D_1} = -V_{SS} + V_{0V_{11}} + 0.1V$$

$$V_{1C} > -V_{SS} + V_{0V_{11}} + 0.1V + V_{t_1}$$

$$> 1.5 + 0.1 + 0.1 - 0.8 = -2.1V$$

so, the common mode range includes $-V_{SS} = -1.5 \text{ V}$

To operate M5 in the active region,

$$V_{1C} < V_{DD} + V_{t_1} + V_{OV_1} + V_{OV_5}$$

$$V_{1C} < 1.5 - 0.8 + 2V_{OV}$$

$$0.5 < 0.7 + 2V_{OV}$$

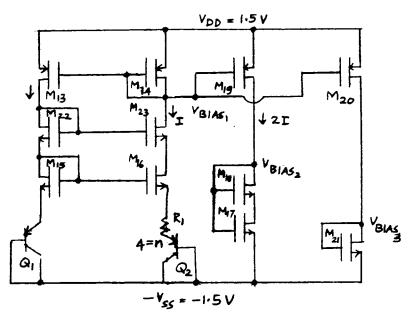

$$V_{OV} = V_{OV_1} - V_{OV_5} > -0.1V$$

$$(W_1) = 2(50) \approx 150$$

$$\left(\frac{W}{L}\right)_1 = \frac{2(50)}{64.7(0.1)^2} \approx 150$$

$$\left(\frac{W}{L}\right)_5 = \frac{2(100)}{64.7(0.1)^2} \approx 300$$

BIAS CIRCUIT :

$$I = \frac{4}{R_1} \ln (n) = 50 \text{ MA} \Rightarrow$$

$$R_1 = \frac{V_1 \ln 4}{5044} = 721 \Omega$$

in the bias circuit For the branch including M13

$$V_{DD} - (|V_{OV_{13}}| + 0.1 V) - V_{t_{22}} - V_{ov_{22}} - V_{t_{15}} - V_{ov_{15}} - 0.7$$

$$- (-V_{SS}) = 0$$
Let $|V_{OV_{13}}| = |V_{OV_{15}}| = |V_{15}| = |V_{15}|$

Let
$$|V_{OV_{13}}| = V_{OV_{22}} = V_{OV_{15}} = V_{OV}$$

 $V_{t_{22}} = V_{t_{15}} = 0.6 \text{ V}$

$$1.5 - 0.1 - 0.6 - 0.6 - 0.7 - (-1.5) = 3V_{ov}$$

 $1 - 3V_{ov} \Rightarrow V_{ov} = 0.33V$

so, this branch operates with all transistors in the active region if You < 0.33 V

For the branch including
$$M_{14}$$
, $V_{DD}-|V_{14}|-|V_{OV_{14}}|-(V_{OV_{23}}+0.1V)-(V_{OV_{16}}+0.1V)-V_{T}\ln 4-0.7V-(-V_{SS})=0$
Let $|V_{OV_{14}}|=|V_{OV_{23}}-|V_{V_{16}}|=|V_{OV_{14}}|=|V_{OV_{23}}-|V_{V_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{16}}|=|V_{OV_{1$

so, this branch operates with all transistors in the active region if $V_{OV} < 0.43 \, V$

so, this design will use the previously computed value of $V_{ov} = 0.1 \, \text{V}$

$$\left(\frac{W}{L}\right)_{13} = \left(\frac{W}{L}\right)_{14} = \frac{2(50)}{64.7(0.1)^2} \approx 150$$

$$\left(\frac{W}{L}\right)_{22} = \left(\frac{W}{L}\right)_{23} = \left(\frac{W}{L}\right)_{15} = \left(\frac{W}{L}\right)_{16} = \frac{2(50)}{194(0.1)^2} \approx 50$$

$$\left(\frac{W}{L}\right)_{19} = \left(\frac{W}{L}\right)_{20} = 2\left(\frac{W}{L}\right)_{14} = 300$$

$$\left(\frac{W}{L}\right)_{18} = \left(\frac{W}{L}\right)_{21} = \frac{2(100)}{194(0.1)^2} \approx 100$$

 M_{IB} forces M_{II} to operate in the triode region

To increase $V_{DS_{17}}$ to $V_{OV} + 0.1V = 0.2V$,

This choice is confirmed in simulation It biases $M_{11} & M_{12} & \text{so that } V_{DS_{11}} = V_{DS_{12}} \simeq 0.2 \text{ V}$

                                                                                                      = 1.000E+20
                                                                                                      = 9.858E+02
                                                                  OUTPUT RESISTANCE AT V(16)
```

6.21

From Table (24), $M_n = 3 \, \mu_p$.

Therefore, to produce overdrives with equal magnitudes for identical drain current magnitudes, n-channel transistors require $\left(\frac{W}{L}\right)$ 3 times smaller than corresponding p-channel transistors.

Let
$$|I_{D_1}| = |I_{D_2}| = I$$

Then $|I_{D_5}| = I_{D_{11}} = I_{D_{12}} = 2I$
All other transistors have $|I_D| = I$

M₃, M_{3A}, M_{3B}, M_{3C}, M_{3D}, M₄, M_{4A} and M_{4B} form a double-cascode sooch current mirror

$$\left(\frac{W}{L}\right)_{3c} = \frac{1}{3} \left(\frac{W}{L}\right)_{3D} = \frac{1}{3} \left(\frac{W}{L}\right)_{1}$$

From Problem (4.8),

$$\left(\frac{N}{L}\right)_{3B} = \frac{1}{5} \left(\frac{N}{L}\right)_{3D} = \frac{1}{5} \left(\frac{N}{L}\right)_{1}$$

to maximize output swing.

6.22

M₄, M_{4A}, M_{2A} and M₁₂ should all operate in the active region for a peak to peak output swing of 2:5 V

$$V_{DD} - (-V_{SS}) - V_{O(P-P)} = 1.65 - (-1.65)$$

-2.5
= 0.8 V

Divide this amount equally among M_4 , M_{4A} , M_{2A} and M_{12} to get |VDS(min)| = 0.2 VTo set |VDS(min)| = |Vov| + 0.1 V choose |Vov| = 0.1 V

Since all transistors are biased with equal |Vov|, set |Vov| = 0.1 V for all the transistors

since
$$I_{BIAS} = 25 \text{ MA}$$
assume

$$\begin{split} I_{D_{101}} &= I_{D_{102}} = I_{D_{103}} = I_{D_{104}} \\ &= |I_{D_{105}}| = |I_{D_{106}}| = |I_{D_{107}}| = |I_{D_{108}}| \\ &= I_{D_{109}} = I_{D_{110}} \end{split}$$

$$= |I_{D_{111}}| - |I_{D_{112}}|$$

$$= I_{D_{113}} = I_{D_{114}} = 25 \text{ MA}$$

Since
$$I_{D_{25}} = |I_{D_{35}}| = 200 \, \mu A$$

 $I_{D_{21}} = I_{D_{22}} = |I_{D_{23}}| = |I_{D_{24}}| = |00 \, \mu A$

Since
$$|I_{D_5}| = 200 \text{ MA}$$

 $|I_{D_1}| = |I_{D_2}| = 100 \text{ MA}$

Since
$$I_{D_{11}} = I_{D_{12}} = 200 \text{ 4A}$$

 $I_{D_{1A}} = I_{D_{2A}}$

$$I_{D_{1A}} = I_{D_{2A}}$$

$$= |I_{D_{3A}}| = |I_{D_3}| = |I_{D_4}| = I_{D_{4A}} = |I_{D_{4A}}| = |I_{D_{4A}}|$$

Since
$$|I_D| = \frac{2|I_D|}{|X|V_D^2|}$$

In the bias circuit,

$$\left(\frac{W}{L}\right)_{IOI} = \left(\frac{W}{L}\right)_{IO2} = \left(\frac{W}{L}\right)_{IO3} = \left(\frac{W}{L}\right)_{IO4} = \left(\frac{W}{L}\right)_{IO9} = \left(\frac{W}{L}\right)_{IIO} = \left(\frac{W}{L}\right)_{IIO}$$

$$= \frac{2(25)}{194(0.1)^2} \approx 25$$

In the A, amplifiers,

$$\left(\frac{W}{L}\right)_{25} = \frac{2(200)}{194(0.1)^2} = 200$$

$$\left(\frac{W}{L}\right)_{21} = \left(\frac{W}{L}\right)_{22} = \frac{2(100)}{194(0.1)^2} = 100$$

$$\left(\frac{W}{L}\right)_{23} = \left(\frac{W}{L}\right)_{24} = \frac{2(100)}{64\cdot7(0\cdot1)^2} \approx 300$$

In the Az amplifiers,

$$\left(\frac{W}{L}\right)_{35} = \frac{2(200)}{64.7(0.1)^2} \approx 600$$

$$\left(\frac{W}{L}\right)_{31} = \left(\frac{W}{L}\right)_{32} = \frac{2(100)}{64.7(0.1)^2} \approx 300$$

$$\left(\frac{W}{L}\right)_{33} = \left(\frac{W}{L}\right)_{34} = \frac{2(100)}{194(0.1)^2} \approx 100$$

In the main op-amp,
$$\left(\frac{W}{L}\right)_{5} = \frac{2(200)}{64.7(0.1)^{2}} \approx 600$$

$$\left(\frac{W}{L}\right)_{1} = \left(\frac{W}{L}\right)_{2} = \frac{2(100)}{64.7(0.1)^{2}} \approx 300$$

$$\left(\frac{W}{L}\right)_{11} = \left(\frac{W}{L}\right)_{12} = \frac{2(200)}{194(0.1)^{2}} \approx 200$$

$$\left(\frac{W}{L}\right)_{1A} = \left(\frac{W}{L}\right)_{2A} = \frac{2(100)}{194(0.1)^{2}} \approx 100$$

$$\left(\frac{W}{L}\right)_{3A} = \left(\frac{W}{L}\right)_{3} = \left(\frac{W}{L}\right)_{4} = \left(\frac{W}{L}\right)_{4A} = \frac{2(100)}{64.7(0.1)^{2}} \approx 300$$

From SPICE,

$$\left(\frac{W}{L}\right)_{\parallel 4} = 2.5$$
 to set $V_{DS_{\parallel 4}} = 0.1 \text{ V}$

$$\lambda_{\rm h} = \frac{0.02}{1-2(0.09)} = 0.024 \, V^{-1}$$

$$|\lambda_p| = 0.04 = 0.049 \text{ V}^{-1}$$

and | Vto | = 0.7 V

With Vton= 0.6 V and Vtop = -0.8 V

$$\frac{v_0}{v_i} = 35 \times 10^4$$

The gain falls in this case because M_{22} in the A1 amplifiers operates in the triode region. This happens

because $V_{6D_{22}} = |V_{4p}| + |V_{0Vp}| > V_{422}$ as explained in section 6.7 Therefore, increasing $|V_{4o}|$ for p-channel transistors and reducing V_{4o} for n-channel transistors both push M_{22} closer to the triode region.

6.23

The limiting branch includes

Mio7, Mio8, Mio9, and Milo because

IVDS | for three of these four

transistors includes a |V₁|

|VDS|107| = |V₁107| + |V₀V₁07|

|VDS|108| = |V₁108| + |V₀V₁08|

VDS|108 = |V₁108| + |V₀V₁08|

VDS|106 = V₁02 + V₀V₁02 if V₀S|106 |V₀S|109

No other branch includes

more than two |V₁| terms.

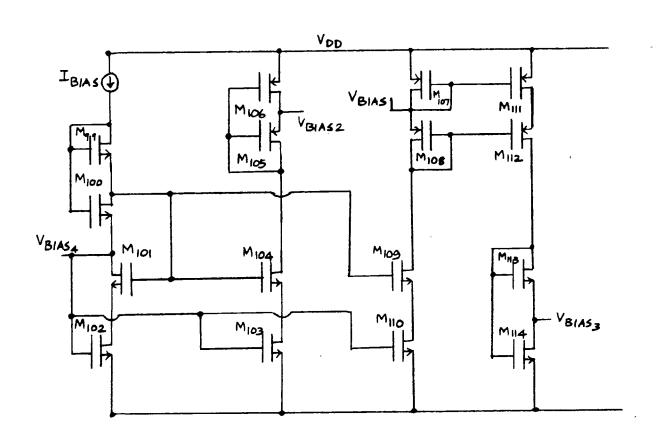

Since |V₀S| of M₁₀7, M₁₀8, and M₁₁0

are set to a |V₁| above |V₀V₁,

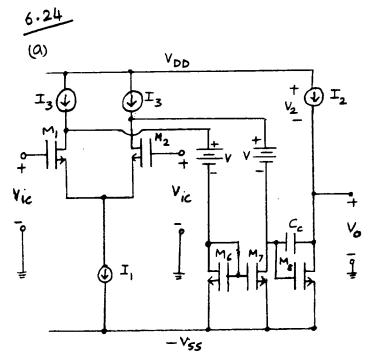

these transistors stay in the active region as |Vov| is increased. Therefore, Mios enters the triode region first because its drainsource voltage is determined by the power-supply voltages and the drain-source voltages of Mio7, Mios, and Milo as follows

VDS108 VDD - (-VSS) - |Vtio7| - |Vovi07| - |Vtio8| - |Vovi08| - Vtio2 - Vovi02

To increase the allowed |Vov|, use a sooch cascode

If $(\frac{W}{L})_{in}$ is adjusted so that VDS100 = VOV110+ 0.1 V Then, VDS110 = VOV110 + 0.1 V instead of VDS110 = Vt102 + Vovioz in the previous circuit. Assuming Vovino = Vovioz , the sooch cascode reduces VDS 16 Vt102 > 0.1 V In turn, this increases Vosing for a fixed I Vovl, which means that a larger |Vov | is required to push Miog into the triode region The Key disadvantage of the new circuit is that it reduces the voltage across the IBIAS generator.

CM input range:

To keep the transistor that forms I, in the active region,

$$V_{ic} > -V_{ss} + V_{ov_n} + V_{ov_i} + V_{t_i}$$

$$V_{1C} > -V_{SS} + V_{t_1} + 2V_{OV_n}$$

To keep M, in the active region,

$$V_{G_1} = V_{IC}$$

$$V_{D_1} = -V_{SS} + V_{t_3} + V_{OV_3} + V$$

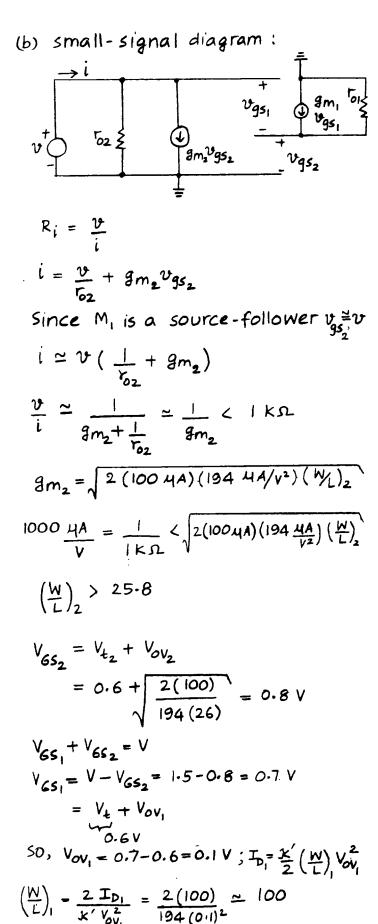

= $-V_{SS} + V_{t_3} + V_{OV_3} + V$

so the CM input range is:

$$-V_{SS} + V_{t_1} + 2V_{OV_n} < V_{IC} < -V_{SS} + V_{t_3} + V_{OV_n} + V + V_{t_1}$$

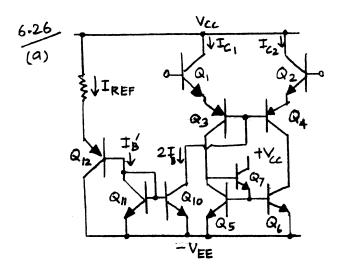

output swing :

because $V_{DS_8} > V_{OV_n}$ is required to operate M_8 in the active region and $V_2 > |V_{OV_p}|$ is required to operate the transistor forming I_2 in the active region.

    PRINT AC IM(VOUT) IP(VOUT)
    * THE TRANSCONDUCTANCE CAN ALSO BE MEASURED BY ELIMINATING
   * THE VOLTAGE SOURCE CONNECTED AT THE OUTPUT AND THE
    * AC AMALYSIS ABOVE, FINDING THE VOLTAGE GAIN AND OUTPUT
    * RESISTANCE WITH A .TF STATEMENT AS SHOWN BELOW,
    * AND CALCULATING GM = (VOLTAGE GAIN)/(OUTPUT RESISTANCE)
    * THE RESULT IS CM = 1.942E4/2.065E8 = 94E-6 A/V
    * THE TRANSCONDUCTANCE IS REDUCED HERE COMPARED
    * TO THE TRANSCONDUCTANCE IN PART (A) BECAUSE
    * THE COLLECTOR CURRENT OF Q13 AND Q14 HERE FLOWS
    IN Q10 AND DOES NOT CONTRIBUTE TO THE STAGE OUTPUT.
    * TF V(16) VI2
    . END
```

Neglect current flow through R_1 and R_2 from 200 4A source. $: I_{C_2} = 200 \text{ MA}, V_{BE_2} = V_T \ln \frac{I_{C_2}}{I_{S_2}}$ $V_{BE_4} + V_{BE_3} = V_{BE_2} + \frac{V_{BE_2}}{R_1} \times R_2$

$$= \frac{V_{T}}{R_{1}} (R_{1} + R_{2}) \ln \frac{I_{c_{2}}}{I_{s_{2}}}$$

$$= V_{T} \ln \left(\frac{I_{c_{3}} |I_{c_{4}}|}{I_{s_{3}} I_{s_{4}}} \right)$$

Areas of Q_3 , Q_4 are 5 times of Q_1 and Q_2 . Therefore, $I_{S_1} = I_{S_2} = 10^{-15}A = I_S$ $I_{S_3} = I_{S_4} = 5 \times 10^{-15}A = 5 I_S$

$$V_{T} \ln \left(\frac{I_{BIAS}^{2}}{25 I_{s}^{2}} \right) = V_{T} \left(I + \frac{R_{2}}{R_{I}} \right) \ln \left(\frac{I_{C_{2}}}{I_{s}} \right)$$

$$\therefore I_{BIAS} = 5 I_{s} \left(\frac{I_{C_{2}}}{I_{s}} \right)^{\frac{1}{2} \left(I + \frac{R_{2}}{R_{I}} \right)}$$

$$= 5 \left(I_{C_{2}} \right)^{\frac{1}{2} \left(I + \frac{R_{2}}{R_{I}} \right)} \left(I_{s} \right)^{\frac{1}{2} \left(I - \frac{R_{2}}{R_{I}} \right)}$$

$$\xrightarrow{R_{2}} = \frac{2 \ln \left(\frac{I_{BIAS}}{5I_{s}} \right)}{\ln \left(\frac{I_{C_{2}}}{I_{s}} \right)} - 1$$

 $I_{BIAS} = 50 \text{ 4A}$, $I_S = 10^{-15}A$, $I_{C_2} = 200 \text{ 4A}$ $\therefore \frac{R_2}{R_1} = 0.77$ From ①, If we choose $\frac{R_2}{R_1} = 1$ then $I_{BIAS} = 5(I_{C_2})^{k_2(1+R_2/R_1)}$ = 1000 4A = 1 mAand I_{BIAS} is independent of temperature. In general, if $\frac{R_2}{R_1} \neq 1$ then I_{BIAS} is dependent on temperature because I_S depends on temperature.

TEMP (DEG C)	IÇ3 = IBIAS (A)	TEN	IC3 = IBIAS (A)
-55	3.253E-05	45	1.935E-04
-35	5.215%-05	65	2.446B-04
-15	7.790E-05	85	3.014E-04
5	1.100E-04	105	3.636E-04
25	1.486E-04	125	4.308E-04

If the bias current level of 741 input stage is doubled, then from (6.134), $G_{m_1} = \frac{1}{2.7 \text{ K} \Omega}$

From (6.138),

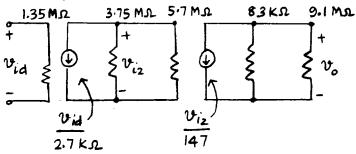

$$R_{01} = R_{00} |_{Q_4} ||_{R_{00}} |_{Q_6}$$

$$= 2 |_{Q_4} ||_{R_{06}} (1 + g_{m_2}(1KR))$$

$$r_{04} = \frac{1}{\eta g_{m}} = \frac{10^{4}}{5} \frac{26}{19 \times 10^{-3}} = 2.74 \text{ M}\Omega$$

$$r_{06} = \frac{10^4}{2} \frac{26}{19 \times 10^{-3}} = 6.84 \text{ Ms.}$$

741 equivalent

3.75 || 5.7 2.26 Ms.; 83K||9.1M=82Ks. $A_{v} = \frac{2260}{2.7} \cdot \frac{82}{0.147} = 836 \times 558$ = 468,000

If the 1001 emitter resistor of Q17 is removed, then in (6.142) We have,

$$Req_1 = \frac{1}{\pi_{17}} \pm \frac{B}{g_m} = 250 \times \frac{26}{0.55} = 11.8 \text{ KJZ}$$

$$R_{i_2} = \chi_{\pi_{16}} + (1 + \beta_0) (\chi_{\pi_{17}} \parallel 50 \text{ Kg})$$

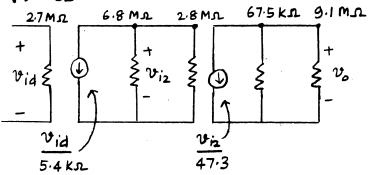

From (6:146)

$$Gm_2 \simeq gm_{17} = \frac{0.55}{26} = \frac{1}{47.3\Omega}$$

From (6.147)

$$v_{0|3|s} = \frac{1}{19m} = \frac{10^4}{5} \frac{26}{0.55} = 94.5 \text{ K}\Omega$$

$$r_{017} = \frac{1}{72m} = \frac{10^4}{2} \cdot \frac{26}{0.55} = 236 \text{ K}\Omega$$

$$A_{v} = \frac{1980}{5.4} \times \frac{67}{0.047} = 67.5 \text{ k | | 9.1 M = 67 k}$$
$$= 523,000$$

Minimum CM input voltage:

The circuit ceases to function correctly when ag and Q4 saturate.

Q3 and Q4 operate in the F.A.R. when.

$$V_{E_3} = V_{IC} - V_{BE_1}$$
 $V_{C_3} = -V_{EE} + V_{BE_5} + V_{BE_7} + I_{C_5}(IK)$
 $V_{EC_3} = V_{IC} - V_{BE_1} - (-V_{EE}) - V_{BE_5} - V_{BE_7} > V_{CE(sat)}$
 $V_{IC} > -V_{EE} + V_{BE_1} + V_{BE_5} + V_{BE_7} + V_{CE(sat)}$

Maximum CM in but valtage:

Maximum cm input voltage:

Q1 and Q2 operate in the FAR. When

$$V_{CE_1} > V_{CE_2}(sat)$$

$$V_{C_1} = V_{CC} - |V_{BE_8}|$$

$$V_{E_1} = V_{IC} - V_{BE_1}$$

$$V_{CE_1} = V_{CC} - |V_{BE_8}| - V_{IC} + V_{BE_1} > V_{CE_2(sat)}$$

$$V_{CE_1} = V_{CC} - |V_{BE_8}| - V_{IC} + V_{BE_1} > V_{CE_2(sat)}$$

$$V_{CE_1} = V_{CC} - |V_{CE_2(sat)}|$$

$$V_{CE_1} = V_{CC} - |V_{CE_2(sat)}|$$

$$V_{CE_1} = V_{CC_1} - |V_{CE_2(sat)}|$$

$$V_{CE_1} = V_{CC_1} - |V_{CE_2(sat)}|$$

6.31

First consider the bipolar differential pair with tail current source and resistive loads by itself. Let Vos, represent the offset of that circuit referred to the input of that circuit (the bases of Q1 and Q2)

From (6.164),

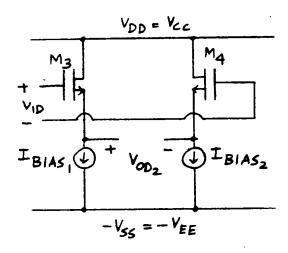

$$V_{OS_1} = V_T \left(-\frac{\Delta I_S}{I_S} - \frac{\Delta R}{R} \right)$$
where $I_S = \frac{I_{S_1} + I_{S_2}}{2}$

$$\Delta I_S = I_{S_1} - I_{S_2}$$

$$R = \frac{R_1 + R_2}{2}$$

$$\Delta R = R_1 - R_2$$

second, consider the Mos source followers by themselves. Let V_{os_2} represent the offset of the source followers only referred to the input of the entire circuit (the gates of M₃ and M₄)

$$V_{OD_{2}} = V_{ID} - (V_{GS_{3}} - V_{GS_{4}})$$

$$V_{ID} = V_{OD_{2}} + V_{GS_{3}} - V_{GS_{4}}$$

$$V_{OS_{2}} = V_{ID} \text{ for which } V_{OD_{2}} = 0$$

$$V_{OS_{2}} = V_{GS_{3}} - V_{GS_{4}}$$

$$V_{GS_{3}} = V_{t_{3}} - V_{OV_{3}}$$

$$V_{GS_{4}} = V_{t_{4}} - V_{OV_{4}}$$

$$V_{OV_{3}} = \sqrt{\frac{2 I_{BIAS_{1}}}{x'(\frac{W}{L})_{3}}}$$

$$V_{OV_{4}} = \sqrt{\frac{2 I_{BIAS_{2}}}{x'(\frac{W}{L})_{4}}} - \sqrt{\frac{2 I_{BIAS_{2}}}{x'(\frac{W}{L})_{4}}}$$

$$V_{OS_{2}} = V_{t_{3}} - V_{t_{4}} + \sqrt{\frac{2 I_{BIAS_{1}}}{x'(\frac{W}{L})_{3}}} - \sqrt{\frac{2 I_{BIAS_{2}}}{x'(\frac{W}{L})_{4}}}$$

$$Let I_{BIAS} = \frac{I_{BIAS_{1}} + I_{BIAS_{2}}}{2}$$

$$\triangle I_{BIAS_{1}} = I_{BIAS_{1}} - I_{BIAS_{2}}$$

$$I_{BIAS_{2}} = I_{BIAS_{1}} - \Delta I_{BIAS_{2}}$$

$$I_{BIAS_{2}} = I_{BIAS_{1}} - \Delta I_{BIAS_{2}}$$

$$I_{BIAS_{2}} = I_{BIAS_{1}} - \Delta I_{BIAS_{2}}$$

Also,
$$\left(\frac{W}{L}\right)_3 = \left(\frac{W}{L}\right) + \frac{1}{2} \Delta \left(\frac{W}{L}\right)$$

$$\left(\frac{W}{L}\right)_4 = \left(\frac{W}{L}\right) - \frac{1}{2} \Delta \left(\frac{W}{L}\right)$$
Where, $\left(\frac{W}{L}\right) = \frac{\left(\frac{W}{L}\right)_3 + \left(\frac{W}{L}\right)_4}{2}$

$$\Delta \left(\frac{W}{L}\right) = \frac{\left(\frac{W}{L}\right)_3 - \left(\frac{W}{L}\right)_4}{2}$$
Finally, $\Delta V_t = V_{t_3} - V_{t_4}$

$$V_{OS} = \Delta V_t + 2 \left(I_{BIAS}\right) \left(I + \Delta I_{BIAS}\right)$$

$$V_{OS_{2}} = \Delta V_{L} + \frac{2(I_{BIAS})(I + \frac{\Delta I_{BIAS}}{2I_{BIAS}})}{X'(\frac{W}{L})[I + \frac{\Delta(N_{L})}{2(N_{L})}]} - \frac{2(I_{BIAS})(I - \Delta I_{BIAS})}{2I_{BIAS}}$$

$$X'(\frac{W}{L})[I + \frac{\Delta(N_{L})}{2(N_{L})}]$$

$$X'(\frac{W}{L})[I - \frac{\Delta(N_{L})}{2(N_{L})}]$$

Let Vov =
$$\sqrt{\frac{2I_{BIAS}}{x' W_L}}$$

$$V_{OS_2} = \Delta V_t + V_{OV} \left[\begin{array}{c} 1 + \frac{\Delta I_{BIAS}}{2 I_{BIAS}} \\ 1 + \frac{\Delta (W_L)}{2 (W_L)} \end{array} \right] \frac{1 - \frac{\Delta I_{BIAS}}{2 I_{BIAS}}}{1 - \frac{\Delta (W_L)}{2 (W_L)}} \right]$$

Since
$$\sqrt{x} = 1 + \frac{x}{2}$$
 for $x = 1$

$$V_{OS_2} \simeq \Delta V_t + \frac{V_{OV}}{2} \left[\begin{array}{c|c} 1 + \frac{\Delta I_{BIAS}}{2I_{BIAS}} & 1 - \frac{\Delta I_{BIAS}}{2I_{BIAS}} \\ \hline 1 + \frac{\Delta (W_L)}{2(W_L)} & 1 - \frac{\Delta (W_L)}{2(W_L)} \end{array} \right]$$

since
$$\frac{1}{1+y} \approx 1-y$$
 for $y < < 1$,

$$V_{OS_2} = \Delta V_1 + \frac{V_{OV}}{2} \left[1 + \frac{\Delta I_{BIAS}}{2 I_{BIAS}} - \frac{\Delta (W/L)}{2 (W/L)} - \left(1 - \frac{\Delta I_{BIAS}}{2 I_{BIAS}} + \frac{\Delta (W/L)}{2 (W/L)} \right) \right]$$

$$V_{OS_2} \approx \Delta V_{\downarrow} + \frac{V_{OV}}{2} \left[\frac{\Delta I_{BIAS}}{I_{BIAS}} - \frac{\Delta (W_{\downarrow})}{(W_{\downarrow})} \right]$$

Let Vos represent the total offset including both Vos, and Vos,.

$$V_{OS} = \frac{V_{OS_1}}{Source-follower gain} + V_{OS_2}$$

Since the source-follower gain = 1,

COMMON BOUNCE AMPLIFIER

$$\frac{72}{9m = 7k'_{1}} \frac{W}{L} I_{0} = 2x60x10^{6}x \frac{100}{2-2x0.2-0}x500x10^{6}$$

$$= 1.9 \times 10^{3} A/V$$

$$A_{v} = -9mR_{L} = -1.9 \times 10^{3}x 5 \times 10^{3} = -9.5$$

$$C_{95} = \frac{2}{3} \text{ WLeff Cox} + \text{WLd Cox}$$

$$= \frac{2}{3} 100 \times 1.6 \times 6.7 + 100 \times 0.2 \times 0.7$$

$$= 89 \text{ FF}$$

$$C_{9d} = \text{WLd Cox} = 100 \times 0.2 \times 0.7 = 14 \text{ FF}$$
(a) Use the Miller effect.
$$|P_{1}| = \frac{1}{R_{5} [C_{95} + C_{9d}(1-Av)]}$$

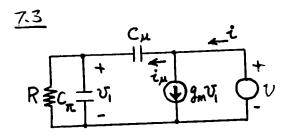

$$= \frac{1}{10k[89 + 14(1+9.5)] \times 10^{15}}$$

$$= \frac{1}{2.4 \times 10^{9}} = 4.2 \times 10^{8} \text{ rad/s}$$

$$f_{-x1B} = \frac{|P_{1}|}{2\pi} = 67 \text{ MHz}$$
(b) Do not use the Miller effect to calculate the second pole.
From Eq. (7.26),
$$|P_{2}| = \frac{1}{|P_{1}|} R_{L} R_{S} C_{9d} C_{95}$$

$$= \frac{1}{42 \times 10^{8}} 5k \times 10k \times 14 + 5 \times 89 + 5 \times 10^{15}$$
It is equivalent to 6.1 GHz.

$$\frac{7.7}{A_{cm}} \approx -\frac{R_{L}}{2R_{T}} (1+SR_{T}C_{T})$$

$$= -\frac{3}{2\times300} (1+S\times300\times10^{3}\times2\times10^{-12})$$

$$= -5\times10^{3} (1+6\times10^{-7}S)$$
To calculate Adm, the dominant pole is
$$|P| = \frac{1}{R_{S}[C_{gS} + C_{gd}(1+g_{mR_{L}})]}$$

$$= \frac{1}{5\times10^{3}} \frac{1}{98+14(1+1.8\times10^{3}\times3\times10^{3})} \times 10^{-15}$$

$$= 1.1\times10^{9} \text{ rad/S}$$

$$A_{dm} = \frac{-9 \text{ mR_{L}}}{1+S/(1.1\times10^{9})} = \frac{-1.8\times10^{3}\times3\times10^{3}}{1+S/(1.1\times10^{9})}$$

$$CMRR = \frac{|A_{dm}|}{|A_{cm}|} = 1.1\times10^{3} \frac{1+S/(1.7\times10^{6})}{1+S/(1.1\times10^{9})}$$

$$A_{dB}$$

$$= \frac{1}{1+S} \frac{1}$$

....

```

Bias
$$I_{cb} = \frac{5.4}{11} = 0.49 \text{ mA}$$

 $\therefore I_{c4} \simeq \frac{0.49}{2.5} = 196 \mu\text{A}$

:.
$$I_{c3} = \frac{1.227 - 0.6}{/} = 0.627 \text{ mA}$$
 $I_{B3} = 6 \text{ MA}$

Recalculate

$$V_{C2} = 6 - 0.092 \times 12.5 = 4.85 \text{V}$$

 $\therefore I_{C3} = \frac{1.15 - 0.6}{1.15 - 0.6} = 0.55 \text{ mA}$

Parameters

$$\frac{Q_{1}}{C_{\pi}+C_{\mu}} = \frac{\beta}{\beta_{m}} = 200 \times \frac{26}{0.098} = 53.1 \text{ KP}$$

$$C_{\pi}+C_{\mu} = \frac{\beta_{m}}{2\pi f_{\pi}} = \frac{1}{2\pi \times 26 \times 400 \times 10^{6}}$$

$$= 15.3 \text{ pF at ImA}$$

$$\therefore C_{\pi} = 15 \text{ pF at ImA}$$

$$C_{b} = 12 \text{ pF at 0.098 mA}$$

$$C_{R1} = 4.2 \text{ pF}$$

$$\frac{Q_3}{Q_{M3}} \quad r_{R3} = \frac{\beta}{g_{M3}} = 100 \times \frac{26}{0.55} = 4.7 \text{ k} \Omega$$

$$C_{bs} + C_{\pi} + C_{\mu} = \frac{g_{m3}}{2\pi f_{T}}$$

$$= \frac{0.5}{2 \times 26 \times 6 \times 10^6} = 510 \text{ pF}$$

Half-circuit

$$\frac{V_o}{V_i} = \frac{\gamma_{K1}}{r_{K1} + R_S} q_{m_1} \frac{R_{L1} R_{i3}}{R_{L1} + R_{i3}} G_{m_3} R_{L3}$$

$$G_{m3} = \frac{g_{m3}}{1 + g_{m3}RE3} = \frac{0.55}{26} \frac{1}{22.2}$$

$$\frac{V_0}{V_1} = \frac{53.1}{63.1} \frac{0.098}{26} \frac{12.5 \times 104}{116.5} \times 1000 \times 0.953$$

Actual gain = $\frac{1}{2}$ x 337 = 169

$$R_{R03} = r_{R3} \left\| \frac{R_{L1} + R_{E3}}{1 + g_{m3} R_{E3}} = 4.7 \right\| \frac{12.6^{K}}{22.2}$$

$$R_{M03} = R_1 + R_{L3} + G_m R_1 R_{L3}$$

$$R_{\mu 03} = 11.2 + 10 + 0.953 \times 10 \times 11.2$$
= 128 k \Omega

7.46

To calculate the dominant pole, calculate the open circuit time constants

$$C(R+R_0+\frac{av}{R_0}RR_0)=C(R+R_0+avR)$$

$$=C[(1+av)R+Ro]$$

$$P_1 = -\frac{1}{4 \times 10^{-3}} = -1 \times 10^3 \text{ rad/s}$$

To calculate the nondominant pole, calculate the short circuit time constants

$$C_{in}(R | \frac{Ro}{a_0} | | R_o) = q_2 \times 10^{-12} (20 \times 10^{-11} | \frac{5 \times 10^{-11}}{1000} | | 5 \times 10^{-12})$$

$$CR_0 = 50 \times 10^{-12} \times 5 \times 10^3 = 2.5 \times 10^{-7} \text{S}$$

$$P_2 = -\left(\frac{1}{1 \times 10^{12}} + \frac{1}{2.5 \times 10^{-7}}\right) = -1 \times 10^{12} \text{ rad/s}$$

Note that there is a zero at

$$Z = -\frac{av/Ro}{C} = -\frac{1000/5 \times 10^3}{50 \times 10^{12}} = -4 \times 10^9 \text{ rad/S}$$

It is between the two poles and confirmed by SPICE.

$$Z=-2\frac{g_{m3}}{C_{x}}=-2\times 10^{10} \text{ tad/s}$$

CHAPTER 8

$$\frac{8.1}{(a)} A = \frac{a}{1+af} = \frac{10^{5}}{1+100} = 990.1$$

$$\frac{8.3}{(a)} \delta_{\epsilon} = \frac{\Delta S_{i}}{1+af}$$

$$\frac{SA}{A} = \frac{Sa}{a} \frac{1}{1+T} = \frac{10}{101} = 0.1\%$$

$$For |S_{i}| < 0.7V | 1+af = 5001$$

$$For 0.7V < |S_{i}| < 1.5V | 1+af = 2001$$

$$For |S_{i}| > 1.5V | 1+af = 1$$

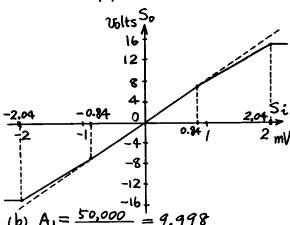

$$\frac{SA}{A} = \frac{10}{10,001} = 0.001\%$$

$$\frac{SA}{A} = \frac{10}{10,001} = 0.001\%$$

$$\frac{SE}{A} = \frac{10}{10,001} = 0.001\%$$

$$\frac{8.2}{(a)} A_1 = \frac{a_1}{1+a_1f} = \frac{50000}{1+5} = 8333$$

$$A_2 = \frac{20.0000}{1+2} = 6667$$

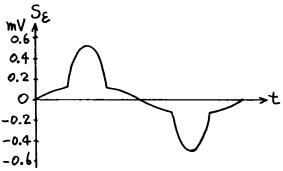

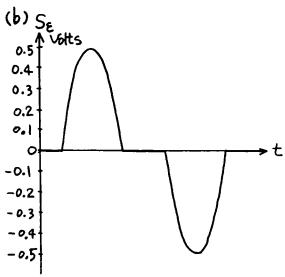

(b)
$$A_1 = \frac{50,000}{1+5000} = 9.998$$

 $A_2 = \frac{20,000}{1+2000} = 9.995$

$$\frac{8.3}{(A)} = \frac{\Delta S_i}{1 + af}$$

For 15:1 >1.5 v 1+ a5 = 1

$$\frac{8.4}{i_i = i_{\varepsilon} + i_{fb}}$$

$$i_0 = ai_{\varepsilon} = a (i_i - i_{fb})$$

$$= ai_i - af_{io}$$

$$\vdots i_o = \frac{a}{1 + af_{io}}$$

$$8-1$$

$$V_i = i_{\ell} Z_i = \frac{i_0}{a} Z_i = \frac{Z_i}{a} \frac{a}{1+a_{\ell}} i_i$$

$$\therefore Z_i = \frac{V_i}{i_{\ell}} = \frac{Z_i}{1+T} - \cdots - (9.4)$$

Apply a voltage vo at the output and open-circuit input

$$i_o = \frac{v_o}{z_o} + ai_{\varepsilon} = \frac{v_o}{z_o} - si_o$$

$$i_o(1+T) = \frac{v_o}{z_o}$$

$$\therefore Z_o = \frac{v_o}{i_o} \frac{z_o}{1+T}$$

$$\begin{aligned}
v_i &= v_{\hat{\epsilon}} + v_{fb} \\
\dot{v}_o &= av_{\hat{\epsilon}} = a(v_i - v_{fb}) \\
&= av_i - afio \\
\vdots \frac{i_o}{v_i} &= \frac{a}{1+af} - \dots - (8.43) \\
\dot{v}_e &= \frac{v_{\hat{\epsilon}}}{z_i} = \frac{i_o}{a} \frac{1}{z_i} = \frac{v_i}{1+af} \frac{1}{z_i}
\end{aligned}$$

$$\therefore Z_i = \frac{v_i}{i_s} = Z_i(1+T)$$

Apply a voltage vo at the output and short-circuit the input

$$i_0 = \frac{v_0}{z_0} + av_{\xi} = \frac{v_0}{z_0} - afi_0$$

$$\therefore Z_0 = \frac{V_0}{i_0} = Z_0(1+T)$$

8.6(a)

From (8.66)

$$Z_{ia} = \frac{R_F Z_i}{R_F + Z_i} = \frac{100 \times 500}{600} = 83.3$$

From (8.68)

$$Z_{0a} = Z_0 ||R_F||R_L$$

= 200 || 100 k|| 15 k
 $\simeq 200 \Omega$

$$T = \frac{10^{5} \times 15 \times 10^{3}}{10^{5} \times 15 \times 10^{3} + 200 \times 15 \times 10^{3}} \times 75,000$$

$$= 61,560 \times \frac{500}{600}$$

Thus with feedback

$$Z_i = \frac{83.3 \,\mathrm{k}}{6560} = 1.4 \,\Omega$$

$$Z_0 = \frac{200}{61.560} = 0.0032 \Omega$$

$$A = \frac{1}{5} \frac{1}{1+\frac{1}{T}} = \frac{100 \text{ k}\Omega}{1+\frac{1}{61,560}}$$
$$= 99.998 \text{ k}\Omega$$

$$R = \frac{R \sqcup |(R_F + Z_i)}{Z_0 + R \sqcup ||(R_F + Z_i)} \frac{Z_i}{Z_i + R_F} a_{ij}$$

$$= \frac{15k \parallel (100k + 500k)}{200 + 15k \parallel (100k + 500k)} \frac{500k}{500k + 100k} 75000$$

$$= 6.16 \times 10^{+}$$

$$A_{04} = -R_F = -100 \text{ k}\Omega$$

$$d = \frac{V_0}{i_i} \Big|_{a_0 = 0} = \frac{Z_i}{Z_i + \lceil R_F + Z_0 \rceil \mid R_L \rceil} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 = 0}^{\infty} \frac{Z_i}{Z_0 + \lceil R_F + Z_0 \rceil \mid R_L \rceil} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 = 0}^{\infty} \frac{Z_i}{1 + Q_i} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 = 0}^{\infty} \frac{Z_i}{1 + Q_i} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 = 0}^{\infty} \frac{Z_i}{1 + Q_i} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 = 0}^{\infty} \frac{Z_i}{1 + Q_i} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 = 0}^{\infty} \frac{Z_i}{1 + Q_i} \Big|_{a_0 = 0}^{\infty} \Big|_{a_0 =$$

8.7

$$RF lok$$

$$RF lo$$

$$i_{i} = \frac{1}{2} \frac{1}$$

$$Y_{03} = \frac{40}{0.73} = 54.8 \text{ k}\Omega$$

In forward gain calculation, neglect You and Yoz.

For the basic amplifier,

$$\frac{io}{V_{i}} = \frac{g_{m1}}{1 + g_{m1}R_{A}} R_{1} g_{m2} R_{2} \frac{g_{m3}}{1 + g_{m1}R_{B}}$$

$$R_{1} = 10.6 \text{ K} \| Y_{R2} = 2.93 \text{ K} \Omega$$

$$R_{2} = Y_{02} \| 6 \text{ K} \| R_{i} 3$$

$$R_{i3} = Y_{R3} (1 + g_{m3}R_{B})$$

$$= 4.27 (1 + \frac{0.73}{26} \times 256)$$

$$= 35 \text{ K} \Omega$$

$$\therefore R_{2} = 52 \text{ K} \| 6 \text{ K} \| 35 \text{ K} = 4.66 \text{ K} \Omega$$

$$\therefore \frac{io}{V_{i}} = \frac{1}{52} \frac{1}{1 + \frac{256}{52}} 2930 \frac{0.77}{26} 4460$$

$$\times \frac{0.73}{26} \frac{1}{8.19}$$

$$\therefore \alpha = 4.5 \text{ A/V}$$

From (8.95)
$$f = \frac{1}{0.3} \frac{RE1 RE2}{RE1 + RE2 + RE}$$

$$= \frac{1}{0.99} \frac{290 \times 290}{290 + 290 + 1900}$$

$$= 34.25 \Omega$$

$$\therefore loop gain = af = 4.5 \times 34.25 = 154$$
Overall gain with feedback
$$= \frac{a}{1 + af} = \frac{4.5}{1 + 154} = \frac{4.5}{155} A/V$$

$$\therefore \frac{io}{16} = 29 \text{ mA/V}$$

For the basic amplifier

Input resistance.

$$Y_{ia} = Y_{\pi 1} (1 + 9_{m_1} R_A)$$

$$= 6.24 (1 + \frac{256}{52}) = 36.96 \text{ k}\Omega$$
Output resistance
$$Y_{oa} = Y_{o3} (1 + 9_{m_3} R_B \frac{Y_{\pi 3}}{Y_{\pi 3} + R_{53}})$$

$$r_{0a} = r_{03} (1 + g_{m_3} R_8 \frac{r_{m_3}}{r_{m_3} + R_{s_3}})$$

$$\therefore Y_{0a} = 54.8 \left(1 + \frac{0.13}{26} 256 + \frac{4.27}{4.27 + 5.38}\right)$$

$$= 229 \text{ K.D.}$$

For the feedback amplifier $R_i = Y_{ia}(1+af) = 36.96 \times 155 = 5.73$ Ro= You (1+af) = 229x155 = 35.5

For the basic amplifier

$$\frac{v_0}{v_i} = \frac{\dot{v}_0}{v_i} R_B = 4.5 \times 256 = 1152$$

where Vo is the voltage at Q3 emitter

$$f = h_{12}f = \frac{v_1}{v_2} = \frac{R_{E1}}{R_{E1} + R_F}$$
$$= \frac{290}{290 + 1900} = 0.132$$

: loop gain =
$$af = 1152 \times 0.132 = 152$$

as in 8.8

: with feedback, overall gain is

$$\frac{v_0}{v_0} = \frac{a}{1+af} = \frac{1152}{1+152} = 7.53$$

Input resistance is

$$Ri = Yia(1+af) = 36.96 \times 153$$

= 5.65 Ms. as in 8.8

Output resistance

$$R_0 = \frac{Y_{00}}{1+af}$$

$$Y_{00} = 256 \left\| \left(\frac{1}{g_{m3}} + \frac{R_{53}}{\beta_3} \right) \right\|$$

$$= 256 \left\| \left(36 + \frac{5380}{120} \right) \right\|$$

$$= 256 \left\| 81 - 61.5 \Omega \right\|$$

:. With feedback
$$R_0 = \frac{61.5}{153} = 0.4 \Omega$$

8.13

Bias

$$I_{c1}+I_{c2} = \frac{5.3}{5} = 1.06 \text{ mA}$$

 $I_{c1} = \frac{V_{BE3}}{1.25} = \frac{0.7}{1.25} = 0.56 \text{ mA}$
 $I_{c2} = 0.5 \text{ mA}$

Assume Ic1 = Ic2 = 0.53 mA

Then
$$Y_{\pi 1} = Y_{\pi 2} = \frac{200 \times 26}{0.53} = 9.81 \text{ kg}$$

$$Y_{\pi 3} = 2.6 \text{ k} \cdot \Omega$$

Basic amplifier

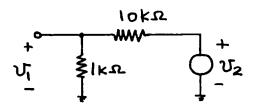

$$R_{E1} = \frac{1}{g_{m2}} + \frac{909}{\beta_2} = \frac{26}{0.53} + \frac{909}{200}$$
$$= 54 \Omega$$

$$\frac{v_0}{v_i} = \frac{0.53}{26} \frac{1}{1 + \frac{0.53}{26} 54} 844 \frac{3880}{26}$$

:
$$a = 1222$$

 $f = h_{12} f = \frac{v_1}{v_2} = \frac{1}{11}$

: loop gain =
$$\frac{1222}{11}$$
 = 111

$$\frac{v_0}{v_i} = \frac{1222}{1+10} = 10.9$$

For the basic amplifier

With feedback

$$R_0 = \frac{3880}{112} = 34.6 \Omega$$

$$I_{01} = \frac{kn'}{2} \frac{W}{L} (0 - Vs_{12} - Vtn)^{2}$$

$$= \frac{60x | 5^{6}}{2} |00(-Vs_{12} - 1)^{2} = 3x | 0^{3} (Vs_{12} + 1)^{2}$$

$$I_{02} = \frac{kn'}{2} \frac{W}{L} (Vs_{12} - Vs_{12} - Vtn)^{2}$$

$$= 3x | 0^{3} (Vs_{12} - Vs_{12} - 1)^{2}$$

$$Vs_{12} = -6 + 5k (I_{01} + I_{02})$$

$$|Vs_{23}| = 4.35k I_{01}$$

$$I_{03} = \frac{kp'}{2} \frac{W}{L} (|Vs_{23}| - |Vtp|)^{2}$$

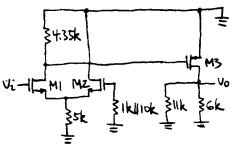

$$= \frac{20x | 0^{6}}{2} |00(|Vs_{23}| - 1)^{2} = |0^{3} (|Vs_{23}| - 1)^{2}$$

$$V_{0} = -6 + 6k I_{03}$$

$$Vs_{12} = \frac{|k|}{|0k+|k|} V_{0} = \frac{1}{|1|} V_{0}$$

Solve the equations $V_{S12} = -1.39V, V_0 = V_9 = 0V,$ $I_{D1} = I_{D2} = 0.46 \text{ mA}, I_{D3} = I_{MA}$ $g_{m1} = g_{m2} = \sqrt{2k'_{1}} \frac{VV}{L} I_{D}$ $= \sqrt{2 \times 60 \times 10^{16} \times 100 \times 0.46 \times 10^{3}} = 2.3 \times 10^{-3} \text{A/V}$ $g_{m3} = \sqrt{2k'_{1}} \frac{VV}{L} I_{D} = \sqrt{2 \times 20 \times 10^{16} \times 100 \times 10^{3}}$ $= 2 \times 10^{-3} \text{A/V}$

Assuming Vo=Vgz=OV, iteratively

The Ikillok resistance at the gate of MZ is effectively a short circuit since Igz=0

$$R_{SI} = \frac{1}{9m_2} 115k = \frac{1}{2.3 \times 10^3} 115k = 435115k$$
=400

$$\frac{V_0}{V_i} = \frac{g_{mi}}{1 + g_{mi}R_{SI}} R_1 g_{m3} R_2$$

$$= \frac{2.3 \times 10^{-3}}{1 + 2.3 \times 10^{-3} \times 400} + 35k \times 2 \times 10^{-3} \times (11k1/6k)$$

$$f = \frac{ik}{lok + lk} = \frac{l}{ll}$$

$$A = \frac{a}{1+af} = \frac{40}{1+3.6} = 8.7$$

ria>00

$$R_0 = \frac{roa}{1+af} = \frac{3.9k}{1+36} = 850\Omega$$

SMALL-SIGNAL TRANSFER CHARACTERISTICS

8.16

(a) T is almost independent of RE. This can be seen if the loop is broken and a signal inserted. RF feeds current to the emitter of Q1 and most of this is shunted into Q1.

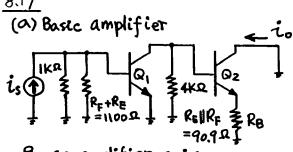

If a and f are calculated, a decreases as RE increases and

f increases by about the same percentage.

(b) Loop gain is almost inversely proportional to Rf. As Rf incre-

-ases, f decreases proportionately, whereas a changes slowly due to the 200 sload resistor.

(C) Loop gain is almost directly proportional to RL since a depends on this quantity.

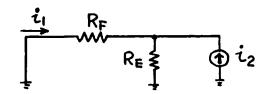

Basic amplifier gain $\frac{io}{is} = -(|k||1.1k||r_{R}|)g_{m_1}R_1 \frac{g_{m_2}}{1+g_{m_2}R_8}$ $R_1 = 4k||r_{R_2}(1+g_{m_2}R_8)||r_{ol}|$ $= 4k||5.2(1+\frac{90.9}{26})k||look|$ $= 2.20 k \Omega$

$$\frac{1}{10} = -476 \times \frac{3300}{26} \times \frac{1}{26} \times \frac{1}{4.5}$$

: $\alpha = -516$ Yia = $|k| | 1.|k| | Y_{\pi |} = 476 \Omega$ Yoa = Yo2 ($|+ g_{m2} R_B \frac{Y_{\pi 2}}{Y_{\pi 2} + R_{52}}$) $R_{52} = Y_{01} | | |4k| = 3.85 k \Omega$: $Y_{0a} = |00| (1 + \frac{90.9}{26} + \frac{5.2}{5.2 + 3.85}) k$ = $300 k \Omega$

Feedback network

$$f = g_{12}f = \frac{i_1}{i_2} = -\frac{RE}{RE + RF} = -\frac{100}{1100}$$

$$= -\frac{1}{11}$$

 $= -\frac{1}{11}$:. loop gain = $\frac{516}{11} = 46.9 = af$

: with feedback applied

overall gain =
$$\frac{io}{ii} = \frac{a}{1+af}$$

= $\frac{-516}{47.9} = -10.8$

Input resistance

$$R_i = \frac{Y_{ia}}{I+T} = \frac{476}{47.9} = 9.94 \Omega$$

Output resistance

(b) f is unchanged

a increases by about 10%

change in overall gain is $\frac{10}{479} = 0.2\%$

Ri changes by -10% because $Ri = \frac{Yia}{1+af}$

(a) Basic amplifier gain

RETRE = 5.2KIL

 $R_1 = R_{L1} \| r_{R2} (1 + g_{M2} R_B) \| r_0 \|$ $= 10K \| 5.2 (1 + \frac{192}{26}) K \| 100K \|$ $= 0.52 K \Omega$

$$\frac{1}{i} = -\left[5.2k | 5.2k\right] \frac{7520}{26} \frac{1}{26} \frac{1}{8.38}$$

:.
$$a = -3451$$

 $Yia = 5.2 \times 115.2 \times 2.6 \times 12$
 $Yia = 5.2 \times 115.2 \times 2.6 \times 12$
 $Yia = 5.2 \times 115.2 \times 15.2 \times 15.2$

:.
$$T_{0a} = 100 \left(1 + \frac{192}{26} + \frac{5.2}{5.2 + 9.09}\right)$$

= 369 K \Omega

Feedback network

$$f = g_{12}f = \frac{i_1}{i_2} = -\frac{R_E}{R_E + R_F}$$
$$= -\frac{200}{5200} = -0.0385$$

:. loop gain = 3451 x 0.0385 = 133

: With feedback applied overall gain = $\frac{i\theta}{ii} = \frac{a}{1+af}$ = $\frac{-3451}{134} = -25.8$

Input resistance

$$R_{t} = \frac{2600}{134} = 19.4 \Omega$$

Output resistance

(b) If Ic1 increases 20 % gmi increases 20 % FRI decreases 20 %

:. \underline{a} increases about 10%, since $(R_F + R_E) = r_{\pi 1}$ \underline{f} is unchanged

: Change in overall gain is $\frac{10}{1+T} = \frac{10}{134} = 0.075 \%$ $R_0 = Yoa(1+af)$

:. Ro increases about 10%

Transconductance
$$G_{1m} = \frac{1}{RE} \frac{1}{1 + \frac{1}{RE} (\frac{1}{g_{1m}} + \frac{Y_b + R_E}{\beta_0})} = \frac{1}{200} \frac{1}{1 + \frac{1}{200} (26 + \frac{400}{150})} = 4.37 \text{ mA//}$$

Input resistance

$$R_i = Y_b + Y_R + (1+\beta_b)R_E$$

= 200+150x26+151 x200
= 34.3 K\$\Omega\$

Output resistance

$$R_{o} = Y_{o}(1 + \frac{g_{m}R_{5}}{1 + \frac{Y_{b} + R_{5}}{Y_{R}}})$$

$$= 80(1 + \frac{\frac{200}{26}}{1 + \frac{400}{150x26}})$$

$$= 638 \text{ K}\Omega$$

$$Loop gain T = \frac{g_m R_E}{1 + \frac{r_b + R_E}{r_R}}$$

$$= 7$$

(a) Assume high
$$\beta$$

 $I_{a8} = \frac{12 - 0.6}{11.4} = 1 \text{ mA}$

$$I_{Q1} = I_{Q2} = \frac{1}{2} \times 4.7 = 2.3 \text{ mA}$$

 $I_{Q4} = 4.7 \text{ mA}$

:.
$$I_{Q3} = I_{Q4} = 2.3 \text{mA}$$

 $I_{Q10} = I_{Q11} = \frac{|400|}{400} \times |= 3.5 \text{mA}$

Sum currents at collector of Q_1 $T_{Q_1} = \frac{6 - V_{C_1}}{2.4} + \frac{2.9 - V_{C_1}}{7}$

:. Current in
$$7 \text{k}\Omega$$
 resistor
$$= \frac{2.9-1}{7} = 0.27 \text{ mA}$$

$$R_i = r_{E1} + (1+\beta)R_{E1}$$

$$= \frac{100\times26}{2.3} + 101\times640 = 66k\Omega$$
For the half circuit

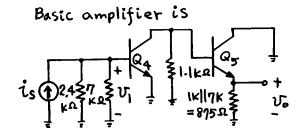

For the first stage

$$\frac{io1}{v_i} = -\frac{1}{640} \frac{1}{1 + \frac{1}{600} \left(\frac{26}{2.3} + \frac{640}{100}\right)}$$

$$= -1.52 \text{ mA//}$$

Consider the shunt-shunt feedback stage.

733 AMP

$$V_i = i_s(2.4K || 7K || Y_{\pi 4})$$

= $i_s \times 0.69 |_K$

$$Ris = r_{RS} + (1+\beta) \times 875$$

=684 + 88.4K = 89 K-\Omega.

$$\frac{v_0}{i_s} = -0.69 \text{K} \times g_{m4} [1.1 \text{K} | 89 \text{K}]$$

$$= -0.69 \text{K} \times \frac{2.3}{26} \times 1087$$

∴
$$\alpha = -66.3 \text{ k}\Omega$$

 $f = -\frac{1}{7 \text{ k}}$

: For the output stage with feedback applied

$$\frac{v_0}{i_{01}} = \frac{a}{1+af} = \frac{-281 \, \text{k}}{1+9.47} = -6.33 \, \text{k} \, \Omega$$

i for the overall circuit

$$\frac{v_0}{v_i} = 1.52 \times 10^{-3} \times 6.33 \times 10^3 = 9.6$$

Loop gain of output stage T=af=9.47

Output impedance of half circuit = $875 \| \left[\frac{1}{g_{m5}} + \frac{1100}{\beta} \right]$

=875 || [7 +11] = 182

:. For the complete circuit $Y_{0a}=36\Omega$, and with feedback applied, $R_0=\frac{36}{1+1}=3.6\Omega$

9.999E+01

USING SPICE, WE SEE THAT THIS 1MA IS DIVIDED AMONG THESE TRANSISTORS: 1MA=TC8+TE7+TE9+TE10+TE11

SO THE SPICE DC BIAS CURRENTS OF TRANSISTORS ARE DIFFERENT FROM THE VALUES OBTAINED BY HAND.

**** SMALL-SIGNAL TRANSFER CHARACTERISTICS

```

 $= \frac{200k || 50k}{|M + |00k + (200k || 50k)} |_0^3 = 35$

If Ui in Fig. 8.59 and it in Fig. 8.61 are disabled, the two circuits are the same, hence the same return ratio

(d)
Return ratios do not depend on feedback configurations, while loop gains do.

	Loop gain	Return ratio
Fig. 8.59	66	35
Fig. 8.61	26	35

CHAPTER 9

9.1

At low frequencies T=af=10 where f is the feedback factor

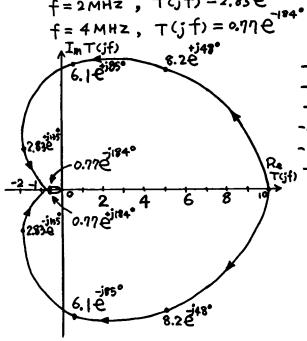

$$T(jf) = \frac{10}{(1+j\frac{f}{f_1})(1+j\frac{f}{f_2})(1+j\frac{f}{f_3})}$$

where f is the frequency

f=IMHZ

T(jf) = 6.1 €

f=2MHz, T(jf)=2.83 e

Does not encircle (-1,0) : Stable

9.2 From 9.1 G(jf) = $\frac{200}{(1+j\frac{f}{f_1})(1+j\frac{f}{f_2})(1+j\frac{f}{f_3})}$

IGI 464B 40 30 20 10 O to I Ph G 0 10-1 -30 -60 -90 -120 -150 Re (TGf) -180 Ph G =-180° at f 24MHz

where G = 23.8dB = 15.4 $f = \frac{1}{15.4} = 0.065$ just causes instability Ph G = -120°, at f = 1.7 MHZ where, G = 71 $f = \frac{1}{71} = 0.014$ gives 60° phase margin.

 $|T(j\omega)|=1, \angle T(j\omega_0)=-160^\circ$ $\therefore A(j\omega_0)=\frac{a(j\omega_0)}{1+T(j\omega_0)}$

$$A(j\omega_0) = \frac{a(j\omega_0)}{1 + e^{-j160^{\circ}}} = \frac{a(j\omega_0)}{1 - 0.940 - 0.342j}$$
$$= \frac{a(j\omega_0)}{0.06 - 0.342j}$$

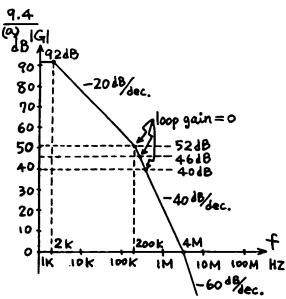

But
$$|T(j\omega_0)| = |a(j\omega_0)f| = 1$$

$$|a(j\omega_0)| = \frac{1}{f}$$

$$|A(j\omega_0)| = \frac{2.88}{f}$$

 $=20\log_{10}\frac{1}{f}+9.28$

Thus the gain peaks 9.21B above the low-frequency value.

Phase margin ~45°

$$\frac{At \ 200 \text{ kHz}}{T(jf) = \frac{100}{(1+j\frac{f}{f_1})(1+j\frac{f}{f_2})(1+\frac{f}{f_2})}}$$

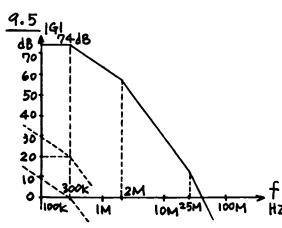

$$\frac{|T(jf)| = 0.706}{(T(jf) = -137^{\circ})}$$

(b)
$$A_0=200$$

 $\therefore T(jf)=\frac{200}{(1+j\frac{f}{f_1})(1+j\frac{f}{f_2})(1+j\frac{f}{f_3})}$
at 300 kHz
 $|T(jf)|=0.74$, $(T(jf)=-150^{\circ}$
at 250 kHz
 $|T(jf)|=1$, $(T(jf)=-144^{\circ}$
 $\therefore Phase margin=36^{\circ}$

$$\frac{A_{o}=100}{... T(jf)} = \frac{400}{(1+j\frac{f}{f_{2}})(1+j\frac{f}{f_{3}})}$$

at 300 kHz |T(jf)|=1.48, $\angle T(jf)=-150^{\circ}$ at 350 kHz |T(jf)|=1.13, $\angle T(jf)=-155^{\circ}$ at 375 kHz |T(jf)|=1, $\angle T(jf)=-157^{\circ}$: Phase margin = 23°

(a) Dominant pole = $\frac{300000}{5000} = 60 \text{ Hz}$ Bandwidth of feedback circuit $\approx 300 \text{ KHz}$

(b) Dominant pole = $\frac{300,000}{500}$ = 600 HZBandwidth of feedback circuit $\approx 300 \text{ KHZ}$

9.6

(a) Dominant pole = $\frac{2MHZ}{5000}$ = 400HZ Bandwidth of feed back circuit \approx 400 ×5000 = 2MHZ

(b) Dominant pole = $\frac{2MHZ}{500}$ = 4kHZ Bandwidth of feedback $\simeq 2MHZ$

9.7
(a) Dominant pole = $\frac{200 \text{ kHZ}}{40,000} = 5 \text{ Hz}$ Bandwidth of feedback circuit $\approx 200 \text{ kHz}$

(b) Dominant pole = $\frac{200 \text{ KHz}}{4000} = 50 \text{ Hz}$ Bandwidth $\approx 200 \text{ KHz}$

9.8

$$Z_o = \frac{R_o}{1 + T(S)} = \frac{R_o}{1 + a_s}$$

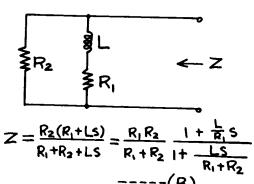

$$f = 0.01, \quad a = \frac{a_o}{1 + \frac{S}{W_1}}$$

₩

$$A_o = 100,000, \quad \omega_1 = 5 \times 2\pi \quad \text{Yadsec}$$

$$Z_o = \frac{R_o}{1 + \frac{a \cdot f}{1 + \frac{s}{\omega_1}}} = \frac{R_o \left(1 + \frac{s}{\omega_1}\right)}{1 + \frac{s}{\omega_1}} + a_o f$$

$$= \frac{R_o}{1 + a_o f} \frac{1 + \frac{s}{\omega_1}}{1 + a_o f} - - (A)$$

From (A) and (B)
$$\frac{R_{1}R_{2}}{R_{1}+R_{2}} = \frac{R_{0}}{1+a_{0}f} = \frac{100}{1001} = 0.1\Omega$$

$$\frac{L}{R_{1}} = \frac{1}{\omega_{1}}$$

$$\frac{L}{R_{1}+R_{2}} = \frac{1}{(1+a_{0}f)} \frac{1}{\omega_{1}}$$

$$\therefore \frac{R_{1}}{R_{1}+R_{2}} = \frac{1}{1+a_{0}f} = \frac{1}{1001}$$

$$\therefore R_{2} = \frac{R_{1}+R_{2}}{R_{1}} \times 0.1\Omega = 100\Omega$$

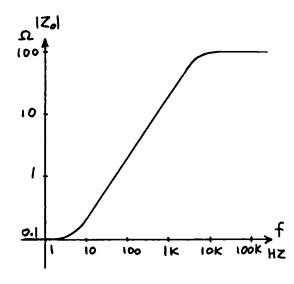

$$\vdots R_{2} = 1000R_{1}$$

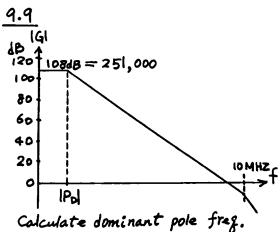

$$\therefore R_{1} = 0.1\Omega$$

$$L = \frac{1}{\omega_{1}}R_{1}$$

$$= \frac{1}{5\times 2\pi} \times 0.1$$

= 3.18 mH

required

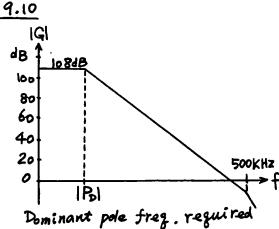

When compensated

$$a = \frac{251,000}{(1+j\frac{f}{f_2})(1+j\frac{f}{f_2})}$$

f2=10MHZ, f1=1PD1 at the unity gain frequency

$$\Delta \simeq \frac{251,000}{j\frac{f}{f_1}(1+j\frac{f}{f_2})}$$

Try f = 30HZ By trial 101=1 at f=6.5 MHZ where (a = -123° -> Phase margin = 57° Try f = 25 HZ By trial 1a1=1 at f = 5.5 MHZ where \a = -119° -> Phase margin = 61° By interpolation we need fi=26Hz, giving a unity gain frequency of 5.7 MHZ From Chapter 7 $f_1 = \frac{1}{2\pi} \frac{1}{C_M Ric}$ where CM = (It Gmc Roc) Cc = 552 Cc and Ric= 1.95 × 106 $\therefore 26 = \frac{1}{2\pi} \frac{1}{552C_c \times 1.95 \times 10^6}$

1Pp < 500 KHZ = 2HZ

when compensated

$$a = \frac{251,000}{(1+j\frac{f}{f_1})(1+j\frac{f}{f_2})}$$

f2 = 500 KHZ , f1 = 1 Pol

at the unity gain frequency

$$\alpha \simeq \frac{251,000}{j\frac{f}{f_1}(1+j\frac{f}{f_2})}$$

From problem 9.9, we found for 60° phase margin that

$$\frac{f_z}{f_1} = \frac{10 \text{ MHZ}}{26 \text{ Hz}} = 3.85 \times 10^5$$

: we now need

$$f_1 = \frac{500 \text{ HZ}}{3.85 \times 10^5} = 1.3 \text{ HZ}$$

In problem 9.9 unity gain freq. = 5.7 MHZ

: In this case unity gain freq.

=
$$\frac{5.7 \text{ MHZ}}{20} = 285 \text{ kHZ}$$

From Section (9.4) for this Compensation

$$f_1 = \frac{1}{2\pi RC}$$

Breakaway between P, and P2 $\frac{1}{\sigma_{i}+1} + \frac{1}{\sigma_{i}+3} + \frac{1}{\sigma_{i}+4} = 0$

$$\frac{1}{\sigma_{\zeta}+1}+\frac{1}{\sigma_{\zeta}+3}+\frac{1}{\sigma_{\zeta}+4}=0$$

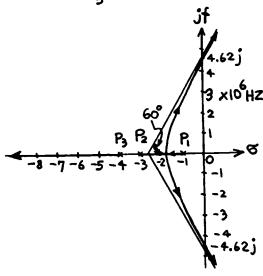

:.
$$(\sigma_{i+3})(\sigma_{i+4}) + (\sigma_{i+1})(\sigma_{i+4}) + (\sigma_{i+1})(\sigma_{i+3}) = 0$$

$$\therefore G_{i} = \frac{-16 \pm \sqrt{16^{2} - 12 \times 19}}{6}$$

$$= -1.78 \text{ or } -3.55$$

Angle of asymptotes to axis = 60° Asymptotes meet real axis at

$$\sigma_{a} = \frac{-1-3-4+0}{3} = -2.67$$

Root locus crosses axis at S=j4.62 (normalized to 106HZ) Then

Using (9.60)

$$T_0 \times \frac{(x \cdot 3 \times 4)}{4.93 \times 5.51 \times 6.11} = 1$$

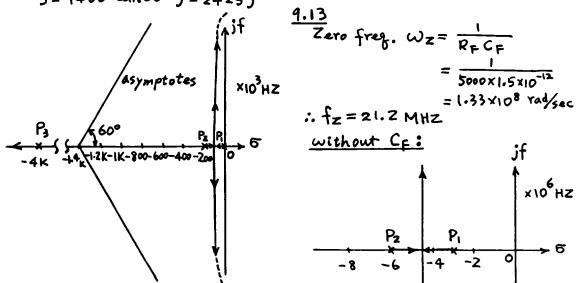

$$f = \frac{13.3}{200} = 0.067$$

for instability.

Breakaway point between Rand P2

Angle of asymptotes to axis = 60° Asymptotes meet real axis at $\sigma_{\alpha} = \frac{-2-200-4000}{3} = -1400$

Root locus crosses axis at S = 1400 tan60 j = 2425 j

Then 15-P1=2425, 15-P21 = 2433, 15-P3 = 4677 using (9.60) $T_0 \times \frac{2 \times 200 \times 4000}{2425 \times 2433 \times 4677} = 1$

: To = 17,250 Since 00=40,000 the value of f causing instability is

40,000 f = 17,250
:
$$f = 0.43$$

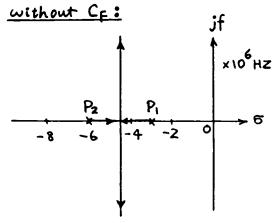

Using Nyquist calculate $T(j\omega)$
 $T(jf) = \frac{17,250}{(1+j\frac{f}{200})(1+j\frac{f}{4000})}$

Unstable, but since LT(jf) is less than -180°, the circuit would be unstable for smaller values of f.

$$\frac{9.13}{\text{Zero freq. } \omega_{z} = \frac{1}{R_{F}C_{F}}}$$

$$= \frac{1}{5000 \times 1.5 \times 10^{-12}}$$

$$= 1.33 \times 10^{8} \text{ rad/sec}$$

$$A = \frac{\alpha}{1 + \alpha f} \qquad \alpha = \frac{\alpha_0}{(1 - \frac{5}{P_1})(1 - \frac{5}{P_2}) + \alpha_0 f}$$

$$= \frac{\alpha_0}{(1 - \frac{5}{P_1})(1 - \frac{5}{P_2}) + \alpha_0 f}$$

For f = 0.01, a.f = 40 and poles are

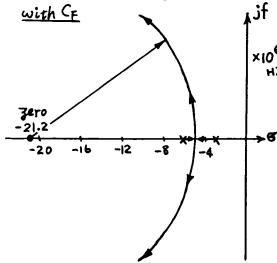

$$(1+\frac{5}{3})(1+\frac{5}{6}) + 40 = 0$$

$$\therefore 5^{2} + 95 + 738 = 0$$

$$\therefore 5 = \frac{-9 \pm \sqrt{51 - 4 \times 738}}{2}$$

$$= -4.5 \pm \frac{1}{2} \cdot 26.8$$

: for f = 0.01, poles Pa and Pb are at (-4.5 ± j 26.8) MHZ

Breakaway point
$$\frac{1}{\sigma_{i+3}} + \frac{1}{\sigma_{i+6}} = \frac{1}{\sigma_{i+21,2}}$$

.. vi ~-4.5 as for previous case.

$$A = \frac{a}{1+af} \qquad a = \frac{a_0}{(1-\frac{S}{P_1})(1-\frac{S}{P_2})}$$

$$f = f_0(1-\frac{S}{Z})$$

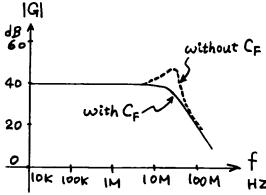

$$\therefore A = \frac{a_o}{(1 - \frac{S}{P_1})(1 - \frac{S}{P_2}) + a_o f_o (1 - \frac{S}{Z})}$$

For fo = 0.01, a.f. = 40 and poles are

$$(1+\frac{S}{3})(1+\frac{S}{6})+40(1+\frac{S}{21.2})=0$$

$$S = \frac{-43 \pm \sqrt{43^2 - 4 \times 1738}}{2}$$
= -21.5 \pm j 16.6

:. poles Pa and Pb are at (-21.5 ± j 16.6) MHZ

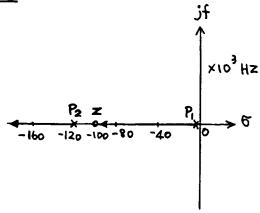

For the feedback amplifier

$$G = \frac{100}{(1 - \frac{S}{P_a})(1 - \frac{S}{P_b})}$$

where Pa and Pb are calculated above.

9.14

$$A(s) = \frac{a(s)}{1 + af(s)}$$

$$a(s) = \frac{a_0(1 - \frac{s}{z})}{(1 - \frac{s}{P_1})(1 - \frac{s}{P_2})}$$

$$A(s) = \frac{a_0(1 - \frac{s}{z})}{a_0(1 - \frac{s}{z})}$$

$$\therefore A(s) = \frac{a_0(1-\frac{s}{Z})}{(1-\frac{s}{P_1})(1-\frac{s}{P_2})+a_0f(1-\frac{s}{Z})}$$

Poles are the solutions of $(1-\frac{5}{R})(1-\frac{5}{R})+a_0f(1-\frac{5}{Z})=0$

:
$$1-(\frac{1}{P_1}+\frac{1}{P_2}+\frac{a_0f}{z})S+\frac{S^2}{P_1P_2}+a_0f=0$$

:.
$$S^2 - RR_2 \left(\frac{1}{R_1} + \frac{1}{R_2} + \frac{a_0 f}{Z} \right) S + R_1 R_2 (1 + a_0 f) = 0$$

Normalized to KHZ

$$P_1 = -0.1$$
, $P_2 = -120$
 $Z = -100$. $Q_0 = 10^5$

 $S^2-12(-10-\frac{1}{120}-\frac{100}{100})S+12x101=0$

$$5^{2}+1325+12|2=0$$

$$5 = \frac{-132 \pm \sqrt{132^{2}-4 \times 1212}}{2}$$

= -66 ± 56 = -10 or -122

: Poles are at -10 KHZ and -122 KHZ

Zero is at -100 KHZ

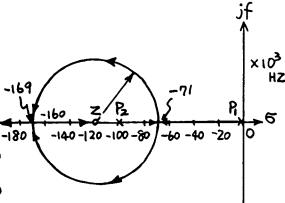

J=1

 $S^2 - 12(-10 - \frac{1}{120} - \frac{10^5}{100})S + 12 \times 10^5 = 0$

$$\therefore S = \frac{-|2|20 \pm \sqrt{|2|20^2 - |2|10^5 \times 4}}{2}$$

= -6060 ± 5960.2 = -99.8 or -12020

Zero is at -100 KHZ

Normalize to KHZ Breakaway point

$$\frac{1}{\sigma_{i} + o_{i}} + \frac{1}{\sigma_{i} + 100} = \frac{1}{\sigma_{i} + 120}$$

$$\therefore \theta_i = \frac{-240 \pm \sqrt{240^2 - 4 \times 12002}}{2}$$

$$= -120 \pm 49$$

 $= -169 \text{ or } -71$

From 9.14 poles of feedback amplifier are given by solutions of $s^{2} - RR_{2}(\frac{1}{R} + \frac{1}{R} + \frac{a \cdot f}{Z})s + RR_{2}(1+a \cdot f) = 0$

$$P_1 = -0.1$$
, $P_2 = -100$, $Z = -120$

$$\frac{G_0 = 10^5}{\int_{-10}^{2} (-10^{-\frac{1}{100}} - \frac{100}{120}) + 10 \times |0| = 0}$$

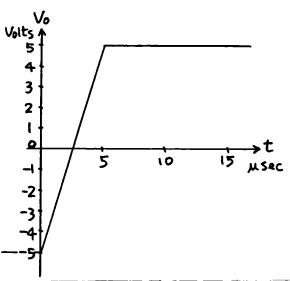

$$\therefore S = \frac{-108.4 \pm \sqrt{108.4^2 - 4040}}{2}$$

$$= -98.1 \text{ or } -10.3$$

· Poles are at -10.3 kHz and -98.1KHZ Zero is at -120 KHZ

$$\frac{f=1}{S^2-10(-10-\frac{1}{100}-\frac{105}{120})S+10x10^5=0}$$

$$\therefore$$
 S = -4216.5 ± 4096
= -8313 or -120.5

$$\frac{9.16}{(a)} \frac{4 \text{Vo}}{4 \text{Vi}} (j\omega) \simeq -G_m \frac{1}{j\omega c}$$

SLEW RATE = 10V/1.2US = 8.33V/US 8.33/1.9 = 4.4 IMPROVEMENT

1.800E-06 5.00E+03 +

is the full-power bandwidth.

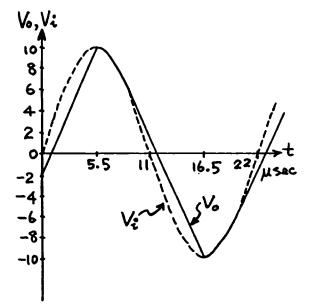

$$V_i = 10 \sin 2\pi ft$$

$$\omega here f = 45 \text{ KHZ}$$

$$\frac{dV_i}{dt} = 2\pi f \times 10 \cos 2\pi ft$$

$$= 2.83 \times 10^6 \cos 2\pi ft$$

To find point of slew limiting put $\frac{dVi}{dt} = 2 \times 10^6 \text{ V/s}$

9.19

$$G_{m} = 0.3 \text{ mA/V}$$
 $\frac{\Delta V_{0}}{\Delta V_{i}}(j\omega) = -G_{m} \frac{1}{j\omega c}$
 $\therefore |= 0.3 \times 10^{3} \frac{1}{6.12 \times 10^{6} \times 2\pi \times C}$
 $\therefore c = 7.8 \text{ pF}$

Slew Yate = $\frac{2\text{Tcl}}{C}$
 $= \frac{600 \times 10^{-6}}{7.8 \times 10^{-12}} = 77 \text{ V/us}$

Slew Yate improves 38 times

$$\frac{9.20}{(a)} \frac{dV_i}{dt}\Big|_{MAX} = \omega V_M$$

$$\therefore \omega = \frac{2V/MS}{15V} = 133 \times 10^3 \text{ Yad/sec}$$

$$\therefore f = 21.2 \text{ KHZ}$$

9-13
$$\frac{1}{ro_7} = \frac{20u}{6.4u} \quad 0.1u = 313n$$

$$\frac{1}{ro_6} = \frac{20u}{6.4u} \quad 0.2u = 625n$$

$$\frac{V_0}{V_i} = 9m_2 (ro_2||ro_4) 9m_6 (ro_i||ro_7)$$

$$= 97.1u (2.13 M)(194u)(1.07 M)$$

$$= 4.28 \times 10^4 \quad low frequency$$
open loop gain

$$Z = \frac{-1}{C_c(R_z - \frac{1}{gm_b})}$$
cancel this zero by moving it to infinity: $R_z = \frac{1}{gm_L} = 5.15k$

$$\frac{1}{R_z} = \frac{\partial I_D}{\partial V_{DS}} = k (V_{GS} - V_L - V_{DS})$$

$$\stackrel{\cong}{=} k (V_G - V_S - V_L)$$
assume $Y = 0$

$$= k' \frac{W}{L} (5V - V_{GS} - 0.7V)$$

$$\frac{1}{5.15k} = 60.4 \mu \frac{W}{L} (5 - 0.906V - 0.7V)$$

$$= 205 \mu \frac{W}{L}$$

$$0.95 = \frac{W}{L_{eff}} = \frac{6.1 \mu}{6.4 \mu}$$

$$(\frac{W}{L})_q = \frac{6.1 \mu}{8 \mu}$$

$$V_{GS}_6 = \sqrt{\frac{2 I_D}{k'_n W}} + V_L$$

$$= \sqrt{\frac{2 (20 \mu)}{6.4 \mu}} + 0.7$$

$$= 0.906 V$$

VI1 5 0 -48UV
```

9.24 From Problem 9.22, $\frac{1}{Ra} = k'(\frac{W}{1})_{\alpha}(Vera - Vta)$ Since $I_{0/2} = I_{06}$ and $(W/L)_{12} = (W/L)_{6}$ Vouiz=Vove, Therefore VSBII = Vasiz = Vaz+Voviz = Vs89 = VGS6 = Vt6+Vov6, because Vt1z=Vt6 (no body effect). Also, Vov11 = Vouz because In1 = Inzand $(W/L)_{II} = (W/L)_{IZ}$ Therefore, VGSq = Vasil + Vasiz - VGSb =V=1+Vov1+V612+Vov12-V66-Vou = V41+ Vov. where Vov = Vous = Vov 11 = Vov 12. So Vasq - Vtq = Vt1 + Vov - Vtq = Jov. Since Vasq-Vaq = Vasc-Va6 and Rq should equal Img to cancel the RHP zero, Rg=k'(と)g(VGS9-V4g) =9m6=k'(W)6(VGS6-Vt6) (Y) q=(Y) = 100

To get 45° phase margin,
set the 2nd pole = unity gain freq.

$$\frac{|P_2| = \frac{gm_6 C_c}{C_L C_1 + C_C C_L + C_1 C_c}}{\frac{gm_2}{C_L C_1 + C_C C_L + C_1 C_c}} = \frac{gm_2}{C_C}$$

$$\frac{gm_2}{gm_6} = \frac{194 \text{ M A}}{gm_6}$$

$$C_C = 5 \text{ pF}$$

$$C_1 = C_{0L_2} + C_{0L_4} + C_{gS_6} + C_{0L_9}$$

$$= 0.35 \text{ fF} (100 \text{ M} + 50 \text{ M})$$

$$+ \frac{3}{3} (100 \text{ M})(8 \text{ M}) 0.869 \text{ fF}$$

$$+ 0.35 \text{ fF} (100 \text{ M})$$

$$= 551 \text{ fF}$$

$$\frac{gm_2}{C_C} = 19.4 \text{ M rad}$$

$$19.4 \text{ M} = \frac{194 \text{ M} (5 \text{ p})}{C_L 551 \text{ f} + C_L 5 \text{ p} + 551 \text{ f} (5 \text{ p})}$$
solve for C_L

$$C_L = 8.51 \text{ pF}$$

To obtain 45° phase margin, set the 2nd pole to funity
$$|P_{2}| = \frac{g_{mo}C_{c}}{C_{L}C_{1}+C_{c}C_{L}+C_{1}C_{c}} = \frac{g_{mz}}{C_{c}} = \frac{1.64 \text{ mAV}}{5 \text{ pF}}$$

$$= 328 \text{ M rad/s}$$
C. is dominated by the gate of M6
Minimum estimate for $C_{1} = C_{gso(i)} + C_{gso(a)}$

$$= \frac{2}{3}100 \times 0.72 \times 4.3 + 0.35 \times 100 = 244 \text{ FF}$$
Maximum estimate for C_{1}

$$= C_{gso(i)} + C_{gso(a)} + C_{gso(a)}$$

TRANSFER FUNCTION HAS PEAKING THE EXPECTED RI=66.3K CAUSES OSCILLATION (I.E. NEGATIVE PHASE MARGIN), BECAUSE WE DID NOT TAKE INTO ACCOUNT THE PHASE CONTRIBUTION FROM THE POLE IN THE FEEDBACK PATH BY RX AND IMPUT CAPACITANCE OF M1.

ME USE RX=30K HERE.
FINDING THE EXACT RX VALUE FOR THE PHASE MARGIN OF 20 DEGREES IS NOT AS IMPORTANT AS OBSERVING THIS GENERAL TREND:
THE SMALLER THE PHASE MARGIN,
THE HIGHER THE OVERSHOOT & THE LONGER THE SETTLING TIME IN THE STEP RESPONSE.

dc bias

$$I_{D} = 20 \mu A = I_{1}$$

3.109E-05 3.096E-05

9.30

Assume the zero has been diminated and 1931 > 1921 > 1921, at the op-ampunitygain frequency, IPI contributes -90° phase shift. If IP2 contributes -30° phase shift, the phase margin is 60°. phase shift due to 1P21 = -tan-1 Wunity = -30° at Wunity Wunity = tan 30. |P2| = 13 |P2| $=a_0|p_i|$ 90|P1 = 13 |P2 9m1R19m6R2 9m1R2 R1C = 3 9m6 3 C1+C2 3m1 = 13 9m6 From the example in Section 9.43, gm=1mAV, gm6=1.55mA/V, C1+C2≈5PF $C = \sqrt{3} \frac{9m1}{9m!} (C_1 + C_2) = 1.7 \frac{1}{1.555} = 5.4 pc$

9.31

(a) Similar to Problem 9.30, the op-amp unity-gain frequency Quanty = 2 tan45 |P2| = 2|P2| = a01P11 $\frac{g_{m_1}}{c} = 2 \frac{g_{m_0}}{c_{1+c_0}}$ $\frac{0.5}{c} = 2 \frac{2}{0.1 + 8}$ C=IPF (b) Rz = 1 = 500 D

9.32

Similar to Problem 9.3 la, $|P_z| = \frac{9m6}{C+C} \cdot \frac{C}{C_1}$ ao1P11 = 21P21 $\frac{9m1}{C} = 2 \frac{9m6}{C+C_2} \frac{C}{C_1}$ $\frac{0.5}{C} = 2 \frac{2}{C+8} \frac{C}{0.1}$ C=Q3ZPF It is smaller than the

compensation capacitor in Problem 9.31a.

9.33
$$V_{i} \longrightarrow \frac{1}{2} V_{o}$$

$$V_{i} \longrightarrow \frac{1}{2} V_{o}$$

$$V_{i} \longrightarrow \frac{1}{2} V_{o}$$

$$V_{i} \longrightarrow V_{o}$$

In (9.40a), (9.40b) and (9.41), C, can be ignored and SC replaced by 39milC;

$$\frac{U_0}{is} = \frac{g_{m6}R_1R_2}{1+SR_2C_2+S(1+g_{m6}R_1)R_2C} \text{ becomes}$$

$$\frac{U_0}{is} = \frac{g_{m6}R_1R_2}{1+SR_2C_2+S(1+g_{m6}R_1)R_2C} \frac{g_{m11}}{g_{m11}+SC}$$

$$= \frac{g_{m6}R_1R_2(g_{m11}+SC)}{g_{m11}+SC(g_{m11}+SC)} \frac{g_{m11}}{g_{m11}+SC}$$

$$= \frac{g_{m6}R_1R_2(g_{m11}+SC)}{g_{m11}+SC(g_{m11}+SC)} \frac{g_{m11}}{g_{m11}+SC}$$
There is a zero at $-\frac{g_{m11}}{C}$

The denominator of (9.27) is

1+5(C2R2+C1R1)+52R2R1C2C1+

 $C[S(R_2+R_1+g_mR_2R_1)+S^2R_2R_1(C_2+C_1)]=0$

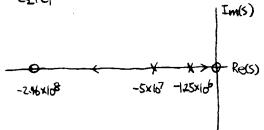

Roots of the denominator;

$$-\frac{1}{R_2C_2} = -1.25 \times 10^6 \text{ rad/s}$$

$$-\frac{1}{R_1C_1} = -5 \times 10^7 \text{ rad/s}$$

Roots of the numerator;

$$\frac{0}{\frac{g_{m}}{C_{z}+C_{1}}} = -2.46 \times 10^{8} \text{ rad/s}$$

$$P_z \approx -\frac{g_{mi}}{G_{mi}}$$

$$P_3 \approx -\frac{g_{mz}}{C_2}$$

ao = gmoRogmiRigmzRz

$$C_{mz} = \frac{g_{m0}}{g_{m1}} C_{m1} = C_{m1}$$

Cm1, Cm2 Z Co, C1, C2 should be satisfied.

One possible answer is Cm=Cmz=lopf

$$|P_3| = \frac{69m_1}{69F} > |P_2| = \frac{9m_1}{109F} > |P_1| = \frac{|P_2|}{a_0}$$

9.36

Assume 1P21>>1P11. At Wunity, P. contributes -90° phase shift. If Pz contributes - 30°, the phase margin

will be 60°.

$$-\tan^{-1}\frac{\omega_{\text{unity}}}{|P_2|} = -30^{\circ}$$

$$\omega_{\text{unity}} = \frac{\sqrt{3}}{3}|P_2|$$

ao | Pr| = 1 · Wunity =
$$1 \cdot \frac{\sqrt{3}}{3}$$
 | P₂|
Pr= $\frac{1}{9m_1R_19m_2R_2R_0Cm_2}$

One possible answer is Cm=10PF,

Cm2 = 17 PF.

$$IP_{i}I = \frac{1}{R_{0}C_{L}}$$

ao, 1921 are constant.

To give a 45° phase margin,

a. |P1 = 1. tan (90° - 45°) |P2 | = 1. |P2 |

$$C_L = \frac{a_0}{|P_2|R_0}$$

To give a 60° phase margin,

$$a_0 \cdot |P_1| = 1 \cdot \tan(90^\circ - 60^\circ) |P_2| = 1 \cdot \frac{\sqrt{3}}{3} |P_2|$$

9.38
(a)
$$Q_0 \cdot \frac{1}{R_0 C_L} = |P_2|$$
 $\frac{9m_1 R_0 \cdot \frac{1}{R_0 C_L}}{\frac{0.3 \times 10^3}{C_L}} = \frac{9m_1}{C_L} = |P_2|$
 $\frac{0.3 \times 10^3}{C_L} = 200 \times 10^b$
 $C_L = 1.5 \times 10^{-12} F = 1.5 PF$

(b) $SR = \frac{I_{TATL}}{C_L} = \frac{0.5mA}{1.5 PF}$
 $= 330 V/\mu S$

9.39

(a) The equivalent load is

$$CL = CL + C_{I} || (C_{S} + C_{I}p)$$
 $= 1.5 + 411 (0.4 + 0.1)$
 $= 1.9PF$
 $SR = \frac{0.2mA}{1.9PF} = 105 V/\mu S$

(b)
$$C_{S}$$

$$= C_{IP} \downarrow L$$

$$= C_{IP$$

$$|R| \approx \frac{g_{m_1} R_0 f}{|SR_0C_L'(1-S/P_2)|}$$

$$= \frac{g_{m_1} f}{|C_L'| |S||1-S/P_2|}$$

$$= \frac{a_1 x_1 s_3 \times a_8 q}{|1.9 \times 10^3 \times a_8 q} \frac{1}{|j_w||1-j_w/P_2|}$$

$$= \frac{47 \times 10^7}{|w_1| + |w_2'| P_2^2}$$

$$= 1$$

$$|W_{unity} = 4.7 \times 10^7 \text{ tod/s} \ll |P_2|$$
The phase shift from P_1 is q_0° .
The phase shift from P_2 is $tan^{-1}(\frac{w_1 w_1 t_2}{1P_2|} + tan^{-1}(\frac{4.7 \times 10^7}{2 \times 10^8}) = 13^\circ$
The phase margin is

The phase margin is
$$(80^{\circ}-(90^{\circ}+13^{\circ})=77^{\circ}$$

9.40
$$V_{x} = -\frac{Z_{1}}{Z_{1}+Z_{2}}Vt$$

$$V_{r} = \alpha_{V}U_{x}$$

$$R = -\frac{U_{r}}{Vt} = \alpha_{V}\frac{Z_{1}}{Z_{1}+Z_{2}}$$
There are 4 possibilities:

(1) $R = \alpha_{V}\frac{R_{1}}{R_{1}+R_{2}}$, and the phase shift is 0° ;

(2) $R = \alpha_{V}\frac{R_{1}}{R_{1}+V_{1}\omega C_{2}} = \alpha_{V}\frac{j\omega R_{1}C_{2}}{1+j\omega R_{1}C_{2}}$, and the phase shift is between 0° and 9° ;

(3) $R = \alpha_{V}\frac{V_{1}^{2}\omega C_{1}}{V_{1}^{2}\omega C_{1}+R_{2}} = \alpha_{V}\frac{1+j\omega R_{2}C_{1}}{1+j\omega R_{2}C_{2}}$, and

the phase shift is between
$$-90^\circ$$
 and 0° , $(4)R = av \frac{VjwC_1}{1/jwC_1 + 1/jwC_2} = av \frac{C_2}{C_1 + C_2}$, and the phase shift is 0° .

The phase shift never reaches 1809, so the circuit is stable.

$$\frac{9.41}{R = a_{V(S)} \frac{j\omega RC}{1+j\omega RC}} = \frac{a_{V}}{(1+\frac{j\omega}{1P_{1}})(1+\frac{j\omega}{1P_{2}})} \frac{j\omega RC}{1+j\omega RC}$$

The av.jwRC term contributes a 90° phase shift. Each of the 3LHP poles contributes a -90° phase shift when w > 00. The total phase shift never reaches -180° for 0< w < 00, so the circuit is stable.

$$\frac{9.42}{V_{i}} \frac{R_{s}}{Q_{s}} = \frac{R_{s}}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{R_{s}}{|Q_{s}|} \frac{1}{|Q_{s}|} \frac{1}{|Q_{s}|}$$

(a)
$$C_{in} = 0$$

$$R = \frac{500}{(1 + \frac{5}{106})(1 + \frac{5}{106})}$$

When $s=j\omega=j5\times lo^4$, $|R(j\omega)|=1$. When $s=j\omega=j(lo^5, |av(j\omega)|=1$.

The latter frequency is twice the former.

	(P)				
	Cin	Wu	poles		phase
	(PF)	(radk)	(radk)	shift	margin
			100	-90°	870
	0		106	-3°	
			100	900	
	4	5×104	106	-3°	86°
			5শ&	-10	
			100	-90°	
İ	20		106	-60	84°
-			(double)	<u> </u>	

Even with the addition of the third pole from Cin, the phase shift never reaches -180° at Wu.

9.43
(a) See next page.
(b) The unity-gain frequency is ~4MHz.

The phase margin is $\sim 70^{\circ}$. The gain margin is ~ 10 dB.

CHAPTER 10

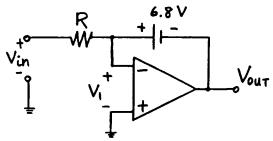

10.1

Zener diode characteristic

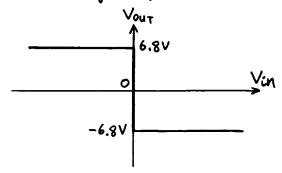

For Vin positive, Vout is negative and we have

Since V1 = 0, Vout = -6.8V

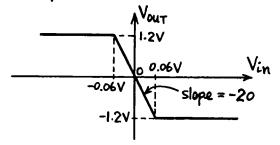

For Vin negative, Vout = +6.8V

For Vour between ±1.2V, the transistor is off and

$$\frac{\Delta V_{\text{out}}}{\Delta V_{\text{in}}} = -\frac{20 \, \text{k} \, \Omega}{1 \, \text{k} \, \Omega} = -20$$

Outside this range, Vout is clamped to ±1.2V

10.2

Consider the VBE-multiplier.

: Symmetrical transistor, :

10.3

For Vin > - Vref, the input to the op amp is positive, and Vour is negative.

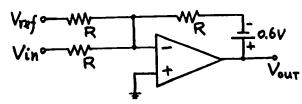

:. D₁ is on, D₂ is off.

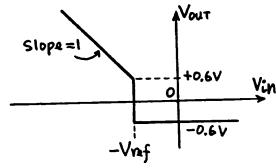

Vout = -0.6V

For Vin <- Vref. Vour is positive and Dzis on, Dis off.

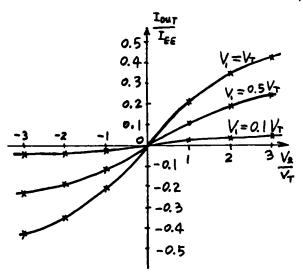

Vout = 0.6 + Vin + Vref

The multiplier transfer function I out = I c 3-5 - I c 4-6 = $I_{ee} \tanh \frac{V_1}{2V_1} \tanh \frac{V_2}{2V_1}$

For VI = 0.1 VT $I_{out} = I_{eE} \times 0.050 \tanh \frac{V_2}{2V_4}$ V1=0,5 VT $I_{out} = I_{EE} \times 0.245 \tanh \frac{V_2}{2V_T}$ V. = V+ $I_{out} = I_{ee} \times 0.462 \tanh \frac{V_2}{2V_1}$

10.5

For the emitter coupled pair

$$\Delta I_c = I_{c_1} - I_{c_2} = I_{e_e} \tanh\left(\frac{V_{id}}{2V_{f}}\right)$$

$$= I_{e_e} \frac{Q^{\frac{V_{id}}{V_{f}}} - 1}{Q^{\frac{V_{id}}{V_{f}}} + 1}$$

The slope of the characteristic

$$\frac{d(\Delta I_c)}{dV_{id}} = \frac{I_{EE}}{V_{\tau}} \frac{(e^{\frac{V_{\tau}^{id}}{V_{\tau}}} + 1)e^{\frac{V_{\tau}^{id}}{V_{\tau}}} - (e^{\frac{V_{\tau}^{id}}{V_{\tau}}})e^{\frac{V_{\tau}^{id}}{V_{\tau}}}}{(e^{\frac{V_{\tau}^{id}}{V_{\tau}}} + 1)^{2}}$$

$$= \frac{I_{EE}}{V_{\tau}} \frac{2 e^{\frac{V_{\tau}^{id}}{V_{\tau}}}}{(e^{\frac{V_{\tau}^{id}}{V_{\tau}}} + 1)^{2}} - - - - - (1)$$

For Vid = 0

$$\frac{d(aI_c)}{dV_{id}} = \frac{1}{2} \frac{I_{ee}}{V_T}$$

In (1) put d(412) = 0.99x 1/2 x Ter VT

:.
$$0.99 = 4 \frac{a}{(a+1)^2}$$
 where $a = e^{\frac{Vi3}{4}}$

$$\therefore \alpha = \frac{2.0404 \pm \sqrt{4.1632 - 4}}{2}$$
= 1.222 or 0.8182
$$\therefore V_{id} = \pm 0.2V_{T} = \pm 5 \, \text{mV}$$

$$\frac{10.6}{\Delta I_c} = I_{ee} \tanh \left(\frac{V_{id}}{2V_T} \right)$$

$$\simeq I_{ee} \left[\frac{V_{id}}{2V_T} - \frac{1}{3} \left(\frac{V_{id}}{2V_T} \right)^3 \right]$$

Put Vid = Vsinwat

Then
$$\Delta I_{c} = \frac{I_{EE}}{2V_{T}} \left[V \sin \omega_{0} t - \frac{1}{12} \frac{V^{3}}{V_{T}^{2}} \sin^{3} \omega_{0} t \right]$$

$$= \frac{I_{EE}V}{2V_{T}} \left[\sin \omega_{0} t - \frac{V^{3}}{48V_{T}^{2}} (3 \sin \omega_{0} t - \sin 3\omega_{0} t) \right]$$

$$\therefore I_{OUT}(t) = I_{o} \left[\sin \omega_{0} t + \frac{V^{2}}{1 - 3\frac{V^{2}}{48V_{T}^{2}}} \sin 3\omega_{0} t \right]$$

Put
$$\frac{V^2}{48V_1^2} = 0.01$$

 $1-3\frac{V_1^2}{48V_1^2}$

This is the maximum allowable input amplitude.

TOTAL HARMONIC DISTORTION = 1.243E-01 PERCENT

The nominal bias currents are $I_{c_1} = I_{c_2} = I_{c_3} = I_{c_4} = I_m A$ Given $\frac{\Delta R}{R} = \pm 0.3 \, \phi_0$, $\frac{\Delta I_S}{I_S} = \pm 2 \, \phi_0$ From (4.154) the worst-case mismatch in I_{c_1} and I_{c_2} is $\left|\frac{\Delta I_C}{I_c}\right| = \frac{1}{1+\frac{1}{2}mR}\frac{\Delta I_S}{I_S} + \frac{\frac{2}{1+\frac{1}{2}mR}}{1+\frac{1000}{26}}\frac{\Delta R}{R}$ $= \frac{1}{1+\frac{1000}{26}}0.02 + \frac{\frac{1000}{26}}{1+\frac{1000}{26}}0.003$ $= 3.43 \times 10^{-3}$ $\therefore \Delta I_C = 3.43 \times 10^{-3} \times 10^{-3} A$ $= 3.43 \times 10^{-3} \times 10^{-3} A$ This gives an input offset (when $I_1 = I_2$) of $V_{oS} = \frac{\Delta I_C}{2G_m} = \frac{3.43 \mu A}{19.19 \times 10^{-3} A} \times \frac{1}{2} \times$

10.8

Assuming an ideal op amp.

$$\frac{V_{in}}{R} = -\frac{V_z}{R} : V_z = -V_{in}$$

But
$$V_z = KV_xV_Y = KV_{aut}V_{REF}$$

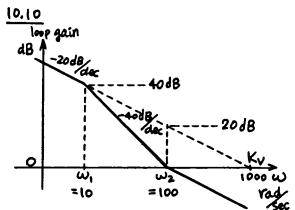

Thus $V_{out} = \frac{-V_{in}}{KV_{REF}}$

and this circuit produces an output proportional to the <u>quotient</u> of two voltages.

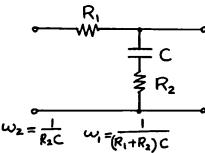

Loop bandwidth = $Kv = K_0 K_D$ = $10^3 \frac{1}{5}$

In order to produce poles at 45° to the axis, we add a loop filter

Pole at ω_1 where $\omega_1 = 2K_V = 2000 \text{ rad}_S$

If w_2 (the zero frequency) is at the unity gain point, then then the loop phase shift will be -135° at this point, ... we require $w_2 = 100 \text{ rad/sec}$. If $w_1 = 10 \text{ rad/sec}$; the requirements will be satisfied (see diagram). The filter becomes

$$\frac{\omega_2}{\omega_1} = 1 + \frac{R_1}{R_2} = 10$$

Appropriate values of R, Rz and C can now be chosen.

10.11

For capture we need

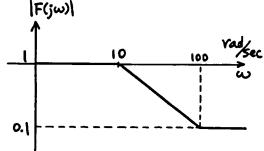

$$|(\omega_i - \omega_o)| < \frac{\pi}{2} K_V |F(j(\omega_i - \omega_o))|$$

$$\omega_0 = 10^5 \text{ rad/sec}$$

Ky = 1000 rad/sec

$$|\langle \omega_i - \omega_o \rangle| = 1570 |F[j(\omega_i - \omega_o)]|$$

From Problem 10.10

From the figure we can solve(1) to find

and this is the capture range.

10.12

For the 560B

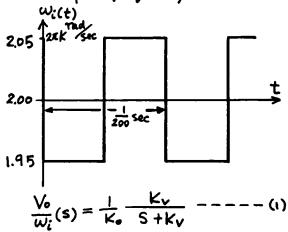

$$K_0 = 0.93 W_0 = 0.93 (2\pi)(2000)$$

= 11687 rad V_{\cdot}

$$K_V = 2.36 w_0 = 2.36(2\pi)(2000)$$

= 29657 rad/s

The input frequency is

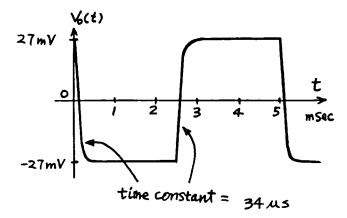

The peak-to-peak amplitude of the output is

$$\Delta V_o = \frac{\Delta W_i}{K_o} = \frac{2\pi (100)}{11687} = 54 \text{ mV}$$

Since Wi(t) is a square wave,

(1) predicts that $V_0(t)$ has a time constant $\frac{1}{K_V} = 34 \,\mu s$ and the waveform shown below.

$$f = \frac{I_i}{4C V_{BE(ON)}}$$

$$I_1 = (0 \text{ kHz})(4)(0.01\mu\text{F})(0.7\text{V})$$

$$V_{BE} = V_T l_n \frac{2(280 \mu A)}{10^{-16}}$$

$$= 0.763 V$$

$$I_1 = 305 \mu A$$
 at center freq

$$I_{1} = \frac{V_{i} - V_{BE_{X}}}{R_{X}}$$

de bias :

$$I_1 = 305 \mu = \frac{V_i - 0.763}{R_X}$$

$$\Delta I_1 \simeq \frac{\Delta V_i}{R_V}$$

$$\Delta I_{1} \simeq \frac{\Delta V_{i}}{R_{x}}$$

$$204 M = \frac{200 \text{ mV}}{R_{x}}$$

$$R_{x} = 1k$$

dc bias
$$I_1 = 305 \mu = \frac{Vi - 0.763}{1 k}$$

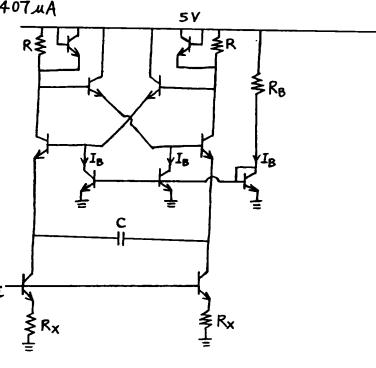

bias
$$V_i = 1.07 V$$

make current in R small compared to 21

$$\frac{V_{BE}}{R} = 60 \mu A$$

$$R = \frac{0.763 \text{ V}}{60 \text{ MA}} = 12.7 \text{ k}$$

$$I_{B} = \frac{5 - V_{T} \ln \frac{200u}{10^{-16}}}{R_{B}} = 200u$$

TOTAL HARMONIC DISTORTION = 2.315E+05 PERCENT

THE SECOND HARMONIC COMPONENT IN IO IS MUCH LARGER THAN THE FIRST HARMONIC COMPONENT. BECAUSE THE TRANSFER FUNCTION IS IO-K*VI^2, WE EXPECT, IDEALLY, TO SEE ONLY A SECOND HARMONIC COMPONENT AND NO FIRST HARMONIC COMPONENT.

CHAPTER 11

11.1

Diode current $I_{D} = \frac{10-0.6}{20K} = 470 \mu A$ where K is kilo = 10^3 Equivalent circuit

$$Y_d = \frac{RT}{8I_0} = \frac{26}{470} k\Omega = 55.3\Omega$$

where k is the Boltzmann's const.

$$\overline{U_{\text{OT}}^{2}} = 4.63 \times 10^{19} \times 10^{5}$$

$$= 4.63 \times 10^{14} \text{ V}^{2}$$

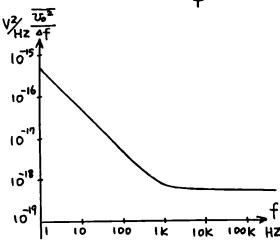

$$\frac{11.2}{\tilde{t}_{A}^{2}} = 2gI_{D}\Delta f + 3\times10^{16} \frac{I_{D}}{f}\Delta f$$

$$\frac{\vec{i}_{A}^{2}}{4f} = 3.2 \times 10^{19} \times 470 \times 10^{6} + 3 \times 10^{16} \times \frac{470 \times 10^{6}}{f}$$

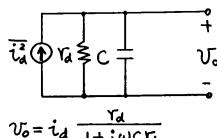

$$= 1.5 \times 10^{22} + \frac{1.41 \times 10^{-19}}{f}$$

$$\frac{\overline{V_0^2}}{4f} = 3060(1.51 \times 10^{-22} + \frac{1.41 \times 10^{-19}}{f})$$

$$= 4.62 \times 10^{-19} + \frac{4.32 \times 10^{-16}}{f}$$

Neglect R and noise in R.

$$\overline{V_0^2} = \overline{id} \frac{\Upsilon_0^2}{1 + (\omega \Upsilon_0 c)^2}$$

FREO VOLTAGE H OMOISE INCISE

$$\therefore i_x = 6.8 \text{ nA rms}$$
---- the same as in 11.4

Equate voltage across Rs isRs +iiRs+Vi = ixRs $\therefore \overline{i_x^2} = \overline{i_s^2} + \overline{i_i^2} + \frac{\overline{v_i^2}}{\rho^2}$ $\frac{1}{4f} = 4kT \frac{1}{R_s} + 64 \times 10^{25} + \frac{21.6 \times 10^{20}}{106}$ $\frac{1}{4f} = 3.2 \times 10^{-19} (5 \times 10^{-6})$ $= 1.66 \times 10^{-23} + 0.64 \times 10^{-23} + 0.02 \times 10^{-23} \qquad \frac{\overline{V_1^2}}{\Delta f} = 1.66 \times 10^{-15} + 16 \times 10^{-25} \times 10^{10}$ If of = 2 MHZ

$$\frac{1x}{x} = 15 + 1i + \frac{1}{R_5^2}$$

$$\frac{1x}{4f} = 4kT\frac{1}{R_5} + 64 \times 10^{-25} + \frac{2}{4}$$

$$= 1.66 \times 10^{-23} + 0.64 \times 10^{-23}$$

$$= 2.32 \times 10^{-23} A^2 / Hz$$

$$\frac{1}{12} = 2.32 \times 10^{-23} \times 2 \times 10^{6}$$

$$= 4.64 \times 10^{-17} A^2$$

Short inputs and equate noise
$$V_{i} = V_{i} + i_{i}R_{s}$$

$$V_1 = V_1 + V_1 K_s$$
 $V_2 = \overline{V_1}^2 + \overline{i_1}^2 K_s^2$

neglecting correlation

Open inputs and equate noise

 $\overline{i_1}^2 = \overline{i_1}^2$

for the transistor plus Rs $V_i^2 = 4kT(r_b + \frac{1}{2gm} + R_s)\Delta f$ $= 1.66 \times 10^{-20} (100 + 26 + 10^{5}) \Delta f$ $\frac{V_i^2}{\Delta f} = 1.66 \times 10^{-15} \frac{V^2}{Hz}$ $\overline{i_i^2} = 2q(I_B + \frac{I_C}{B^2})\Delta f$ $= 16 \times 10^{-25} A^{2} = \frac{i_{1}^{2}}{4f}$ $= 17.7 \times 10^{-15} V^{2}$

(ii)
$$\frac{\overline{V_{i}^{2}}}{V_{i}^{2}} = 4kT (Y_{b} + R_{5} + \frac{1}{2g_{m}}) \Delta f + 4kT \frac{1}{R_{L}} \Delta f R_{E}^{2}$$

$$\frac{\overline{V_{i}^{2}}}{\Delta f} = 1.66x10^{20} (100 + 1000 + 26 + 100)$$

$$= 2.04 \times 10^{-17} \text{ V}^{2}$$

$$\frac{\overline{U_{i}^{2}}}{\Delta f} = 2g (I_{B} + \frac{I_{C}}{\beta^{2}}) = 16\times 10^{-25} \text{ A}_{HZ}^{2}$$
(iii)
$$\frac{\overline{U_{i}^{2}}}{\Delta f} = 4kT (Y_{b} + \frac{1}{2g_{m}}) + \frac{4kT}{R_{L}} \frac{1}{g_{m}^{2}}$$

$$= 1.66x10^{-20} (100 + 1000 + 400)$$

$$= 2.49 \times 10^{-17} \text{ V}^{2}/\text{HZ}$$

$$\frac{\overline{U_{i}^{2}}}{\Delta f} \simeq 2g (I_{B}) = 3.2 \times 10^{-19} \times \frac{13 \times 10^{-6}}{50}$$

$$= 8.32 \times 10^{-26} \text{ A}^{2}/\text{HZ}$$
(iv)
$$\frac{\overline{U_{i}^{2}}}{\Delta f} = 4kT \frac{2}{3} \frac{1}{g_{m}} + \frac{4kT}{g_{m}^{2}}$$

$$= 4kT \frac{1}{g_{m}} (0.67 + \frac{1}{10})$$

$$= 1.66x10^{-20} \times 10000 \times 0.77$$

$$= 1.28 \times 10^{-17} \text{ V}^{2}/\text{HZ}$$

$$\frac{\overline{U_{i}^{2}}}{\Delta f} \simeq 0$$
(b)(i) $\overline{V_{i}^{2}} = 17.7 \times 10^{-15} \times 20,000 \text{ V}^{2}$

$$V_{iT} = 18.8 \text{ AV rms}$$
(iii) $\overline{U_{i}^{2}} = 2.04 \times 10^{-17} \times 20,000 \text{ V}^{2}$

$$\therefore V_{iT} = 0.64 \text{ AV yms}$$
(iii) $\overline{U_{i}^{2}} = 2.49 \times 10^{-17} \times 20,000 \text{ V}^{2}$

$$\therefore V_{iT}^{2} = 0.64 \text{ AV yms}$$
(iv) $\overline{V_{i}^{2}} = 1.28 \times 10^{-17} \times 20,000 \text{ V}^{2}$

$$\therefore V_{iT}^{2} = 0.5 \text{ AV yms}$$
(iv) $\overline{V_{i}^{2}} = 1.28 \times 10^{-17} \times 20,000 \text{ V}^{2}$

$$\therefore V_{iT}^{2} = 0.5 \text{ AV yms}$$

Thus the FET is best and (i) is worst.

For the FET $\frac{i\lambda}{af} = 4kT(\frac{2}{3}g_{m}) + K\frac{T_{0}}{f}$ $4kT^{\frac{2}{3}}g_{m} = \frac{KI_{0}}{105}$ $\frac{i\lambda}{af} = 4kT(\frac{2}{3}g_{m})[1 + \frac{10^{5}}{f}]$ $\frac{i\lambda}{af} = 4kT(\frac{2}{3}g_{m})[1 + \frac{10^{5}}{f}]$ $\frac{i\lambda}{af} = 4kT^{\frac{2}{3}g_{m}}(1 + \frac{10^{5}}{f})$ $\frac{i\lambda}{af} = 2g_{1}G_{1} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{2} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{1} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{2} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{1} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{2} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{1} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{2} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{1} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{2} \times 0$ $\frac{i\lambda}{af} = 2g_{1}G_{1}

bias

$$V_{BE} = V_T l_n \frac{I_c}{I_s}$$

$$= (26m) l_n \frac{10^{-3}}{10^{-16}}$$

$$= 0.778 V$$

$$I_D = \frac{0.778 + 0.1}{300}$$

$$= 2.93 \text{ mA}$$

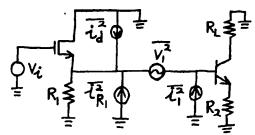

mos
$$gm = \sqrt{2 I_D \mu Cox \frac{W}{L}}$$

= $\sqrt{2(2.93 \text{ m})(60 \mu)(100)}$
= 5.93 mA_V

input noise current generator

= 0 (mosfets have
very small input noise
current at low freq)

input noise voltage generator

$$id^{2} = 4kT \frac{2}{3}gm \Delta f$$

$$id^{2} = 4kT \frac{1}{300} \Delta f$$

neglect R3

looking into source of m_1 , we see $\frac{1}{9m} = 169 \Omega$

$$V_{i} = \frac{169}{1 \cdot 300} = \frac{1}{1 \cdot 100} = \frac{1}{1 \cdot 100}$$

$$\overline{U}^{2} = \overline{U}^{2} + \overline{U}^{2} + \overline{U}^{2} = \frac{1}{1 \cdot 100} = \frac{1}{1$$

 $= 1.22 \times 10^{-17} \frac{V^2}{4}$

MODEL

IB IC

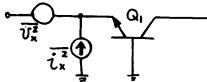

Viz negligible.

$$\frac{\overline{i_{i,1}^{2}}}{\frac{\delta f}{\delta f}} = 2\frac{9}{6} \left(I_{B1} + \frac{I_{C1}}{|\beta_{1}|^{2}} \right)$$

$$\frac{\overline{i_{i,2}^{2}}}{\frac{\delta f}{\delta f}} = 2\frac{9}{6} \left(I_{B2} + \frac{I_{C2}}{|\beta_{2}|^{2}} \right)$$

Represent total noise by

Open circuit input and equate output noise, (d, ~1)

$$\frac{\overline{i_{x}^{2}}}{i_{x}^{2}} = \overline{i_{i_{1}}^{2}} + \overline{i_{i_{2}}^{2}} + \overline{i_{i_{2}}^{2}} + \overline{i_{i_{2}}^{2}}$$

$$\therefore \frac{\overline{i_{x}^{2}}}{cf} = 2 \times 2 f \left(I_{8} + \frac{I_{C}}{|\beta|^{2}} \right) + 4 f T \frac{1}{R_{L}}$$

$$= 4 \times 1.6 \times 10^{19} \left(|\overline{0}^{5} + \frac{10^{3}}{10^{4}} (|+|0^{4} + \frac{f^{2}}{f_{1}^{2}}) \right)$$

$$+ 1.66 \times 10^{-20} \times \frac{1}{5000}$$

$$= 9.7 \times 10^{-24} + 6.4 \times 10^{-22} \left(\frac{f}{f} \right)^{2}$$

Short circuit input and equate output noise

$$g_{m}U_{x} = g_{m}U_{i1} + i_{L} + i_{i2}$$

$$\therefore \overline{U_{x}^{2}} = \overline{U_{i1}^{2}} + \frac{\overline{i_{L}^{2}}}{g_{m}^{2}} + \frac{\overline{i_{i2}^{2}}}{g_{m}^{2}}$$

$$\therefore \overline{U_{x}^{2}} = 4kT \frac{1}{2g_{m}} + 4kT \frac{1}{g_{m}} \frac{1}{g_{m}R_{L}}$$

$$+ \frac{1}{g_{m}^{2}} \times 2g(I_{B2} + \frac{I_{C2}}{|\beta|^{2}})$$

$$\simeq 4kT \frac{1}{2g_{m}}$$

$$= 1.66 \times 10^{-20} \times 13$$

$$= 2.2 \times 10^{-19} \text{ V}_{HZ}^{2}$$

(b) With $R_s = 5k\Omega$, $\overline{V_{il}}^2$ is negligible. Total input current noise is

$$\frac{\overline{i_y^2} = \overline{i_x^2} + 4kT \frac{1}{R_s} \triangle f}$$

$$\frac{\overline{i_y^2}}{\triangle f} = 9.7 \times 10^{24} + 6.4 \times 10^{22} \left(\frac{f}{f_T}\right)^2 + 1.66 \times 10^{20} \times \frac{1}{5000}$$

$$= 13 \times 10^{24} + 6.4 \times 10^{22} \left(\frac{f}{f_T}\right)^2$$

Total current noise

$$\overline{i_T}^2 = \int_0^f \left[13 \times 10^{-24} + 6.4 \times 10^{-22} \left(\frac{f}{f_T} \right)^2 \right] df$$

$$f_1 = 150 \text{ MHZ}$$

$$\overline{i_T}^2 = 13 \times 10^{-24} \times 150 \times 10^6 + 6.4 \times 10^{-22} \frac{1}{f_T} \frac{f_1^3}{3}$$

$$= 1.95 \times 10^{15} + 4.5 \times 10^{15}$$

$$= 6.45 \times 10^{-15} \text{ A}^2$$

$$\therefore i_T = 80 \text{ nA } \text{ Yms}$$

***** OPERATING POINT INFORMATION

.02 .EEED

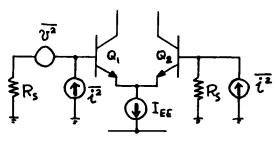

Make $\overline{v_x^2}$ equiv. to noise of the circuit.

At the base of Q1 this produces a voltage

$$\overline{V_{ix}^2} = \left(\frac{R_i}{R_i + R_s}\right)^2 \overline{V_x^2} - \cdots - (A)$$

where Ri is resistance seen looking in at the base of Q1

Include noise due to Rs in $\overline{i^2}$ At the base of Q_1

$$v = v \frac{Ri}{Ri + Rs} + i \frac{Rs Ri}{Ri + Rs}$$

At the base of Q2

$$V_2 = i \frac{R_5 R_i}{R_i + R_5}$$

Thus total input noise voltage is

$$\overline{v_{i}^{2}} + \overline{v_{i}^{2}} = \overline{v^{2}} \left(\frac{R_{i}^{2}}{R_{i}^{2} + R_{5}} \right)^{2} + 2 \overline{i^{2}} \frac{R_{i}^{2} R_{5}^{2}}{(R_{i} + R_{5})^{2}}$$

Equate to Vix in(A)

Include noise due to is in $\overline{i^2}$

$$\frac{1}{100} = 28 I_B + 4 RT \frac{1}{Rs}$$

$$= 3.2 \times 10^{29} + 1.66 \times 10^{20} \frac{1}{108}$$

$$= 19.8 \times 10^{-29} A^2/Hz$$

$$\frac{\sqrt{V_4^2}}{4f} = 8.8 \times 10^{16} + 2 \times 19.8 \times 10^{24} \times 10^{6}$$
$$= 3.96 \times 10^{-12} \text{ V}^2/\text{Hz}$$

: Total input noise with of = 1 KHZ

$$\overline{V_T}^2 = 3.96 \times 10^{-12} \times 1000$$

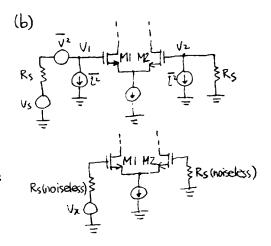

= 3.96 × 10-9 V^2

$$\frac{(1.12)^{2}}{(a)^{\frac{1}{2}}} = 2 \times 4k + \frac{2}{3} \frac{1}{g_{m}}$$

$$= 2 \times 4k + \frac{2}{3} \frac{1}{g_{m}}$$

$$= 2 \times 4 \times 1.38 \times 10^{23} \times 300 \times \frac{2}{3} \times \frac{1}{0.5 \times 10^{3}}$$

$$= 4.4 \times 10^{-17} \text{ V}^{2}/\text{Hz}$$

The noise voltage at the gate of MI U,=U+iRs

At the gate of M2

 $\overline{\mathbf{U}}^{\mathbf{L}}$ is the same as previous, and $\widetilde{\mathbf{L}}^{\mathbf{L}}$ also includes the contribution of Rs

$$\frac{\tilde{l}^2}{\Delta f} = 29 \text{ IG} + 4 \text{ kT} \frac{1}{\text{Rs}}$$

$$= 3.2 \times 10^{-35} + 4 \times 1.38 \times 10^{-23} \times 300 \times \frac{1}{100 \times 10^{6}}$$

$$= 3.2 \times 10^{-35} + 1.6 \times 10^{-28}$$

$$= 1.2 \times 10^{-28} \text{ A}^2 \text{ Hz}$$

If Uz is placed at Rs to give the same noise, its only contribution at the gate of MI is

$$\frac{\overline{V_{k}^{2}}}{\Delta f} = \frac{\overline{U_{k}^{2}}}{\Delta f} + \frac{\overline{U_{k}^{2}}}{\Delta f}$$

$$= \frac{\overline{U_{k}^{2}}}{\Delta f} + 2\frac{\overline{U_{k}^{2}}}{\Delta f} R_{s}^{2}$$

$$= 4.4 \times 10^{-17} + 2 \times 1.6 \times 10^{-28} \times (100 \times 10^{6})^{2}$$

$$= 4.4 \times 10^{-17} + 3.2 \times 10^{-12}$$

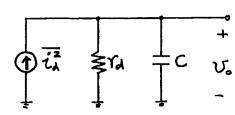

$$= 3.2 \times 10^{-12} V^{2} / Hz$$

$$V_{k}^{2} = 3.2 \times 10^{-12} \times 10^{3} = 3.2 \times 10^{-9} V^{2}$$

$$V_T^2 = 3.2 \times 10^{-12} \times 10^3 = 3.2 \times 10^{-9} V^2$$

 $V_T = 5.6 \times 10^5 V = 56 \mu V$

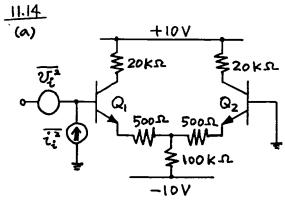

11.13

Neglect noise in R Ta=55.352, C=100PF Noise bandwidth $= \frac{\pi}{2} \frac{1}{2\pi Y_d C} = \frac{\pi}{2} \frac{1}{2\pi x 55.3 \times 10^{10}}$:. f, = 45,2 MHZ

.. Total output noise is
$$\frac{\overline{V_{or}^2} = \frac{i \hbar}{o f} \times V_d^2 \times f_N}{o f} = \frac{3060 \times 1.51 \times 10^{-22} \times 45.2 \times 10^6}{2.1 \times 10^{-11} \text{ V}^2}$$

$$= 2.1 \times 10^{-11} \text{ V}^2$$
.. $V_{of} = 4.6 \, \mu\text{V} \, \text{rms}$

$$I_{c1} = \frac{1}{2} \frac{9.4}{100 \text{ K}} = 47 \text{ MA}$$

Neglect noise due to RL

$$\overline{v_i^2} = 4RT(2V_b + \frac{1}{g_{mi}} + 2R_E) \circ f$$

$$\therefore \overline{v_i^2} = 1.66 \times 10^{-20} (4\infty + 553 + 1000)$$

$$= 3.24 \times 10^{-17} \text{ V}^2/\text{Hz}$$

$$\overline{v_i^2} = 28 \text{ Tg of}$$

$$-19 47 \times 10^{-6}$$

$$\frac{1}{2} = 3.2 \times 10^{-19} \times \frac{47 \times 10^{-6}}{100}$$
$$= 1.5 \times 10^{-25} A^{2}/Hz$$

(b) Since $R_s = 50 \Omega$, neglect \overline{i}_i^2 Total input noise voltage $\overline{V}_{iT}^2 = 3.24 \times 10^{-17} \times 30 \times 10^6 \times \frac{\pi}{2}$ $= 1.53 \times 10^{-9} \text{ V}^2$

$$\overline{V_{iT}^2} = 3.24 \times 10^{-17} \times 30 \times 10^6 \times \frac{\pi}{2}$$

= 1.53 × 10⁻⁹ V²

Gain

$$\frac{V_0}{V_5} = \frac{g_{m1}}{1 + g_{m1}R_E} R_L$$

$$= \frac{0.047}{26} \frac{1}{1 + \frac{0.047}{26} \times 500} \times 2000$$

$$= 19$$

$$\frac{11.15}{(a)} \frac{\overline{V_{i}^{2}}}{\frac{\lambda f}{af}} = 4kT (r_{b} + \frac{1}{2gm})$$

$$= 1.66 \times 10^{-20} (100 + 6.5)$$

$$= 1.77 \times 10^{-18} \frac{V^{2}}{Hz}$$

$$\frac{i_{i}^{2}}{af} = 2q I_{B} = 3.2 \times 10^{-19} \times \frac{2 \times 10^{-3}}{50}$$

$$= 1.28 \times 10^{-23} \frac{A^{2}}{Hz}$$

$$Rs_{opt}^{2} = \frac{1.77 \times 10^{-18}}{1.28 \times 10^{-23}} = 1.38 \times 10^{5} \Omega^{2}$$

$$Rs_{opt} = 372 \Omega$$

$$Fopt = 1 + \frac{1}{\sqrt{B}} \sqrt{1 + 2 \frac{gm}{13}}$$

$$= 1.57 = 1.97 dB$$
(b)
$$Rs_{opt} = \frac{\sqrt{B}}{gm} \sqrt{1 + 2 \frac{gm}{12}}$$

$$= 10(2600) \sqrt{1 + 2 \frac{300}{2600}}$$

$$= 28.8 k\Omega$$

$$F_{opt} = 1 + \frac{1}{10} \sqrt{1 + 2 \frac{300}{2600}}$$

$$= 1.111 = 0.46 dB$$

11.16

(a) From 11.15
$$\frac{\overline{V_i^2}}{4f} = 1.77 \times 10^{-18} V_{Hz}^2$$

$$\frac{\overline{i_i^2}}{4f} = 29I_B + \frac{K}{f}$$

$$29I_B = \frac{K}{f} \text{ at } f = 10^3 \text{ Hz}$$

$$\frac{K}{4f} = 29I_B \cdot 10^3$$

$$\frac{\overline{i_i^2}}{4f} = 29I_B \cdot (1 + \frac{10^3}{f})$$
at 500Hz
$$\frac{\overline{i_i^2}}{4f} = 3.2 \times 10^{-19} \cdot (\frac{2 \times 10^{-3}}{50})(3)$$

$$= 3.84 \times 10^{-23} \Lambda_{Hz}^2$$

$$Rs_{opt}^{2} = \frac{1.77 \times 10^{-18}}{3.84 \times 10^{-23}}$$

$$F_{opt} = 1 + \frac{\overline{v_s^2}}{4RTR_s af} + \frac{\overline{i_s^2}}{4RTR_s^2}$$

$$= 1 + \frac{1.97 \times 10^{-18}}{1.66 \times 10^{20} \times 215} + \frac{3.84 \times 10^{-23}}{1.66 \times 10^{20} \times \frac{1}{215}}$$

$$= 1 + 0.496 + 0.496$$

$$= 1.992 = 3 dB$$

(b)
$$\frac{\overline{U_i^2}}{of} = 4RT(Y_b + \frac{1}{29m})$$

=1.66×10²⁰(300 + 1300)
= 2.66×10⁻¹⁷ V²/HZ
 $\frac{\overline{U_i^2}}{of} = 28I_B + \frac{K}{f}$
=28I_B(1+\frac{1000}{f})

At 500 HZ $\frac{\overline{l_1^2}}{\text{of}} = 3.2 \times 10^{19} \times \frac{10 \times 10^6}{100} \times 3$ $= 9.6 \times 10^{-26} \text{ A}^2/\text{Hz}$ $\therefore R_{\text{sopt.}}^{2} = \frac{2.66 \times 10^{-17}}{9.6 \times 10^{-26}}$: Rsopt = 16.6 KD

Fopt. =
$$1 + 2 \times \frac{2.66 \times 10^{-17}}{1.66 \times 10^{-20} \times 16600}$$

= $1.193 = 0.77 \text{ dB}$

11.17

The emitter resistor can be added to Yb and (11.146) and (11.147) can be used

(a)
$$R_{sopt} = \sqrt{50} \times 13 \sqrt{1+2 - \frac{1100}{13}}$$

= 1200 Ω
 $F_{opt} = 1 + \sqrt{50} \sqrt{1+2 - \frac{1100}{13}}$
= 2.85 = 4.54 dB

(b)
$$R_{\text{sopt}} = \sqrt{100} \times 2600 \sqrt{1+2} \frac{1300}{2600}$$

= 36.8 K. Ω
Fopt = $1+\frac{1}{10}\sqrt{1+2} \frac{1300}{2600}$
= 1.14 = 0.57 dB

11.18

(a) Equivalent input noise generators for the differential pair

$$\frac{\overline{V_i^2}}{2f} = 4RT(2V_b + \frac{1}{g_m} + 2RE)$$
= 3.24 × 10⁻¹⁷ V²/Hz
from 11.13

$$\frac{\overline{i_i^2}}{\alpha f} = 1.5 \times 10^{25} \text{ A}^2/\text{Hz} \qquad \frac{11.19}{\overline{i_i^2}}$$

$$F = 1 + \frac{\overline{v_i^2}}{4kTR_s \Delta f} + \frac{\overline{i_i^2}}{4kTR_s \Delta f} \qquad \frac{(0) \text{ Naglect effect of 10k}}{4kTR_s \Delta f}$$

$$= 1 + \frac{3.24 \times 10^{-19}}{1.66 \times 10^{-20} \times 50} + \frac{1.5 \times 10^{-25}}{1.66 \times 10^{-20} \times \frac{1}{50}}$$

$$= 1 + 39.0 + 0$$

$$= 40 = 16 \text{ dB}$$

$$\frac{11.19}{4kTR_s \Delta f} \qquad \frac{\overline{v_i^2}}{4kTR_s \Delta f} = 4kT(Y_b + \frac{1}{29m})$$

$$= 1.66 \times 10^{-20} (100 + 26)$$

$$= 2.09 \times 10^{-18} \text{ V}^2/\text{I}$$

(b)
$$R_{sopt}^{2} = \frac{\overline{v_{i}^{2}}}{\overline{i_{i}^{2}}} = \frac{3.24 \times 10^{-17}}{1.5 \times 10^{-25}}$$

 $\therefore R_{sopt} = 14.7 \text{ K} \Omega$

Obviously NF decreases for Rs = 100.2, because we move closer to Rs opt.

Rs=200K\$\Omega\$ is larger than Rsopt.

but only 14x. This is closer

to Rsopt than 50\$\Omega\$ and thus

NF for Rs=200K will be lower

than for Rs=50\$\Omega\$ = 1 + 0.01 + 2.93 = 3.94 = 5.96 dB = 3.94 = 5.96 dBThen for Rs=50\$\Omega\$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{20} \times 10^{4}} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2}} \times 10^{4} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2}} \times 10^{4} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2}} \times 10^{4} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2}} \times 10^{4} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2}} \times 10^{2} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2}} \times 10^{2} = 1.66 \times 10^{2}$ $= \frac{1}{1.66 \times 10^{2}} \times 10^{2} = 1.66 \times 10^{2}$ $= \frac{1}{1.6$

$$\frac{\overline{v_{i}^{2}}}{\frac{2}{4}} = 3.24 \times 10^{-17} \text{ V}^{2}/\text{Hz}$$

$$\frac{\overline{v_{i}^{2}}}{\frac{2}{4}} = 1.5 \times 10^{-25} \left(1 + \frac{10,000}{f}\right) A^{2}/\text{Hz}$$

$$F = 1 + \frac{\overline{v_{i}^{2}}}{4RTR_{5}} + \frac{\overline{v_{i}^{2}}}{4RT} + \frac{\overline{v_{i}^{2}}}{4RT} + \frac{1.5 \times 10^{25} (1 + \frac{10000}{2})}{1.66 \times 10^{20} \times 2 \times 10^{5}}$$

$$= 1 + \frac{3.24 \times 10^{-17}}{1.66 \times 10^{20} \times 2 \times 10^{5}} + \frac{1.5 \times 10^{25} (1 + \frac{10000}{2})}{1.66 \times 10^{20}}$$

$$= 1 + 9.8 \times 10^{-3} + 1.8 \left(1 + \frac{10000}{f}\right)$$

$$= 1.01 + 1.8 + \frac{18,000}{f}$$

$$Rut F = 100 \quad (20dB)$$

$$\therefore f = 185 \text{ Hz}$$

11.19
(A) Naglect affect of 10 k Ω load $\frac{\overline{v_i}^2}{cf} = 4RT (Y_b + \frac{1}{2}\frac{1}{9m})$ $= 1.66 \times 10^{-20} (100 + 26)$ $= 2.09 \times 10^{-18} V^2 / HZ$ $\frac{\overline{t_i}^2}{cf} = 28T_B + 4RT \frac{1}{RF}$ $= 3.2 \times 10^{19} \times \frac{500 \times 10^{-6}}{50} + 1.66 \times 10^{24}$ $= 3.2 \times 10^{-24} + 1.66 \times 10^{-24}$ $= 4.86 \times 10^{-24} A^2 / HZ$ $F = 1 + \frac{\overline{v_i}^2}{4RT R_5 cf} + \frac{4.86 \times 10^{-24}}{1.66 \times 10^{-24}}$ $= 1 + \frac{2.09 \times 10^{-18}}{1.66 \times 10^{-20} \times 10^{-4}} + \frac{4.86 \times 10^{-24}}{1.66 \times 10^{-20} \times 10^{-4}}$ = 1 + 0.01 + 2.93 = 3.94 = 5.96 dB(b) $\frac{\overline{t_i}^2}{cf} = 28(T_B + \frac{\overline{I_c}}{|\beta|^2}) + 4RT \frac{1}{R_F}$ $\approx 28(T_B + \overline{I_c}(\frac{f}{f_T})^2) + 4RT \frac{1}{R_F}$

$$\frac{ii}{cf} = 3.2 \times 10^{24} \left[1 + \frac{I_{c}}{I_{B}} \left(\frac{f}{f_{T}} \right)^{2} \right] + 1.66 \times 10^{24}$$

$$= 3.2 \times 10^{24} \left(1 + 50 \left(\frac{f}{f_{T}} \right)^{2} \right) + 1.66 \times 10^{24}$$

$$= 3.2 \times 10^{24} \left(1 + 50 \left(\frac{f}{f_{T}} \right)^{2} \right) + 1.66 \times 10^{24}$$

$$= 3.2 \times 10^{24} \left(1 + 50 \left(\frac{f}{f_{T}} \right)^{2} \right) + 1.66 \times 10^{24}$$

$$= 2.27 \times 10^{23} \quad A^{2}/HZ$$

$$\text{With flicker noise}$$

$$\frac{i \cdot i}{cf} = 2 \times 2 \cdot g \cdot I_{B} \left(1 + \frac{1000}{f} \right) + 4 \cdot k \cdot T_{RL}$$

$$= 6.4 \times 10^{24} \left(1 + \frac{1000}{f} \right) + 3.32 \times 10^{24}$$

$$\therefore \frac{i \cdot i}{cf} = 6.86 \times 1.66 \times 10^{20} \times 10^{4}$$

$$\therefore \frac{i}{cf} = 6.86 \times 1.66 \times 10^{20} \times 10^{4}$$

$$\therefore f = 493 \text{ HZ}$$

$$\therefore 11.4 = 3.2 + 3.2 \times 50 \left(\frac{f}{f_{T}} \right)^{2} + 1.66$$

$$\therefore f = 0.2 \cdot f_{T} = 100 \text{ MHZ}$$
From the basic amplifier of Fig. 2.1(b)

11.20

(a) From 11.10, the total input noise current is

$$\frac{\overline{i_{x}^{2}}}{\sqrt{c_{1}^{2}}} = 2 \times 2_{1}^{2} \overline{I}_{P} + 4_{1}^{2} \overline{I}_{RL}$$

$$= 2 \times 3_{1} \times 1_{1}^{2} \times 1_{1}^{2} \cdot 1_$$

(b) Put
$$F = 8.94 dB = 7.83$$

$$\therefore \frac{\hat{l}x^2}{4\hat{k}T \, dx} = 6.83$$

$$\frac{i_{x}^{2}}{4f} = 6.83 \times 1.66 \times 10^{20} \times \frac{1}{5000}$$

$$= 2.27 \times 10^{23} \quad A^{2}/HZ$$
With flicker noise
$$\frac{i_{x}^{2}}{4f} = 2 \times 28 I_{B} \left(1 + \frac{1000}{f}\right) + 4RT \frac{1}{RL}$$

$$= 6.4 \times 10^{24} \left(1 + \frac{1000}{f}\right) + 3.32 \times 10^{24}$$

$$\therefore 6 = 493 HZ$$

Trom the basic amplifier of 130.21(b)

$$\frac{\overline{V_{i}^{2}}}{\Delta f} = 4RT (\gamma_{bi} + \frac{1}{2g_{mi}} + R_{Ei})$$

$$I_{Ci} = 0.58 \text{ mA}$$

$$\therefore \frac{\overline{U_{i}^{2}}}{\Delta f} = 1.66 \times 10^{2} (100 + 22 + 88)$$

$$= 3.5 \times 10^{-18} \text{ V}^{2}/\text{Hz}$$
For $R_{5} = 50 \Omega$, \overline{i}_{i}^{2} is negligible

as is the effect of $R_{D} = 12 \text{ k}\Omega$

$$\therefore \overline{V_{i}^{2}} = 3.5 \times 10^{-18} \times 50 \times 10^{6} \text{ V}^{2}$$

$$= 1.75 \times 10^{-10} \text{ V}^{2}$$

$$\therefore \overline{V_{i}^{2}} = 3.5 \times 10^{-18} \times 50 \times 10^{6} \text{ V}^{2}$$

$$= 1.75 \times 10^{-10} \text{ V}^{2}$$

$$\therefore \overline{V_{i}^{2}} = 4RTR_{5} = 1.66 \times 10^{20} \times 50$$

$$= 9.3 \times 10^{-19} \text{ V}^{2}/\text{Hz}$$
In 50 MHz
$$\overline{V_{i}^{2}} = 9.3 \times 10^{-19} \times 50 \times 10^{6} = 4.15 \times 10^{-10}$$

$$\therefore F = 1 + \frac{\overline{V_{i}^{2}}}{\overline{V_{i}^{2}}} = 1 + \frac{1.75 \times 10^{-10}}{4.15 \times 10^{-11}} = 5.22$$

$$= 7.17 18$$

$$\frac{11.22}{Co_{x}} = \frac{1.9 \times 8.85 \times 10^{-12}}{80 \times 10^{-10}} = 4.3 \times 10^{-3} \text{ F/m}^{2}$$

For Acm, replace Rod/2 with Roc, and adm with acm,

$$I_{O1} = I_{D1} - |I_{D3}|$$

$$I_{O2} = I_{D2} - |I_{D4}|$$

$$I_{01}-I_{02}=I_{01}-I_{02}-(|I_{03}|-|I_{04}|)$$

= $I_{01}-I_{02}$

For In or IDZ, the maximum is 200 MA,

$$\frac{dVod}{dt} = \frac{200\mu\text{A}}{CL} = \frac{200\mu\text{A}}{5\text{PF}} = 40V/\text{MS}$$

12.10 When M1, M2 are off,

$$\frac{dV_{oc}}{dt}\Big|_{+} = \frac{|I_{os}|}{c_L} = \frac{100 \, \text{MA}}{5 \, \text{PF}} = 20 \, \text{V/MS}$$

When M3, M4 are off,

$$\frac{dVoc}{dt}|_{-} = -\frac{Io}{CL} = -\frac{Ioo\mu A}{5PF} = -20V/MS$$

$$\frac{|2.1|}{dV_{od}} = \frac{|Ios|}{C} = \frac{200\mu A}{1.39pF} = 144V/\mu S$$

(a)

$$|a_{cmso}| = \frac{|V_{cms}|}{|V_{oc}|} = 0.95 \frac{q_{mz1}}{q_{mz3}}$$
$$= 0.95 \frac{|2k'_{n}(W/L)_{21}|I_{021}|}{|2k'_{p}(W/L)_{23}|I_{023}|}$$

$$=0.95\sqrt{\frac{k'_n}{k'_0}}\sqrt{\frac{(W/L)_{24}}{(W/L)_{23}}}=0.95\sqrt{\frac{194}{66}\sqrt{\frac{(W/L)_{24}}{(W/L)_{23}}}}$$

=0.71

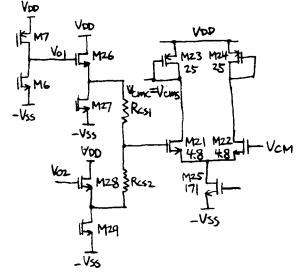

Choose M23 to match M5

$$(W/L)_{23} = (W/L)_5 = 25$$

$$(W/L)_{21} = (W/L)_{23} \left(\frac{0.71}{0.95} \sqrt{\frac{66}{94}}\right)^2 = 4.8$$

Choose M25 to have an overdrive of 0.2V ID25=400 MA

$$(W/L)_{25} = \frac{2I_{025}}{k_n^2 V_{0425}^2} = \frac{2 \times 400 \times 10^6}{194 \times 10^6 \times 0.2^2} = 171$$

(b), (c)

$$|V_{0V7}| = \sqrt{\frac{2|I_{07}|}{k_p'(w/L)_7}} = \sqrt{\frac{2\times100\times10^{-6}}{66\times10^{-6}\times50}} = 0.25V$$

Similarly, Vov6 = 0.25V, Vov21 = 0.66V

Consider the output stage

Consider the source follower

12.12 continued

Consider the CMS amplifier

-Vss+Vov25+VGs21+VGs26<Vo1

-1.65+0.2+(0.6+0.66)+0.8<Vo1

(VGs21=Vt21+Vov21)

Voj>0.61V

\[
\tilde{\text{.0.61V}}\tilde{\text{Voj}}\tilde{\text{.1.4V}}

To give the maximum symmetric autput swing, choose the DC value of Vo1 to be

\[
\frac{1.4+0.61}{2} = 1V

\]

Vcn = 1V - VGs26 = 1 - 0.8 = 0.2VThe output swing is $Voip = \frac{1.4-0.61}{2}$ = 0.4V

For the differential pair M21, M22 to work properly, 0.95 Voip < 1/2 Vov21 should be satisfied.
0.95 Voip = 0.95 × 0.4 = 0.38 V
1/2 Vov21 = 1/2 × 0.66 = 0.93 V
Therefore, the CMS amplifier will be active over the entire output range.

ന്ദ്രമ

12.13

Symmetry or the Miller effect can be used.

(b)
$$\frac{Vod}{2}$$

$$-\frac{Vod}{2}$$

(a)
$$Cox = \frac{E_0}{t_{0x}} = \frac{3.9 \times 8.85 \times 10^{12}}{150 \times 10^{-10}} = 2.3 \times 10^{3} \text{ Hm}^{2}$$

$$k_n' = \mu_n C_{OX} = 550 \times 10^4 \times 2.3 \times 10^3$$

= 1.26×10⁴ A/V²=126 μ A/V²

$$\left(\frac{W}{L}\right)_{23} = \frac{zI_{D23}}{k'_{1}V_{OV23}^{2}} = \frac{z \times 0.2 \times 10^{-3}}{126 \times 10^{-6} \times 0.2^{2}} = 79$$

$$C_{gs} = \frac{2}{3} WLC_{0x} + WC_{0L}$$

$$= \frac{2}{3} \times 63 \times 10^{5} \times 0.8 \times 10^{5} \times 2.3 \times 10^{-3}$$

$$+63 \times 0.12 \times 10^{-15}$$

$$= 7.7 \times 10^{-14} + 7.6 \times 10^{-15}$$

$$= 8.4 \times 10^{-14} = 84 \text{ f}$$

$$g_{mz3} = \frac{2 \text{ Toz}_3}{V_{0yzz}} = \frac{2 \times 0.2 \times 10^{-3}}{0.2} = 2 \times 10^{-3} \text{ A/V}$$

The RC time constant is

$$\frac{1}{9m23}(C9s+90fF) = \frac{1}{2\times10^{-3}A/V}(84+90)fF$$
= 8.7×10⁻¹¹S = 87PS

(b)
$$\left(\frac{W}{L}\right)_{23} = 20$$

 $W = 16 \mu m$
 $C_{95} = 21 fF$
 $g_{m23} = 5 \times 10^{4} AV$

The time constant is

=0.22NS

(c) The size of M23 becomes 4 the original size, hence the transconductance and gate-source capacitance, the contribution from which is the same as in the original case. The contribution from the 90ff capacitance becomes greater, so does the total time constant.

$$|2.15|$$
(a) $Voc = VG3 = VoD - |Vtp| - |Vov3|$

$$= 2.5 - 0.6 - 0.2 = 1.7V$$
(b) $adm = -gmi(toilltoz||20k)$

$$= -\frac{2IDI}{Voui}(\frac{VAI}{IDI}||\frac{IVA3}{IDO3}||20k)$$

$$= -\frac{2xlooxlob}{0.2}(\frac{10}{100xlob}||\frac{20}{100xlob}||20k)$$

$$= -1xlo³(100k||200k||20k)$$

$$= -15.4$$

$$acm = -\frac{gmi}{1+gmitosh}(Rodown)||to3)$$

$$\approx -\frac{1}{tosh}(Rodown)||to3)$$

$$= -1.96$$

In the DM half circuit, the load is $20k\Omega$ in parallel with rollTo3, and is less than the original load, rollTo3, hence the smaller DM gain. The CM circuit is not affected by the $20k\Omega$ resistor, so the CM gain is unchanged.

(a)
$$adm = -9m_1(r_{01}||r_{03}) = -66.7$$

 $acm = -9m_1(r_{01}||r_{03}) = -66.7$

(b) The DM and CM half circuits are the same as the DM half circuit in the first example in Section 12.4.1; the two gains are identical to the DM gain in that example.

(a)
$$adm_0 = -gm_1(r_0||r_{03})$$

 $Pdm = -\frac{1}{2(r_0||r_{03})C_1d}$
 $fdm_1 = \frac{1}{2(r_0||r_{03})C_1d}$
 $fdm_2 = \frac{1}{2(r_0||r_{03})C_1d}$
 $= \frac{1}{2(r_0|$

acmo=-gmsh(Ro(daun)1/103)

Fanc, unity =
$$\frac{|Acmcol|Pcmc|}{2TT} = \frac{1}{2TT} \frac{9msh}{CLc}$$

= $\frac{1}{2TT} \frac{1}{CLc} \frac{2Tosh}{Vovsh}$
= $\frac{1}{2TT} \frac{1}{2X_0^{-12}} \frac{2\times100\times10^{-6}}{0.25}$
= 6.4×10^{7} Hz = 64 MHz

(b)
$$f_{dm, unity} = \frac{1}{2\pi} \frac{1}{2C_{Lol}} \frac{2I_{DI}}{2v_{Vol}}$$

 $\frac{1}{2\pi} \frac{1}{2\times 4\times 10^{-12}} \frac{2\times 100\times 10^{-6}}{0.25}$
 $= 1.6\times 10^{7} Hz = 16MHz$

$$f_{cmc, writy} = \frac{1}{211} \frac{1}{CLc} \frac{2Iosh}{Vovsh}$$

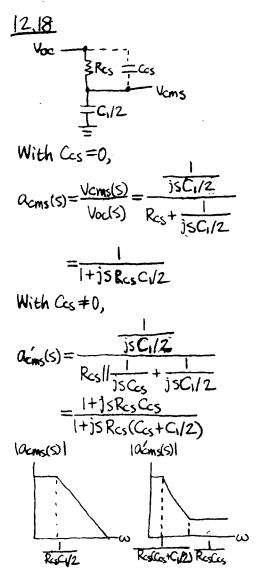

$$= \frac{1}{211} \frac{1}{2 \times 10^{12}} \frac{2 \times 100 \times 10^{16}}{0.25}$$

$$= 6.4 \times 10^{7} \text{ Hz} = 64 \text{ MHz}$$

$$\frac{2I_{DS2h}}{V_{OVS2h}} = \frac{1}{2}\frac{2I_{DSh}}{V_{OVSh}}$$

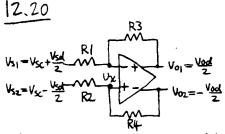

$$I_{D52h} = \frac{1}{2}I_{D5h}\frac{V_{OV52h}}{V_{OV5h}} = \frac{1}{2}I_{OOMA}\frac{0.25V}{0.25V}$$

=50MA

The Coscapacitors introduce a LHP zero and keeplacing(s) I from dropping at high frequencies; therefore, CMFB still works at high frequencies. Also, the phase shift of acms(s) approaches 0 at high frequencies.

In the triode region, $Id = \frac{kn'}{2} \frac{W}{L} [2(V_{gs} - V_{t})V_{ds} - V_{ds}^{2}]$ $g_{m,t} = \frac{\partial I_{d}}{\partial V_{gs}} = \frac{kn'}{2} \frac{W}{L} 2V_{ds} = kn' \frac{W}{L} V_{ds}^{2}$ In the active region, $g_{m,a} = kn' \frac{W}{L} (V_{gs} - V_{t})$ In the triode region, $V_{ds} < V_{gs} - V_{t}$ $g_{m,t} < g_{m,a}$

The opamp has infinite DM gain, so the voltages at its two inputs are the same and denoted by Ux.

It has zero CM gain, so there is no CM voltage at the outputs

$$V_{01} = \frac{V_{02}}{2}, \quad V_{02} = -\frac{V_{00}d}{2}$$
